HENRY HOLT & CO., N. Y.

Have Just Published

7th Edition, Entirely Re-written, of

Martin's The Human Body

American Science Series—Advanced Course. 685 pp. 8vo, $2.50, *net.*

Considerable new matter, especially in connection with the cardiac and vascular nerves and the physiology of the brain has been added, and throughout the book, new material from the discoveries of the last three or four years has been included.

Hertwig's Zoology.

General Principles of Zoology. By Prof. Richard Hertwig of the University of Munich. Translated by Prof. Geo. W. Field of Brown University. 226 pp. 8vo. $1.60 *net.*

Traverses historically the chief problems of zoology, and discusses the main generalizations of the science without any detailed survey of the animal kingdom. Contents: History of Zoology, General Anatomy, General Embryology, Inter relations of Animals and Plants, Geographical Distribution of Animals.

Pierce's Physics Problems.

Problems in Elementary Physics. By E. Dana Pierce of the Hotchkiss School. 194 pp. 12mo. 60c., *net.*

Some 1,200 classified and graded numerical problems for secondary schools, capable of easy illustration under ordinary laboratory conditions.

*** The publishers' descriptive list of works in Science and Mathematics, or of Works in General Literature, free.*

RECENTLY PUBLISHED IN GERMAN

Der Pratische Deutsche

By U. Jos. Beiley. Der Pratische Deutsche is arranged after the plan of Paul Bercy's Le Français Pratique, but it is by no means a mere translation of that book. The original plan has been preserved, but the exercises reconstructed and fitted to the particular needs of the student of German. The aim has been to provide the material necessary to enable the learner to converse with Germans in their own language, and to arrange it in such an order that the study will be pleasurable as well as profitable. Roman type is used throughout, excepting with the first two lessons, and a Vocabulary is at the end of the volume.

12mo, cloth, 251 pages, $1.00.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 17, 1896.

The Week.

THE full significance of Monday's election in Maine can be appreciated only in comparison with the corresponding elections of Presidential years during the past quarter of a century:

	Rep. vote.	Dem. vote.	Rep. plurality.
1872	71,917	54,701	17,216
1876	75,867	60,423	15,444
1884	78 912	59,061	19,851
1888	79,398	61,350	18,048
1892	67,600	55,078	12,522
1896	83,000	34,000	49,000

Nothing like this has ever been known, or even remotely approached, in the history of Maine, or of any other State in the Union. The surrender to Populism has split the Democratic party in Maine almost evenly in two. About two-fifths of those who voted for a Cleveland candidate for Governor four years ago refused to vote for the Bryan candidate on Monday, or voted directly for his Republican opponent. Even in the last year of the war, when Democracy insisted that the war was a failure, the party was able to poll 45,332 votes. The September election in Maine undoubtedly shows the way that the November election in the nation will go. The only thing now left is to insure that the national verdict shall be as emphatic.

The full returns of the Vermont election show that the surrender of the Chicago convention to Populism cost the Democrats more than one-fifth of their vote of 1892, the total falling from 19,171 to 14,961. The full significance of this is not appreciated until one considers that the Democracy of Vermont is more "rock-ribbed" than that of any other Northern State. It takes a good deal of grit to be a Democrat in many a town, and when a man has once taken his stand for life with that party, he is generally ready to vote the regular ticket under any and all circumstances. That more than one-fifth of the party should refuse to support its candidate this year shows the existence of a revolt which is likely to cause still greater ravages in other States where independent voting is more common.

A Senator is to be chosen by the South Carolina Legislature which will be elected in November. An agreement was reached that candidates should submit their claims to the people at primaries. Tillman wanted Governor Evans for his colleague, and expected that the knowledge of his wish would settle the matter. At the first trial no one of the three candidates had a majority. The vote was taken over again last week with only Governor Evans and Judge Earle in the field. The Tillman machine made the most desperate efforts to win; State officers, county officers, and the whole force of the dispensary system being used in the Governor's behalf. Tillman made it a personal matter, and announced that, "if Governor Evans is defeated, it is the beginning of the end" of Tillmanism. The result is the conclusive defeat of Tillman's man, and to that extent of Tillman himself. Governor Evans was rejected, and Judge Earle received a majority of several thousands. The successful candidate is a man of character and ability, who will represent the State honorably. For this the whole nation has reason to rejoice.

For the first time in the history of the country a regularly nominated candidate of a great party for the Presidency has been formally repudiated by the national Administration of his party. President Cleveland, his Secretary of the Treasury, his Attorney-General, and all the other members of his cabinet make public announcement that they do not consider Mr. Bryan a true representative of the principles of their party, that they regard his candidacy as a menace to the national honor and welfare, and that they support heartily the Democratic ticket which has been nominated in opposition to him. No such political disaster as this has ever befallen a candidate for the Presidency at the opening of his campaign, or at any other stage of it. When it follows upon the revolt of over 200 of the journals of the party, comprising its strongest members in nearly all parts of the country, and the refusal of the leading men of the party to support him, this disaster brings the Bryan campaign to the point of collapse two months before election day. There is no longer any doubt that the entire moral force of the Democratic party, its stability, character, and intelligence, has decided to oppose Bryan. Thousands of these voters will support McKinley, as the surest way of defeating Bryan, and thousands more will vote for Palmer and Buckner. The great usefulness of the latter ticket lies in the fact that it gives opportunity for Democrats to enter the campaign with speeches and documents against Bryan. The speeches at the Louisville ratification meeting on Saturday, by Messrs. Palmer and Buckner and by Messrs. Caffery and Bynum, go to Democrats as the views of Democratic leaders whom the party honors and trusts, and they have vastly more influence in turning Democrats away from Bryan than Republican speeches and documents could have. They enter unquestioned into the Democratic households of the land, and their plain exposition of what Bryanism really is will play such havoc among Democratic voters that, when election day arrives, it is likely to have little support save that which the Populists and Anarchists give it.

Having got the National Silver party off his hands the day before, Mr. Bryan returned on Wednesday week to the subject of the Chicago platform in a formal letter accepting the nomination conferred by the convention which framed that platform. This letter is more after the usual style than most of his deliverances, although, of course, he has to work in such a phrase as "the cause which greed is prosecuting against humanity." The greater part of the letter demands and invites no comment whatever. It is interesting, however, to note that he tries to dodge the natural interpretation of the Altgeld plank about federal interference by making it relate simply to the "domestic affairs" of a State, whereas the action taken by President Cleveland in 1894, which was so bitterly condemned by the Governor of Illinois, grew out of interference with the transmission of the mails and of interstate commerce. On the subject of the civil service Mr. Bryan arrays himself openly on the side of the spoilsmen by clap-trap talk against "life tenure" and "a permanent office-holding class," and by advocating a general extension of the fixed-term system introduced under Jackson, which has been the fruitful source of evils for two generations. The tariff Mr. Bryan dismisses as of no account in comparison with the issue of the monetary standard, and he is quite right in thinking that the votes this year will be cast with reference to that issue.

Attorney-General Harmon treats Mr. Bryan with great consideration in courteously assuming that the latter was merely committing an "inadvertence" when he denied, in his letter of acceptance, that the President had any authority under the Constitution to maintain the authority and enforce the laws of the United States within the boundaries of a State unless requested to do so by the Legislature and Governor of the State. Mr. Bryan called it "interfering with the domestic affairs" of any State, but there is no doubt whatever that he had in mind the Chicago railway riots of 1894, and was putting himself squarely in line with Debs and the Chicago platform against Presidential interference in such disturbances in future. He is after the turbulent labor vote of the country, and knows perfectly well what he is advocating. Mr. Harmon is not a particle too emphatic when he says that this "is a far more serious matter than the money question, or any of the other questions now before the people, grave as they are." As he says, his statement of what the Constitution really provides is well known

to lawyers and students of the Constitution, and in the minds of all such persons there is no question of the authority under which the President acted. Neither is there any question of the entire accuracy of Mr. Harmon's estimate of what the Bryan-Debs-Altgeld view of the matter would bring us to:

"It was under the power conferred that the late rebellion was suppressed. Mr. Bryan's doctrine that this law is unconstitutional is more dangerous than that of secession. The latter at least left the Government some power and authority in the territory of States which should choose to remain. Mr. Bryan's would reduce it to the idle mimicry of the stage."

Mr. Harmon cites the resolution which Senator Daniel proposed and the Senate passed on July 12, 1894, warmly approving President Cleveland's action, and declaring that he "has the full sympathy and support of the law-abiding masses of the people of the United States, and he will be supported by all departments of the Government and by the power and resources of the entire nation." A like resolution was passed in the House a few days later, but we search the *Congressional Record* in vain to find any protest against it from Mr. Bryan. His fellow-Popocrats in this campaign, Lafe Pence and Mr. Bland, protested vigorously, but, though Mr. Bryan was present, as a vote on another question taken immediately after this resolution was disposed of showed, he had nothing whatever to say. The resolution was passed by a *viva-voce* vote, the demand for the ayes and noes not being sustained. Where was Bryan as the friend of the people, the champion of downtrodden labor, the upholder of the Constitution, in this crisis? He was not running for the Presidency then, and was not seeking the turbulent labor vote as he is now.

Mr. Hobart is extremely fortunate in having his letter of acceptance appear simultaneously with Mr. Bryan's. He devotes three-fourths of his letter to a presentation of reasons against the free coinage of silver and for the maintenance of the gold standard, and his arguments are clear and cogent. He makes a strong presentation of the injury that would be suffered by depositors in savings banks, shareholders in building and loan associations, pensioners, and other classes of people who have saved money or have been receiving money that was as good as gold. Particularly commendable is his readiness to declare that the gold standard is the best possible standard, and to state what "an honest dollar" means, as when he says:

"Any nation which is worthy of credit or confidence can afford to say explicitly, on a question so vital to every interest, what it means, when such meaning is challenged or doubted. It is desirable that we should make it known, at once and authoritatively, that an 'honest dollar' means any dollar equivalent to a gold dollar of the present standard of weight and fineness. The world should likewise be assured that the standard dollar of America is as inflexible a quantity as the French Napoleon, the British sovereign, or the German twenty-mark piece."

Political turpitude has seldom put itself more openly and shamelessly on exhibition than in the action of those State Democratic conventions which are reversing themselves on the silver issue. The New Jersey Democrats last May adopted what was probably the soundest and stoutest currency plank of the year. They were for a "firm, unvarying maintenance of the gold standard," and "unalterably opposed to all devices and schemes for the debasement of our currency." Last week at Trenton the same Democrats (or nominally and officially the same) showed what their unalterable opposition was good for by going for the Chicago platform with enthusiasm. In Pennsylvania the abandonment of conviction was even baser, as actually the same men who in April were for gold, in September are for silver. It was not a new convention, but the April convention reconvened. What in April was un-Democratic, dangerous, dishonest, is now "thoroughly Democratic and purely American"! The merciful Providence that fashioned men hollow on purpose that they might their principles swallow, must look upon the work of his hands in New Jersey and Pennsylvania and pronounce it good.

Nothing seems to have hit the Bryan newspaper organs nearer the belt than the exposure of the forgery which attributed to the London *Financial News* an opinion that free silver coinage would lift America to the pinnacle of prosperity and hurl England into the depths of commercial ruin. We do not think there is a free-silver newspaper in this country which has not copied this alleged opinion, British though it was, and it has been sent out in sheets by general and local committees. The flat denial of the London journal that it ever expressed such an opinion could be met in only one of two ways, either by acknowledging the "mistake" or by impeaching the denial. The latter seems to be the course decided on by the Bryanite press. The Philadelphia *Item* declares that it has made strenuous efforts to obtain a copy of the *Financial News* of the date to which the opinion quoted was credited, but that "a liberal offer in London has thus far failed" to fetch one, and "the natural inference is that the entire edition has been destroyed, as they refuse to let you see the files." We have no doubt that if the *Item* will go through the public libraries, it will find that the edition of March 10 has also been cut out of the bound files. This would be just like a British editor. But what mystifies us is why this particular editor, who was so ready to assist the American silver cause in the early spring, withdraws the hand of friendship entirely in midsummer.

A Chicago banking firm, Peabody, Houghteling & Co., publishes a list of the "gold-bugs" who have bought gold mortgages through them during the past four months. Widows predominate in the number of investors, thus adding one more to the many reasons for bewaring of them known to the elder Weller. What could be more nefarious or more convincing evidence of the need of a change in our oppressive currency laws than the greedy haste of widows to invest their $500 to $3,500 insurance money in Chicago mortgages, and their actually insisting upon being paid back as much as they loan? These are the real "money-changers" and persons of "fixed incomes," for whose destruction Mr. Bryan so loudly calls. With these grinders of the faces of the poor the free-coinage law will deal sternly, as it will also with the clergymen, the clerks, the retired army and navy officers, the authors, the hospitals and colleges, whose investments are recorded in the lists. Down with the Widows! No Savings-Bank Domination!

President Walker hastens to resent and denounce the efforts of George Fred Williams and other silver orators to make him out an authority in favor of free coinage. This he calls "folly" and "suicidal," and says that all the leading bimetallists of Europe consider the attempt to establish free coinage in this country alone as a terrible blow to their cherished hopes. It was not necessary for President Walker to assure those who know him that he is firmly opposed to the Bryan madness. But, in the great dearth of "professors" to give aid and comfort to the silver reasoners, his name has been a godsend, and has been so freely used that it is well to have him disavow all connection with repudiationists. At the same time it is rather funny to find him so indignant over the baseness of using his "argument" for international free coinage as an argument for independent free coinage. Arguments are strange things, and are wrested by the unlearned to their own destruction with uncommon ease. When President Walker and the other New England bimetallists put out their silver programme early in 1894, just after the fearful struggle to repeal the Sherman law, they carried great joy to the camp of the cheap-money men, and were perhaps the most potent single force in causing a revival of the silver craze. We admit that it is possible to discriminate between their arguments and those of the 50-cent-dollar men, but the distinction is too fine for the common mind to draw.

An advance in the Bank of England's official discount rate is the traditional recourse, on the London market, to check or modify a heavy outflow of gold. Such an advance ordinarily serves its purpose,

in part, if not in full. The theory of the change in the discount rate is that the Bank of England, being the largest single lender on the London money market, ceases to loan money except at a rate above existing open-market quotations. By so doing it gives an upward tendency to London money rates in general. If then the subsequent advance in the open market goes far enough, capital will be drawn to London from all other important money markets, with a result, in the first place, of turning the foreign exchanges partly in London's favor, and therefore, in the second place, of checking the gold export from England. This is a perfectly simple and mechanical operation, and is especially efficacious in stopping a heavy gold movement from London to the Continent. Of course, however, the success of such a measure must depend largely upon two other factors in the situation. The open London money market must be in shape to follow the rise in the Bank of England rate; if it were not, the Bank would simply lose its own business to no purpose. But, more than this, the operation, to effect its purpose, must not be offset by an unusually heavy foreign trade indebtedness. If, for example, England's merchandise imports from Germany had been doubled, without the doubling of its exports to Germany, there is reason to doubt whether a rise in the Bank of England's discount rate could check in any large degree the flow of gold to Germany. Now this, as it happens, is precisely the present situation as between Great Britain and the United States. For the seven months ending July 31, this country exported to Europe nearly $69,000,000 more of merchandise than we sent in the same months of 1895. We have imported also $43,000,000 less. The result is a foreign credit balance this year, on merchandise trade alone, of $90,743,609, against an actual debit balance last year of $21,219,092. August returns will probably emphasize this difference.

The Treasury circular entitled "Information respecting United States bonds, paper currency, coin, etc.," contains the mint estimates of gold and silver production during the calendar year 1895—figures not previously published. Our readers are already familiar with the great increase in the world's gold output, which rose from $180,626,100 in 1894 to $203,000,000 in 1895. But the equally remarkable increase in the world's silver production has attracted less general notice. The world's output of silver, reckoned in coining value, was $226,000,000 in 1895. This was an increase of $9,107,000 over 1894, of $28,000,000 over 1892, and of $144,200,000 over 1873. The particular significance of this enormous and continuous increase in the silver output is the light which it sheds on the probable amount of depreciated metal which would be thrown upon our mints if silver free coinage were adopted. The more conservative bimetallists have lately harped upon the allegation that no "flood of foreign silver" could submerge our currency, because, as they declare, all foreign silver is in the shape of coin, whose value would be lost by melting. There is reason to doubt the force of even this contention regarding foreign coin. But it is quite sufficient to point out the fact, embodied in these mint returns for 1895, that in a year when the market price of silver bullion was almost at its lowest, enough was mined to have forced $226,000,000 new silver dollars into our circulation. Of this product, moreover, $154,000,000 worth, or 68 per cent., was produced outside of the United States. To what total the annual production would advance were coinage of silver opened free to all comers at our mints, is a matter of conjecture merely. Four hundred millions' worth pressing annually for coinage into legal-tender dollars is no excessive estimate.

A notice in the *Journal des Économistes* of the various bimetallic publications of the month says that "most of the authors have great need, in truth, of learning what are money, supply and demand, exchange, credit, and all commercial negotiations," but they are not aware of it. One of them, M. Allard, declares that everybody, except a few ignorant and obstinate economists, is of his way of thinking, and adds that an "enormous party is rising, North and South, East and West, crying for the free coinage of silver." There is no doubt that the complete mental soundness of bimetallists has long been suspected and discourteously questioned by some of their opponents. We know of one who says that every bimetallist he has ever known had a far, vague look in his eyes. But the fact is that they are not madder than all believers in a social panacea. Every man who thinks he can diffuse plenty through a smiling land by a single stroke of the pen, becomes so excited by the prospect that he makes bystanders doubt his soundness on other topics. Money has been seized on by these enthusiastic individuals because its influence is so tremendous, and the bimetallists are rarely business men, and have to meet a good many sneers and much ridicule. But if they knew all the things the *Journal des Économistes* says they ought to know, they would not be bimetallists. No business man, for instance, wants two standards, because business has never been done on two standards. Nor would any absolutely sane man expect nations to change their currency because *he* thought gold had appreciated and goods had not fallen. Nor would he believe, as some do, that God Almighty had forbidden the demonetization of silver. We must regard bimetallists as agitators, not financiers.

The growing belief in Europe that some decisive action must soon be taken by the Powers in Constantinople is not hard to account for. Time has shown what a complete mockery was the Sultan's promise of reform, with which European diplomacy had to be content a year ago. He lacks either the power or the will, or both, to carry out the reforms he pledged himself to effect. The present situation would be regarded by everybody as intolerable were there not a reasonable fear that any proposed or possible change would but lead to a situation still more intolerable. To depose the present Sultan, as is suggested, and set up another one in his stead, might work in Zanzibar, but would promise little improvement in Turkey. It is doubtless the system, the conditions, the inherited traditions of the Sultan's rule, and not the mere man who happens to be Sultan, that makes Turkish government such an anachronism. The incredible thing is that the civilized Powers should much longer protect a government which would be destroyed by its own cruelty and blindness were it not so supported. We have reason to know that a break-up of some sort is thought to be inevitable by the oldest American residents in the Turkish Empire. The American professors in Robert College, with other Americans resident in Constantinople, have a regular drill that they go through in anticipation of the smash. Every man, woman, and child knows just what to do—to just what legation or battle-ship to fly for protection—the moment the general insurrection and massacring begin. They do not know when it will begin, but that it will begin some day they feel certain, and think it only reasonable caution to be ready.

Spain continues to put forth desperate efforts to hold Cuba. She now has 40,000 additional troops on the way to the island to be ready for operations in the fall. This will make a total of nearly 175,000 men sent out in less than two years. No such force was ever sent so great a distance by sea to wage war. The cost is enormous for a nation of impaired resources, and it seems to be the opinion of London financiers that it will force Spain into bankruptcy if it has to be borne much longer. Meanwhile new complications arise to worry her rulers in the shape of revolutions in Porto Rico and the Philippine Islands. Whether these have been incited, as Prime Minister Cánovas asserts, by Cuban emissaries, it is not important to know. The point is that they call for more troops and more money, when it appeared as if the last available man and the last borrowable dollar had already been requisitioned. The Spanish generals are not saying so much as they were a year ago about a speedy suppression of the Cuban rebellion, but they are probably more keenly conscious than they were then that it must be suppressed quickly or not at all.

"FREE COINAGE EXPLAINED."

THE precise way in which the new silver dollars were to reach the people when the silver régime was established, has engaged the best thought of the silver party, but all have felt that it was a subject of great difficulty. The first and cruder view was that an office of Silver Distributor would be created in each State, on the model of our liquor law, with Assistant Distributors under him in each county, whose duty it would be to pass the silver out to the people as fast as it was coined. But what was to be the rule of distribution? How much silver was each person to get? Well, the earlier thought on this point was that each person was to get sixteen dollars, and that this was the true and honest interpretation of the maxim "16 to 1." But necessarily an error of this sort could not last long, and could find currency only among our more simple-minded citizens. The correct explanation of the phrase 16 to 1 speedily made its way to the front. It was soon understood that 16 to 1 meant that the nations were to agree that every one who had an ounce of gold was to be able to procure for it sixteen ounces of silver. But no sooner was this explanation diffused than a new difficulty arose. Even the most ignorant could not understand why, if they could get thirty-two ounces of silver for one ounce of gold in the market now, the nations were to agree that they should hereafter get only sixteen. They understood the market practice of taking all you could get, but they could not understand being bound to take only about half what you could get. This point has not yet been cleared up, and this province of the subject remains to this moment a good deal of a muddle.

The clearest and most convincing excursus on the subject we have seen is a paper issued by Mr. Henkle of Rochester, N. Y., under the heading of this article. He shows what free coinage really means, in terms and with an authority so clear that nobody can hereafter honorably profess ignorance on the subject. The Government is to buy silver at the market price, 53 cents to the dollar, and coin it into dollars at 100 cents—profit to the Government, 47 cents. Some donkeys may suppose that it is the value of the silver that makes the dollar, whereas "it is the Government stamp of authority." "Isn't this plain and true?" asks Mr. Henkle. We should think so. To us it seems plain as a pikestaff. Well, now, how are these dollars to reach the people, and how is the Government to get its profits? Nothing easier. The Government is to buy material for 600,000,000 silver dollars from the Western mine-owners at the market price. For this it can pay with 318,000,000 legal-tender dollars, and thus have a profit of $282,000,000. It is then to establish a State bank in each State and county, and in it deposit this money, and these banks are to lend the money to the people, on the usual security, at 3 per cent. In this way the Government is to have control of all the money in the community, and to relieve a suffering people from the payment of all taxes, and it appears that this control of all the money in the community by the Government is provided for by the Constitution of the United States—a point which, we confess, we had not noticed ourselves. Nothing more admirable for the relief of the taxpayer than this plan of buying silver and paying for it with legal-tender dollars coined out of it has as yet been produced, and its best feature is its simplicity.

But we cannot say we are altogether satisfied with Mr. Henkle's way of distributing the silver among the people, and we fear it will excite much discontent. It will be observed that it is to be entirely by way of loan, "on the securities now furnished to banks." Now, we must remind him that one of the most devilish of the devices resorted to by those "thieving institutions," the banks, for the oppression of the poor is the exaction of security for loans, and, above all, what these monsters call "good" or "gilt-edged securities," meaning stocks or bonds capable of being sold on the exchange at a certain price. How many honest citizens allow their homes to be defiled by such securities? Why, not even 10 per cent. The great mass are far too proud, and too American, let us say, to allow such things to enter their houses. Now, how are these to get their share of the Government silver loans? We fear Mr. Henkle has not given this branch of the subject the attention it merits. We say let the banks loan to every citizen at 3 per cent. on his honor as a man. We say that giving security for loans is a degradation to which no American should submit, and is a practice of English aristocratic origin.

But the Government is not to confine itself to coining silver. It is also "to print and put in circulation in the same way as many millions of full legal-tender money as the necessities of our industry may require to put them all into operation." Every mill and mine and shop is to draw from the Government through the banks all the money they may require. Gold-bugs would doubtless say that in this way the country would be "flooded with money." Not so, O gold-bug! As Mr. Henkle well remarks: "No one would borrow and pay interest on more money than he could profitably use." But we must again point out to him that if the money had to be borrowed on ordinary security, very little would be borrowed. We would suggest, therefore, respectfully, either that the security condition should be removed from Mr. Henkle's plan, or that every citizen should be furnished by the Treasury with a reasonable amount of collateral to be used in making his loans. This done, we agree with him that no citizen would borrow more money than he could profitably use. The reluctance of citizens to borrow any money they cannot employ profitably, is one of the great facts of the day, though in gold circles people may affect to doubt it.

Mr. Henkle also proposes an enormous tariff, and the restriction of all payments on mortgages to 10 per cent. a year, and one of the most determined overhaulings of corporations, telegraph and railway lines in history, so as to enable all the American people to send their telegraphic messages at five cents for ten words and to travel by rail 100 miles for 63 cents, and a variety of other startling but good changes in our society. In fact, if his programme should be carried out, none but foolish and simple-minded persons will earn a living, seeing the facility with which they will be able to borrow. What we like in his paper, which has been widely circulated, is that it shows us that the determination which existed at the time of the French Revolution to emancipate the people from the rule of the money power, is not dead. It has slept for 100 years, but Mr. Henkle's manifesto proves that the great thoughts about money which presided over French finances in 1796 still exist among us, and that crack-brained people of that period, as the children of the world called them, have their successors on American soil, thank Heaven.

POPULISM IN AUSTRALASIA.

IN speaking of M. Pierre Leroy-Beaulieu's accounts of New Zealand last week, we said we should return to his report on Australasia, as the Populists are working their sweet will there in the absence of a political constitution. He compares Australia with America, but says the profound difference between them is that the latter was first settled over two centuries ago by a very superior population, and had a government long established when its immigration began to arrive, while the former was invaded by immigrants of a very poor class in its very infancy—that is to say, about fifty years ago. Contrasted with America, Australia is, in fact, a mushroom, the very land of Populism—that is, of love of novelty, of want of responsibility, and of ignorance and recklessness applied to government. In fact, our Populists are politically Australians.

In the first place, nearly if not quite half the population live in cities, where they can hold meetings easily and harangue each other; and to the city they are drawn by the high tariff. In fact, the city population is largely composed of ruined and unsuccessful gold-miners and furious protectionists. The state, too, occupies a very high position in their minds, but with more reason than here, because, ever since they have known anything of it, it has met the public burdens largely by the sale of public lands. They were therefore led in the beginning to insist on the state constructing all the railways, and employment was thus

given during several years to a very large body of laborers. But the railroads were eventually finished, and then the laborers had to be discharged or otherwise employed. But the laborers would not allow themselves to be discharged. Consequently, works of all descriptions, called "relief works," had to be set on foot to support them, and before very long the people came to feel, like the Populists here, that the supply of employment to labor is one of the functions, if not the chief function, of Government. But when the state is the chief employer, there is not much, if any, rising into the position of employer among the men, and as each province has its own tariff, and no market beyond its own borders, the industries are poor and feeble. Consequently, the laborers form a distinct, separate, and somewhat hopeless class, which, like our Populists, hates all other classes, and especially the great landholders, who remain in the country, own thousands of acres of land, and give themselves airs, take a daily bath, wear white cravats, and dine late, as in England, and are known as "squatters." These men, and the agricultural class generally, are said to be the bone and sinew of Australia, but they have little or no power in the state. The Government is really in the hands of the Populists of the towns.

It is these Populists who dominate in the legislative assemblies, and, as the country has no regular historical parties, they are divided into "groups" as in France, and delight in turning ministries out of office, so that Victoria, New South Wales, and New Zealand have had twenty-eight cabinets in forty years; South Australia forty-two. As here in America, the separation between what is called "society" and politics is complete. There is the greatest hostility towards "squatters," merchants, and bankers, and their appearance in politics is considered an intrusion. M. Leroy-Beaulieu says, to "succeed in a profession is death for a politician." A leading politician does not study any legislative reform with regard to its effect on the community, but with regard to its effect on his own political fortunes. When one of them, named Reid, came into office in New South Wales, with a mandate to reduce the tariff simply, he forthwith started an income tax, exempting all incomes below $1,500, and treated the members of the Upper Chamber, who are appointed by the Governor, and who opposed his schemes, as "rotten and corrupt old fossils."

In New Zealand the Prime Minister is an old saloon-keeper, and the principal work of the Parliament in one session was voting state guarantees for banks. In one night it voted a guarantee of $16,000,000, the total revenue not being more than $20,000,000. They have, curiously enough, the phrase, "forcing bills through the House," the equivalent of our phrase "jamming a bill through." In fact, their legislatures are so like ours that there is, M. Leroy-Beaulieu says, a growing agitation in favor of the referendum. In all the legislatures Labor is so powerful as to dominate all parties, and it employs its strength almost wholly in getting "reproductive works" set on foot, no matter what, so long as they give employment—generally railways, or roads, or wharves. In all these the wages are enormous and the day's work very short. The States borrowed for this purpose, M. Leroy-Beaulieu thinks, about $700,000,000 of European capital. They have had strikes, too, with the usual accompaniments of murder and incendiarism, instigated by orators who denounce the parliaments as "committees of corpulent robbers, well-bred thieves, oratorical prostitutes, and abject mercenaries." "The tree of liberty," said one, "will never flourish till it is manured with the bones of these fat usurers and insolent despots." Who would not think he was listening to Bryan, or Tillman, or Altgeld, or Kearney? In fact, says M. Beaulieu, "the influence of socialistic doctrines makes itself felt in all parts of Australian legislation—the land laws, the laws on labor, the system of taxation, and the general tendency of the state to make itself a merchant or manufacturer, and to encroach more and more on the domain of private enterprise."

From most of these excesses we are saved by our system of constitutions, the great wisdom of which was never so manifest as at this moment. But we have here, as in Australia, a large body of ignorant and poor men, who chafe under constitutions, who cannot be got to understand the delicacy and complication of modern governmental machinery, and, in their joy at finding themselves in power, make light not only of knowledge, but of all human experience.

PROFITABLE SCIENCE.

No small stir was caused in England a few months ago by a book entitled 'Made in Germany.' It was put forth by the Fair Traders, and undertook to show, by a lot of haphazard figures, that the Germans were alarmingly encroaching upon England's foreign trade. The remedy was, of course, discriminating or protective duties—the Q. E. D. of all such clamorous pamphleteers. Lord Rosebery rather thoughtlessly cited the book, and this led the *Economist* to dissect its assertions and statistics, with the result that the remains were hardly worth decent burial. But the real source and danger of German competition, with a sure indication of the only means of meeting it, have recently been brought to the attention of the English public in a way to cause 'Made in Germany' to appear more than ever vulgar and futile.

Prof. Ostwald, the distinguished German chemist, in a letter to his friend Prof. Ramsay, set forth the reasons for the superiority of German science, theoretical and applied, in so striking a manner that his English correspondent felt impelled to give the letter to the public through the London *Times*. Its significance was at once perceived. Here was something deeper and more powerful than tariffs. Here was a frank disclosing of the secret of German power as a competitor for the world's commerce, with the unavoidable inference that there was but one way to rival it—not by laws or diplomatic manœuvres, but by meeting knowledge with knowledge and skill with skill. Papers like *Nature* have taken the matter up, and insist that the need of reorganizing English scientific education requires no clearer demonstration.

Prof. Ostwald showed, in the first place, how the root idea of German higher education—freedom of teaching and freedom of learning—necessarily carried research and specialization to their highest terms. Originality and independent investigation alone give the teacher his place and retain his pupils. But it is the splendid opportunity for technical careers offered to students by German manufactures that makes, as Prof. Ostwald asserts, the organization of the power of invention in the arts and industries, now to be observed in Germany, something unique in the world's history. Referring to his own specialty, he says:

> "Each large work has the greater part of its scientific staff—and there are often more than one hundred Ph.D.s in a single manufactory—occupied, not in the management of the manufacture, but in making inventions. The research laboratory in such a work is only different from one in a university by its being more splendidly and sumptuously fitted than the latter. I have heard from the business managers of such works that they have not infrequently men who have worked for four years without practical success; but if they know them to possess ability, they keep them notwithstanding, and in most cases with ultimate success sufficient to pay the expenses of the former resultless years."

Is it any wonder that, by such methods, Germany has come to control the fine chemical markets of the world? By her superiority in this respect alone she is able, silently and without any legislation, to lay a tax upon almost every industry in every country. German manufacturers have come to a clear understanding of the commercial importance of science. Not long ago one of them offered a university professor a very large salary simply to come into his works and make experiments regarding the practical use of certain scientific methods which the professor had been developing. This close relationship between science and industry is good for both. It puts the best trained and highest inventive power at the service of manufacturers, and it also furnishes the scientist not only with new openings for a livelihood, but with wide opportunities for research. Prof. Ostwald declares that some great establishments provide finer technical means

and appliances to chemists than any university laboratory.

Against such arms of precision what are the bows and arrows of protective tariffs going to avail? While the Fair Traders are inventing laws, the skilled Germans are inventing processes, making discoveries, converting theory into practice, in a way to make the laws null and void from the moment they receive the Queen's signature. The only thing to pit against a man who knows, is a man who knows more. The English papers in general face the situation fairly, the *Times*, for example, saying that there is no remedy except in Englishmen becoming "practical enough to look beyond their noses, and wise enough to believe in knowledge." Of course, in the cry for a reform in English scientific education, there are those quick to catch at the German idea of state endowment and control. But it is clear that, whatever the system of education, the secret of German commercial success lies in the private initiative of German manufacturers. In their case it is really industry, not the state, which endows research. As for English scientific education, the rather pitiful attempts of Oxford to enlarge and better her science courses have been much commented on of late in the columns of *Nature*. The main difficulty lies in supposing that a body like Convocation is capable of saying what a scientific education is or ought to be. On this head Prof. Fitzgerald of Trinity College, Dublin, declares:

> "The fact is, Oxford's best is bad, and her ideal education is one-sided. The most serious cause of complaint of modern society against the old universities is that they have so controlled the education of the wealthy classes of the community that the landed and professional classes have been educated apart from the commercial and industrial classes, to the very great injury of both. One might as well consult a committee of clergy as to the best education for a doctor as advise with university dons as to the best education for the general community."

The conclusion of the whole matter is simply the moral we have so often had to enforce. The world of commerce, like the world of literature, the world of the professions, the world of war, is at the feet of the men who know. Science is not merely a thing for spectacled professors to dabble in, but is profitable in mart and manufactory. It is the true transmuter of dross into gold. A near-sighted German professor works away in his laboratory for a few years and comes out with an invention which has not only a fortune in it for himself, but a revolution in it for some great industry. What can laws do to help or hinder such things? What way is there of competing with knowledge except by means of a finer knowledge? From of old it has been true that the man of knowledge is the man who increaseth strength, and nothing that Fair Traders or unfair traders say or assert can make law or trickery or retaliation or bargaining take the place of knowledge in increasing strength in international trade.

THE GERMAN CRISIS.

THE Germans have just been passing through a crisis which at one time promised to be serious, but has happily passed over without any evil results, and is very interesting to students of English history. The Prussian monarchy has always in some degree represented the Tudor Kings in England, in its attitude towards the nation; but since the creation of the Empire, and the appearance of the Bundesrath and Reichstag, its position has been rather that of the English Georges, and particularly George III., for it is only since George III. (and in fact one may say since the accession of Victoria) that the English monarchy has become what it is to-day, limited and nearly powerless. The Germans are just entering on the political struggle which the English carried to a successful issue with the Stuarts, but are greatly weighted by the possession of a large army, and the diffusion among the population of military habits of obedience, which is a great support for naked or unconstitutional authority.

The present German Emperor is not prepared to enter on an open conflict with the Reichstag, like Charles I., for he does not seem capable of deep-seated designs or long-lived plans of any kind, but he has a boy's pleasure in the possession of power and the exercise of it, and seeks in youthful ways to evade constitutional checks on its display. The late Minister of War, Gen. Bronsart von Schellendorf, has recently resigned because his plan of a reform in the code of military procedure for the trial of military offences, which Prussia has been loudly calling for and which has been adopted in most other States of the Empire, had been set aside by the Emperor under the advice or instigation of another and secret cabinet, called "the Military Cabinet of his Majesty the Emperor," unknown to the Constitution and the laws. There is an official publication in Germany called the *Rang- und Quartier-Liste* in which one finds everything relating to the army. If we turn in it to the chapter relating to the ministry of war, we find an account there of this "Military Cabinet of the Emperor and King," showing that it controls everything relating to the nomination, promotion, and discipline of the troops; so that its head, General Hahnke, one of the most unbending of the reactionaries, and one of the greatest opponents of the Reichstag and its rights, living close to the Emperor, sharing his labors every day, and making confidential reports to him on all persons and things military, had gradually succeeded in withdrawing the administration of the army from its constitutional head, the Minister of War. Then when the constitutional cabinet had determined on a reform in the procedure of the military courts, by making it public and oral, it was found, and boldly announced, that the Military Cabinet would have none of it, whereupon the Minister of War resigned and the Chancellor, Prince Hohenlohe, retired to his estates. Things accordingly looked very serious for a while, but a note in the official paper announced that the Emperor was desirous of submitting a project of reform in the code of military procedure to the Federal Council this fall, on the line of the announcements made by the Chancellor on the 18th of May in the Reichstag. Moreover, if we understand the matter rightly, the Military Cabinet is not to appear any more in *Rang- und Quartier-Liste*.

It will be easily seen that the quarrel was at one time likely to be far graver than a mere difference of opinion between the monarch and the nation with regard to the mode of trying military offences. It was a direct issue between the Kaiser and the Constitution. If the Kaiser could govern the army through other than constitutional channels, he could do anything, and the resignation of Gen. von Schellendorf made it plain that it would involve an open quarrel with the Reichstag, and that the Reichstag would have the country behind it. In every country now enjoying a constitutional régime, there has always come a time when the monarch has seen with great reluctance the control of the army pass from him.

In England until very recently there has always been a division of power between Parliament, as represented by the Secretary of War, presiding over general administration, and the Horse Guards, representing more particularly discipline and promotion, and presided over by a relative or favorite of the King. George III. held very fast to this distinction, and the scandal excited by the sale of commissions by the mistress of the commander-in-chief, his son the Duke of York, was one of the most startling phenomena of modern English history. The Duke of Wellington stepped into the place quite naturally when he came home with the laurels of Waterloo; but he strongly advised the Queen always to hold on to the army through her family, and he was accordingly succeeded by her cousin, the Duke of Cambridge, though he had no sort of claim to the place other than his cousinship to the sovereign. When he became superannuated the other day, it was only the rising tide of Liberalism which, after a sharp fight, prevented the Duke of Connaught's stepping into his shoes. In France the Restoration, in 1828, made a desperate but unsuccessful attempt to hand over to the Dauphin, as he was still called, the Duc d'Angoulême, the exclusive control of the personnel of the army, leaving to the Minister of War only what was in England left to the Secretary of War.

With a young monarch like William of Germany, excessively fond of soldiering

and firmly convinced that God has authorized him to kill as many people as he pleases whenever he thinks proper to declare war, and with a nation as thoroughly imbued with military ideas and as firmly convinced of the military value of subordination to a single head, the struggle is likely to last much longer. William personally instructs the recruits every year, touching their obedience and devotion to him next after God Almighty, and on one occasion told them to hold themselves in readiness to kill their fathers and brothers should he desire it. From this position to that of a constitutional monarch like Queen Victoria, taking the organization, discipline, and command of the army from a minister appointed and dismissed by Parliament, there is a great distance which will not be traversed in a year. William is still young, profoundly impressed with his own enormous value to the German nation, and with the deep concern of the Creator about all his doings.

ON THE STUDY OF DUTCH.

AN opportunity to study the Dutch language and literature has, thus far, never been offered by one of our metropolitan universities. According to official announcements for the forthcoming academic year, it is possible to investigate critically almost any phase of either the literature of Germany or the language in which it is written, at almost any period of its career—old, middle, or new, with side glances at the Goths and the Vandals. Courses are also announced in the Scandinavian languages, including such a far-away Germanic dialect as Icelandic; but beyond the merely negative statement in one programme that "as yet no course has been offered in Dutch," there is no reference whatsoever, in any of them, to the language or literature of Holland.

From single points of view this is, no doubt, to be explained and even partly to be justified. It can scarcely be seriously maintained, for instance, however invidious such a comparison may seem to Dutchmen, that Dutch literature is to be set upon terms of equality with German literature, which outranks it in extent, and, except in Holland, in intrinsic importance. As for Icelandic, it was the medium in its classic age of a phenomenal literature, greater, in prose and verse, than that of all the other early Germanic peoples put together, and a veritable treasure-house of material affecting our own matters and institutions, some of which even go back in their genesis to Scandinavian soil.

Every such comparison, however, is odious and misleading, for Dutch literature, in reality, is neither small nor unimportant. It has at various times set an undeniable stamp upon German literature, and English literature, too, has fallen notably within the direct circle of its influence. Dutch literature, in fact, is an integral part of that mutual action and reaction so conspicuous in the evolution of the literature of Europe and of the world, and not to take it into account is often to miss the clue that alone is able to lead out of dark places. Wholly aside, however, from this phase of the matter is the additional circumstance that Dutch literature *per se* has beauties of its own; that there are in it the immortal works of immortal men, and of women, too. The lyre has been attuned in Holland to lyrics than which there are scarcely sweeter in the poetry of Europe, and her boards have resounded to periods as sonorous; and if this should be construed to savor of the past more than of the present, it need only be remembered that the Dutch "Sensitivists" of to-day form a front rank of their own in the puissant army of modern realism. To mention Kuenen and his school of Biblical critics suggests the need of Dutch for every modern theologian thoroughly furnished for his work.

As for the language, very similar arguments might be advanced with regard to its importance as a link in the chain of intelligibility. Neither German, on the one hand, nor English, on the other, can be followed to ultimate conclusions without it. English and Dutch, in particular, are fundamentally akin, and many fixed conditions in the one, thus far unexplained and apparently inexplicable, will doubtless yet be cleared up by an appeal to the living traditions of the other. Besides all this, the value of a knowledge of the Dutch language also, if the value of Dutch literature is to be conceded, must follow as a matter of course. The one, the characteristic vehicle by which the other is conveyed, is simply the body of which the other is the soul, and will as little bear translation as this.

Not at all oddly, when one is brought face to face with the facts of the case, there are, furthermore, considerations that will appeal to some as even more trenchant, since they are more practical, for an accurate knowledge of the Dutch language among us. What we have in mind is a direct result of historical conditions in which Holland has been a participant. The Venezuelan Boundary Commission, for instance, found it necessary, at an early stage of its existence, to send an expert to Holland to examine the Dutch records bearing upon the boundary controversy in their original form; and only the other day the printing of the old Dutch documents in our city library was considered of sufficient importance to allow the Board of City Record to award the contract at an outlay of $7,000.

The paramount reason why an opportunity to study Dutch should be presented in New York, above all other places, is a patriotic one. New York, whatever else it may be, is first of all a Dutch city. Not only has it the honor of being preëminently the largest colony planted by Dutchmen, but, beyond all other cities of this continent, it has best preserved in its institutions and its inhabitants the memories of its Dutch beginnings, which, as time goes on, instead of being allowed to fade, are consciously fostered by societies instituted for this very purpose. Nor would they lapse without such adventitious aid. The names of much of our surrounding geography, of our streets and our public places, and even the words of our daily discourse, bear too many Dutch reminders to permit us easily to forget their source.

Such aids to memory, however well calculated they may be to call up original conditions, are, nevertheless, not enough. There should be in New York, for all the reasons that have been stated, the opportunity to study, as thoroughly as other foreign languages and literatures are studied, the language and literature of Holland. Strikingly enough, we are even able to make our own native contributions to the latter. Our first literary efforts were in Dutch. Jacob Steendam, the first poet of New York, wrote three considerable poems in that sturdy speech; and in the mother-tongue were the occasional verses both of Henricus Selyns, the first settled minister of Brooklyn, afterwards the minister of the Dutch Reformed Church in New York, whom Washington Irving calls "the earliest poet of the province," and of Nicasius de Sille, first Councillor of State under Gov. Stuyvesant.

For the study of Dutch we have much fundamental material already at hand. Besides still unexploited matter for historical investigation, printed and unprinted, preserved in city and church records, our libraries have not unimportant collections in the Dutch language. The Astor Library leads with some 5,000 volumes, comprising Dutch literature, history, and the transactions of academies and learned societies; Columbia University has about 2,500 volumes; other libraries, like the Society Library and the Mercantile Library, have together a few hundred more. What is primarily needed, however, more than Dutch books, though these are necessarily and inherently a part, is an opportunity to study the language and the literature, not perfunctorily, as the chance spirit moves, out of handbooks and inadequate Dutch Ollendorffs, but under a competent university professor. Such a chair of instruction some of our Dutch societies or our Dutchmen should find it easy to provide. The St. Nicholas or the Pieter Stuyvesant professorship of the Dutch language and literature not only would perpetuate to succeeding generations the deed of the donor, as such things do, but would stand a most fitting monument to the memory of the Dutch in New Amsterdam.

PROFESSOR CHILD.

FRANCIS JAMES CHILD, who died on Friday, was one of the last of the remarkable men who, in the latter half of the century, have done so much to make the name of their university illustrious. In scholarship, in letters, in science, and even in public life this group of students became conspicuous; and in most cases their careers were marked by a singular devotion to aims higher than any that scholarship alone can supply. Lowell, in his letters and poems, has made it clear that they were all in their youth inspired by the great hope of the new century—an inspiration which we now, at its end, can see was to be justified no less in their lives than in the new learning, the inventions and discoveries of science, the obliteration of slavery, the mighty record of human progress which its close witnesses. It is hard to say, perhaps, exactly what the inspiration was, and no doubt very few of them foresaw at all clearly what the future was to bring forth; but that it was to be a new order, and in the end a better order, they were confident. To the younger men of that generation it seemed as if a summons to their task was echoing throughout the world. Lowell was in the habit of saying that when he first read Carlyle, it was as if he had heard a bugle-call. The same call rang in the ears of his friend who died last week. He, too, obeyed it.

The bare record of Prof. Child's life is nothing more than a few dates. He was born in 1825 in Cambridge, and entered Harvard in the class of 1846. Shortly after graduation he became a tutor. At that time instruction at Harvard was not specialized as it now is, and he at first taught in several different branches—mathematics, rhetoric, and history. In 1849–50 he studied in Germany, and in 1851 succeeded Prof. E. T. Channing as Professor of Rhetoric

and Oratory. Poetry and English Literature had, however, from the first been his favorite studies, and it was through them that he was drawn to the study of Anglo-Saxon, in which he early became an authority. He also gave most valuable instruction in English writing, his own very simple and straightforward style serving as an excellent demonstration of the correctness of his principles. In 1860 he married Miss Elizabeth Ellery Sedgwick, daughter of Robert and granddaughter of Theodore Sedgwick.

Down to the close of the war, the old system of oral instruction, combined with a curriculum consisting almost altogether of required studies, made the work of a professor at Harvard very different from what it now is. Teaching was done, not by lectures, but by recitations, supplemented by wearisome correction and marking of innumerable examination-books. The instructor often taught in turn a variety of subjects, and in this way an enormous amount of time was wasted, while a professor might be for years without any professorship in the proper university sense. The election of Mr. Eliot as President in 1869 marked the beginning of the change to the present system; but it was not until 1876 that Prof. Child took the chair of English literature, for which all his studies were a preparation. Since then his work has consisted mainly of courses in Anglo-Saxon, Chaucer, and Shakspere.

The great work of his life has been his 'English and Scotch Ballads,' a monument of research and scholarship which can never be superseded, his industry and the thoroughness of his investigations having made it complete. His aim was to trace to its sources and preserve in an authentic form this whole body of popular literature, and at the close of his life he was able to say that he believed not a single ballad had eluded his search. An introduction remained to be written, but the work itself was done. The labor and linguistic knowledge involved in it no one who had not some acquaintance with the daily course of his studies would be likely to understand. Not merely constant correspondence with scholars all over the world, with reference to forms of ballads existing in foreign countries, but also endless collation of texts and manuscripts, was required, and all this in addition to his regular duties. The shelves of the university library are enriched by a precious collection of volumes gathered together in the course of these labors. His other contributions to literature and scholarship have been mainly as an editor. The general editorship of the American edition of the British Poets, in which was included an edition of Spenser under his charge, was among them, as were also 'Four Old Plays' (1848), a collection of 'Poems of Sorrow and Comfort' (1865), and two invaluable papers published in the Transactions of the American Academy of Arts and Sciences, 'Observations on the Language of Chaucer and Gower,' which conclusively settled long-disputed questions with regard to the forms of Chaucer's language and versification. A number of lectures before the Lowell Institute have never been published. Had his time for twenty-five years not been so taken up with the almost mechanical labor of hearing recitations and correcting examination-books, he would no doubt have accomplished more. To those who are aware how his time was further limited by self-imposed tasks of all sorts, public and private, it is surprising that he should have accomplished so much.

His fame as a scholar is secure; but it is not as a scholar that he will be chiefly thought of by those who knew him best. Indeed, his own modesty led him to keep his acquirements always in the background; no one was less inclined to parade his knowledge. What all who met him felt was the variety, interest, humanity, and sincerity of his character, the singular force of his individual and original personality. It is difficult to reproduce in words the impression he made, for it came of many qualities seemingly inconsistent—an inconsistency which a man less simple might have tried to conceal. It did not seem necessary for Prof. Child to conceal anything, for when he was most impulsive and natural, the qualities and even the defects which showed themselves were all little short of delightful. His very idiosyncrasies were endearing. Many of us go through life with an ideal of action or character for which our real qualities totally unfit us. With him there seemed to be no motive for playing a part, even with himself. His warmth of heart, his hatred of wrong and injustice, his keen sympathies, his devotion to duty, were as real as his lively convictions, his strong religious feeling, his prejudices, his shyness, his combativeness, his melancholy, and his quaint and inexhaustible humor. He expressed them all as he felt them, and it was the strongest proof of the excellence and beauty of his character that his sincerity only made his conversation more entertaining and himself more attractive.

His interest in public affairs was far from perfunctory, being a necessary result of his character and education. The concerns of Old Cambridge were those of democratic village life in a highly educated and respectable community. Much more engrossing were those of the nation in the throes of the rebellion. Many of the most distinguished officers who volunteered from Massachusetts had been his pupils and friends, and the war was to him at once a sacred struggle and a cruel slaughter. His constant regret was that he could not offer his own life in it. He busied himself with assisting those in the field in any way in his power, and throughout the whole period, from 1861 to 1865, he might almost be said to have been actually in the service. His deep interest in the careers of many of the Harvard graduates who had fallen in the war, made him the chief promoter of the publication of the Harvard Memorial volumes. When the war ended, his participation in public affairs did not cease, and he continued to do more than his share for many years. His inborn independence of character forbade his being a party man, and his efforts were always in behalf of good government and proper nominations, without regard to their effect on immediate party fortunes. He was very fearless, and his transparent honesty compelled the respect of his opponents during the years when, as an independent Republican, he was continually driven into opposition to the party to which he originally belonged.

We have left ourselves little space to speak of his characteristics in private life. To those of our readers to whom Prof. Child was personally unknown, the more intimate and more peculiar qualities of his nature can be only dimly indicated. The memories of a sensitive, woman-like tenderness and sweetness, which made him one of the most widely beloved of men, of a faithfulness of friendship which created about him a narrower unbroken circle of deeper affections—these and other precious memories are his priceless legacy to his familiar friends. Among these his originality had full play and expression. Doing nothing for effect, and having variable spirits, his conversation was unequal, and was most characteristic when no effort of any kind was required. Then his peculiar vein of humor was at its best, his expressive and vigorous face became the mirror of his mind, and the spirit of true friendship breathed in his talk. He was fond of children, and liked to devote himself to them, ready to take his share in their gayety and playfulness. To the poor his heart and his hand were equally open. He knew that his judgment was likely to be misled by his goodness of heart; and though he could seldom resist an impostor's appeal to his charity, the enjoyment which he derived from his own narrative of the adventure seemed quite to make up for any pecuniary loss. He was born and remained to the last a lover of his kind; he attributed to others the native good desires he found in his own heart.

We cannot close this imperfect tribute without a reference to the loss which this journal sustains. From the inception of the *Nation*, Prof. Child was among its warmest friends and most generous contributors; and if the burden of his latter years forced him to withdraw from our active staff of reviewers, of which his name was a chief ornament, he never found himself out of sympathy with the political aims of the *Nation*, or out of touch with it on its literary side.

THE PROSPECT IN NEBRASKA.

GERING, September 7, 1896.

IT is now nearly thirty years since I made my first visit to the Missouri Valley. Since that time I have had occasion to revisit it at regular intervals of three or four years. During this period the changes have been marvellous. On my way now, I was warned by friends in Chicago who learned of my destination that it was important to be vaccinated before crossing the Nebraska line in order to avoid the contagion of Bryanism. But, so far, that has not proved necessary; for there is still much force in the proverb that a "prophet is not without honor save in his own country." The severest critics of the regular Democratic nominee I have met have been among his own neighbors. A leading judge in Lincoln told me that in the five years during which he has been on the bench, Mr. Bryan has not had a case before him. In short, Mr. Bryan is a politician, pure and simple. He has not been connected with any business or commercial enterprises such as to command confidence in his ability to manage even ordinary affairs, much less the vast business interests of the nation. The enthusiasm for Bryan, therefore, has no such basis as that which commended Lincoln both to his own State and to the country at large. For Bryan to say that "in my opinion" the free coinage of silver will be safe for the Government, is to present a slender basis for confidence.

Another omen which bodes the Bryan movement ill even in his own State is the magnificent crops of the year. The acreage of corn is the largest ever planted, and the fields are fairly burdened with the ripening grain. Conservative judges say that it will run up to 300,000,000 bushels, which, if properly cared for and fed to stock, will yield to the producers $100,000,000. The two previous years were, indeed, disastrous, from lack of rain; but this year the rains have been abundant and well distributed, so that the average return for five

years, even with present prices, is far from discouraging. This is becoming more and more apparent as the weeks go by, and will tell heavily against the free-silver enthusiasts.

I struck the State at the time of the State Fair at Omaha, and the scenes which everywhere greeted me there were far from depressing. The railroads had made a five-dollar round-trip rate from the extreme portions of the State, and tens of thousands of people had come in in gala attire. The fair grounds were overcrowded, processions of fraternal and industrial organizations thronged the streets, headed by brass bands almost without number. Thousands of Scandinavians were pouring in from every direction for a great musical festival. Apparently everybody was good-natured and happy. There was ground for great diversity of opinion as to whether the Bryan buttons were more numerous than the McKinley badges, but there was no appearance of general gloom. The papers estimated that 200,000 people witnessed the processions.

Of course this may seem a superficial view, but it is not wholly so. One does, indeed, hear of the occasional sale of products at ruinously low rates. I was told of a farmer in the northwestern part of the State who recently sold 700 bushels of corn at five cents a bushel, netting him, when certain expenses were taken out, but thirty-two dollars. I have heard of a locality where horses are "eighteen dollars a dozen," but have not been able to verify the report. Without doubt the victims of such hard necessity, who are compelled to sacrifice their products at forced sales, are sufficiently numerous strongly to elicit public sympathy. But to one who has watched the course of events for the last twenty years the surprise is that they are not more numerous. The reckless way in which families with little or no capital have been drawn out into this vast region to compete with each other and with the world in the production of a few staple articles, has made it inevitable that there should be great disappointment.

The place from which I write is in an irrigated section on the North Platte River, sixty miles from railroad communication. The station from which we drove was one of the most flourishing towns of the region, containing about two thousand inhabitants. About half of these consist of the families of ranchmen, which reside there nine months of the year for the sake of the excellent public schools which are maintained. During the summer all together have an outing on the ranches. So dry is the climate that there is not a shade tree in sight either in town or on the prairie, yet the houses, though small, are all rather neat, and there is a general appearance of thrift. On starting out for our long drive over the country, we were at once confronted with the evidence of disappointment which has overtaken so many in the western part of the State. For hours our course lay over a beautiful prairie country in which there was not a house or tree in sight. The only sign of man's presence was the diminishing town we were rapidly leaving behind. But on almost every quarter section there was a mound of earth, reminding one of the abandoned village sites in the Valley of the Nile. These were the remains of sod houses which were built a few years ago by eager settlers drawn into the country by the report of good crops occasioned by two altogether exceptional years of moderate rainfall. On the strength of these good years, loan agents secured an immense amount of capital to aid the settlers. But the successive years of normal drought have done their work, and both borrower and lender have lost all. Clearly, the western quarter of the State is valueless for general agriculture, except in the irrigated portions. On the whole, however, one is agreeably surprised at the evidences of general prosperity. In the eastern part of the State land is four times as valuable as it was twenty-five years ago. Then ten dollars an acre was a good price. Since that time it has doubled in value twice, and improved land in the eastern third of the State cannot now be had for less than forty dollars. But, of course, this process of geometrical increase of values cannot go on indefinitely, and when the check in the rate comes it is very disappointing to many. Prices of land, however, are keeping up better in the eastern part of this State than in Ohio. Foreclosures are, indeed, frequent, but not excessively or alarmingly so.

To the more intelligent, and they are the majority, an extension of credit is seen to be the all-important thing in a region of such present distress, but of ultimately increasing values. But credit is just what Bryan and Altgeld and their followers are destroying. A loan agent in the central part of the State told me that, at the time of the Chicago riots two years ago, the fright of capitalists completely checked the extension of credit, while the present agitation prevents its reëstablishment. The chief thing which the farmers need this year is the credit required to draw into the State the live stock (depleted by the last two years of drought) to which they can profitably feed their enormous crop of corn. In this irrigated section the relation of capital to production is more apparent than elsewhere, and the importance of credit is keenly felt. It is an instructive illustration of the complicated relations of modern society that the severest blow the interests in this region have received for a long time, fell in connection with the disturbance of credit occasioned by Mr. Cleveland's unfortunate Venezuelan message last winter.

Coming from the centennial celebration of northern Ohio, it is interesting to contrast the story of pioneer life a hundred years ago and now. The comparison is entirely in favor of the present times. The sod-house of to-day is more comfortable than the log-house of our fathers. The prairie is far more easily subdued than the forest. As the cheap railroad excursion rates and the vast crowds at the State Fair witness, the pioneer of to-day is not beyond the reach of general civilizing agencies. The well-established State University and the numerous public schools of high grade, with their feeders in every district of the State, bring education within reach of every enterprising boy or girl, and very generally all are possessed with a desire to improve their educational opportunities. On my drive here we stopped at a sod-house to exchange horses. A buxom lass soon came over a swell in the prairie, riding a horse and driving a dozen others before her from which we could take our pick. We afterwards learned that during the last school year she regularly rode horseback thirteen miles and back each day to attend a school which was held in a sod school-house. But the school was kept by a graduate of the University.

It may seem unfortunate that the financial policy of a great nation should perhaps be dependent on the opinion of a few recent emigrants from Europe now living in sod-houses on the prairie. The foreign element of this State, however, is unusually intelligent, being largely German and Scandinavian. The Germans are reported as generally favoring the gold standard, while the Swedes and Norwegians are less decided, and are still making up their minds. Much attention is therefore paid to them by both parties, for very likely the scale may be turned by the votes of the two or three counties in this State in which they largely preponderate. Good crops, much discussion, and sound sense are sure to cause the truth to prevail among this population. Bryanism is not a new thing in Nebraska. His star has already passed the zenith. He never has carried his own State, and does not seem likely ever to do so. At any rate, the votes which were taken on the long trains on which I rode from the State Fair showed an overwhelming majority against him.

G. Frederick Wright.

A RALLY FOR HOME RULE.

Dublin, September 5, 1896.

The cause of home rule for Ireland, which six years ago was apparently on the threshold of success, has latterly seemed to all but a few in a nearly hopeless condition. This has been due mainly to the inordinate self-assertion of two men, and to consequent divisions and difficulties. Had Mr. Parnell expressed the least regret for the trouble which his disgrace in the Divorce Court had brought upon Ireland, had he been willing to withdraw even for a few months from public life, all his offences would soon have been forgotten in his splendid services and his sufferings on behalf of the country. He stood firm as a rock for himself, and against that rock the Irish party went to pieces. The services to the Irish cause of the parties and individuals in Ireland and England who could not tolerate Mr. Parnell's conduct and attitude, were preserved largely through the abilities and untiring energy of one man, Mr. Healy. In the exigencies and excitement of the time, men were blinded as to the wrongfulness and the certain consequences of the bitterness with which he imbued and waged the contest. We had a painful example of the extent to which clamor has to be resorted to, and seeds of future woe implanted, in a country that has no constitutional method of carrying out its wishes in local affairs. When, six months later, Mr. Dillon and Mr. O'Brien emerged from prison and took their stand against Mr. Parnell, they were unwilling to assent to Mr. Healy's methods; and when, in the autumn of the same year, Mr. Parnell died, and all legitimate cause of quarrel appeared removed, his followers declared themselves in honor bound still to hold aloof from their old associates, whose methods, they declared, had brought their leader to his grave.

At the elections of 1892 all seemed well so far as Ireland was concerned. The Parnellite representatives were reduced to nine. An apparently solid party of over seventy, united by the most stringent pledge to sit, act, and vote together or resign their seats, stood behind Mr. McCarthy. I know of nothing stranger in the turnings and intricacies of the human mind than the rôle which Mr. Healy has since played, and which has brought affairs to their present pass. He whose most trenchant weapon of attack against the seceders was that they had broken the party pledge in not siding with the majority against Mr. Parnell, has since, having again twice taken it, set that pledge at defiance, and in-

terpreted it in a manner calculated to make of it a mockery, a delusion, and a snare. His intellect, exceptionally keen and subtle, and sharpened to the finest point by the education and practice of the law, has been applied to prove that a pledge can be kept in the letter and broken in the spirit. The changes were wrung upon charges the most audacious, the most damaging, the most untrue, and over and over again thoroughly disproved, as to the disposal of funds by his colleagues; and this during the heat of last year's election. The Parnellites place Mr. Parnell's memory before everything else. The feud is to be kept up until those who could not approve his course of action are in their graves or are prepared to do penance at his grave.

Mr. Healy's inexplicable policy, whether consciously or not, if continued, could have no other end than the utter destruction of the present movement. He has more than once avowed, as the proper method of party warfare, to "hit a head wherever you see it"; and as those on his own side are the nearest to him, and as those who rise above the ordinary level are most easily seen, they are one by one singled out for attack. (Seldom having to bear responsibility, never having to suffer directly, to any great extent, for not standing by and supporting able men, cavil and criticism are by us indulged in to an inordinate degree.) Mr. Sexton, a most devoted man, the best parliamentarian of the party, one of the ablest financiers in Parliament, has been driven into private life. Mr. Blake, who abandoned his Canadian career to aid the cause, and is said lately to have refused a judgeship and £6,000 a year further to serve Ireland, has held his place, notwithstanding abuse and vilification, with heroic patience and devotion. But no party, however small, can keep its place by reliance upon personal feeling alone. The Parnellite party, while including sincere Home-Rulers, is composed mainly of pronounced anti-clericals and of men who desire to be considered respectable as well as Nationalist, and to avoid pecuniary sacrifice. A Parnellite Lord Mayor was the first Home-Ruler to be honored with a degree *honoris causa* by Trinity College. No young man in Government or Unionist employment is likely to be called to account if he airs his Nationality under the guise of Parnellism. Mr. Healy's strength lies, amongst the Parliamentary party, in the fact that he has several relatives members of Parliament, in the sharpness of his tongue, in a certain charm of manner; outside it lies mainly, I am convinced, in clerical feeling that would gladly see a revival of the pre-Home Rule days, when all the spare cash of the laity went into the coffers of the Church, and when Irish members were to a considerable degree the nominees of the priests. So it is not surprising that Mr. Chamberlain should designate Mr. Healy as the "greatest living Irishman."

Thus, taken altogether, the situation in Ireland had become intolerable. A convention to consider the matter was called for at home and abroad; and it must be difficult for outside Protestants to understand that this convention, meeting under the Pope's blessing, with a Catholic bishop in the chair, and addressed by numerous Catholic clergymen, has been directed against the claims of the leader of an extreme clerical party. The convention was decided upon by the unanimous vote of the party of which Mr. Healy is a member. All parties were asked to join in issuing the invitations and making the arrangements. Mr. Redmond refused. Mr. Healy at first carefully abstained from committing himself; and when he recognized that the assembly that would come together would most certainly pronounce against the unpatriotic course he had taken, did all in his power to make it a failure, and, later on, violently attacked and belittled it. All Irish members of Parliament, clergymen of all denominations, Nationalist members of local public bodies, delegates from clubs, Young Ireland societies, literary societies, labor organizations, Foresters, and other bodies, many of them Parnellite, were invited. Delegations were requested from Irish Nationalists of all parties abroad. Never before was there a convention at which the doors were more widely thrown open to persons of all shades of opinion in connection with the subject for which it was called. As the result, the convention met and held its sittings in the most capacious hall in Dublin three days of this week. Some 42 members of Parliament attended; 21 delegates came from the United States, 18 from Canada, 3 from Australasia, 2 from South Africa; 300 came from Great Britain, and many hundreds from all parts of Ireland, every county being represented.

It was the most remarkable gathering of Irish men and women ever brought together. The great hall behind and in front of the delegates was crowded with a respectable, intelligent, and well-conducted assembly. The speaking was of a high order. Every one had fair play. What struck me most was the unflagging interest with which the proceedings were followed. There were no pauses for rest or refreshment, yet at the conclusion on Tuesday of the four-hours' sitting, on Wednesday of five hours, and on Thursday of five hours and a half, the hall was apparently as full as at the commencement. All sides had professed a desire for unity on the common basis of love for Ireland. Mr. Healy had often declared his anxiety to be afforded an opportunity of laying his grievances before the world. Neither Mr. Redmond, nor Mr. Healy, nor yet any of their followers, appeared to state their case, or show any other possible grounds upon which a united fight for home rule can be maintained than by friendly councils, and, after due discussion, the subordination of the judgment of the minority to that of the majority. Nothing was said to offend the susceptibilities of any party. In accordance with the feelings of the meeting, resolutions were withdrawn in which persons and newspapers were by name condemned. Mr. Parnell's name was received with hearty applause. An extract from one of his speeches found its place among the mottoes with which the hall was adorned. We may be certain that if his name ceased to be used as the shibboleth of faction, all in his career would soon be forgotten but the services of his earlier years. The attitude of late among Irishmen abroad has been: "Until you are united as of old, we shall refuse to give you moral or material aid in the contest for home rule." The foreign delegates have this morning unanimously issued a manifesto declaring that they came unbiassed in their views towards any party, that those who were responsible for the arrangements scrupulously abstained from any attempt to influence their judgment, and that they undertake on their return to their various homes to convey to their people their sense of the magnitude, authority, and order of the convention, and pledge themselves to give their loyal and unfailing support to the parliamentary party.

There is some danger of the resolution and expressions of desire for the release of the remaining dynamite prisoners being misconstrued. It arises in no degree from sympathy with a policy of dynamite. These men are rightly styled "political prisoners," because they were arraigned so that they might receive life instead of ten-year sentences, not as dynamiters, but as conspiring against the Crown. The feeling here and among Irishmen abroad is so strong regarding England's past treatment of Ireland and late attitude towards her, that it is well understood why men of a certain class of mind break down under the strain, and attempt or do desperate deeds. Irishmen know and feel their own grievances, and they ask that their attitude towards these offenders should be judged by the English and others by their own towards conspirators with whose grievances they sympathized. An English jury enthusiastically acquitted Dr. Bernard, although of known complicity in the Orsini outrage, by which many lives were lost. I need scarcely call to mind the general attitude of mind in Great Britain towards German and Italian conspirators in the forties and fifties, towards Russians of late years, towards the Johannesburg committee and Dr. Jameson the other day. These Irishmen received life sentences in 1884, while in 1892 Englishmen and foreigners for more overt offences in the matter of dynamite were sentenced to but ten years' imprisonment. Moreover, the English penal-servitude system is one to which no living creature ought to be subjected. One of these men, at least, has been turned out insane. Mr. Davitt has declared that for seven of the nine years he spent in prison he never ceased to suffer the pangs of hunger. The mildest extreme of laxity in prison discipline is less likely to encourage crime, and bring the administration of the law into contempt, than the cold, inhuman, relentless severity with which Irish offenders, at least, have been treated under the British penal-servitude system. Light sentences and abuse of the power of pardon in the interests of the many in your country are, in the long run, less hurtful to the best interests of society and general content than are here light sentences and abuse of the power of pardon in the interests of the few as practised in England.

I have been led into a digression from a consideration of the Irish Race Convention. It was altogether an eminent success. There is still a majority of forty or fifty entirely reliable and clear-headed members prepared to support united, disciplined action. Mr. McCarthy has, on account of failing health, resigned the chairmanship. Mr. Dillon, an able man, has been elected to the post. He is highly cultured, of irreproachable personal character; one who has given hostages to fortune by his late marriage with a daughter of Sir James Mathew, one of the English judges (a nephew of Father Mathew, the temperance reformer). If Irishmen at home and abroad properly support this party and act reasonably, the movement will be soon again on firm ground. This conference is by far the most representative national gathering that I have seen in Ireland. Only four persons took any distinctive part in it whose names I can find as having been present at the Home-Rule Convention of 1873 under Mr. Butt. As one of the speakers said the other day: "Men come and go, the personnel alters from generation to generation; the National movement ever renews itself and urges forward, deep and strong."

Correspondence.

THE NEW ZEALAND LAND EXPERIMENT.

TO THE EDITOR OF THE NATION:

SIR: In your article on "A Striking Illustration," September 10, you say that "the Government of New Zealand has taken possession of the land on the Henry George plan." Permit me to correct you in that. The "Henry George plan" does not contemplate any of the foolish, socialistic things credited to the New Zealand Government by M. Leroy-Beaulieu. On the contrary, it contemplates leaving the individual in greater freedom than before. It asks the Government to simplify the system of taxation by taxing nothing but land values, and then to keep its hands off all those things that belong to the individual.

Single-taxers have watched the legislation in New Zealand with interest, and especially that regarding taxation; for although mixed with much error, it appears to be a step in the right direction, relieving personal property of taxation and supporting the Government, or a portion of it, from land values. But they do not believe that it is a function of the Government to say what the people shall eat and wear, to loan money to them, and establish settlements. The Henry George plan is not paternalistic. It looks to individualism. HOWARD M. HOLMES.

DETROIT, MICH., September 11.

Notes.

FORTHCOMING works bearing the Scribners' imprint are President Andrews's 'History of the Last Quarter-Century in the United States,' in two large volumes; a new (limited) edition of Vasari's 'Lives of the Painters,' in four octavo volumes, annotated by Mr. and Mrs. Edwin H. Blashfield and Mr. A. A. Hopkins, with 48 photogravures after the masterpieces of Italian painting and sculpture; a new and long-desiderated edition of Mrs. Mary Mapes Dodge's 'Hans Brinker,' with more than a hundred drawings expressly made in Holland by Allan B. Doggett; 'On the Trail of Don Quixote,' by A. F. Jaccaci, with many illustrations in addition to those which have appeared serially in *Scribner's Magazine*; and 'Problems of Modern Democracy,' essays by E. L. Godkin.

Henry Holt & Co.'s fall announcements include 'The Island of Cuba,' with an account of the present war, by Prof. M. M. Ramsay and Lieut. A. S. Rowan, U.S.A.; 'A Diplomat in London,' by Charles Gavard; 'Music and Musicians,' by Albert Lavignac; 'Telepathy and the Subliminal Self,' by Dr. Osgood Mason; 'The Irreligion of the Future,' by J. M. Guyau; the third volume of Ten Brink's 'English Literature'; 'The Fern Collector's Handbook and Herbarium,' by Miss Sadie F. Price; 'The Grasses of North America,' by Prof. W. J. Beal; and 'The Outlines of Electricity and Magnetism,' by Prof. Charles A. Perkins of the University of Tennessee.

The Putnams' holiday Irving will be 'Bracebridge Hall,' in two volumes; and they will also bring out Tilford Groesbeck's poem 'The Incas,' with illustrations by Eric Pape; and the second volume of Mr. George Haven Putnam's 'Books and their Makers during the Middle Ages.'

Next month the Century Co. will issue a collection of wood-engravings and half-tone plates under the title, 'Modern French Masters,' with text by Prof. John C. Van Dyke—twenty biographical and critical monographs.

Harper & Bros. promise Prof. Woodrow Wilson's 'Life of Washington,' with illustrations by Howard Pyle and Harry Fenn, and 'The Naval Actions of the War of 1812,' by James Barnes.

'The Seven Seas,' poems by Rudyard Kipling, a translation of Dr. William Hirsch's 'Genius and Degeneration,' 'Alterations in Personality,' by Alfred Binet, 'What is Electricity?' by Prof. John Trowbridge of Harvard, and a new edition of Andrew D. White's 'Fiat Money in France,' are in the press of D. Appleton & Co.

Macmillan Co. have nearly ready 'The Education of the Nervous System: A Study of Foundations, especially of Sensory and Motor Training,' by Reuben Post Halleck, M.A. (Yale).

Houghton, Mifflin & Co. will publish seasonably 'Football,' by Walter Camp and Lorin F. Deland.

William Doxey, San Francisco, "at the sign of the *Lark*" (the droll periodical edited with pen and most original pencil by Gelett Burgess), announces 'The Wild Flowers of California, their Homes and Habits,' in which more than 600 varieties will be described by Mary Elizabeth Parsons, and 150 delineated in full-page drawings by Margaret Warriner Buck; 'Tales of Languedoc,' by Prof. Samuel Jacques Brun of Leland Stanford University, illustrated by Ernest Peixotto; 'An Itinerant House, and Other Stories,' by Emma Frances Dawson; and new editions of Rearden's 'Petrarch, and Other Essays,' and of Alfred Robinson's 'Life in California.'

An *édition de luxe* of FitzGerald's 'Omar Khayyám' is to be issued by the Dodge Book and Stationery Co. of San Francisco.

Bliss, Sands & Co., London, are preparing 'Venus and Apollo in Paintings and Sculpture,' with letterpress by William J. Stillman, and eighty-one large-sized photogravures, including Botticelli's 'Birth of Venus,' probably in colors, as a frontispiece. A Burne-Jones is the only modern instance admitted.

'A Cycle of Cathay; or, China, South and North,' by Dr. W. A. P. Martin (Fleming H. Revell Co.), is rich in personal reminiscences, but is hardly the book on China which those most interested in the country are earnestly looking for. Dr. Wells Williams's work—a monument of old-fashioned learning—will still remain our reference and reading-book, unless some one with equal ability shall furnish us with a view of modern China as seen through the glass of science. Perhaps we had not the right to expect this from the busy President of the Imperial Tung Wen College at Peking. As it is, Dr. Martin's pages are readable, and are made attractive by the author's own metrical renderings of some pretty Chinese poems. Most valuable are the chapters discussing China's neighbors, her diplomacy, education, and the missionary question.

The translation of Nietzsche's works into English pursues its paradoxical course. After vol. xi. comes vol. viii., entitled 'Thus Spake Zarathustra: A Book for All and None' (Macmillan). It is *the* sacred book *par excellence* of the Nietzschians, and, like other "Sacred Books of the East," demands much patience from a reader on whom a protractedly prophetic style is likely to pall; so much, indeed, that the doubt indicated in the sub-title, viz., as to whether what is intended for all will be perused by any, appears amply justified. A book of the sort is necessarily a difficulty for translators, and so the task has been undertaken by the editor of the whole series. Unfortunately, though Dr. Tille possesses a far better knowledge of Nietzsche's German than his predecessor in vol. xi., his command of English idiom is quite insufficient to render it satisfactorily into the latter language. A lavish use of the archaic *-eth* in the third person singular of English verbs does not alone constitute a lofty and prophetic style, nor redeem the bulk of the translation from commonplace and clumsy literality. Dr. Tille ought not to require to have it pointed out to him that the significance of the word "lust" (p. 132, etc.) is not the same in German and in English. And, lastly, what is the casual reader to make of passages like the following: "My gift of the gab—is of the folk. Too coarsely and heartily for angora-rabbits I speak. And still stranger my word soundeth unto all ink-fish and pen-foxes" (p. 278)?

The *Portfolio* monograph for the current (July) number is 'The Life of Velazquez,' by Walter Armstrong (Macmillan). As the Art of Velazquez is to be treated of by the same author in a future number, he confines himself for the present to an account of the great Spaniard's career, which is "based chiefly, though by no means exclusively, on the researches of Prof. Justi," and which gives the known facts clearly and concisely—something which the ponderous German was unable to do. The illustrations are, perhaps, as good as could be expected, the qualities of Velazquez's painting being extremely difficult of reproduction; and some of them are especially welcome as being of little known works.

Those who have retained their earlier liking for the clever work of M. Victor Cherbuliez and for the romance of thirty years ago, will read with interest the Swiss writer's latest novel, 'Après Fortune Faite.' To those who have been immersed in the stream of later fiction, or who have even watched the current of it as it has run, the book will seem somewhat like a resurrection from the dead. It does not concern itself much, if at all, with life. Its subtileness in the analysis and portrayal of character is like that of a child drawing upon a slate. It is the farthest possible remove, or almost the farthest, from the human document. And yet it is an extremely interesting and entertaining novel. In reading it one has a sensation not unlike that of driving over a well-made road through a pleasant country with a good horse. From the first page to the last one feels the satisfaction of easy, delightful motion. The book will consequently provide an agreeable hour or two. In this all too serious world there are many more serious novels which are less restful and less amusing.

We have already spoken briefly of Otto Mühlbrecht's 'Die Bücherliebhaberei' (Berlin), which now comes to us from Lemcke & Buechner, New York; but it may not be amiss to specify its useful appendices, forming half the book. The bibliophile, then, is treated to a general and critical bibliography; book-fancying and book-knowledge in general; general history of the art of printing and the book-trade; special ditto (in which category we miss Friedrich Kapp's History of the German Book Trade); works in advocacy of Gutenberg's title as inventor, and in opposition thereto; incunabula; curiosities and rarities; prohibited works; pseudonyms and anonyms (with no account of Halkett and Laing's three large volumes); privately printed books; ex-libris; printers' marks, etc.; binding. The

imperfections we have hinted at have two compensations in an alphabetical list of printers of the fifteenth century; a chronological index of printing-places to the year 1830—both after Falkenstein—and a general index of commendable completeness.

'Adolf Bastian als Festgruss zu seinem 70. Geburtstage 26. Juni, 1896,' is the title of a stately volume of 630 pages, dedicated to the distinguished traveller and ethnographer by "his friends and admirers," and published by Reimer in Berlin. The contents consist of thirty-two essays on comparative psychology, mythology, ethnology, anthropology, linguistics, and other sciences of a cognate character, in many of which Bastian was a pioneer. Thus, Virchow discusses "Rassenbildung und Erblichkeit," Steinthal "Dialekt, Sprache, Volk, Staat, Rasse," Preuss "Menschenopfer und Selbstverstümmelung in Amerika" (especially in connection with rites for the dead), Weber interprets an obscure passage of the 'Arthava-veda' as "Ein Indischer Zauberspruch," and there are papers by Ranke, Kuhn, Hirth, Achelis, Bartels, Buchner, and other well-known scholars. The value of the work is increased by numerous illustrations, but greatly diminished by the lack of an index.

'Trunksucht und Selbstmord' (Drunkenness and Suicide) is the title of a statistical study recently published in Leipzig by Dr. Prinzing. Of all nations, he says, the Germans have the strongest tendency to suicide, and this tendency is greatly aggravated by the habitual use of brandy as a beverage, so prevalent in many provinces of North Germany. Excessive beer-drinking promotes suicide indirectly by causing diseases of the heart and liver productive of melancholy.

A brochure of 119 pages entitled 'Henrik Ibsen's Jugenddramen,' by Dr. Roman Woerner (Munich: Beck), contains the first instalment of an historical and critical survey of the works of the Norwegian dramatist, to be completed in two volumes, of which the first will treat the historical and philosophical dramas from a biographical as well as a literary point of view, and the second the modern stage-plays from the publication of "Love's Comedy" in 1863 to the present time. Dr. Woerner's thorough knowledge of the languages and literature of Northern Europe renders him fully equipped for the task he has undertaken. The brochure ends with an extended and acute analysis of "The Warriors at Helgeland" (1858), known in Germany as "Nordische Heerfahrt."

A hitherto unpublished manuscript of Bossuet's has just been discovered in the library of the Seminary of Saint-Sulpice, well known to be especially rich in manuscripts of Fénelon and Bossuet, though no one had supposed that it contained any which had not already seen the light in print. In the course of his long controversies with Fénelon concerning spiritual matters, Bossuet was led to write a series of treatises on the "états d'oraison." Only the first of these treatises has been printed and made familiar to theologians. A manuscript of considerable bulk entitled "États d'Oraison," preserved in the library at Saint-Sulpice, had long been regarded as the original of the already printed work. Some weeks ago, however, the librarian of the Seminary, wishing to make a more careful study of the manuscript, began to examine it. Almost at once he perceived that it contained the text of a second treatise, bearing the same title as the first, which had been overlooked and which was believed to be lost. This treatise carries on, without completing it, the great work undertaken by Bossuet against Quietism. Like the first, it is written in French. The manuscript is now being copied and will soon be in print.

The Union pour Action Morale, of which M. Paul Desjardins is the founder, has resolved to placard the hoardings of Paris with ideal pictures, seeking thus an influence upon the minds of the people beyond that of the Louvre and the Luxembourg. M. Puvis de Chavannes has lent himself to the good work by permitting the reproduction (in full size, but in only two colors) of his five famous frescoes in the Panthéon, representing incidents in the life of St. Geneviève, patron saint and traditional saviour of the city of Paris. Reproductions of an "Adoration of the Magi," by Benozzo Gozzoli, and of a picture by Fra Angelico are to follow. The artistic poster we know in this country, as well as the disfigurement of the face of the earth by the "smart" advertising agent; even the placing of sensational texts in rural spots to catch the eyes of the ungodly is an expedient not untried by us. There are still blank spaces left in the minds of our people that the Paris plan might admirably help to fill.

An anonymous writer in *Macmillan's Magazine* for September offers some acute observations on "The Man Pepys" as revealed in his unblushing Diary. He seems to us, however, unnecessarily perplexed as to the purpose and motive of "this daily record for himself only," which, after all, differentiates itself from the great mass of introspective diaries only in degree. From the point of view of the man of affairs, it was a prudent memorandum of whatever affected or promised to affect his reputation as a public officer, and, through that, his worldly prosperity. On the side of the thousand and one interests which his active and curious mind entertained, and preëminently of his amours, the Diary must, we believe, have been kept not so much for reference (though here too prudence entered in) as for rereading. The mere recording of his infidelities must have revived, in imagination, the passionate pleasure of them, and it is significant that in the poignant passage (the word is hardly too strong) in which he notifies himself that now, in default of eyesight, the Diary must terminate, he also snaps the thread of his amour with Deb.

In view of the recent sickening reports of Japanese atrocities in Formosa, an account of this island by the Rev. W. Campbell, for more than twenty years a missionary there, in the Scottish *Geographical Magazine*, is timely and interesting. The great alluvial western plains, he says, "offer simply illimitable opportunities" for raising sugar-cane, rice, indigo, turmeric, etc., not to speak of the gold and coal mines, sulphur deposits, and petroleum fields in other parts of the island. In 1894 twenty-one million pounds of tea and forty thousand cwt. of camphor were exported. A graphic description is given of the surrender of the capital, Tainanfu, on the collapse of the short-lived republic, to the Japanese, which was accomplished without bloodshed through the interposition of the English missionaries. With the advent of the new rulers the chief obstacles to the development of the country, the mandarins and the literary class, have been removed, while the importation of opium, except for medicinal purposes, is prohibited. Roads are to be built, the railway extended, harbors opened, a proper currency introduced, and the head-hunting tribes of the interior are to be brought into subjection.

There is an excellent map of Venezuela, with accompanying text, in the seventh number of *Petermann's Mitteilungen*. It shows the various lines of communication, both land and water, even to the most important mule-paths. The same number contains proposals, endorsed by a numerous body of European scientific men, for the establishment of an international system of seismological stations. The sites chosen are Shanghai, Hongkong, Tokio, Calcutta, Sydney, Rome, Tacubaya (Mexico), Port Natal, Capetown, Santiago de Chile, and Rio de Janeiro.

The Boston Public Library Bulletin for September contains a very useful list of some 218 titles of books, Government reports, and pamphlets on the currency question.

The number of foreigners studying in German universities during the past summer semester was 2,192, of whom 1,665 were Europeans and 527 non-Europeans. Of the latter, 442 came from America, 56 from Asia, 15 from Africa, and 4 from Australia; of the former, 515 were Russians, 316 Austrians and Hungarians, 283 Swiss, 139 English, 96 Belgians, 56 French, 44 Netherlanders, 34 Italians, 31 Swedes and Norwegians, 28 Luxemburgers, 25 Rumanians, 24 Turks, 23 Servians, 21 Greeks, 12 Bulgarians, 9 Danes, 5 Spaniards, 2 Portuguese, 1 Lichtensteiner, and 1 Montenegriner. Of the whole number of foreigners, 595 studied philosophy, philology, and history, 488 medicine, 444 mathematics and natural science, 261 law, 148 Protestant theology, 126 agriculture, 74 cameralistics, 24 Catholic theology, 24 pharmacy, and 8 dentistry.

A recent rescript issued by the Minister of Public Instruction in Germany admits women to the lectures in all the departments of the University of Bonn, provided that they are found by the rector to have pursued the necessary preparatory studies, and that they obtain the consent of the professor or docent whose lectures they wish to attend.

The Classical Club of Yale University will celebrate the opening of their new rooms in Phelps Hall on October 9 with an address in the Battell Chapel by Prof. B. L. Gildersleeve of Johns Hopkins, at 8 P. M., followed by a reception in the library of the club. At 4 P. M. on the same day Dr. Dörpfeld will speak in Osborn Hall on "Recent Excavations in Greece."

—The attention of the librarians in their annual meeting at Cleveland, week before last, was largely centred on Washington. Mr. Bernard Green, who has been superintendent of the construction of the Congressional Library building from the start, gave an interesting account of the work. This building, the largest if not the finest library building in the world, will accommodate four million volumes and give every facility for their use, is most complete and thoroughly fitted in every part, and decorated in a manner quite commensurate with its character and use. The most remarkable thing about it is that it is completed within the time (eight years) assigned by Congress in 1888, and for the sum appropriated—six million dollars. As Mr. Green remarked, Congress had so thoroughly worn out both itself and the subject in fifteen years of fruitless discussion and experimentation that when a definite plan for the work was adopted, providing for its execution under the direction of the Chief of Engineers, Gen. Casey, and thus removing it from the realm of jobbery, there was no further meddling on the part of that body, and we have this magnificent structure as a standing proof

that Government work is not always bad. The same lesson was enforced upon the librarians by Mr. F. A. Crandall, United States Superintendent of Documents, in a paper on the work of his office. He made it quite evident that, under the law of 1894, which created his office, a radical reform of the abuses which have been connected with the public-document business has already been accomplished, and that if the supplementary bill drawn up by him and already passed unanimously by the House becomes a law, we shall have a system at least fifty per cent. more efficient, and at the same time twenty per cent. more economical, than the old one. Still another Washington note was sounded by Dr. Cyrus Adler of the Smithsonian Institution Library in a paper on the bibliographical and library work of that Institution. By his showing, it appears quite probable that the library interests of the country have, after all, been better served by the Institution under its actual system than they would have been had the whole fund been originally devoted to the establishment of a great library, as was at first proposed.

—Apart from these matters, the chief interest of the convention lay in the work, rather lately undertaken by the Association, of furnishing intelligent direction and aid in the selection of good books for libraries. Mr. George Iles of New York, who has shown his practical interest in this enterprise by his generous aid, both editorial and financial, in the issue of the Association's 'Annotated List of Books,' read a thoughtful paper on "The Appraisal of Literature." Recognizing the value of the book notices and reviews to be found in the critical journals, there still, he said, seems to be need of and ready use for discriminating and intelligent advice to librarians and readers as to the actual and relative value of the different books offered for purchase. Nothing ever done by the Association has seemed to be of greater general utility than the A. L. A. catalogue of 5,000 books recommended for libraries, published for the Association by the United States Bureau of Education in 1893. One session of this year's convention was devoted to the discussion of titles for a proposed supplement of newer books, and it was determined that there should be a rigorous exclusion of everything of questionable value or of questionable morals. The President's address at this meeting, by Mr. J. C. Dana, librarian at Denver, and an able paper following it by Mr. J. N. Larned of Buffalo, were devoted to the discussion of the larger bearing and real value of the public-library movement. Mr. Dana sounded a minor key, giving considerable value to many grave charges which are often brought against free libraries, but still contending that, if properly administered, these libraries contribute largely to the public welfare. Mr. Larned, viewing this movement in its historical setting, characterized it as the one means to be depended upon in addition to the free school to overcome the evils of a *fin-de-siècle* civilization fostered by a debauched and mercenary newspaper press.

—The practical pedagogue sometimes finds it difficult to see that the psychologist is making such additions to the art of teaching, as laid down by the philosophy of common sense, as he thinks he is, but it is easy to believe that a study of "common motor automatisms," reported on by Mr. E. H. Lindley in the last number of the *Journal of Psychology*, may be the basis of very important practical regulations. By this phrase the author means the little tricks of movement that grown people as well as children are strongly inclined to when called upon for severe or unusual mental effort. The material for the study was in large part collected by Miss L. A. Williams of the State Normal School at Trenton, N. J., and is of unusually high value. Some of the apparent results are that adults are hardly less prone to such habits than children, that there is no difference due to sex, that swaying with the body is almost confined to children, and drumming with the fingers to adults. Young children are little given to these movements, but that is due to the fact that they are almost incapable of any considerable sustained effort. Automatisms increase in number with fatigue, and with the intensity of the effort; automatisms of posture show a reversion to the fœtal position. These habits have their origin in the enormous activity of the child, his inability to control his movements completely, and his proneness to imitation. They are accordingly a much more frequent accompaniment of volitional attention than of spontaneous—the former is a late development, and still imperfect and more or less difficult to sustain. But the most important point brought out by the paper is that these forms of motor activity are of two fundamentally different kinds; part of them are processes for the production and maintenance of central nervous activity, and are important features in the mechanism of voluntary attention, while others are the result of deficient control, and hence represent serious leakages of energy. It follows that while some demand summary suppression at the teacher's hands, others are means for the development of working power, and should at least not be interfered with. An interesting field is opened in determining with some exactness the relative effect upon the cerebral circulation of the various automatisms. It is pointed out in passing that if a child in learning to write does not easily overcome the marked twistings of the mouth, etc., which accompany the effort, it is an indication that it is not yet old enough to undertake the mastery of the art.

—It is safe to conjecture that Malwida von Meysenbug, who contributes to the August *Cosmopolis* some unpublished letters of Richard Wagner with a connecting commentary, is the author of the anonymous 'Memoiren einer Idealistin' which has provided biographers with interesting details regarding Wagner's life and sufferings in Paris during the time of the "Tannhäuser" rehearsals in 1860-'61, several of the incidents related in the text being nearly identical with passages in that book. The writer had been led by admiration of Wagner's genius to seek his acquaintance. She was a frequent visitor at his residence in Paris, and subsequently tried to keep up a correspondence. In seven years she received nine letters from him, in one of which he praises her for being "a genuine friend, who isn't frightened into immediate silence if one of her letters remains unanswered, but kindly writes again." It cannot be said that the letters she received from him reveal any important incidents in his life hitherto unknown, but they contain many characteristic details. Wagner not only was an indefatigable writer, but he had a rare faculty for adapting the style of his letters to the character of the recipient: the tone or atmosphere of these letters is quite different from the varied spirit of the letters to Liszt, Uhlig, Heine, Praeger, Frau Wille, and others, so that one is almost tempted at first to believe in a mystification; but as the letters proceed, the real Wagner is soon revealed unmistakably. We have space for only one brief extract, from a letter dated Biebrich on the Rhine, March 12, 1862:

"During all this time there was only one period when I really existed. That was when, amid unprecedentedly disagreeable circumstances, and as though it were the last chance to save my life, I locked myself up four weeks in Paris to write the poem of my 'Meistersinger.' By the end of January I had finished it, and my next task was to find an asylum where I might set it to music. After overcoming countless difficulties I have found such a place here in Biebrich, and to-morrow I hope to begin on the composition. . . . For such an undertaking I could ask my publisher for the advance of such a sum as is requisite to support me for a year while I am at work. The four weeks of literary activity in Paris were my happiest, but I was able to keep up the charm only by refusing to look right or left, until no one remained about me but *garçons* and *concierges*. The poem gave me ineffable pleasure; I am convinced it is my most inspired effort."

And in a later letter, when the music, too, was completed, he wrote: "That is my masterwork; no other comes up to it. To *that* performance you must come."

—The past spring and summer witnessed in Paris a general recrudescence, or one might say exacerbation, of interest in the love affairs of Musset and George Sand. The movement was started by the curious volume of Mme. Arvède Barine, and by an article by M. Spoelberch de Lovenjoul in *Cosmopolis*. Other periodicals followed suit, each taking its part in the controversy and throwing its little pebble of document or of hypothesis on the large and growing cairn. Among these later articles may be signalled as of especial interest one which Dr. Cabanès contributed somewhat more than a month ago to the *Revue Hebdomadaire* on the relations of George Sand, Pagello, and Musset at the time of the winter in Venice. Pagello is still alive, and Dr. Cabanès appealed to him directly as to an historical source. He, who all his life till now has been very discreet, permitted one of his friends to make some disclosures. The legend that Musset became aware of his betrayal by Mme. Sand through seeing two shadows projected on the wall of the Hôtel Danielli, is rejected by Pagello, as it was always denied by the heroine of the incident. Signor Fontana, who speaks for Pagello, tells the story thus: One night George Sand, after having written three pages of inspired poetic prose (Signor Pagello has kept them and they are unpublished), put them into a blank envelope and handed them to Pagello. He, seeing no address, and either not understanding or feigning not to understand the situation, asked her to whom he should give them. She snatched the envelope out of his hands and addressed it: "Au stupide Pagelo." A few days afterwards George Sand declared frankly to Musset that she could no longer be more than a friend to him. At one time Pagello had almost made up his mind to burn his correspondence with the author of 'Lélia,' but he has not done so. Her letters, of which there are enough to form a volume, are in the hands of an Italian writer and will appear after Pagello's death. A memorial which the nonogenarian has written, and which he gave in charge to his eldest son, will be published at the same epoch by the filial piety of a grandchild.

—The *Revue de Paris* of August 15 is the latest to take up the tale, though doubtless the *Revue des Deux Mondes* will have its innings yet. This latest article is the work of M. Maurice Clouard, and the most piquant part of his study bears upon the relations of

the two famous lovers after they returned from Venice. Musset came back first and alone; George Sand followed with Pagello. Then began the period of storm and stress chronicled by Mme. Arvède Barine. It was storm and stress of a very undignified and trivial sort—daily tempests in a teapot, with the jealous Pagello looking on. M. Clouard prints a number of the notes and letters that were written at the time, and they are not pleasant reading. Lifelong exile to Spain was threatened, and the result was a month's sojourn at Bâle. Eternal separations were announced every day, and none lasted twenty-four hours. Pagello soon tired of the sight of these lovers' quarrels and withdrew to Italy. At last George Sand, in an access of good sense, departed for Nohant on the 6th of March, 1835, and this time the episode was definitively closed. During the rest of the life of Musset, George Sand and he were on friendly terms. They wrote to each other, and saw each other, and their relations appeared to be wholly cordial. Why, twenty years after Musset's death, George Sand should have written 'Elle et Lui,' is a mystery which M. Maurice Clouard professes himself incapable of explaining. He only states the problem, and urges, in order to its resolving, the publication of all the correspondence between the lovers. But not all of those who are in possession of these most interesting literary documents appear as yet to have made up their minds to let them see the light.

—Complaints are again made in the German newspapers of the stagnant condition of the book trade, overproduction being usually advanced as the chief cause (there were more than 20,000 new publications last year). But there are other causes, one of which is feelingly dwelt on in the following extract from one of the letters to the poet Anastasius Grün by Frankl (and others), with their answers, which are to appear in book form this autumn. It was written in 1865, but might as well be dated yesterday :

"Every laboring man, provided he isn't a fool and is willing to work, may succeed in making a comfortable living; the German author alone cannot do so. Who is to blame for this? No one but the German public! It buys no books. While hardly any one hesitates to spend 4, 8, or 10 florins for a few hours' fleeting amusement in theatre or concert-hall, he cannot make up his mind to give two or three florins for a book. Ladies of the highest circles do not hesitate to send to the circulating library for their favorite novels, which may have been in the hands of the unwashed and diseased—perhaps a leper. Why the alms of a Schiller stipend if Germans bought the books of their writers as the English and French do? I know that poets and authors starve with them, too, but none of the standing of Gutzkow [who had just made an attempt at suicide]. Would not even Goethe and Schiller, Herder, Uhland, Lenau, and Grün have died of starvation had they been dependent on the profits on their writings alone? Grillparzer received in Austria for the whole work of his career 2,800 florins, or 400 florins for each 'piece.' . . . Our poets must learn to imitate the good custom of former potentates, each of whom learned a trade in order to have something to support himself in case he lost his crown."

—The papers bring us news of the death, at the age of sixty-five, of Joseph Delbœuf of Liège, one of the most original philosophic writers of our time. Those who know him best as a philosopher will be surprised to learn that his official life was spent in teaching Latin and Greek at the Belgian University, and that we owe numerous contributions to classical philology to his pen. His first work, published in the 50's, was his essay on Scientific Logic. His contributions to psychology, especially to the elucidation of space-perception, of Weber's law, of sleep and dreams ; to algorithmic logic ; to speculative biology ; to the philosophy of mathematics, and to metaphysics—have made him widely known. A dozen years ago he became interested in hypnotism, and, owing to a certain natural talent, had much success in therapeutic suggestion, making interesting contributions to that subject. He stoutly resisted the Belgian doctors in their attempts to restrict by law the liberty of experimenting in these directions. He was a fascinating writer, such an alliance of wit and reasoning as he commanded being excessively rare. He was a most original and lovable personality, and all students of philosophy will deplore that he has passed away without having given to the world a final systematic elaboration of his ideas on the philosophy of Nature. He was an indeterminist, and one of the very few—Fechner and our own Charles S. Peirce are others—who see more hope in speculatively evolving dead matter from living than living matter from dead. In the clash of opinions, this point of view is also precious, and Delbœuf's final work would have been of first-rate importance.

INDULGENCES.

A History of Auricular Confession and Indulgences in the Latin Church. By Henry Charles Lea, LL.D. Vol. III. Philadelphia : Lea Brothers & Co. 1896.

Dr. Lea's third volume comes with gratifying promptness to complete this really great contribution to our knowledge of the Roman Church in one of its most interesting aspects. Though it rests upon the former volumes as a basis, it may well be read as an independent treatise by that larger public for which the subject of indulgences has always a peculiar attraction. At no other point does the Roman institution come so close to the daily and hourly experience of its members. By no other device does it so effectively command their allegiance. We predict, therefore, for this volume a wide circle of readers. It ought even to commend itself to candid Roman Catholics, for we doubt if they can find anywhere a more careful presentation of the history of this institution or a more intelligent appreciation of its purpose. That the author is wholly out of sympathy with that purpose goes without saying ; yet here, even more than in the former volumes, he holds his prejudices in check, and subordinates them to the purely historical aim he has set before himself.

In pursuance of this aim Dr. Lea tries first to fix, on the basis of the most trustworthy Roman authorities, the definitions of the terms most frequently to be employed, and then proceeds to show the almost endless variety of ways in which these definitions have been interpreted in practice. Probably nine out of ten Protestants have always thought of the indulgence as a remission of sins for a money payment, and have even fancied, without much reflection, that it was a license to commit indefinite sins in the future. Dr. Lea corrects these errors at the outset, and never, throughout the volume, loses sight of the original meaning of indulgence as a remission of some part of the penalty due for sins in consideration of a voluntary contribution to some one of the many pious uses for which, ever since the days of the crusades, the Church has always needed money. Given the system of penance described in Dr. Lea's first two volumes, and given also the theory of the Church as the sole dispenser of the divine bounty; add to this the notion of a purgatory after death in which the soul is gradually freed from the burden of sin left upon it after all the sacramental functions of the Church in this life have been duly performed, and the theory of indulgences follows by a very natural progression.

Like many another comparatively harmless theory, however, it begins to be dangerous as soon as it gets into the hands of men who have ends of their own to serve by it. As defined by the law-making and law-interpreting power of the Church, the indulgence was never anything but what it was in the beginning—a part of that beneficent activity by which the Church reconciles offending man with a forgiving God. There was never a moment, to the present day, when the Church could not defy the world to point to a single case of authoritative departure from the received definitions. Yet, from the very earliest time, there was a great variety of opinion among orthodox scholars as to the limitations of the indulgence, and almost any abuse could justify itself by reference to first-rate authorities. Still more inevitable was the diversity of practice arising from the frailty of the instruments to whom this awful power must needs be intrusted.

The rule that a principal is bound by the acts of his agents, one of the safeguards of civil society, has never been very strictly understood by the Church. The central power has always been jealous of its ministers, and has gone on steadily diminishing their independent activity, until, by the act of papal infallibility, it has practically destroyed it. The history of indulgences illustrates perfectly this demoralizing tendency. No matter how gross the violations of the early, simple, and comparatively harmless theory might be, the Church could always throw the blame upon its wicked or ignorant agents, and, by its merciful pardoning power, cover any evil they might have done. From time to time, as evils came to be too notorious or too scandalous, it yielded to demands for reform, but always with the reaffirmation of the principles underlying the abuses it was (no doubt sincerely) trying to amend.

Nor has the papal power ever been very careful about consistency in detail. Above all else it is a practical institution, and concerns itself with immediate demands, always justifying its action by reference to certain great fundamental ideas which it alone can truly interpret. So, in the matter of indulgences, it has always been able to clear itself of all imputation by showing how the great needs of "religion" demanded the action in question. Dr. Lea carries us forward through the tangled maze of scholastic theology and Jesuit casuistry and Roman assertion to an almost clear understanding of the devious ways whereby the indulgence system has kept its marvellous hold upon the conscience of an "enlightened" generation. We say "almost," because it is doubtful if the uninspired non-Roman intelligence of the nineteenth century is capable of really comprehending that shading into each other of the true, the fictitious, and the false which alone can make this view of the moral life acceptable.

On no point, perhaps, in the whole range of ecclesiastical administration has the policy of vagueness been so consistently carried out as here. Even the very terms of the indulgence are to this day undefined by any decisive au-

thority. Doctors have differed radically, for example, as to the meaning of the phrase "an indulgence of so many days." Does it mean remission of so many days' penance on earth, and, if so, in what does a day's penance consist? Or does it mean shortening by so many days the period of purgatory, and, since the length of this period is unknown, is there any conceivable proportion between the amount of sin for which purgatory is due, and the act in consideration of which the indulgence is granted? Rome has been employing this language for now at least a thousand years, but has never defined it, and so it goes on cheerfully spurring on the zeal of the faithful by promises of they know not and do not stop to ask what. The Church gains its revenues, the faithful are edified, and the day of compromising explanations is indefinitely postponed. The phrases by which all action of Rome is justified are familiar, but it needs just such a careful presentation as this of Dr. Lea to bring out the curious disproportion of these phrases to the demand of the enlightened conscience which calls them forth.

The sketch of the part played by the indulgence in bringing out the protest of the Reformation is the least weighty part of the volume, perhaps because by that time the system was itself the chief agency in its own ruin, and, therefore, needs less emphasis. Dr. Lea is not writing a history of the Reformation, but tracing an institution, and the interest of his narrative therefore leads him on along the course of the Counter-Reformation, and into the vast application of the indulgence as a weapon against the ever-present enemy. If the Roman institution has become more decent under the constant criticism of Protestantism, it cannot be said that, so far as the indulgence is concerned, it has become more intelligent. Dr. Lea's last four chapters, with their calm enumeration of the recent developments of the indulgence theory, offer a subject of study as serious to the student of social science as it is curious to the psychologist.

RECENT MUSICAL BOOKS.

The Story of British Music. By F. J. Crowest. Scribners. Pp. 396.

Legends of the Wagner Dramas. By Jessie L. Weston. Scribners. Pp. 380.

The Evolution of Church Music. By F. Landon-Humphreys. Scribners. Pp. 179.

THERE are some queer statements in Mr. Crowest's history of British music. In the preface the reader is told that "histories of music almost rival the planets in number"; but we are quite sure there are a great many more, though perhaps not quite as many as there are stars. On one of the last pages we read that in England, during the Elizabethan age, "musicians rose up who were as great in their way as were Shakspere, Bacon, Halley, and Frobisher in theirs." If Mr. Crowest will name the British musician who was as great in his way as Shakspere, his discovery will make his own fame second only to that of Columbus. This revelation is probably reserved for a second volume, which is incidentally promised on page 384. The present volume extends from the earliest times to the Tudor period, and it must be conceded that, apart from astronomical and patriotic eccentricities, the author has produced a readable and useful volume. There is necessarily a good deal of padding in it, for up to within a few centuries accurate knowledge regarding the history of music in any country is very scant; the earliest recorded piece of secular music in England belongs to the thirteenth century, and remains nearly isolated for a couple of centuries more.

Mr. Crowest has followed the example of Naumann in illustrating his volume with numerous cuts, some of which possess exceptional interest, as, for instance, that of the Welsh *crwth* (crowth), generally considered the earliest instrument played with a bow, or those of the primitive organs, with their curious arrangements for "raising the wind." Amusing details are given regarding that musical wonder of the tenth century, the Winchester Cathedral organ, with its four hundred pipes and twenty-six bellows worked by seventy strong men, which produced tones "like thunder" that made every one "stop with his hands his gaping ears," and was "heard throughout the town." Mr. Crowest says that no such organs are made to-day, but he might have suggested that this organ was nevertheless typical of what is perhaps more characteristic of musical England than anything else—the love of massive effects. To this day the "biggest thing" in musical London is a Handel Festival concert, with 5,000 singers. Such a performance attracts an audience of from 20,000 to 30,000 in the Crystal Palace, and the big organ, which makes itself heard above all these voices, does its share of the attracting. Another curiosity mentioned is the old custom of one church lending an instrument to another, which indicates that in the fourteenth and fifteenth centuries some of the church organs were of a portable character. Though he gives no statistics, it is safe, in view of the religious propensities of the English, to believe Mr. Crowest when he says that "to-day the building of organs, whether for church, concert hall, or chamber, has become one of the leading trades" of England. Fathers of the Church allowed the lyre, cithara, and other instruments in the church service, but it is easy to see why the organ drove all rivals from the field: its sustaining power supported the voices and prevented the flatting usual in congregational singing.

Mr. Crowest concedes that the indigenous music of England has a less distinctive quality than that of Wales, Scotland, and Ireland; but for British music as a totality he claims that "when the whole story has been told, it will be found that no country—neither France, Germany, nor Italy—has so ancient an origin in music, or a more glorious record than has England." The last part of this sentence is absurd: England has not produced a single composer of the first rank (like Bach, Beethoven, Schubert, Chopin, Wagner), or even of the second (Handel, Mendelssohn, Gounod, Verdi, etc.). It must be conceded that the quaint melodies of Scotland, Wales, and Ireland are as beautiful and as original as the folkmusic of any country, including Russia and Germany; but why the English, who had such a splendid foundation to build on, and who, for many centuries, really were, as abundant testimony shows, as much addicted to music in public and private life as any nation, should have never built a musical cathedral on those foundations is an ethnological and æsthetic mystery which our author does not solve. He suggests, indeed, after speaking of the great popularity of the minstrels, that "the obloquy which for so many years afterwards attended the following of music as a profession in this country, and which reputation only the persistent example of musicians of the latter half of the nineteenth century has permanently removed," was due to the degradation of the minstrel love-ditties to songs of a licentious, satirical, and libellous character, which caused the church and society to taboo them. But that such a cause could not have prevented the rise of a musical genius we know from the analogous case of literature and the drama. In view of their poetry, architecture, and painting, it would be absurd to call the English an unæsthetic nation; why, then, have they produced no musical genius? The great absorption of the British mind in political questions and commercialism has been suggested in these columns as a partial answer to that question, but it does not explain why (since, after all, a great deal of music is made in Great Britain) not a single great genius has appeared as the exception to emphasize the general mediocrity.

The claim, to which Mr. Crowest recurs again and again, that England is the oldest musical country—he even says that it "played the major part in making the art of music that vast medium of thought and expression which it now is"!—is, of course, based chiefly on that eternal and rather commonplace canon, "Sumer is icumen in," of which one is getting rather tired. Granted that it is by far the earliest preserved secular piece of its kind, Mr. Crowest himself gives the reasons (pp. 376–7) why secular music had so little chance of preservation except orally; and the fact that the earliest piece preserved is English may be a mere accident, and affords no valid proof that in other countries such pieces may not have been sung much earlier. If there were a large number of such English pieces, the case would be stronger; but one swallow does not make *sumer*. On the other hand, Mr. Crowest does well to emphasize the fact that in the twelfth and thirteenth centuries secular music was greatly in advance of church music, on which historians have usually based their inferences. The minstrels, not being bound by conservative ecclesiastic rules, caught the modern spirit of music in rhythm and harmony much sooner than the church composers. Exactly what their harmony was it is difficult to say. Following Sir Frederick Ouseley, Mr. Crowest makes rather rash inferences as to the use of harmonic intervals and part singing in very early times. When he says (p. 68) that "man is a harmonious creature, who must have been endued from the beginning with the faculty of forming harmony with the voice—just as the merest children can add to-day what they term 'seconds' to a tune," and again (p. 269), "It is in the nature of things that wherever there is melody there harmony is close by"—he makes assertions which, in view of what we know of ancient Greek and Oriental music and the art of savages, cannot be accepted.

One of the most interesting quotations in this volume is from the Venerable Bede (672-735); it indicates the esteem in which music was held in some early English minds:

> "Music is the most worthy, courteous, pleasant, joyous and lovely of all knowledge; it makes a man gentlemanly in his demeanor, pleasant, courteous, joyous, lovely, for it acts upon his feelings. . . . Music encourages us to bear the heaviest afflictions, administers consolation in every difficulty, refreshes the broken spirit, removes headache and sorrow, expels foul spirits, and cures crossness and melancholy."

The opponents of Wagner, in their eager search for ammunition, used to predict that his dramas would never become popular outside of Germany, because their German sub-

jects could not be expected to appeal to audiences of a different nationality. Jessie L. Weston, in the 'Legends of the Wagner Drama,' makes (or ought to make) these critics blush by pointing out that

"of the great cycle of legends based on well-known works of mediæval German literature, which forms the subject-matter of Wagner's music-dramas, two alone, the Nibelungen and the Tannhäuser legends, can be claimed as purely German; and of these, the hero of the first, Siegfried, is but the Teutonic development of an Aryan original whose British parallel is to be found in Parsifal. . . . The heroes of the Wagner drama are no strange creations of a foreign tongue and a foreign literature, but belong to us by hereditary right."

Again, she confutes those who, while admitting Wagner's selective instinct and dramatic power, denied his poetic gift and denounced his dramas as rubbish. As a matter of fact, what is unique and original in these dramas is precisely that selective instinct and dramatic power; the material for his dramas Wagner, like Shakspere, borrowed from the world's literature. "We need to realize that the life of the Wagner drama is the genius, not alone of the musician and dramatist, but of men whose work has already stood the test of centuries." In the 380 pages of the present volume the author endeavors to show the relation of Wagner's work to the literary and legendary sources upon which it is founded. The book is not, therefore, like several others that have recently appeared, a mere attempt to tell the stories of Wagner's poems in English prose, but it is a study in comparative mythology and poetry which may interest even those to whom Wagner is mortal and Bayreuth a mundane city.

Bishop Potter, in an introduction to the Rev. F. Landon-Humphreys's 'Evolution of Church Music,' says that "the history of music may be said, in one aspect of it, to be almost a history of religion." Fortunately, the author of the volume before us has not looked at his task from such a broad and comprehensive point of view. He writes as an amateur for amateurs; but his elegantly printed volume contains much that will interest clergymen and others. It is a compilation of well-known facts which are clearly presented on the whole, although some of the technical points will be difficult to grasp by those unfamiliar with musical history. Our author thinks that "musical taste is nowhere at a lower level than in our own land," and he attributes this in part to the popular demand for novelty in the hymn-books. He has a great admiration for German chorals, and justly remarks that if the compilers of hymn-books would select more of these in place of the feeble, trivial tunes they prefer, our psalmody would be greatly improved. He says that the German edition of the Moody and Sankey hymns

"has been enriched by a full harmony which changes their slight melodies so completely that you would hardly know them for the same as the originals. But it should be reiterated that in Germany these hymns are used only by the smaller sects—the dissenters, so to speak. In the Lutheran Church the introduction of these trifling tunes, even for Sunday-school use, would not be permitted."

The London Burial Grounds. By Mrs. Basil Holmes. Macmillan.

London Street Names. By F. H. Habben. Philadelphia: Lippincott.

It is difficult to realize that, up to about thirty years ago, intramural interment was still permitted in London. For many years Mrs. Basil Holmes was engaged in making a list of London burial-grounds. The reader may naturally ask why to make such a list should have required so much labor. The answer is, that the list was intended to include sites which had ceased to be recognizable as burial-grounds. An immense number of burial-grounds were opened by private speculators; when these grounds were full, the sites were, after an interval more or less indecent, utilized for building purposes, the human remains being carted away. Starting, therefore, with Rocque's map of 1746, Mrs. Holmes set to work to find out by actual inspection what had become of the burial spaces marked in this and later maps. The work, tedious and difficult enough, had, as Mrs. Holmes shows, its humorous side; she gives narratives of her encounters with grave-diggers, gardeners, and others, sometimes friendly, sometimes hostile, generally with a flavor of suspicion. The work was undertaken first for the Metropolitan Public Gardens Association, and later for the London County Council—in both cases with a view to laying out the disused burial-grounds as public gardens. The book is full of painful and even of horrible details, telling of gorged graveyards, raised by burials many feet above the old levels, with the sickening accompaniments which we prefer to leave to the reader's imagination. We are not surprised to find that, as the result of her dreadful experiences, Mrs. Basil Holmes is an advocate of cremation. While it cannot be said that the book furnishes agreeable reading, it bears every evidence of most praiseworthy care in its compilation, and should be of great value to those in search of information on the subject of London burial-places.

In a volume of fewer than three hundred pages Mr. Habben has endeavored to give an account of the street-names of a portion of London—of Old London, one may say. The subject is interesting and is well treated, and our author has evidently spent much time and research on it. The arrangement is alphabetical, in which Mr. Habben follows Elmes, Cunningham, and others. Some London names are of great antiquity: for example, Watling Street and Addle Street come down to us from Saxon times; Basinghall Street dates from the thirteenth century; Bucklersbury, famed in Shakspere's day for its trade in "simples," takes its name from the Buckerel family, a member of which was Mayor in 1231. Goodman's Fields was called after the owner of a farm there, "at the which farm," says Stow, "I myself in my youth have fetched many a half-penny worth of milk." Many a name like Austin Friars, Crutched Friars, Blackfriars, Whitefriars, Minories recalls the name of a monastery swept away by that zealous reformer Henry VIII., who turned the sick into the street and put the cost of their keep into his own pocket. Curtain Road preserves the name of the Curtain Theatre, built about 1576; Bear Gardens, in Southwark (omitted by Mr. Habben), derives its name from the bear-garden, a representation of which is given in the earliest map of London—that of Braun and Hogenberg, published in 1572, but probably copied from a map drawn fourteen years earlier.

We do not always agree with Mr. Habben, who is perhaps a little too much inclined to accept the derivations of Stow, which are sometimes of quite antique simplicity. It is, for example, difficult to suppose that the suffix "le Poor," distinguishing the church of St. Peter in Broad Street from other churches similarly dedicated, was derived from the poverty of the parish. Probably research would show that, as in the case of St. Benet Fink, St. Lawrence Pountney, St. Martin Outwich, and others, the distinctive name was that of a family (le Poer) connected with the church as benefactors. But Stow might have saved Mr. Habben from one questionable derivation. Mr. Habben thinks that Gun Square, Houndsditch, "should be rather Gun's Square, the only surviving memento of an obscure individual, probably the owner of the property." But, in discoursing of Houndsditch, Stow tells how, about the latter reign of Henry VIII., certain gunfounders got ground on "the field side" of Houndsditch to enclose for the casting of brass ordnance. Accordingly, on Braun and Hogenberg's map, we find on "the field side" of Houndsditch, "y^e^ Goounefownders h^s^," with a mounted gun in the enclosure. The place is also clearly indicated, although not named, on the map of Aggas, so called. The enclosure occupies, apparently, exactly the site of Gun Square.

Camping in the Canadian Rockies. By Walter Dwight Wilcox. With twenty-five full-page photogravures and many text illustrations from photographs by the author. G. P. Putnam's Sons. 1896.

The tourist era of the Canadian Rockies began ten years ago with the opening of the Canadian Pacific Railway. More recently the construction of one hotel at Banff in the Canadian National Park, and of another at the heart of the Selkirk glaciers, has made the region a recognized centre of mountaineering effort. New fields so alluring soon attracted travellers from every part of the world, and the work of individual exploration in the neighborhood of the railway line has gone forward apace. We may now confidently await the publication from time to time of sumptuous illustrated bulletins relating to the Canadian Rockies, in which successive climbers will announce their exploits, discoveries, and pleasures. Dr. Green and Emil Huber have already printed interesting accounts of adventure in the Selkirk range. Mr. Wilcox surpasses them both in completeness of survey, fulness of detail, and beauty of illustration.

Neither the Canadian Rockies proper nor the Selkirks reach the same elevation that is attained by the main ridge of the Rockies in the United States. The highest summit yet found, between the boundary and the railway, falls short of 12,000 feet. Mounts Forbes, Brown, and Hooker in the Waputehk range probably reach 13,000 or 14,000 feet, though nothing very definite is at present known about them. The great charm of the Canadian Rockies to mountaineers is not their altitude, but their glaciers. These surpass the Aletsch glacier in extent and the Rhone glacier in beauty. To take a single example of their abundance, Mr. Wilcox says incidentally of the view from Eagle Peak: "The great Illicellewaet *névé*, with its twenty square miles or more of unbroken snow fields, stretches out in the distance and forms part of the eastern horizon. . . . It has been stated on good authority that from Mount Abbott, a far lower ridge on the farther side of the valley, more than one hundred and twenty individual glaciers may be counted, but there are even more within view from Eagle Peak." The fish and game, the flowers and rocks of the district appeal equally to sportsmen and scientists. If only their flies and their jungle were less trying,

the length and breadth of the Canadian Rockies would be compassed in the next ten years.

Mr. Wilcox's interest in the Rockies and Selkirks is so diversified that his book can hardly be viewed from the standpoint of a single sport. He is devoted to camp life—even to the length of describing its beneficial effect on the character—and when it comes to a choice between mountaineering and photography, the latter seems to carry the day. He has historical chapters on the early explorers and their work. He discusses the pleasures of the natural sciences, the origin and cause of mountains, the Chinook winds, the effect of high latitude on sun and moon, etc. Withal, the present volume comes within the range of tourist literature. We have six or seven works on the same region by geologists, geographers, and railway surveyors. The difference between Mr. Wilcox and his most important predecessors is that he was out for pleasure and they were out for work. Mr. Wilcox ventured far enough from the beaten path to encounter some trials and privations, but the well-equipped camper of modern times treads a primrose path. To gain an idea of what the Canadian Rockies are at their worst, one must read the narratives of Mackenzie, Hector, Milton and Cheadle, or at least Mr. Wilcox's abridgment of their most harrowing experiences. Geographical curiosity and the peltry trade were the motives of the pioneers. Mr. Wilcox went out to camp, to climb, and to take photographs. Yet his account of the first complete journey around the base of Mount Assiniboine shows that he has the energy and endurance of the true explorer. It is pervaded by a tone of resolution and objective purpose which leads us to hope that he will continue in the same field, and come home some autumn with the top of the highest of the Waputehks in his pocket. At present he stands half way between the ordinary tourist and the professed explorer.

Mr. Wilcox's principal centres were Banff, Lake Louise, and the Glacier House. His longest expeditions led to "Paradise" Valley, to the foot of Mount Assiniboine, and to the Bow Lakes. His best summit was Mount Temple, the highest of the Canadian Rockies yet ascended. The quotation marks about "Paradise" require an explanation. The valley in question lies at the base of Mount Temple and received its name from a variety of qualities delectable to campers. Mr. Wilcox lays such stress upon its beauty that one is reminded of Rasselas and the Happy Valley of Abyssinia. Fortunately it is within easy reach of Lake Louise, and even the casual tourist can reach it without much inconvenience. Mr. Wilcox praises the scenery of the Canadian Rockies enthusiastically, and numerous full-page illustrations justify all that he says. One should not conceal the fact that the danger to climbers is considerable in both Rockies and Selkirks. The assistance of trained local guides is wholly wanting, and the mountains are, to use a phrase of Alpine slang, "in a very bad state of repair." When to these sources of risk is added complete isolation in case of accident, it will be seen that the utmost care is required in the equipment and conduct of expeditions to the Kootanie and the Bow. A member of Mr. Wilcox's party nearly lost his life on Mount Lefroy two years before the death of Philip S. Abbot at the same point brought sorrow to many hearts and loss to his country.

We have only one stricture of consequence to make upon this excellent book of travel and adventure. It should have been accompanied by a map. Mr. Wilcox fails to justify his remissness in this respect by stating in the preface: "A map is not included in the volume, as, owing to the wildness of the country, there are no detailed maps covering this region that are entirely satisfactory." A confessedly rough map based on Dr. Dawson's Preliminary Report would have been much better than nothing.

The Thomas Book, giving the Genealogies of Sir Rhys ap Thomas, K.G., the Thomas family descended from him, and of some allied families. By Lawrence Buckley Thomas, D.D. Imprinted at New York city by the Henry T. Thomas Co. 1896. 8vo, pp. 627.

The Ashley Genealogy: A History of the Descendants of Robert Ashley of Springfield, Mass. By Francis Bacon Trowbridge, author of the Champion Genealogy and the Hoadley Genealogy. New Haven: The Author. 1896. 8vo, pp. 472.

THE large and well-printed volume, 'The Thomas Book,' will take its only suitable place among the curiosities of the collector, as a monument of money wasted. The editor or compiler evidently had no plan of arrangement, and seemingly had no special object in view except to empty his scrap-books. Undoubtedly many facts are truly recorded herein, but most of them have been printed before, and the need of the reproduction is not evident. Thus, the first twenty-eight pages relate the pedigree of a Thomas family of Wales, leading up to the unfounded suggestion that one member was Philip Thomas, a colonist in Maryland 1651–1675. Then follow some forty pages of the genealogies of various Thomas families in Maryland; and, as far as p. 193, other Thomas families are recorded, arranged alphabetically according to their localities. Little can be said in praise of this part of the book, as the longer pedigrees are entirely lacking in suitable arrangement, numbering, or cross-references, and the shorter ones are simply scraps. For example, two pages are given to the noted Thomas family of Marshfield, as an excuse for putting in a portrait of Gen. John Thomas, and adding a "society item" in regard to one other member of the family. On p. 155 will be found a record of the Thomas family of Portland, Me., giving the names of Hon. William W. Thomas and his two sons, copied from some printed source of information, but filling out the requisite number of pages. Pp. 196–556 are made up of families allied to the Thomases, arranged alphabetically and located indiscriminately in America or in Europe. Of these sketches the principal ones relate to the Chew, Lawrence, Fairfax, and Snowden families, and the connection in most cases seems to be that some one member of such family has married some Thomas.

It is impossible to call this book in any sense a genealogy or even a help to genealogy. There cannot be the slightest gain in reprinting scraps from Burke's 'Peerage' or his 'Commoners,' covering a few generations of a single line of some English family no more connected with America than with Ethiopia. Nor are we to be edified by cuts of English coats-of-arms or portraits of English worthies copied from books easily accessible. As we have already said, it is highly probable that much of the American portion is new and correct, but no author who neglects the well-known rules for arranging and printing genealogies can expect more than reluctant thanks for his work. A book of this size and miscellaneous character could be pardoned only had there been a suitable index; but, as might be presumed, nothing of the kind is provided. The only attempt to make matters intelligible is the use of the childish plan of using various fonts of type to mark the generations, which not only disfigures the page but adds enormously to the cost. In fact, the main impression made upon the reader is that expense was no object, and that a big volume with as many illustrations as could be dragged in was the end to be attained. We by no means object to the publication of English genealogies by American namesakes, especially if due prominence be given to the fact that the connecting link is missing. But really if one should try to collect all families with so common a surname as Thomas, it seems absurd to drag in Thomas, Archbishop of York, who died A. D. 1100 (pp. 71-73), and Thomas à Becket (p. 564).

In the 'Ashley Genealogy' are recorded the descendants, in the male line, of Robert Ashley of Springfield, 1639–1682, through his three sons David, Jonathan, and Joseph. The difference in the lines is quite marked, David having 284 male descendants, heads of families; Jonathan 53, and Joseph 84; the last being divided into two branches. These Ashleys seem to have been remarkable for an attachment to their birthplace unusual in this country, and most of those recorded spent their lives in the vicinity of Springfield. The most noted of the name was perhaps Chester Ashley, born in Amherst, Mass., in 1791, an emigrant to Arkansas, and a Senator therefrom in 1844–48. This family history is in all respects creditable to the compiler. The system is clear and full, the dates are precise, the sketches wonderfully complete, especially of men pursuing the ordinary avocations of life. The illustrations, mainly views of houses, will appeal to the hearts of future generations, and every bearer of the name must feel under obligations to the author.

BOOKS OF THE WEEK.

Abrahams, Israel. Jewish Life in the Middle Ages. Macmillan. $1.75.

NEW BOOKS.

A History of Presidential Elections.

By EDWARD STANWOOD. Fifth Edition, revised. 12mo, $1.50.

This work, by Mr. Edward Stanwood, formerly editor of the Boston *Daily Advertiser*, is a recognized authority concerning the circumstances, distinctive issues, political bearings, and candidates in all the presidential elections yet held in the United States. It has been revised and brought up to date by including the result of the election in 1892, also the platforms and nominations of the several parties for the campaign of this autumn.

Talks on Writing English.

By ARLO BATES, Litt.D., Professor of English in the Massachusetts Institute of Technology, and author of "The Philistines," "The Pagans," etc. Crown 8vo, $1.50.

Mr. Bates has done the difficult task of writing an interesting book about the art of writing. It is not a formal treatise, but a familiar and animated explanation, full of apt illustrations of the principles of effective expression.

A Primer of American Literature.

By CHARLES F. RICHARDSON, Professor af Literature in Dartmouth College. *New Edition* (71st thousand), rewritten and brought up to date. With portraits of eight authors, pictures of their homes, and a full Index. 18mo, 35 cents *net.*

Sold by Booksellers. Sent, postpaid, by
HOUGHTON, MIFFLIN & CO., Boston,
11 East 17th St., New York.

Yale Mixture.

A GENTLEMAN'S SMOKE.

You won't know the luxury of Pipe-Smoking until you use Yale Mixture.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 24, 1896.

The Week.

THREE States have held elections this month. In all of them the rural population greatly preponderates. Not one of them contains any city of the first or even second rank in population. One is an overwhelmingly Democratic State in the far Southwest. The other two are strong Republican commonwealths in the extreme Northeast. Arkansas has a slightly larger population than Maine and Vermont combined. It is a State in which the free-silver sentiment has always been very strong. No canvass was made in it by the Republicans. Since the last Presidential election, the payment of a poll-tax has been made a qualification for the exercise of the suffrage. The new test was designed, as in all the Southern States since the war it always has been designed, to reduce the Republican vote. In twenty or more counties of the State, including nearly all of those in which the Republican vote would be large, the Republicans, in defiance of the spirit of the State law, were refused any representation among the election officials. The day after the election, and for a week or more longer, every dispatch from Little Rock reported enormous Democratic gains. Pluralities of seventy-five and eighty thousand were said to be indicated by the returns. The official figures are now in. It appears that the Populist vote of 31,117 in 1892 has been reduced to 13,989. This means, of course, that 17,000 Populists who in 1892 supported their own ticket, have been reconciled to the Democratic party by the declarations of the Chicago platform and by the nomination of Mr. Bryan. In spite of this large reinforcement, the Democratic vote, which was 90,115 in 1892, is only 1,009 larger in 1896. On the other hand, the Republican vote, in spite of the election methods and of the poll-tax qualification, has increased 1,742, so that even in Arkansas there has been a net Republican gain—trifling, it is true, but still a gain. The fair method of comparison, however, between the results of the two elections is to consider the Populist and the Democratic vote together on the one side and the Republican vote on the other. So considered, the anti-Republican forces in 1892 polled 121,232 votes; in 1896 they polled but 105,113 votes. Their majority over the Republicans in 1892 was 87,588; in 1896 it was but 69,727—a loss of 17,861, and this figure probably represents the number of sound-money Democrats who declined to vote their party ticket this year. Even in Arkansas, therefore, something like twenty per cent. of the Democratic vote cannot be polled for the nominees of the Chicago convention.

In Maine and Vermont the total Republican vote polled this year was 136,971, as against 106,527 four years ago—a gain of 30,444. The total Republican vote in these States this year is 9,000 greater than was ever before polled in them at any election by any party. The total Democratic vote in the same States, which in 1892 was 74,294, has fallen to 49,746—a loss of 24,448, or very nearly one-third. Never since the Republican and Democratic parties have faced each other, has so small a Democratic vote been polled in these States in the year of a Presidential election. The heaviest Republican plurality ever before given in them was 47,729, in 1868. This year the plurality amounts to 87,225, or nearly double that of twenty-eight years ago. Taking the three States together, it appears that a Democratic plurality of 24,000 in 1892 has been changed into a Republican plurality of 31,500 in 1896. It was said just after the Arkansas election that it answered Vermont. The facts show that the answer was an echo. Indeed, the result in Arkansas points to the overwhelming overthrow of the free-silver forces perhaps even more certainly than did the outcome in Maine and Vermont, for it shows not only that in the East and in New England is the Democratic party weaker than it was four years ago, but that it cannot this year poll its entire vote even in those sections of the country in which free silver has for a score of years been a part of the local party creed.

Neither the Vermont nor the Maine election casts any light upon the probable strength of the Palmer and Buckner ticket in November. In Vermont there was no Democratic gold-standard ticket, and in Maine the one which was nominated could not be got on the official ballot, so that anybody who wished to vote it had to write the names. Even with this immense disadvantage to contend against, Mr. Clifford received 567 ballots, which is almost exactly 1 per cent. of the Democratic vote of 55,078 at the corresponding election in 1892. If it had been as easy to vote for Mr. Clifford as for the Republican candidate, he would undoubtedly have been supported by more than one Democrat in a hundred, as many would have gone to the polls for that purpose who stayed away as it was. At the same time the prevailing feeling among those Democrats who rejected Bryanism with indignation, was to make their opposition as effective as possible by swelling the majority for the Republican candidate; and this seems to be the prevailing tendency among voters of that class throughout the North at present.

The Buffalo "Democratic" convention "completed its work" by adopting a platform which declares virtually that all previous platforms of the party for a quarter of a century have been lies, and by putting in the field for Governor a man who could not accept the nomination without either repudiating the platform or repudiating his own utterances of three months ago. This astonishing performance by a great party is excused and defended on the ground that in no other way could the organization be held together for future work. It is confessed that overwhelming defeat at the polls is expected, but that is thought to be of small moment compared with the preservation inviolate of the principle of "party regularity." Though Senator Hill held aloof from the convention, there seems to be no doubt that he directed its action, and that both the platform and the ticket are the results of his orders. It is even intimated that he will himself support the ticket, and will also support Bryan and Sewall, taking the ground that as an uncompromising bimetallist and unswerving Democrat he has no other course to follow. This would be the only logical course for Mr. Hill. The Buffalo convention was the natural fruit of his eleven years of party leadership in this State. He it is who has reduced the party organization to such a level that it is not ashamed to have Sheehan, the Buffalo defaulter, for a leader, or to sit in a convention with Tom Grady as presiding officer, or to go into the campaign with Danforth, the canvasser of illegal election returns, as chairman of its State committee, on a platform which favors repudiation and national dishonor and business chaos, and with a candidate for Governor who has not sufficient self-respect to refuse to stand on a platform which favors what he has denounced as unpatriotic and dishonorable.

Mr. John Boyd Thacher wishes it to be understood that he is himself the sole author of the letter which has made him the most despicable candidate that ever ran for high office in this State, and he should be allowed to have his way about it. He has made it impossible for either Bryan or anti-Bryan Democrats to vote for him, and, standing before the people of the State in this isolated attitude, he declares with great vehemence: "No human being on God's footstool knew anything about that letter except John Boyd Thacher." What is the matter with him? Why, bimetallism. He says he has not declared for gold, neither has he declared for silver, but that he stands for bimetallism, international bimetallism. The fact that the present campaign is a square fight between gold and silver does not bother

him at all. "I don't care four cents about being elected Governor; I want to be right in this matter." It is useless to try to understand Thacher, to explain his conduct by applying rational tests to it. If you will look in his eye, you will detect there that far, vague look which is said to characterize the eyes of most incurable bimetallists. The trouble with him is fundamental.

An attempt is made in the Buffalo Bryan Democratic platform to get up a State issue on the repeal of the Raines liquor-tax law, but it cannot succeed. It will be impossible to repeal or change the law in the next two Legislatures, because the Senate holds over for two years longer, having been elected for three years. It is a strongly Republican body and the Raines law is a strong Republican measure, and as such will not be meddled with. The members of the next Assembly, and their successors also, will be powerless to effect any change in the law, and it will be useless to endeavor to make such a proposition an issue in their election either this year or next. The Raines law is, in fact, a fixture for more than two years, and all efforts to get rid of it in the meantime will be wasted energy. It is, furthermore, working with far greater general satisfaction than was expected. The liquor-dealers seem reconciled to it, and even our alarmed German citizens do not make any complaints. As an issue it will play no part in this year's campaign, and cannot be counted upon to keep the Republican majority much below 200,000.

Tom Watson must have been delighted at the revelations made by the *Tribune* on Friday morning about his "hated rival" for the Vice-Presidency on the Bryan ticket, or rather tickets. Mr. Sewall recently took the contract for carrying four ship-loads of timber from Maine to Long Island City, and insisted upon having this clause inserted in it:

"The party of the second part agrees to pay to said party of the first part, or agent, for the transportion of said timber .....dollars and.....cents, United States gold, or its equivalent."

Nor is this an isolated case. The *Tribune* has also discovered that one of Mr. Sewall's ships has been chartered to the Standard Oil Company, and has just loaded a cargo of case oil at Philadelphia for Japan, and that this clause appears in her contract of affreightment:

"The party of the second part agrees to pay to said party of the first part or agent, for the use of said vessel during the voyage aforesaid, ...cents, United States gold, on each and every case delivered."

At best, Sewall with his known record was an absurd candidate for Vice-President on a platform declaring for 53-cent silver dollars, but when it is found that he insists upon 100-cent gold dollars in his own business, only Tom Watson's vocabulary is equal to the demands of the situation.

As a contribution to financial and economic thought, the following utterance of Mr. Bryan, made in Kentucky on Tuesday week, is the most remarkable yet offered even by him:

"If any man in this community would offer to buy all the eggs produced at 25 cents a dozen, and was able to make good the offer, nobody would sell eggs for less, no matter what the cost of production, whether 1 cent or 5 cents a dozen. So with silver. Free coinage would establish the market price of silver at $1.29, and nobody would sell it for a cent less."

Why limit the price of eggs to 25 cents and of silver to $1.29? If the reasoning is sound, the price in each case might easily be doubled, and the consequent benefit to the human race correspondingly increased. And why stop with eggs and silver? Why not mark up the price of everything you wish to buy, offer to pay double or treble what is asked for it, and keep on paying that price to all comers—hold it there? That's all you have to do—hold it there. "Nobody would sell it for a cent less," says Bryan, so long as you held it. "So with silver." And the man who is putting forth such thought as this is a candidate for the Presidency of 70,000,000 of people in the closing years of the nineteenth century!

The Populist platform demands the acquisition by the Government of all the railroads in the country, in order that the "tyranny and political power" of those corporations, which result in the impairment, "if not the destruction," of the citizen's "political rights and personal liberties," may themselves be destroyed. The system which is to be acquired consists, according to *Poor's Manual*, just issued, of roads owing $5,640,942,567 in bonds, and $840,000,000 of current and unfunded debt. The owners of it have stock put down as worth $5,182,121,999. It is the stockholders of whose tyranny the Populists complain; whatever power the railroads have is wielded by directors and Presidents who are selected by and are themselves stockholders. To judge by Poor's pages, their devotion to tyranny has the peculiar result of producing the most shocking effects on their own income. In the last year they paid 4.25 per cent. interest on the bonds they owed, keeping for themselves only 1.59 per cent. on their stock. In 1894 they got 1.64; in 1888, 1.77. A disinterested love of tyranny is a novelty; but it must certainly be stamped out at all hazards. It is not for anybody's real interests that tyranny should increase as dividends decline. A tyrant who will take 1.59 per cent. for the sake of tyranny will never let liberty thrive even if he has to take less; and there are roads which have gone so far as to take nothing at all.

An illuminating glimpse into the constituents of "the money power" is afforded by an analysis of the depositors in a savings bank of Dubuque, Ia., which has 7,614 accounts, representing $4,000,000. These 7,614 persons are classified as follows: mechanics and laborers, 5,120; farmers, 1,207; teachers and professional men, 632; administrators and executors, 604; capitalists, 51. Still another glimpse is furnished in this statement by an exceptionally well-informed citizen of Franklin County, Mass., a county composed almost entirely of small farming towns, in a recent address to the "plutocrats" of that region who have loaned money on Western mortgages; "From data that I have obtained, I believe that not less than $3,000,000 of Franklin County money is to-day invested in Western farm mortgages, and that two-thirds of this belongs to farmers now in active life." With these revelations as to the character of "the money power" should be put an incident illustrative of the class of farmers in the West who are not deluded as to the source of their troubles, and who have no notion of trying to cheat their creditors out of half that they owe them. A savings bank in Windham County, Vermont, holds a small mortgage on a farm in Kansas—the money that went West being very likely the savings of a farmer in the Green Mountain State. The Western farmer recently sent the six months' interest due on his loan, and added in a postscript that he "did intend to send some principal on this pay-day, but the free-silverites are raising the very devil with business here in Kansas, and for a fact all over the West, and prices for all farm products are ruinous."

We have received a number of inquiries as to the redemption of silver dollars by the Treasury Department. So far as the statutes are concerned under which the present silver dollars have been coined, the dollars are not redeemable in any other coin or currency. The Treasury, moreover, has not made a practice of exchanging gold for silver dollars on demand. But this is because no test case has actually arisen, chiefly for the reason, as Mr. Carlisle has lately pointed out, that the supply of silver currency in existence has been limited. We were very near to something of a crisis in this regard in 1884 and 1885, when the pressure of silver coin or certificates in payment of dues to the Government, plainly menacing the maintenance of the gold reserve against legal tenders, was finally relieved only by Secretary Manning's very able management of the currency. Mr. Manning withdrew the legal-tender notes of small denominations, replacing them with certificates for large denominations. This void in the smaller currency was then filled by silver certificates in ten-dollar denominations or less. The certificates, by this process, were kept in permanent

circulation outside the Treasury, for use in small exchanges. The law which may be construed as guaranteeing the maintenance of our silver currency at its face value in gold, is the clause in the silver-purchase act of 1890 wherein it is declared to be "the established policy of the United States to maintain the two metals on a parity with each other." This declaration was reaffirmed, as Mr. Carlisle points out in his letter of Tuesday week, in the act of November 1, 1893. Mr. Carlisle concludes from both these acts that whenever "the silver dollar cannot be kept equal in purchasing power with the gold dollar, except by receiving it in exchange for the gold dollar, when such exchange is demanded, it will be his [the Secretary's] duty to adopt that course." The Secretary is, however, entirely right in adding that such a demand is quite improbable.

Mr. G. Bernard Shaw writes entertainingly and suggestively in the September *Cosmopolis* of the late International Socialist Congress. That it made itself a laughing-stock in so many ways is a manifest gain. "I, the Socialist, am no longer a Red Spectre; I am only a ridiculous fellow." The change is a welcome one for society in general, and it ought to be even for the Socialists, as it insures them much more indulgence and unconcerned hearing than they have enjoyed. As for the disorder and clashing and wild beating of the air which marked the London Congress, Mr. Shaw forcibly says that they were no more than what might have been expected from a body irresponsibly assembled and without any mandate or executive power. The Italian and French Chambers, the House of Representatives of the United States, and latterly even the House of Commons are not in a position to throw stones at the Socialists for disorder. But it is in the analysis of the mental attitude of Socialists that Mr. Shaw is most happy. Most of their working ideas are delusions. "They still see the social problem not sanely and objectively, but imaginatively, as the plot of a melodrama, with its villain and its heroine, its innocent beginning, troubled middle, and happy ending. They are still the children and the romancers of politics."

The Italian statistician Luigi Bodio, in a letter to the Cobden Club, makes a striking exposition of the folly of the protectionist and paternalistic policy of Continental Europe during the past twenty years. Great sums have been spent by the state on railroads and other means of international commerce, and yet tariff laws have been framed ingeniously to make international commerce impossible or unprofitable. The real advantage of the European manufacturer and agriculturist over his competitors in America and in the Orient is in the abundance of capital at a low rate of interest. But this advantage the Governments of Italy and France have deliberately thrown away. By their system of vast and increasing state expenditures, they have so increased taxation as to more than make up for the lower rates of interest they have to pay. What does it profit the French farmer to be able to borrow money at 3 per cent. as compared with the 6 or 7 which his American competitor has to pay, if his taxes are made three or four times what they used to be, and what they should be, by lavish public outlay? This, as Signor Bodio affirms, is one of the worst forms of socialism, and prevents industry and agriculture from profiting as they might by abundant capital and reduced taxes.

When defining, or deftly refusing to define, in the Commons the objective of the Anglo-Egyptian expedition up the Nile, Secretary Chamberlain said that the aim was to go towards Dongola, but whether they went as far as that point or beyond it would depend upon the amount of "resistance" encountered. As Dongola was taken on Saturday practically without any resistance whatever, there is no reason on that score why the advance should pause there. Nor is there any likelihood that it will. The reconquest and holding of the Sudan was doubtless the intention from the first, and though there was more or less shuffling about it in the beginning, it is now pretty well understood. And there seems no probability of any effective protest against the movement as long as all goes prosperously. The country made little response at the time to Mr. Morley's attack on Salisbury's disingenuous and somewhat sinuous Egyptian policy, and is secretly, no doubt, rather glad to have the African success to set over against the Turkish humiliations. Certainly the original excuse given for the expedition has now been entirely abandoned. Who talks any more of a demonstration in aid of the Italians, or cares whether Kassala is evacuated or not?

Cholera has been a far deadlier foe than the Dervishes to the Anglo-Egyptian expedition up the Nile, and the account of the way in which the disease was faced and vanquished makes interesting reading for the laity as well as for the profession. In brief, the method followed was that of isolation, disinfection, sanitation. There was no pretence of establishing a quarantine. There could not be, as troops and transports had constantly to pass through infected districts in order that the preparations for advance might go on. Surgeon Gallwey, an experienced cholera-fighter, was put in charge, and at every camp where cholera broke out he would say, "We ought to be ashamed of ourselves if we cannot stamp it out in ten days." He was able to do so in nearly every case, though the men had often to be flogged or threatened with shooting to keep them from poisoning themselves with the germ-laden water of the Nile. Even at Wady Halfa, where a large civilian population of filthy habits, ignorant and superstitious, added to the difficulties of the situation, the epidemic, though more severe than elsewhere, was held in check and finally extinguished. Everywhere Gallwey Bey and his staff of English and Egyptian medical assistants went on the supposition that the cholera germ was a definite thing, taken into the system in definite ways, and with a definite period of incubation. This made the treatment definite and precise and successful. But there are doubtless thousands of people in New York who would be as ready now as they were in 1892 to regard a case or two of cholera on an incoming steamer as a thing to be shrieked over and fled before, instead of being calmly treated by the methods of rational medicine.

The Pope has at last decided, or his theologians have decided for him, that Anglican orders are absolutely invalid, and that there is nothing for it but a return to the Catholic fold. This is a somewhat amusing anti-climax to the huge row kicked up by the Nonconformists last June over Gladstone's letter on this subject to Cardinal Rampolla. They called it "a miserable trifling with Rome," but the result shows that Rome, for her part, is not at all to be trifled with. The Nonconformists, in fact, could have asked for nothing better than thus to have High Church pretensions stamped upon by the Higher Church. Many Anglican bosoms will doubtless be wrung at this dashing of their hopes; but the great mass of the English clergy will very likely say that, if the Pope does not approve of them, neither do they approve of *him*, and so that score is even.

A new Carlist agitation in Spain appears imminent. The Carlist Deputies walked out of the Cortes a few days ago, in indignation, real or pretended, at the vote extending railway charters and privileges, and on Monday their party published a manifesto. What these divine-right monarchists want, or say they want, is "administrative and economical decentralization," and they also propose that no official in Spain shall draw his salary until the soldiers in Cuba and the Philippines are paid. All this is certainly ominous. The Carlists have been very patient and loyal, ostentatiously saying that all home differences must be sunk in the face of the Cuban peril. Like the Spanish Republicans, they have professed to be willing to join forces with any Government in order to put down the Cuban rebellion. But they now seem to be losing both patience and hope. The chance to improve their political fortunes in this time of the country's troubles is too good to be forborne much longer. In Spain's multiplying embarrassments, a Carlist uprising might well prove to be the final push into chaos.

THE SECRET OF MONEY.

THERE is probably nothing stranger in the bimetallic and the silver movement than the fact that money has been from the beginning a human invention for human convenience, and never has been regulated, shaped, or directed by any government successfully. Since the use of cowries and wampum, money has been the creature of human desires and tastes, and all attempts to do anything with it but follow human inclinations about it have surely failed miserably. No attempts to make people use currency in some way they did not like, have succeeded, and no attempt to affix to gold and silver a value, positive or relative, that was not the market value, has succeeded either. All we know about currency we know from history. We can tell nothing about gold and silver except by seeing what men have done about it in times past. The way the human mind acts on media of exchange contains the whole science of money. "Gresham's law," so called, for instance, is no more "Gresham's law" than the law of gravitation is "Newton's law." What Gresham did was to observe the way in which the mind regarded two kinds of currency of unequal value and report it. He did not say whether it was good or bad, wise or foolish. He simply said it existed. When the Bullion Committee in England was set to discover why inconvertible paper and gold differed in value in 1810, what it found out was not anything in the nature of gold or the nature of paper, but the manner in which the minds of dealers regarded gold and paper; and it reported accordingly.

All treatises on currency or money, from the earliest days to our time, are of no value except to explain to us how the human mind acted on certain phenomena. All that economists and financiers have ever said about currency, which is of any value, is simply the record of what people have done about the standard of value. If a college professor is examining students about money, he asks: What happens if certain things occur in the money market or any other market, and how do you know? The only answer is: We know simply that such things have occurred already, under similar circumstances. All finance is, in short, history, and so is nearly all political economy. If any political economy is more than history, it is simply prophecy. Every government which has ever sought to impose a currency of some kind for its own purposes, has found that the people would have their own way by putting a discount on the Government money and having their own medium of exchange on which they made their calculations.

It is the same with the price of all commodities as with gold and silver. Things are cheap simply because people do not want them much; dear because they want them a good deal. They are not dear or cheap because some politician or dictator says they ought to be cheap or dear. In fact, cheapness and dearness, both of gold and silver and of everything else, are states of mind. They are not qualities or things. There was an attempt made in 1890 to persuade the people that things ought to be dear because dearness was "American," but it only produced ridicule. Dearness and cheapness remained dependent on human desires, not on national polity. No matter how holy a cause may be, it cannot raise prices one iota.

We are now witnessing, both here and in Europe, the first attempt ever made in the history of currency to provide people with money against their will, in virtue of superior wisdom. All other attempts made by governments to provide currency for the people against their will as manifested in prices, have resulted either from a desire to cheat or to provide revenue or to show their power. We have to-day in America, England, and Germany a large body of persons rarely engaged in business, or familiar with exchange, who have undertaken to get mankind to take a new departure and fix prices, not by human inclination, but by international agreement. This makes the silver and bimetallic movement something new in finance. They have determined that money should not any longer be the product of human tastes and desires, but the product of a treaty made by philosophers and statesmen. They are to furnish the nation, not with natural money, but with artificial money—that is, an entirely new kind of money, which will not depend on the cost of production and will have nothing to do with people's likes and dislikes. It will be thought out, so to speak, rather than issued or coined. Silver will be cheap, and gold will be dear, not because silver is plenty and gold is scarce, but because professors and economists can settle what gold and silver ought to cost. The quantity produced of either by labor will have nothing to do with the price at all. The price of either in relation to each other will be settled between a few dozen men, who will decide what price will be best for human happiness. They will meet in a room, and say one ounce of gold ought to cost sixteen ounces of silver, or it ought to cost forty, as may seem to be best. Human desires will have nothing to do with the matter.

This change in the mode of making money and settling prices will be something completely new in the history of the human race. It will be a complete revolution in human affairs. The standard of value will either be settled by a majority vote or by an agreement between plenipotentiaries. The members of Congress, or the diplomatists, will let the merchants and bankers and dealers who have things to sell, know how much they ought to get for their wares; and their minds will be kept in a state of equilibrium by statute. If they find themselves valuing gold too high, they will check their desires and moderate them to a wise proportion with silver, while if they find themselves placing too little value on silver, they will piously raise their estimate for it to the recognized and happy ratio of the philosophers. We do not believe any such revolution has been attempted in human affairs before. If successful, and the influence of human tastes and desires on prices can be destroyed, and conventional prices substituted therefor, four dimensions of space will at last have a chance.

LEGISLATION DE MINIMIS.

THE attention of Americans has frequently been called in recent years to the increasing floods of local legislation. They are whelming State legislatures and Congress alike, and are multiplying statute-books at a rate which will soon make a new Omar necessary to deliver us. From the successive "State Library Bulletins" published at Albany, with their comparative summaries of legislation in the several States, we have had an impressive annual hint as to the way the time and strength of our legislatures are wasted on minor local affairs. The present Governor of New Jersey was the first public officer in high authority to come out against the growing evil. By his open threat to use the veto on the petty back-yard bills, and by an actual use of it on many such measures, he succeeded in keeping down the mustard-seed laws in New Jersey to unwontedly small, if still too swollen, proportions.

But the plague is not one from which we alone suffer. All English-speaking nations and legislatures seem to be succumbing to it. The extent of its ravages across the seas may be seen from a glance at the "Review of the Legislation of the British Empire in 1895," published in the first number of the new *Journal of Comparative Legislation*. Here in summary form we have a classification of the acts not alone of the English Parliament, but of all the colonies from the least to the greatest. It is a comprehensive survey, from which perhaps the strongest impression one derives is that of the extraordinary demands made upon parliaments, both imperial and colonial, upon cabinets and councils, prime ministers and high commissioners and governors, by minor affairs that could be much better disposed of by a local administrator.

The very ratio between public and local bills is suggestive. The first session of the English Parliament in 1895 passed 44 acts which could be called general, but its local acts numbered 158. In the short second session the figures were 6 and 15, respectively. Specimens of the bills classified as "general" show over what miserable details the wits and time of the Commons are wasted. Thus there had to be much debate over the nice question whether laundries should be regarded as

factories. After long wrestling with the Market Gardeners' Compensation Act, it was triumphantly voted that the landlord's consent was not necessary in order to allow a tenant to set out a currant-bush. With such bills as these set down as measures of general public interest, it may be imagined what back-country and cross-roads affairs the laws conceded to be local really were.

The exact figures for the several colonies are not given; but the showing would doubtless be worse rather than better, as the Prime Minister in England has a more rigid control over legislation, and exercises it more relentlessly, than is the custom in colonial parliaments. At any rate, one look at the kind of thing which engaged the attention of the latter in 1895 is enough to make the proverb *De minimis non curat lex* appear ridiculous. Many necessary and useful bills were doubtless passed, but the swarm of acts straining at gnats and aiming at the impossible is simply prodigious. Take the mere matter of animal pests. Vermin seem fairly to crawl over this index of colonial legislation. South Australia amended its Vermin Act so as to impose penalties on corporations and districts "which are negligent in suppressing rabbits." Beetles had the floor in the Straits Settlements, and locusts buzzed about the ears of legislators in Natal. The registration of dogs took up the time of the New Zealand Solons, while rabbits and marsupials fairly revelled in the legislative halls of Tasmania, South Australia, and Queensland. Sierra Leone made a unique record in its ordinance against the Human Leopard Society.

A good example of the way in which laws expect executive officers to make omniscience their foible is furnished in the West Australian statute entitled the Engine Sparks Fire-Prevention Act. Among many other provisions it is ordered that every engine shall be equipped with a "spark-arrester," and that the pattern of it is to be determined "by the Governor in Council." Imagine the Governor in Council gravely passing on spark-arresters! What is really needed is an arrester of absurd and petty laws. Of like genus is the law making it the duty of magistrates in Fiji to determine whether a given man is "of confirmed intemperate habit," so as to be a "prohibited person" to whom it is a crime to sell liquor. But New Zealand has outstripped all other lands in audacity in its Institute of Journalists Act, whereby, under the authority of the Governor in Council, such monstrous undertakings as the following are to be lawful:

"Devising measures for testing the qualifications of candidates for admission to professional membership of the Institute [of Journalists] by examination on theory and in practice or by any other actual and practical tests."

"The ascertainment of the law and practice relating to all things connected with the journalistic profession, and the exercise of supervision over its members when engaged in journalistic duties."

We need not point out that where such things begin, liberty ends.

It is, of course, a powerful stream of political and legislative tendency in the Anglo-Saxon race which, in these latter days, thus spreads itself into so many ineffective tricklings in the sand. We want to leave nothing to the discretion of an executive officer. Everything must be down in black and white. We prefer to have the most complex and conflicting maze of laws, to be fought over in the courts, instead of a short and simple order to a local administrator to do the work required. In that way, we think, we guard ourselves against abuses of power and against that tyranny which is our inherited but unreasonable dread. What we most need to guard against now is the abuse of law, and the tyranny of a mass of statutes which no one can understand, which dissipates official responsibility and breaks down legislatures. What we need is, for example, to lay a mandate on a competent man, "Clean the streets of this city," without doing our best to tie his hands and spoil the work by making laws to fix the wages he must pay, to compel him to choose his assistants in certain ways, and by all the other statutory contrivances which leave us a fine degree of Anglo-Saxon liberty, but with it a lot of Turkish streets. There is clearly a call for reposing greater trust as well as exacting sharper responsibility in local administration of all sorts; and the work bids fair to be helped on by the growing absurdity of the other method which is strangling itself and us all in the endless meshes of red-tape legislation.

THE DYNAMITERS.

THE steady persistence of the new ministry in England in not doing the things which they said they would do if they got into power, and in doing the things which people thought they were sure not to do, is among the remarkable phenomena of recent English politics. One of the things of all things which they were considered sure not to do, was to let the Irish dynamiters out of jail. During the last year or two of Mr. Gladstone's administration, in fact, hostility to everybody and everything Irish was "the thing" in English circles of the Tory class. The principal reason for not conceding home rule was the badness of the Irish. They were all dynamiters or sympathizers with dynamite, and one of the horrors and disgraces of the Gladstonian régime was that Gladstonian ministers deigned to consult with and be on friendly terms with the Irish members. Indeed, the reason given by Mr. Macdonald of the *Times* for believing that Pigott's Parnell letters were genuine, that "they were just the kind of letters Parnell would write," was a fair expression of the mental condition of the whole Tory party about the whole Irish party. Mr. Balfour rose into fame by treating its members of Parliament as common criminals and puting them into prison dress, and dogging their footsteps with spies, and getting a priest indicted for murder because a policeman was killed by a mob who were resisting the priest's arrest; and by making himself the foremost apostle of the doctrine that nothing but coercion would maintain order in Ireland.

No sooner had the Tories got into office, however, than their tune was changed. The new Irish Secretary, Mr. Balfour's brother, was as sweet and conciliatory towards the Irish as Mr. John Morley. Light railways and an amended land act were substituted for jails, and the Irish began to be consulted and complimented, and their amendments accepted. The climax was reached when Mr. Chamberlain, on getting over here, loudly advertised the ability of the much-abused "Tim" Healy. But there was one thing which it was thought they could not possibly do, and that was release the Irish dynamiters. They might pass acts which they had denounced as "immoral" and robbery when they were framed by the Gladstonians, but for the dynamiters there was no hope. When an application for their release was made to Mr. Asquith, and he firmly refused it, the applause was louder on the Tory benches than on the Liberal. It showed that there was still some decency left, it was said, among the Liberals—that Mr. Asquith was not as bad as the rest of them.

Well, having got into power, they have done this accursed thing themselves. The Irish dynamiters have been set free by the Tory Home Secretary. They were not set free, however, until Parliament was on the point of adjourning, when inquiry and explanation were impossible. When Sir Mathew White Ridley is privately asked the cause of this step, he says it is the result of a medical report on the health of the prisoners, but he does not publish the report. The newspapers of all parties have wondered and surmised over the matter for a fortnight, but no light has appeared for some time. It is extraordinary, unaccountable, says the Marquis of Londonderry, a firm supporter and admirer of the Government. He cannot understand it. The time at which it occurred was most mysterious. He delights in the Conservative Government, and did his best to bring it into power, but this is really too much, he says. Other influential members of the Tory party flout equally at Sir Mathew White Ridley's explanation. It is absurd.

According to the latest accounts, the murder is now out. Four notorious but very drunken Irish dynamiters, including Tynan, or "No. 1," have been arrested with a full line of bombs, explosives, infernal machines, and incriminating documents. They explained their plans openly in the various hotels where they stopped, when they were "full"—and they were generally "full," their expenditure on alcoholic drinks in one place being not

less than $10 per day. Their plan was to hire a house opposite St. James's and Buckingham Palaces and dig a tunnel under the street; then, when the Czar and Czarina of Russia were there on a visit, to blow up these two sovereigns, together with the Queen and all the royal family. They were just about to begin their hellish labors when they were arrested. Their plan was either "a gigantic plot" or "a foul mission." It was instigated partly by the Clan-na-Gael, partly by the Anarchists, and partly by the Nihilists.

We now see why the Irish dynamiters were released. It has been alleged, for want of any better reason, that they have been liberated because one of them had given information which led to the arrest of Tynan and the others; and in order not to "give him away," by releasing him alone, the other three were allowed to go out with him. This unfortunately leaves us in some bewilderment as to the management of the prison in which the dynamiters were confined. These worthies were convicted in 1883, and under published rules are kept in close confinement, and can receive and write only letters which are read by the wardens. They might tell the jail authorities what kind of man Tynan and his associates are, but they could have known that he was going to blow up the royal family and the Czar and Czarina of Russia, about this time, only by means of frequent communication with him. So that if they have been able to give the information that led to his arrest, they must have heard from him recently. If all this be correct, it is a curious revelation about the state of prison discipline. Who knows but Mr. Asquith was keeping hold of the dynamiters to supply him with news about Tynan, and that Tynan was warned not to blow up any palace till the Tories got into power?

ENGLAND AND RUSSIA.

THERE seems to be a general agreement in England that the chief reason why the Powers refuse to join in action against the Porte, is jealousy of Great Britain, probably stimulated by her occupation of Egypt. Russia appears more than any other Power to be an obstacle to any sort of union, but Germany is not far behind. Her reluctance to move is probably a tradition of Bismarck's policy in 1877, when he said he was not willing to risk a single Pomeranian grenadier on behalf of the Bulgarians. The whole situation is so clearly a consequence of past British policy that it might almost form the subject of a course of college lectures. For sixty years—in fact, one might almost say, ever since the battle of Waterloo—Russia has been treated as the one historic enemy of Great Britain. She took the place of France, almost immediately after the peace of 1815, as the Power whom true-born Britons were bound to hate and suspect, and down to the Crimean war and the Indian mutiny the British press teemed with exposures of her designs on British India.

Men like Sir Henry Rawlinson made a specialty of this subject, and hundreds of maps showed the way in which she was to pass the mountains and rouse the Hindus. As she advanced in the East, the alarm gradually grew greater, and reached its maximum after her subjugation of the Central Asian principalities. This subjugation was really a very marked gain for British India, for it is always a gain for any community to have civilized instead of barbarous neighbors. But, strange to say, so far was the British public from taking this view that, almost ever since 1820, the time and money which should, one would think, have been spent in making friends with Russia, and seeing that, if she ever did become a neighbor, she should be a good one, have been spent in bullying or cajoling Afghanistan so as to make her hostile to Russia, and thus interpose what is called a "buffer" between the two great Powers. The Afghan war of 1839–42 was undoubtedly undertaken for this purpose, and so was the still more discreditable one set on foot by Beaconsfield and Salisbury in 1878. The Crimean war was, in like manner, fought to make Turkey a "buffer." In fact, during the greater part of this century, nearly all the arts of war and peace have been employed to make and keep Russia an enemy of England, and her immense services to civilization in extending her frontier to the east have been constantly held up to odium, as advances towards India for the purpose of invasion and conquest—an idea the preposterousness of which is only now beginning to be faintly recognized.

At the present moment we are witnessing one of the results of half a century of carefully cultivated hatred and distrust. The proposal of the late Emperor Nicholas, in 1852, to treat Turkey as "a sick man," and take charge of his effects by agreement with England—one of the sanest state papers of this century—would, as we now see, have been an incalculable benefit to mankind. It was peremptorily rejected, and treated as a proof of Nicholas's depravity, and an alliance against him was promptly entered into with one of the paltriest of adventurers. A hundred thousand lives were sacrificed in the Crimean war, a thousand million dollars spent in behalf of the monstrous and inhuman despotism called the Porte. In twenty years not a vestige of its results remained, and the Porte had gone steadily down hill in the interval. Once more, in 1878, England armed to save Turkey, and Lord Salisbury brought back from Berlin a bundle of lies and deceptions as to what he and Disraeli had done to secure reform in Turkey. He has confessed within a year that the whole thing was an elaborate delusion; that not only have no reforms been made in Turkey, but that the Sultan may massacre all Christian subjects for anything Great Britain can do to prevent him.

Is it wonderful that, after this, Russia refuses to join England in disciplining her former protégé? She can well say: "Forty years ago I saw what Turkey was, as well as you now see it. I asked you in a friendly spirit to join me peaceably in removing this terrible stain on our civilization against which Europe had vainly fought for four centuries. You refused me with vituperation, made war on me, destroyed my fleet and arsenals, and removed me from one of my own seas. Twenty years ago the Sultan began massacring again. You discovered the horrors in Bulgaria, but you did nothing to stop them but write newspaper articles. I interfered. I fought the Turk and brought him to his knees, and my bugles were heard in his palace. You again interfered, not to fight him, but to fight me. You brought troops from India, and allowed your Jewish adventurer to fill the air with blatherskite about both me and Turkey. You are now roused by the Sultan's massacres again, and want me to help you to stop them. I shall not do so. I have had enough of your coöperation. You have posed for half a century as the great friend of the Turkish Christians. Now work out the problem yourselves."

If the Czar uses this language when he is in England, no one will venture to say that facts do not justify him. To ask him to help now to make Turkey humane and establish peace within its borders, requires more assurance than any British diplomatist has shown within the present century. We must only hope that personal intercourse with the Queen and with British statesmen and Christians may help to soften his heart and make him forgive the past. If any professor or lecturer wishes to point the moral of Washington's solemn warning against cultivating any international hates, and against allowing our own selfish interests to dominate our foreign policy, he will find nothing better than the history of the relations of England and Russia during the past seventy years.

THE AMHERST ECLIPSE EXPEDITION IN JAPAN.—III.

ESASHI, KITAMI, HOKKAIDO,
August 10, 1896.

THE quiet sound of rhythmic surf from the Sea of Okhotsk, beating upon the sand and rocks of Kitami coast, comes this evening through the little sliding window beside me, where a semicircle of faces is gathered against the dark background of the street. The faces, always indicative of interest and curiosity, but unfailingly amiable and friendly, are quite as much a part of this remote region as the surf itself, and no more intrusive. Ever since the arrival of the expedition, the kindly inhabitants of the town have done everything in their power to facilitate the work of setting up instruments and establishing the station as conveniently as possible,

The "chief officer" immediately placed the school-house—just vacated for a new one—at the disposal of Prof. Todd and his assistants; and one of the leading citizens, who spends half the year here as his summer resort from Hakodate, lent a large piece of land adjoining for the tents and portable house covering the apparatus. Other favors from officials of the region followed rapidly, and when the less scientific members of the *Coronet* party caught the expedition, after a curious and interesting journey along the Yezo coast, it was found to be in fine condition for the eclipse, and with a fair prospect for clear skies on the eventful 9th of August.

From July 10 until August 5 there had been ten perfectly clear afternoons and four only partially shaded. The Hokkaido, in its northern portions, offers a better chance for cloud less skies than the main island, but along its southern coast fogs prevail almost constantly. Reference has been made before to the excellent pamphlet issued by the Central Meteorological Observatory, giving the observations at this season for three years past at all available eclipse locations. From a careful summing up of all results, Esashi, on the northern coast, showed a larger proportion of clear skies than any other, and accordingly Prof. Todd selected it, as did also the French expedition and that sent by the Imperial University at Tokyo; while the Lick Observatory party, under Prof. Schaeberle, and the English expedition, in charge of the Astronomer Royal, Mr. W. H. M. Christie, with his assistants, Prof. Turner and Capt. Hills, R. E., chose Akkeshi, on the southeastern coast, as their location. There were thus five fully equipped expeditions in the Hokkaido, awaiting the moon's shadow to reveal glories and scientific truths perhaps hitherto unknown.

Prof. Terao, in charge of the Tokyo mission, the official party of the Japanese Government, established his camp about half a mile south of the little town and back a short distance from the beach, where the wreck of a small steamer lying in the sand gives a picturesque accent to the scenery. He was well prepared to accomplish excellent photographic work, among his instruments being an especially fine photographic doublet of eight inches aperture, by the well known optician Brashear of Allegheny. It was constructed for this eclipse, and arrived only a few days before, having been delayed by the difficulty in obtaining the finest quality of glass from Germany needed for the lenses.

The French party, under Prof. Deslandres of the Paris Observatory, was established near the western end of the town, in a large open square of land, where the various tents and houses, the brick piers and large instruments, made almost a little village in themselves. The outfit was very elaborate, and was intended quite exclusively for work in spectroscopy, the specialty of this celebrated astronomical physicist, who has added to the fame of the already famous Paris Observatory by his successful and brilliant work in physical research, in photographing the solar prominences without an eclipse (the same line of work as that pursued by Prof. Hale of Chicago), and by his discovery of the rotation of the corona with the sun at the Senegal eclipse of April 16, 1893. Assisting Prof. Deslandres are the brothers F. and J. Mittau and M. Millochau. The French man-of-war *Alger* brought these gentlemen to Esashi from Yokohama, and very valuable coöperation was given by its officers, Capt. Boutet, commanding, Capt. Le Bouleur de Courlou (who had charge of the six-inch telescope, and also of observing the four contacts), Capt. Hurbin and Midshipman Dumas in charge of the photometers and thermo-electric instruments. These gentlemen were assisted by a detachment of sailors from the *Alger*, and their presence quite revolutionized life in the quiet little town. Prof. Deslandres's outfit is probably the most elaborate and complete battery of spectroscopic instruments ever brought to bear on an eclipse by any single expedition Also, appliances were not omitted for pictorial photography of the corona.

The preparation of the Amherst expedition has been already alluded to, with its automatic arrangements whereby electricity is made to do the work of many observers, in exposing and covering plates, removing them from the photographic field, and inserting fresh ones, thus extending almost indefinitely the precious two or three minutes of totality, rich with its tantalizing stores of coronal wealth. Fastened upon one great central axis, made to follow the sun by an ingenious glycerine clock, were the Lyman twelve-inch reflector from the Amherst observatory, the Draper fifteen-inch reflector from Harvard, an Edgecomb eight-and-one-half inch reflector, numerous object glasses by Alvan Clark & Sons, the largest of which are a ten-inch lens lent by Harvard and one of seven and a quarter by Amherst, a six-inch objective made by Schroeder of Hamburg, and a great variety of photographic doublets. In addition were polariscopes arranged and lent by Dr. Wright of the Sloane Laboratory of Yale University, two spectroscopes from Harvard Observatory and the Massachusetts Institute of Technology, and a wheel photometer for measuring the variation of the intensity in the total light of the corona.

All this apparatus was individually connected with the electric commutator (invented by Prof. Todd and made for this eclipse), a slowly revolving copper cylinder full of pins, each of which represented a certain movement of one particular instrument at a given fraction of a second. The whole thing, most complicated to have invented and thought out in all its practical working, but absolutely simple in manipulation, was set up and adjusted in time, and its working was perfect: at a touch of the electric key, plates came into place, were exposed, covered, and passed out, and new ones brought up for exposure, all with the precision of a machine. Thus was demonstrated the practicability of applying an unlimited amount of apparatus, automatically, to the various and fertile problems of eclipse research. It is possible, with the arrangement now perfected, to take between four and five hundred pictures of the corona in two minutes and a half; and that without having to depend upon the fluctuations in the nervous systems of a crowd of observers, many of whom (it is to be hoped in justice to their sense of the sublime in nature) might frequently be so affected by the spectacular part of an eclipse that their routine work would be injured.

The chances for a clear sky in Esashi at this season were a little more than half, at Akkeshi slightly less, and the heavens were closely interrogated during all the weeks while the expedition prepared for the eclipse. As the day drew near, sunshine and rain alternated in ways to try the soul of any but the most calmly scientific human being. If one retired to rest remembering a just past gorgeous sunset, he would probably be awakened in the morning by a heavy shower on the shingled roof of the old school-house. That roof, however, is the usual promenade of the multitudinous crows of the region, who rise at unknown hours, and begin the day's exercise vigorously before dawn, so that always showers or crows were at hand to rouse the unwary. If the forenoon was thickly clouded, a radiant afternoon often followed; and sparkling early mornings often merged themselves into a thickening sky by the eclipse-hour, about two o'clock. Thus hope and despair alternately possessed the present onlooker, although the chief astronomer kept calmly at work, showing no sign that nature's moods were undermining his nerves. He had no time to study the state of the western horizon, and the vagaries of the wind, and the prevailing drift of cirrus or cumulus. And so the hours grew fewer before the 9th, and Friday and Saturday, the 7th and 8th, brought heavy rains; but the sunset of Saturday night was a superb rose and gold and salmon glory, and a group of the leading officers and citizens came in to congratulate us upon the fine prospect for the morrow. The fishermen of the town sent their compliments by these gentlemen, and their opinion that the eclipse would show in a clear sky. These interested and simple hearted friends said they had refrained from calling during the two days' rain, as they so feared it might continue that they could not bear to see us and all the fine instruments, but now they gladly came under the present happy circumstances. One of them reported his visit to a shrine that day, to learn from the oracle the probable state of the coming day, and the reply was, "Be careful." This he interpreted to mean that the morning might be cloudy, and we, thinking observation hopeless, would not get all things ready. Then at the critical moment clear sky would appear, and we should be unprepared. Hence the warning to be on our guard.

Sunday morning saw an early shower, and a later clearing; another shower, and a clear blue western sky; a drifting gray scud from the south, and brief sunshine—altogether an unpromising sort of day, with possibilities of breaks through cloud all the time. The first contact could not be accurately observed, but, shortly after, the clouds became very thin, and with smoked glass the sun showed its bitten side distinctly, but ill defined through cloud. Most of the population of the town seemed to be congregated along the fence around our enclosure, looking with far more interest at us and the instruments than at the sun and the darkening landscape. Just before totality, which occurred about two minutes after three, local time, I went to my appointed station for drawing the corona, at the top of a small lighthouse standing in the grounds of a little temple just above the rocks of the shore—a most picturesque vantage-ground for a spectacle beyond anything that it has ever been my fortune to witness. The sea grew leaden in color, the sky desolately sombre. The crows pretended indifference, but soon succumbed and flew off to the thick pine forests on the mountain sides with heavy haste. The *Alger* grew dimmer and grayer, the sampans and junks became almost one mass of equal colorlessness, and the grass and verdure suddenly grew strangely, vividly yellow-green. It was a moment of appalling suspense: something was being waited for—the air was portentous. Then, with a leap, as it seemed, deep darkness came over the world, and with an indescribable outflashing at the same second the corona burst forth in a heavenly radiance. But dimly seen through thin

cloud, it was nevertheless beautiful beyond description, a celestial flame from an unimaginable heaven. Simultaneously the whole northwestern sky far up toward the zenith was instantly flooded with a lurid and startlingly brilliant orange, the clouds drifting across it slightly darker in shade, while the west and southwest gleamed in shining lemon yellow. It was not like a sunset; it was too sombre, too terrible. The sea was dark, the horizon indistinguishable.

One human being seemed so small, so helpless, so slight a part of all the mystery and weirdness! It was as if the hand of Deity were visibly laid upon space and worlds, and had allowed a momentary glimpse into the awfulness of creation. It might have been hours—time seemed annihilated—and yet when the tiniest possible globule of sunlight, like a drop or a pinhole, appeared, that fair corona and all the color in sky and cloud withdrew, the stormy twilight aspect of entire naturalness returned, and then the two minutes and a half in memory seemed but a few seconds.

All fine detail of the corona was necessarily lost in the thick sky. A few photographs were taken of a corona which must have been unusually brilliant to show so distinctly even through cloud, and it was noticeably flattened at the poles of the sun and extended at its equator, thus indicating to the scientific observer new and extended lines of research for the eclipse of the future. Just after totality a message came from Akkeshi: "Heavy fog. Nothing done." Nature knows how to be cruel—or is it simply indifference? But until man learns to circumvent clouds in his search after the unknown, I shall still feel that she keeps the advantage.

The sound of the surf has grown louder, the street noises less; the circle of faces has disappeared, and the man going about the town beating two sticks to announce his faithfulness on watch has just passed by. The eclipse is over; but the Ainu we still have with us—that mysterious nation retreating more and more into the remote interior, and constantly decreasing in numbers. The world is very interesting; and the heavens remain.

MABEL LOOMIS TODD.

THE ROMANS IN AFRICA.

PARIS, September 9, 1896.

M. GASTON BOISSIER, who has for a twelvemonth past held the important office of Perpetual Secretary of the French Academy, is considered our best Latinist. He has for many years devoted himself to the study of the Latin literature, and among his most important writings I will cite a volume on 'Cicero and his Friends,' two volumes on 'The Roman Religion from Augustus to the Antonines,' two volumes on 'The End of Paganism,' and a volume on 'The Opposition under the Cæsars.' M. Gaston Boissier never forgets his familiar subject, even when travelling; and he is to me particularly interesting when he travels and takes such notes as are found in his 'Archæological Rambles.' Rome and Pompeii have furnished him a most interesting field; he has followed the footsteps of Horace and Virgil in his 'New Archæological Rambles,' and recently he has gone as far afield as Algeria and Tunis, publishing on his return a volume, full of interest, on 'Roman Africa.' It is, I repeat, refreshing for me to travel with M. Gaston Boissier; I learn something from his works, while the sensational volumes of travel which are written now in such abundance are merely descriptions, in which the author generally contents himself with inundating his substantives with adjectives, as a landscape painter might dash color upon color. It is impossible for the writer to compete with the painter, or even with the photographer; this seems, however, the sole object of most of our modern writers.

M. Boissier's method is quite different. He does not pretend to give us sensations, he gives us ideas; he improves our knowledge while improving his own, and adds to the treasures of his memory what can be gained by direct contact with facts, even with ruins. It has seemed to him that, in order to judge aright of the possibilities of the future of our French Africa, it would not be unimportant to know accurately what the past of Roman Africa has to teach us.

"We are not," says he, "the first who came from the realms of the north to establish themselves; we have had, in this land, illustrious predecessors who conquered it, as we have done, and who governed it with glory for several centuries. They met nearly the same difficulties which we have met; they overcame the same resistance of nature, the same opposition of warlike races which occupied the ground and did not wish to share it with anybody."

When the Romans established themselves in Africa, they had chiefly to deal with their old enemies, the Carthaginians, just as the French, in the first period of their conquest, saw only Arabs everywhere. But in reality the Carthaginians were but a small part of the population of Africa; they lived in the great cities, in the seaports. Sallust is the first writer who mentions other peoples who had nothing in common with the Punic race. Cæsar had given to him the province of Numidia; his ethnography of Africa is probably derived from some Greek fables—it has no scientific value. We will note only how much he was struck with the diversity of races in his province. Nothing so much impressed M. Gaston Boissier as this same diversity, particularly one day in the great market of Souk-Ahras.

"In the great square of this little town, the natives were coming from all sides, some on foot, others on horseback, on donkeys, or on camels. It was a pleasure to see them looking for each other in this crowd, recognizing each other, shaking hands with each other, embracing each other with shrieks of joy. There were people of all sizes, all forms, all colors. From the jet black of the negroes of the Sudan to the dull white of the Arabs living in the great tents, you could see every shade which the human skin can show. What astonished me more than anything while I was looking at this crowd was to find under the *chechia* so many faces which I thought I recognized. I noticed at every step short men, with blue eyes, with fair or red hair, a broad face, a smiling mouth, which recalled to me the peasants of our villages. 'Take a djemâa of Kabyles,' says M. de la Blanchère in his 'Student's Journey in a Part of the Cæsarian Mauritania,' 'take off the burnous, put on all these men our blouses or coats, and you will have a municipal council composed of French peasants.'"

We thought for a long time after the conquest that the inhabitants all spoke the Arabic language, and it is the only language which our officers or functionaries still use in their dealings with them; but we found out that there is another, which the inhabitants use in their familiar dealings. It is not, as was at first supposed, a mixture of the local idioms of various provinces or races; it is a true language, with its proper rules. This language is used in Kabylia, and also in the villages of the Aurès, among the wild Touaregs and the tribes of Marocco. It is the universal speech throughout the Sahara, on the banks of the Niger, and as far as the Senegal. This very ancient people, having its peculiar language, known to the Romans under the name of Numidians, to the Arabs under the name of Berbers, divided into an immense number of jealous and often inimical tribes, is now what it was in the time of Jugurtha. The form of government is of the simplest kind. The djemâa of the Kabyles is the most elementary organization; it needs no tribunals, no police, no magistrates. The villages have an independent existence; few chieftains have been able to form powerful aggregations, and these have never had a long existence.

Towards the end of the war with Hannibal there were, however, two Berber kingdoms—the kingdom of Syphax, who had for his capital Cirta (now Constantine), and the kingdom of Gala. These two kings were rivals. Masinissa was the son of Gala, and Corneille's drama "Sophonisbe" has given a sort of immortality to the struggles of these two houses. Cirta changed its name under Constantine. Its situation is very striking: "There is the high, inaccessible mountain, which these little kings could choose in order to put their treasures and their lives in safety." The French troops, under the best of leaders, had to make great efforts in order to take Constantine; its assault was made the subject of one of those vivid pictures by Horace Vernet which are to be seen in the château of Versailles. The palace of Syphax was probably at the highest part of the city, called the Kasba; and there probably took place, when Masinissa gained possession of it, the scene which remained famous in antiquity (it is found on one of the few frescoes at Pompeii), and which has twice been put on the stage. At the gate of the palace of his enemy the Berber king found Sophonisba, daughter of Asdrubal, who had determined Syphax to side with Carthage against the Romans. She fell on her knees and begged Masinissa not to let her fall alive into the hands of the Romans. She was young and handsome, says Livy; at sight of her Masinissa felt something more than pity, and, in order to save her, he married her the same day, thinking that the Romans would not dare to lay their hands on his wife. He little knew them. Scipio ordered Masinissa to give up Sophonisba. Not daring to disobey, and unwilling to put her in the hands of the Romans, Masinissa sent her some poison, and the brave Numidian drank it. Masinissa was rewarded with the title of king; he was treated with the same honors as a consul; he was allowed to take all the territory he could seize from the Carthaginians. Boissier tells us that he freely used this permission, and for fifty years continued his incursions into the land of Carthage. "At the age of eighty-eight he still rode without a saddle, and made war, during the fine season, under the very walls of Carthage. The rest of the time he lived in his seraglio at Cirta, in the midst of a large family which trembled before him. He died at ninety, having never been ill."

The long reign of Masinissa was a period of great prosperity for Numidia; after him, the Romans were obliged to meddle more and more in the affairs of Africa. The history of their long war against Jugurtha has been told by Sallust. This great writer was more occupied with Rome than with Africa; he had his eyes fixed on the Forum and the Senate. He does not indulge in picturesque descriptions,

but his descriptions are absolutely exact. The army of Jugurtha reminds us of the army of Abd el Kader; he too had his regulars, and his contingents or *goums*, furnished by many tribes and vanishing after a defeat. The Roman army had to proceed very much as did the French army in our time.

Carthage was the work of the Phœnicians, who were foreigners of the Semitic race; like the Jews, addicted to commerce more than to agriculture. In what he says of the Phœnicians M. Boissier follows the writers who in our day have made us acquainted with the wonderful city, the Venice of the old world, which kept for some time the fortunes of Rome in the balance. He has traced in Tunis the remains of the city, which was twice completely destroyed. In the modern Tunis you find at every step fragments of marble which must have belonged to the ancient queen of the Mediterranean Sea. A map shows us what has been found of the ruins of old Carthage. King Louis Philippe had a little chapel built, by permission of the Bey of Tunis, in memory of St. Louis, on the rocky elevation called Byrsa, and it fortunately happens that the present almoner of the chapel, the Abbé Delattre, is an ardent archæologist, and is making new discoveries every day. M. Gaston Boissier goes somewhat out of his way to enter into a long analysis of the second book of the 'Æneid,' and in trying to discover Virgil's reasons for making his Dido and Æneas what they are in his immortal poem. I prefer what he has to say when he is on the solid ground of history, and tells us, for instance, how Carthage was taken by the younger Scipio.

M. Boissier touches almost on a modern subject in exhibiting the timid policy of Rome in Africa after the downfall of Carthage, the system of a restricted occupation and a mere protectorate giving way by degrees to the system of direct government and administration. The Romans at first thought it best to establish in their dependencies some king or chief belonging to an ancient race and to govern under his authority. They found out after a while that these dependent monarchies are useless when they are weak, and, if they become strong, they are tempted to make themselves independent. After a while they divided their African possessions into two parts, *Africa vetus*, which became an imperial province, and *Africa nova*, which received not legates, but mere intendants, who had only the command of auxiliary troops levied among the barbarous tribes.

The abundance of ruins in Africa proves what degree of prosperity the conquered provinces had attained. M. Boissier does not attempt to describe all the Roman cities which are known by their ruins. *Ab uno disce omnes;* he chooses Timgad, not on account of its importance, for it does not seem to have played any great part, but in order to show how the Romans took, so to speak, Rome everywhere, just as the English take all over the world their habits and their sports. Each town had its arch of triumph, its forum, its statues, its basilica, its altars, its curia, its tribune. M. Boissier carefully describes the architectural remains of Timgad, following a magnificent publication based upon the researches of a distinguished architect, M. Duthoit. Each Roman town had also its waterworks, its aqueducts, its theatre. M. Boissier describes further the great villas which were built in the country by the Romans; he has very interesting details on the villa of Pompeianus, its stables and baths. His volume will be found very instructive on the subject of the long occupation of Africa by Rome, as well as on the history of African Latin literature, which ends his excellent volume and deals chiefly with the works of Apuleius and Petronius.

Correspondence.

MR BRYAN AT ASHEVILLE.

To the Editor of The Nation:

Sir: This charming little place is situated in the County of Buncombe and formerly used to be called Buncombe Town. The historical phrase of "talking for Buncombe" originated with a former member of Congress from this district, who, when advocating in a long, tedious speech for the benefit of his constituents some measure that had no chance of passing, and upon being urged by his colleagues to stop, answered: "Hush! I am not talking for this bill; I am talking for Buncombe."

However, whether this tradition be true or not, I found, upon my arrival here, a few days ago, posters all over town, and on roadways leading to it, that Mr. Bryan would address this constituency on the 16th, at 3 P. M.; and I found the excitement among the townspeople running pretty high in expectancy of this great event. The early morning hours yesterday already showed that the sturdy farmers and tar-gatherers of the surrounding country had caught the excitement. A forenoon walk showed all the shady places in the woods, in and surrounding the city, filled with farmers' teams, the mules and horses tethered to the wagons and given over to an unquestionably welcome lazy day of munching fodder and corn. Thus, both man and beast had, thanks to Mr. Bryan, a day of lark and festive enjoyment, not to forget the shopkeepers, who reaped a rich harvest. Yes, a lark it seemed to be. The Court House square and the few leading streets of the town were filled with a surging mass of country people of the plainest sort, well-behaved, good natured, good-spirited, kind, and sober. This is a silver town, though, as I understand, not a Tillman town, and Bryan buttons, Bryan flags, hacks and teams carrying the stars and stripes with Bryan devices, and bicyclers with their wheels encircled with the national colors, abounded.

Mr. Bryan arrived, according to programme, at two P M., was escorted by the committee to the beautiful Battery Park Hotel, and, after dining and resting for a while, was taken to the stand prepared for him, in a carriage drawn by four white horses, preceded and followed by an extempore bodyguard of about a hundred citizens on horseback, caparisoned with bunting. Their advance guard made Mr. Bryan, and their followers made his followers, swallow the dust; Mr. Bryan's white cravat showing the worse for it when he ascended the stand.

The view of the crowd was picturesque in the extreme. The stand had been erected facing a green slope, on which the audience were seated on the grass in a wide hemicircle, giving to the whole an amphitheatric appearance, to which the gay colors worn by the listeners (over half of whom were of the non-voting sex, of all classes and conditions), the shifting lights and the green background, lent additional charm. Back of and at each side of the stand were several hundred vehicles, from the smart turn-out of the summer visitor down to the one-mule team of the cabin darky. Mr. Bryan managed to address them from all sides of the compass, though mainly facing the amphitheatre, as, when making a telling point, he wheeled completely around between commencement and ending of the sentence—a forensic trick which I have seen only Thomas H. Benton make in my young days.

I had never seen Bryan, and was much disappointed at his appearance and cast of features, so far as one reads character and intellect in them. He was dressed in conventional black with a white neck-tie, both considerably bedusted, and looked to me the typical Western country lawyer or preacher, such as I have seen in hundreds, with the heavy jaw, broad chin, and strong mouth. His forehead is good, but does not bespeak great intellectual qualities; his hair is bushy, black; his ears large. He looked not young, certainly older than his age; his complexion was sallow and his eyes dull. His voice, though carrying far, was husky and grating, and gave evident signs that his larynx was revolting against the abuse to which he was subjecting it. As he ascended the stand a countryman standing next to me said: "Why, he looks like a hard-shell Baptist minister."

Of his address little can be said. It seemed to me that I had read it all, *ad nauseam*, in the reports of his other railway-platform harangues. Only, the demagogue came to the surface stronger when heard speaking by mouth than when read in print. He confined his remarks exclusively to silver—not a word about anything else. This being a farming and not an industrial community, he left out the usual tirades against the rich and in behalf of the downtrodden who were forced, against their will, to accept good, sound gold for their labor and product. He denounced Mr. Carlisle in unmeasured and, in my judgment, improper and ungentlemanly terms. He pronounced this government to be one "of the syndicate, by the syndicate, and for the syndicate." He said that many poems had been written about silver and about gold, but that only one poem could be written about the Government syndicate, and that would be one in which the only possible rhyme to syndicate that he could think of was "hate." Such stuff he rolled off by the yard.

His delivery is good. He never falters for a word. His gestures are peculiar, and more adapted to the pulpit than to the forum. He throws out both arms parallel to each other, at right angles to the body, or above his head, rarely moving one hand singly, and, when coming to a climax, lifts himself up on his toes, and comes down with a thump at the last word of the sentence. His features do not speak, his eye is lustreless, but his delivery gives the impression of concentrated and sinister power. The genial smile of which newspapers speak was not to be seen; perhaps he was, as he looked, tired and worn out. Grace, ease, and dignity were wanting *in modo*, truthfulness, patriotism, erudition, and candor *in re*.

I cannot close this letter without again expressing satisfaction at the good behavior, the good nature, and, according to its lights, the intelligence of the audience, most of them farmers and rough tillers of the soil. There was great yelling and hurrahing as Mr. Bryan's points came out, most of it upon a signal from one of the three chairmen who occupied the stand with Mr. Bryan, and who applauded almost continuously; but the side remarks and loud interpellations were many and not bad. There was no drunkenness or impropriety of any sort. It is pleasant to feel that

these sturdy and honest people, open as they are to error to-day, will be just as open to truth when it assuredly will, sooner or later, dawn upon them. W. T.

ASHEVILLE, N. C.

GREENBACKS AND DEPRECIATION.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to a statement in a little pamphlet entitled 'Points for Thinkers,' published by the Nonconformist Publishing Co., Indianapolis, as follows:

"The first greenbacks issued in 1862, to the amount of $60,000,000, never did depreciate a cent. They were always on a par with gold, and were receivable for interest on the public debt and duties on imports."

Will you kindly inform me through your paper, if space permits, giving facts concerning the issue referred to, and oblige

C. A. R.

TOLEDO, September 10.

[The statement quoted contains one half-truth and one whole falsehood. The "old demand notes," as the greenbacks referred to were habitually called, could not of course depreciate, as compared with other legal-tender notes, so long as the old notes were receivable for interest and public dues while the new notes were not. As compared with gold, however, they did depreciate. On February 29, 1862, gold sold at 102¼; the old demand notes at 100⅛. On May 12, the price of gold was 103½; of the demand notes, 100½. Later in 1862, the difference in premium between gold and the demand notes ranged from 4 to 7 per cent. In other words, they did from the first depreciate as compared with gold, and they were never at par with gold.—ED. NATION.]

CONSERVATISM IN VIRGINIA.

TO THE EDITOR OF THE NATION:

SIR: Upon a recent visit to a part of Virginia where I have spent my holidays, whenever possible, for half a century, I came upon a state of affairs well calculated to provoke belief in the announcement of the colored Richmond clergyman a few years ago that "the sun do move." Walking in the garden with my host, I was struck by the distinct enunciation of my name from the lips of a coal black negro boy who "bade me the time of day" as we passed where he was pulling up weeds. Suggesting that his improved power of pronunciation was due to attendance at the public school, I was told that it was, and, further, that the principal of the colored public school was a well-educated young negro man of excellent character, who was also superintendent of the colored Episcopal Sunday-school in the neighborhood. The location and condition of this Sunday-school were my discovery, and I will try to describe both.

At the edge of the village stands an Episcopal church, built some seventy years ago, upon nearly every one of whose stained glass windows are engraved names well known in the annals of colonial Virginia. Half a mile away, and separated by what was once a park filled with noble oaks and a broad expanse of green lawn, stands "The Hall," its solid walls and fluted columns showing white and still and strong under the burning August sun, as they have done for more than a century, without a symptom of decay, the fit emblem and abode of conservatism. Its builder a hundred years ago owned some ten square miles of land around it, much the larger part of which still belongs to his descendants, who constitute the greater part of the present congregation of the church, and to whom it came by inheritance and not by purchase.

The lands being fertile to a degree, and the race of people a sturdy one, natural subdivision, even assisted by destructive war, has failed to substitute for the old, refined society of gentle people a class nearer akin to the soil they cultivate. Under changed conditions, of course, and with many a ravelled edge to its garment and some wounds dangerously near its vital, "the neighborhood" stands up against time and change.

In a corner of the churchyard there has stood, for some forty years, a plain wooden chapel, wherein, before the war, a white Episcopal minister, whose salary was paid by the neighboring gentry, most of whom were relations of his wife if not of himself, taught and preached to the negroes of the neighboring plantations. When a boy, as a visitor at "The Hall," I have often seen the muster of the little negroes on their way to Sunday-school, and partaken of the ginger cakes provided for their reward. The negro Sunday-school of to-day is held in that chapel, and the hymn is given out and the prayer led by the colored teacher of the public school, but the singing is led by young ladies of the congregation bearing those historic names, one of whom humbly kneels at the head of each class while the superintendent prays.

The colored sexton of the parish church, whose snow-white head tells of a connection with "old times," does not submit to change so easily. He inveighs with frequency and bitterness against "shacks," as he designates the well to-do part of the population unable to "read their title clear" to descent from some colonial magnate, showing a feeling excusable to those who observe how persistently of late the sun has shone on the "shack" side of the hedge. To one of these, a young clergyman born in the county but outside of "the neighborhood," who, having been invited by the rector to fill his pulpit, appeared at the robing room door, surplice-case in hand, he vouchsafed the following rather chilly greeting: "Hi! *you* gwine to preach here? Don't you know dis congregation is quality?"

Truly, whether the sun stands still as in the days of Joshua, or goes backward as in the days of Hezekiah, or "do move" (presumably forward) in our progressive day, it never fails to illuminate with certain light the place where, under the legend "Noblesse oblige," people rise to the occasion whatever it may be. P. L. BURWELL.

THE SCHOOLS AND POLITICS.

TO THE EDITOR OF THE NATION:

SIR: While commenting on the present political aspect, and after referring to the dangers to our institutions which have been exposed by the money controversy during the last six months, a correspondent of the *Nation* finds a cause for existing conditions in the defects of our school system, or in the fact that the educational institutions of the country fail to furnish proper instruction in the principles of financial integrity and political honesty. He says: "Our system of general, if not universal, education, which has been held as the sufficient safeguard in a free country against the possibility of such conditions, seems not to have justified the hopes of its advocates."

While it is true that our present system of public instruction ignores the fundamental principles upon which a genuine republic rests, and while it is a debatable question whether the sum total of human happiness and prosperity is greatly augmented under the present educational régime, still I think it can scarcely be said that the "utter disregard" which is manifested "for every sound principle in the management of national, State, and municipal finances, and the flagrant and criminally reckless methods of corporate and individual business," are due to the fact that schoolboys receive no sound training in the principles of economics. It would seem that a truer statement of the case would be this, that the causes which underlie the at present dishonest and unwholesome commercial and political transactions are identical with those which are responsible for the apathy respecting the correct training of the youth; or, in other words, that commercial dishonesty and faulty and superficial educational methods are branches from the same root—a root which extends to the very foundation of our so-called republican institutions.

If it is a fact that our present educational system ignores the principles of financial integrity and commercial honesty; if the schoolboys of to-day are "taught nothing of the certain difficulty and probable danger of incurring debt, nothing of the sacredness of money obligations"—we should bear in mind that no ethical standard is demanded by those who support this system. We should remember that a great majority of those who give life and educational advantages to these boys, and who furnish them with examples for their guidance, have themselves no appreciation of the principles which should characterize the conduct of those who aspire to the benefits derived from a republican form of government.

Already in this country liberty has degenerated into license. Among the masses of the people the one object in life seems to be selfish gratification in one form or another; and the mad rush for money goes on with no thought for the methods employed in getting it. The effect of all this upon the youth is exactly what might be expected. Perhaps in no civilized land does one behold "precocious vice" and a determination among youths to procure self-gratification carried to such an alarming extent as in America. The lack of shame evinced by the young men and boys of this age as they indulge in vulgar and distasteful habits upon the streets and in other public places, shows plainly that, according to their own ideas, they are simply enjoying the "inalienable rights of American citizens." The fact that such encroachments upon the rights of others are in any way reprehensible has doubtless never occurred to them. Self-control and a proper regard for the rights of other people—the two fundamental principles necessary to the establishment of a genuine republic—are everywhere ignored, both by the young and the old.

ELIZA BURT GAMBLE.

DETROIT, MICH., September 17, 1896.

WHO HITCHED THE CART?

TO THE EDITOR OF THE NATION:

SIR: Your correspondent who attempts un-

der this heading, in the *Nation* of September 10, to clear the President of the Johns Hopkins University from the charge of obscurantism on *a-priori* grounds—never more dangerously employed than here—does grave injustice to the Trustees of the University; for, as every one familiar with the one man organization of the Johns Hopkins knows, the Faculty is not admitted to the University stable-yard, and all harnessing, whether it be hitching the University wagon to a star, as in its early history, or the strange, crab-like progression of these latter days as concerns the most important educational movement of modern times, must be credited to the Trustees or to the President. Nor can the conservative environment be to blame, as your correspondent suggests, for both the location of the buildings of the University and the existence of the University itself as a great graduate school are a slap in the face of local prejudice.

It is an open secret, well known to the many women who have tried in vain to obtain admission to the University, and to the members of the Faculty who have interested themselves to obtain this admission for special women, that all such petitions have been for years pigeon-holed in the offices of administration. It is perhaps not so well known that the liberal and broad-minded original Trustees appointed by Johns Hopkins were, by a considerable majority, in favor of the admission of well-qualified women, as was proved by successive votes on the subject in the Board, and that the resignation of one of these original Trustees of less liberal views, still living, settled the question affirmatively as far as the Board was concerned. It was then that this Turkish policy of pigeon-holing began. It is also a matter of history that the President of the University was abroad when this same liberal majority accepted the $109,000 raised for the Medical School by the women's committees, and solemnly pledged themselves, as soon as the endowment of $500,000 should be completed, to open the medical school of the University to women on the same terms as to men; and that it was only after the President's return that a strong reactionist party was stirred up in the Board, who urged the Trustees to forswear their unanimous vote of two years before, and refuse Miss Garrett's offer of $306,977 to complete the endowment and enable the school to open immediately. Those who have come in contact with the mediæval lack of sympathy with women's desire for advanced study that streaks the (in many respects) luminous intelligence that guides the University, had little difficulty in explaining this change of heart in what fortunately proved to be a minority of the Board. I am furthermore informed by an eye-witness that, after Miss Garrett's gift was finally accepted, the Board was detained while an effort was made by a committee, owing its inspiration to the same source, to induce Miss Garrett to substitute the word "equal" for "the same" in the sentence, "open to women on the same terms as men," which conditioned her gift to the medical school. The above matters belong to ante-bellum days, and are recalled here only in justice to the Trustees of the Johns Hopkins University.—Yours very truly,

ONE WHO KNOWS.

BALTIMORE, September 11, 1896.

IMMERMANN'S "MERLIN."

TO THE EDITOR OF THE NATION:

SIR: Will you permit me to forestall the condemnation which is waiting for me at the hand of some future critic by making public confession of a bad slip committed in my recently published 'Social Forces in German Literature'? In a brief notice of Immermann's "Merlin" (p. 511) I speak of the hero of this drama as "that mysterious son of Satan and the Holy Virgin who," etc. Lest this sentence arouse what would be a very natural suspicion, that I had here confounded the *Candida* of the Merlin tragedy with the Virgin Mary, I wish to say that my mistake consisted in not rendering the German expression "heilige Jungfrau," which was in my mind, by "saintly virgin" instead of "holy virgin"—a mistake which was subsequently aggravated by the printer's capitalizing both words.

Let me add that Immermann's "Merlin" deserves a much fuller consideration than that which I could give it in my book. The scene where Satan obtains power over *Candida* is a piece of wonderful poetry, combining the fantastic fervor of Calderon's "Mágico Prodigioso" with the profound thought of Goethe's "Prolog im Himmel."—Respectfully,

KUNO FRANCKE.

CAMBRIDGE, September 17, 1896.

A SCOTT LEGEND.

TO THE EDITOR OF THE NATION:

SIR: I notice in Miss Mary Anderson's 'Few Memories' the following passage on p. 131:

"At Kenilworth we stayed at the humble little cottage which had sheltered Walter Scott, who is said to have gone there to write his great novel under the shadow of the noble ruin. A villager told us how, as a child, he had seen Sir Walter standing on the knoll near Amy Robsart's window, and how his figure, wrapped in a long cloak, seemed to tower in the moonlight."

'Kenilworth' was published in November, 1820, and, the 'Abbot' having appeared in the preceding September, Scott must have worked at full speed to accomplish the Elizabethan novel; yet he was at this time much occupied with other business, both public and private. Lockhart makes no mention of any trip to England—Kenilworth is full three hundred miles from Edinburgh — in this interval, though he does record one immediately afterwards, in January, 1821. Of course, at this time, the authorship of the Waverley novels was still a secret, and though Scott was generally respected, his person would hardly be familiar to a "villager" of Warwickshire. It would seem, therefore, that, in sixty years, a "Scott legend" had grown up in the village which owed immortality to his novel, and that Miss Anderson, who undoubtedly put down just what she heard, was the victim of a fable.

It may be remarked in passing that her book suffers grievously from a want of revision in the spelling of proper names. "Merrivale," "Winklemann," etc., have an ungraceful look. W. E.

SEPTEMBER 14, 1896.

Notes.

EDWARD ARNOLD'S fall announcements embrace 'Through Unknown African Countries,' by A. Donaldson Smith, M.D.; 'In and Beyond the Himalayas,' by S. J. Stone; 'Fifty Years' Reminiscences of India,' by Lieut.-Col. W. Pollock; 'The Religions of India,' by Edward Washburn Hopkins, Ph.D.; 'Early Chartered Companies,' by George Cawston and A. H. Keane; 'Early English Furniture: An Account of the Famous English Cabinet-makers,' by Mrs. Warren Clouston; 'Old English Glasses,' *i. e.*, drinking-vessels, by Albert Hartshorne; 'A Treasury of Minor British Poetry,' selected and arranged by J. Churton Collins; 'Plant-lore and Garden-craft in Shakspere,' by Henry N. Ellacombe: 'Wagner's Heroines,' by Constance Maud; 'The Adventures of My Life,' by Henri Rochefort; 'The Chances of Death, and Other Studies in Evolution,' by Karl Pearson; 'Habit and Instinct: A Study in Heredity,' by C. Lloyd Morgan; and 'Fancy Dresses Described,' by Arden Holt.

Additional announcements by D. Appleton & Co. are 'Pioneers of Science in America,' edited by Dr. W. J. Youmans; 'The Story of the Mine,' by Charles Howard Shinn; 'The Story of Electricity,' by John Munro; 'The Story of Architecture,' by Charles T. Mathews; 'The Evolution of the Art of Music,' by C. Hubert H. Parry; 'The Music of the Modern World,' by Anton Seidl, assisted by Fanny Morris Smith; 'Oriental Ceramic Art,' the Walters Collection, with text by Dr. S. W. Bushell; 'A Reference Book of Practical Therapeutics,' by Dr. Frank P. Foster; 'The Beginning of a Nation,' by Dr. Edward Eggleston; 'General Sherman,' by Gen. Manning F. Force; 'The Rise and Growth of the English Nation,' in three volumes, by W. H. S. Aubrey; 'When William IV. Was King,' by John Ashton; 'Memoirs of Marshal Oudinot,' including the unpublished papers of his wife; 'The Forgotten Isles,' the Balearic, namely, by M. Vuillier; 'The Intellectual and Moral Development of the Child,' by Gabriel Compayré; 'Our Juvenile Offenders,' by W. Douglas Morrison; 'The Seven Seas,' verse by Rudyard Kipling; 'Rodney Stone,' by A. Conan Doyle, illustrated; 'The Statement of Stella Maberly,' by F. Anstey; 'The Little Regiment,' by Stephen Crane; 'A Galahad of the Creeks,' by S. Levett Yeats; 'The Complete Bachelor Manners for Men'; 'Driving for Pleasure,' by Francis T. Underhill; and 'Appletons' Natural History.'

G. P. Putnam's Sons promise 'The Nicaragua Canal and the Monroe Doctrine,' a political history, by Prof. Lindley M. Keasbey of Bryn Mawr; 'The Historical Development of Modern Europe,' by Prof. Charles M. Andrews of the same institution; 'The Country of Horace and Virgil,' from the French of Gaston Boissier by D. Havelock Fisher; 'Ancient Idols: A Study of Intellectual and Spiritual Growth,' by Henry Osborn Taylor; 'The Literary Movement in France during the Nineteenth Century,' from the French of Georges Pellissier by Anne G. Brinton; 'Essays in French History,' by J. E. Farmer; 'Studies in Interpretation: Clough—Keats—Matthew Arnold,' by Prof. Wm. Henry Judson of Leland Stanford Junior University; 'Little Journeys to the Homes of American Authors'; 'The Five Great Sceptical Dramas,' by the Rev. John Owen; 'Hopkins' Pond, and Other Sketches,' by Robert T. Morris, M.D.; 'Parakites: A Treatise on the Making and Flying of Tailless Kites,' by Gilbert T. Woglom; 'Lawns and Gardens,' by N. Jönsson Rose: 'The History of Economics,' by Henry Dunning Macleod: 'Songs without Answer,' by Irene Putnam; and 'In My Lady's Name: Poems of Love and Beauty,' compiled by Charles W. Moulton.

From J. B. Lippincott Co.'s list we select 'The True George Washington,' by Paul Lei-

cester Ford; 'Myths and Legends of Our Own Land,' by Charles M. Skinner; 'Songs of the South,' a collection by Jennie Thornley Clarke; 'Half-Hours of Travel at Home and Abroad,' by Charles Morris; 'Paris Days and Evenings,' by Stuart Henry; 'A Comic History of England,' a posthumous work of Bill Nye's; and 'Famous Violinists and Violins,' by Dr. T. L. Phipson.

In has been for some time an open secret that a "Library of the World's Best Literature" was in preparation, under the chief editorial control of Charles Dudley Warner, to be completed in thirty volumes, and sold either upon advance orders or by subscription. Its scheme resembles Humphry Ward's "English Poets" in combining with representative selections "critical essays" on the respective authors "by distinguished writers of the present day," together with biographical sketches. The publication has its headquarters at No. 91 Fifth Avenue, New York.

J. Selwin Tait & Sons have in the press 'Leo XIII. and Modern Civilization,' by J. Bleecker Miller.

Lemcke & Buechner have nearly ready the 'Tell el-Amarna Letters,' from the originals, by Hugo Winckler, being a complete transcription of these tablets, dating from 1500 B.C., with English translation, notes, index, and glossary.

'Totem Tales,' told and pictorially illustrated by W. A. Phillips, is in the press of the Star Publishing Co., Chicago.

Col. Fred C. Pierce, No. 160 Washington Street, Chicago, is at work upon a Genealogy of the Bacheller Family, and desires to communicate with persons of this name, however spelt.

Some time during the month of October there will occur at the University of Leipzig a very interesting celebration, in honor of the completion of twenty-five years of academic work by Professor Eduard Sievers. In memory of this event some friends and former pupils of his have united in publishing a memorial volume, the editors of which are Prof. Kaufmann of Kiel and Prof. John Meier of Halle. Twenty-three prominent philologists and literary historians have contributed articles. Among the foremost are Prof. O. Schrader of Jena, F. Holthausen of Gothenburg, and A. Litzmann, director of the Goethe and Schiller Archives in Weimar. The other contributors are scattered over Germany, Austria, Switzerland, Holland, Sweden, and America. Those from America are Prof. A. S. Cook of Yale, Prof. G. Hempl of Michigan University, E. E. Hale of Schenectady, and Prof. G. E. Karsten of the University of Indiana. The contributions cover a wide range of subjects in Germanic philology and literature. The book will contain about 800 octavo pages, and will cost $10. The publisher, Max Niemeyer of Halle, agrees to furnish the book free of transportation charges to all Americans who order it before the 1st of October.

An opportunity presents itself to purchase *en bloc* seventeen volumes containing the autograph of Martin Luther in several highly interesting forms, especially four church songs, including "Ein feste Burg" and "Vater unser im Himmelreich"—the latter transcribed in 1530, nine years before its first appearance in print. The collection was begun in 1632 and has been nursed to this day, when Luther autographs are so scarce and command so high a price. Particulars may be had of Jacques Rosenthal, No. 10 Karlstrasse, Munich, or through Lemcke & Buechner, 812 Broadway, New York.

Close upon the heels of the 'Bibliographie Française' comes the 'Publishers' Trade-List Annual for 1896' (New York: *Publishers' Weekly*). There is no editorial foreword, and we can say no more than that this volume bulks about an inch less in thickness than last year's, and so puts off the inevitable day when the publishers' catalogues must be bound up in two or more volumes. The French and English examples of indexes cannot, we fear, soon be imitated.

The five original volumes of the 'Memoirs of Baron Thiébault,' which appeared in a straggling manner in 1893–95, and which revived the name of one of the less famous of Napoleon's commanders, have now been translated and judiciously condensed by Arthur John Butler in two compact and handsome volumes (Macmillan). Mr. Butler was also the translator of Marbot, and has therefore been all the better prepared to make an idiomatic and faithful version of this kindred work, which ranks among the most entertaining and impressive of the many produced in the recent Napoleonic revival. There is a fair index, but not analytical. What is one to do with 84 bare figure references under Napoleon?

Those interested in things German will read with pleasure and profit a little book entitled 'Betrachtungen eines in Deutschland reisenden Deutschen,' by P. D. Fischer (Berlin: Julius Springer). The author, who holds one of the higher positions in the imperial postal service, has had for many years exceptional opportunities for a thorough acquaintance with all parts of the empire, and, being a man of experience, culture, and good powers of observation, he has derived from his official journeys and investigations an unusual amount of information concerning the country and the people of to-day. A long-continued study of industrial and commercial questions has not deadened in his versatile mind the historical and poetic sense. He discusses the various modes of travel, not forgetting the "wheel," though unable to decide whether the bicyclist should be counted among "Reiter, Fahrer, or Fussgänger," since he is all three in one. He writes of the mountain-districts and the open country; of rivers, seas, and seaports; of forests, fields, cities; of noblemen's estates and peasants' and laborers' homes—always from the double point of view of general humanity and of modern civilization. Most of the material of the book had been published before in two articles in the *Rundschau* for January and May, 1894, but we find that the tasty little volume contains much additional matter and a few entirely new chapters. The style is faultless, almost classical, and the book deserves to be provided with some historical and geographical notes and a good map, for the use of American students.

The 'Bilder zur Mythologie und Geschichte der Griechen und Römer' (Berlin: Carl Graeser; New York: Lemcke & Buechner) has proceeded from the first number, of which we gave an account, to the fifth. That is to say, thirty permanent photographic prints from as many pieces of Greek and Roman statuary have now been made from approved plaster casts, with a view to mythology and biography. In the latter category are the well-known full-length Demosthenes of the Vatican and Sophocles of the Lateran, and busts of Herodotus, Thucydides, Socrates, Plato, Alexander, Cæsar; in the former, many a masterpiece from the Greek pantheon. It will be remembered that this series is expressly intended to further classical study in the schools, either by framing or hanging upon the walls, or by keeping in a portfolio for use as occasion arises. The plate sheets measure about 15x21 inches.

From a very full official report to the Minister of Public Instruction on courses of instruction for adolescents and adults, and on popular lectures, it appears that these movements have met with much encouragement from the public in most parts of France. The number of courses, averaging three hours per week for three months, has risen from 7,322 in 1894–95 to nearly 16,000 in 1895–96. Four hundred thousand persons registered for these courses, and nearly three-fourths of that number pursued them regularly and with profit, the majority being apprentices, peasants, clerks, and others whose earlier education had been necessarily deficient. Only about one-ninth of the courses were given for young women separately, and "mixed" courses were comparatively rare. Popular lectures have also grown in public favor, their number having increased nearly sixfold in one year. Of the 61,476 lectures given in 1895–96, about one-fourth were illustrated by lantern views. The Ligue de l'Enseignement alone distributed nearly five hundred lanterns and six thousand slides, while it lent as many as forty-eight thousand slides. Considerably more than this was done by the aggregate efforts of two other societies for the advancement of popular instruction, that of Havre and the National Society. Of course, the work has progressed less rapidly in some departments than in others, but it is evident that, on the whole, the movement is eminently practical and successful.

The addresses delivered in the French Senate by M. Alfred Rambaud, Minister of Public Instruction, and by M. Liard, in support of the new University bill, which has since become a law, are so replete with interesting historical and statistical details, otherwise not easily accessible, concerning higher education in France, that we cannot refrain from calling attention to them at this late hour. The addresses are published almost in full in the August number of the *Revue Internationale de l'Enseignement*. The same number contains a reply by a Swiss scholar, M. Zund, to Mr. Schofield's article on French and American universities recently noticed in these columns.

As the Corporation of Harvard University is about to set a memorial window in St. Saviour's Church, Southwark, where John Harvard was baptized in 1607, the interior of this edifice is appropriately shown in the *Harvard Graduates' Magazine* for September. The editor, Mr. Wm. R. Thayer, also pictures and describes the Queen's Head Inn, Southwark, closed only last year, after flourishing for five centuries, and probably kept by Harvard's mother, who bequeathed it to him, he in turn bequeathing to the college the proceeds of the sale of it; and Emmanuel College, Cambridge, from which Harvard graduated. Shakspere's brother is buried in St. Saviour's, along with Gower, Massinger, and Fletcher; and Mr. Thayer's conjecture that Shakspere frequented the inn in Harvard's youth is all the more plausible in view of the Stratford connection revealed by Mr. Waters. The magazine further contains Mr. Geo. S. Morison's suggestive Phi Beta Kappa oration; some curious vital statistics of college-bred men; and the usual miscellany. It seems a pity that the restoration of Bulfinch's fine college chapel in University Building to become the Faculty Room should not be as piously undertaken as was that of the legislative halls in the Old State

House in Boston. The communication on the choice of electives by freshmen deserves serious consideration.

Science was established in 1883 by Mr. A. Graham Bell, who, in conjunction with Mr. Gardiner G. Hubbard, spent more than $80,000 in sustaining it. The loss involved was so large and so continuous that the generous donors finally felt compelled to withdraw their aid, and publication was suspended in 1894. Later an arrangement for coöperation was made between *Science* and the American Association for the Advancement of Science, in accordance with which the Association agreed to appropriate $750 annually towards the support of the journal. But, in view of the fact that it has become necessary to take this money from the invested funds of the Association, it has seemed to friends of the journal and of the Association undesirable to continue this appropriation for the present. *Science* now, under able management, occupies a field which it would be discreditable to American science to leave unfilled, and we trust that its claims will be recognized by a renewed support in excess of the impending deficit.

The American resort of the past summer to the Bodleian Library has been very considerable—so considerable, indeed, that the hospitable authorities there desire to make known beforehand to intending readers one of the regulations governing the library which they are in no case at liberty to suspend. Intending readers must come provided with a personal introduction which they can surrender at the Bodleian. When once their introduction is on file, they are entitled to read at Bodley's Library as often as they may revisit Oxford, and as long as they live. The production of a circular-letter of introduction does not comply with the regulations above alluded to, and embarrassments have sometimes arisen the recurrence of which it is hoped the printing of this information may help to forestall for the future.

—The second series of the 'Index Catalogue of the Library of the Surgeon-General's Office, U. S. A.' (Washington: Government Printing-Office) begins promptly with volume i., uniform with the first series, and exhausting the letter A in 828 quarto pages. It would be a mistake to suppose that the new series is confined chiefly to indexing magazines or works published since the first series was begun. On the contrary, we observe accessions of some sixteen imprints of the fifteenth century, the oldest being an Avicenna of 1482; and editions of Aristotle from 1500, of Vesalius from 1543, of Averrhoes from 1560, testify to the same careful filling up of the earlier gaps. The rubric Astrology furnishes other evidence, and even that of Apes and Monkeys extends from 1699 to 1893, the former date being attached to E. Tyson's 'Orang-utang sive homo sylvestris. Or the anatomy of a pigmie compared with that of a monkey, an ape, and a man. To which is added a philological essay concerning the pigmies, the cynocephali, the satyrs, and sphinges of the ancients. Wherein it will appear that they are all either apes or monkeys, and not men, as formerly pretended.' On the side of recent publications we may instance an article in an Odessa medical gazette on the disease of the late Emperor Alexander III. of Russia (Alexander the Great, Bonaparte and Cæsar being also similarly considered in other works in this Catalogue); Edward Atkinson on the 'Science of Nutrition'; and all the rapidly growing literature on Appendicitis, which mostly belongs to the present decade. Noteworthy are the twenty-four pages devoted to Army, by nationalities. Clearly this great work is going forward on the lines of its projector, Dr. Billings, whose name is succeeded in the preliminary report to the Surgeon General by that of D. L. Huntington, Deputy Surgeon-General, and Lieut.-Col. U. S. A.

—The third volume of the calendar of the Dartmouth Papers (English Historical MSS. Commission) follows close upon the issue of the second, and includes many papers on America discovered after Mr. Stevens had performed his task. This later issue is necessary to complete the earlier, and has the advantage of printing the papers in full, while Mr. Stevens merely summarized the contents. There is much of interest in the private correspondence of the minister. Garbett of Birmingham complains in 1765 of the bad quality of iron goods made in that place, and adds: "America, the principal market for sale, has long complained of the quality of our nails, and will most unquestionably, if the imposition continues, endeavor to raise works of their own." In May, 1766, Lord Chesterfield urges Dartmouth to strive for an increase of his powers: "If we have no Secretary of State with full and undisputed powers for America, in a few years we may as well have no America." The next mention of America is in 1775, when hostilities had begun, and Rev. John Newton, a regular correspondent of Dartmouth, suggests a day of public humiliation "enjoined by authority," a weapon already used by Jefferson, though with no great confidence in its efficacy. John Wesley gives a dark picture of the industrial crisis in 1775 in England, due to the American troubles; and Granville Sharp writes in 1781 a very strong plea in favor of an immediate peace with America. Our extracts may fitly close with Lord North's brief announcement of defeat in March, 1782: "We are beat completely, and nothing but health and domestic comfort is left, that is worth thinking of. I suppose you know that, notwithstanding the method we took to elude a defeat, we lost the question by 19. General Conway, not contented with carrying the question, moved an address of the House to the King to be presented by the whole House, in order to make the measure as grievous and insulting as possible to his best benefactor."

—The University of Wisconsin has published in its Bulletin Series a monograph of Dr. Victor Coffin on "The Province of Quebec and the Early American Revolution." The author keeps in view two principal aspects of Canadian history during the time of Lord North's administration: first, the institutions devised by the home Government for the recently acquired New France, and, secondly, the part of the Canadians in the contest between Great Britain and her revolted colonies. Both lines of investigation converge to 1774, the year of the Quebec Act. Dr. Coffin enters a strong indictment against this measure, accusing it of exasperating the *habitants* at the moment by its insistence on the compulsory tithe, and of creating the greatest of Canada's present difficulties, the dual system. "I am strongly at variance with the hitherto prevailing opinions; being forced to conclude both that the provisions of the Quebec Act were neither occasioned nor appreciably affected by conditions in the other colonies, and that, far from being effective in keeping the mass of the Canadians loyal to the British connection, the measure had a strong influence in precisely the opposite direction." "No single step taken by the ministry of Lord North has been more politically disastrous than that which, besides increasing the colonial difficulties of the moment, is mainly responsible for the continued burdening of modern Canadian life with a steadily growing problem of national divergence." We doubt whether, in assuming these positions, Dr. Coffin is quite so paradoxical as he seems to think himself. The Quebec Act has certainly found its apologists, but at the present moment there are few Protestants in Ontario or Quebec who do not at least hold Dr. Coffin's view of the consequences. One would need to cast about a long while before he found a more notable instance of unsuccessful opportunism. Dr. Coffin does good service in exposing the mass of false conception upon which the Quebec Act rests, particularly "the incorrect ideas which Murray and Carleton had fostered with regard to the origin and character of the English already in the Province." His essay is conceived in a broad spirit, and is the fruit of faithful examination. Though somewhat controversial in tone, it handles the weapons of controversy fairly. One singular little slip should be rectified. It is stated on p. 539 that Lord Durham was sent out in 1839. He reached Canada in May, 1838.

—The Rev. Charles W. Mossell's 'Toussaint L'Ouverture' (Lockport, N. Y.: Ward & Cobb) has something to do with its avowed subject, and something to do with the present condition of Protestantism in the island of Hayti. The mixture of these two subjects gives the book a hybrid complexion, but, in view of Mr. Mossell's own experiences, it is not strange that the cause of evangelization should be close to his heart. Though a Roman Catholic, Toussaint L'Ouverture admitted the legal equality of all Christian bodies, and the Government of Hayti still leaves Protestant missionaries alone. The mass of the population, however, are not so considerate, and Mr. Mossell's lot while pastor of the African Methodist Episcopal Church at Port au Prince seems to have been very trying. We are told that on the 23d of September, 1883, he was "rudely and roughly forced into the streets with revolvers loaded and cocked drawn upon him, and with every circumstance of word and conduct shown by those who had him in this condition, calculated to demonstrate their fiendish purpose." Mr. Mossell's biographical sketch of Toussaint L'Ouverture possesses a certain value from the author's intimate knowledge of Hayti and its inhabitants. Otherwise its merit is slight. The narrative is based on Gragnon Lacoste, and abounds in rejoinders to the depreciation of Saint Rémy. Mr. Mossell makes small pretence to the graces of literary style, and the carelessness of the proof-reader is simply shocking. Yet the robustness, chivalry, and breadth of the great black's character make themselves felt through this jejune account of his struggle to emancipate his race. We cite a specimen of Mr. Mossell's prose: "If it were not that Catharine found herself in a strange land, so different from her native patrie, the remembrance of which strongly binds itself about the heart of the exile, l'ajoupa paternal,—if it were not that she had regrets caused by a cruel separation from the grand lakes, where the copious mongrove trees unite their branches in forming a thick grove,—a forest of sweetest perfume in which one's ears are constantly saluted by the chirping of birds, whose plu-

mage represents a hundred different colors exceedingly bright and beautiful,—we repeat, were it not for these sad recollections added to another, viz.: that while she was free, she was in the midst of her brothers and sisters bowed under the yoke of slavery; the young negress had almost no reason whatever to envy the whites."

—It is nearly seven years since we noticed, with the appreciation which it deserved, the first part of Prof. Paul Fredericq's 'Corpus Documentorum Inquisitionis Neerlandicæ,' embracing the documents concerning the persecution of heresy in the Low Countries from 1025 to 1520. We have waited somewhat impatiently for the continuation of the work, while recognizing the magnitude of the labor involved in collecting from all sources, printed and manuscript, the vast aggregate of material illustrating the vicissitudes of the Reformation in the Netherlands during the stormy reigns of Charles V. and his successors, and it is with some disappointment that we greet the second part (Ghent: J. Vuylsteke), which proves to be, not a continuation, but a supplement to the first part, consisting of some two hundred additional documents illustrating the earlier period which the industry of Prof. Fredericq and his students has discovered. Much, however, as we could have wished for the continuation, we recognize the soundness of the author's method in completing as far as possible the mediæval portion before grappling with the sixteenth-century movement and its momentous results, and we find this gleaning of his former harvest full of interest. Especially important are the contributions to the history of Lambert le Bègue and the Béguines, of the Flagellants, and of the Dancing Mania, although these form but a small portion of the varied contents of the four hundred pages of which the volume consists. While thankful, then, for this present instalment, our impatience is by no means diminished for the promised continuation, which, when executed with the same critical thoroughness, cannot fail to throw a new and striking light on one of the most complicated and important epochs of European history.

—The Vienna *Medicinische Wochenschrift* of July 18 contains an interesting article on the hygienic reforms and sanitary regulations introduced in Bosnia and Herzegovina by two female physicians during the past three years. In 1895 the Government appointed for this purpose two women, Dr. Krayevska and Dr. Keck, at a salary of 1,600 florins ($740) each, hoping thereby to promote the health of the Mohammedans, who constitute about 35 per cent. of the population. The aversion of Mohammedan women to medical treatment by men had hitherto been so strong as to render it almost impossible to apply remedies for their personal infirmities or to enforce sanatory ordinances in their dwellings. It is well known that the prevalence of anæmia among Mohammedan women is due in part to the lack of bodily exercise in the open air, and still more, perhaps, to the exceedingly imperfect ventilation of their houses. Also, the custom of nursing their children for several years is highly injurious to themselves and to their offspring. The patients numbered 1,258 in 1893, 1,382 in 1894, and 1,517 in 1895, and consisted chiefly of the wives and children of merchants, mechanics, peasants, and Government officials. By their tact and professional skill Drs. Krayevska and Keck have won the confidence of the Mohammedans and already succeeded in alleviating much unnecessary suffering and in reducing considerably the percentage of mortality. The inspection of the houses is now attended with no difficulty, and the general health of the inmates has been greatly improved. The poor are treated gratuitously, and regular reports embodying statements and suggestions are sent to the Government. The two physicians are liable at any time to be sent on sanitary missions to remote districts or assigned to duty in the hospitals. We may add that they were appointed as the result of a competitive examination, and that all candidates for such positions must submit to the same ordeal. Recently a female dentist, Emilie Edel of Vienna, has begun to practise her profession at Mostar, the capital of Herzegovina.

—The sight-seer in the English cathedrals has always found a unique exhibition in the famous circular world map of the thirteenth century which the verger at Hereford shows with such an air of self-gratulation. It hangs against an interior wall in one of the side aisles of that minster. It is a celebrated landmark in the broad field of early European cartography, and has for many years been cited as a significant object in the progress of geographical knowledge. After having been the subject of incidental treatment in the great works of Santarem, Lelewel, and Davezac, it was made the topic of monographic study by Beavan and Philott in a London publication in 1874, and a similar study of it by Dr. Konrad Miller constitutes the fourth part of his 'Ältesten Weltkarten,' now in course of publication at Stuttgart (New York: Lemcke & Buechner). A facsimile was first made of the original map in 1831 for the Royal Geographical Society, and a copy of this was made for the Bibliothèque Nationale at Paris. Students of a later day have turned to the reproduction made by Jomard, in several sheets. Dr. Miller has based his facsimile, which is nearly half-size, on Jomard, correcting from the plate used by Beavan and from a lithograph published in 1872 by Stanford, which followed a photograph by Havergal. The original has been resorted to in doubtful cases where the legends are more or less obscure. There are fifteen or twenty other maps of these early periods of map-making, including the Ebstorf (of which Miller also gives us a reproduction), which are necessary to the study of the Hereford map, and Miller has collated its legends with the corresponding ones on such maps. There are nearly two-score early writers associated with this age of geography, and Miller's notes show that he has used them faithfully. One can little need hereafter to go beyond such careful work as this monograph presents.

AN INTRODUCTION TO JURISPRUDENCE.

A First Book of Jurisprudence. By Sir Frederick Pollock, Bart. Macmillan & Co. 1896.

"THIS book," writes Sir Frederick Pollock, "is addressed to readers who have laid the foundation of a liberal education and are beginning the special study of law." For this public it forms an almost perfect manual. Our object in reviewing it, however, is not so much to insist upon its merits, for these will, we may be certain, receive rapid and extensive recognition, as to take the book as the sign of a revolution which will gradually remodel the study of law in England. The revolution is nothing less than this, that law works are becoming a part of English literature. The 'First Book of Jurisprudence' is well adapted for the use of students of the common law; it is a manual which every one should read, but it is also, what few manuals are, and what very few English legal treatises have hitherto been, a book which every man of liberal education can read with pleasure. It is the work of a writer who is the master of his subject; it is the work of a trained thinker; it is the work of a man of letters.

That Sir Frederick Pollock has complete mastery of his topic is proved, if proof were needed, by the mass of useful and appropriate information with which his 300 and odd pages are filled. In this matter the 'First Book of Jurisprudence' resembles Prof. Freeman's admirable little work on the 'Growth of the English Constitution.' From either book a student may learn with ease more that is worth knowing about the elements of an important subject than can easily be gathered from lengthy and ponderous volumes. From Mr. Freeman's book, which could easily be read through in the course of a morning, one can learn what are the essential features of the English Constitution when surveyed by a man versed at once in English history and in English politics. From Prof. Pollock's manual, which also can be read through in a few hours, a student may gather not a mere analysis or outline of jurisprudence, but, what is far better, a substantial knowledge of the ideas which lie at the basis of every treatise of law. He may learn much about the nature of law and the different aspects in which it may be regarded; he may learn what is meant by justice according to law and what are its characteristics; he will, unless we are mistaken, rise from the reading of the work with a sense rarely derived from books, that legal terms and legal discussions have reference to real things, and are connected with the most interesting questions, both of a practical and of a speculative character, presented to us by the transactions of every-day life.

One example out of a score may show what we mean. Nothing in law appears to beginners more technical and conventional than the creation of those artificial persons known to English lawyers as corporations. A student with difficulty realizes that a corporate body is a different being from the members who compose it; and when he accustoms himself to the idea of artificial persons, he fancies that legal subtleties have led him far away from the realities of life. A perusal of Sir Frederick Pollock's chapter on persons, which consists of but fourteen short pages, altogether dispels this delusion. That corporations are in one sense the invention of lawyers is of course manifest; but what is more important (and not equally obvious) is that the creation of artificial persons corresponds to a natural tendency of the human mind—it meets a natural want. It is arguable, at any rate, that the corporate or quasi-corporate existence of the family or the state was recognized by mankind before they fully recognized the separate existence and claims of individual personality. However this may be, popular ways of thought create artificial persons more rapidly than does the invention of lawyers. States, nations, clubs, firms—even, to borrow an apt illustration of our author's, newspapers—are treated in ordinary discourse as personages; our readers, we have no doubt, praise or blame the politics of the *Nation* as freely as they bestow commendation or censure upon the conduct of President

Cleveland or Lord Salisbury. The truth is, that in England, at any rate, lawyers have found it difficult to recognize with sufficient rapidity the existence of artificial persons who are known to every man of business. In the world of trade a firm has long been a person; according to English law a firm is nothing but John Smith and Thomas Brown, who make up the firm. The creation of companies with limited liability is a tardy attempt to give personality to partnerships, and, even as it is, English rules of procedure are in parts rendered complex by the difficulty felt by lawyers in admitting that a firm is a person. To personify is in fact the tendency, it is even the weakness, of human nature; it is a profound remark of our author's, which might serve as the text for an essay, that the personification of nations has given rise to many dangerous fallacies or delusions.

Here we see that Sir Frederick Pollock is not only an excellent lawyer, but also a trained thinker. His book is suggestive of many ideas which he wisely, in order to keep within the proper limits of a manual, does not follow out. Everywhere we feel that he could say more about his topic than he does. Nothing gives a greater sense of a writer's power. There are excellent and instructive authors who illustrate their subject with appropriate examples, but who yet leave upon the mind an impression that they have said everything that they had to say; that in the facts which illustrate their statements we have in reality the measure of their knowledge. Something of this kind, for example, occurs to the reader of Dean Stanley's works. The Dean is a charming writer, his illustrations are apt and interesting, but his works leave on the minds of his readers no sense of reserved power. It would be unjust to say he is shallow, but it is not unjust to say that one touches sometimes the bottom of his knowledge. The truth is, that the Dean was an admirable writer, but he was in no sense an erudite author or a powerful thinker. With Prof. Pollock it is far otherwise. His last book is a manual for students, yet at every turn it arouses thoughts or speculations in the minds of readers who, in age at least, have no longer the right to number themselves among students.

As an illustration of this, let us take the one part of Prof. Pollock's speculations with which critics, with whom may be numbered the present writer, find it difficult to agree. His book does not contain any direct attack upon Austin. With his usual good sense, he has obviously felt that controversial matter ought as far as possible to be kept out of the pages of a manual. But it is perfectly clear to any one who reads the chapter on the nature and meaning of law, that Prof. Pollock does not agree with and does not value highly the Austinian definition of law, or, we conjecture, the system of analytical jurisprudence of which it is the result. What should be noted, however, is that the whole chapter on the nature and meaning of law, with which should be read the admirable disquisition on justice according to law, can be studied by the most ardent Austinian with the greatest profit. At every turn he will find suggestions well worth consideration, and he will, we suspect, come to the conclusion, not that there is no difference between Austin and his critics, but that there is no cause for internecine warfare between them. Austin forced upon a world which at first was unwilling to heed him, an aspect of law which as far as it went is important. Subsequent writers, belonging more or less to the historical school, have revealed to the world the extent to which rules or habits which are not, according to Austin's definition, in strictness laws, are in fact obeyed; they in their turn have done good service in calling attention to another aspect of law, namely, the way in which it is developed. The moment has nearly come, if it has not already arrived, when it will be seen that there is no opposition between the two different ways in which law may be regarded. This reconciliation will assuredly be aided by our author's thoughtful speculations. "Law, for the practical purposes of lawyers and citizens, means the sum of those rules of conduct which courts of justice enforce, the conditions on which they become applicable, and the manner and consequences of their application." This is a statement in which lawyers, whatever their speculative views, may agree. It is precisely one of those wise summaries of admitted facts which one finds in the writings, and only in the writings, of men who bring to the consideration of difficult and controverted questions habits of wide and systematic thought.

Our author writes essentially as a man of letters. Nowhere is this better seen than in the second part of his book, on legal authorities and their use. It may compare, and the comparison is in itself a high compliment, with Blackstone's introduction to the study of the law of England. Each writer has attempted to set before students the elementary facts (*e. g.*, the nature of the common law, the difference between common law and equity, the meaning of case law, the effect of precedents, and the like) which it behooves any man to master before he enters upon the study of the law of England. Each writer has, according to the knowledge of his day, done his work admirably; each has chosen interesting topics and expounded them in an interesting manner; each has realized that there ought to be no divorce between law and letters. That the two should ever have been separated should, to all lovers of the law of England, be a subject of great regret, but the existence of the separation is past a doubt. If we except Blackstone's Commentaries, hardly a single work which fifty, forty, or even thirty years ago was placed in the hands of law students could be called literature. Smith's 'Leading Cases,' White and Tudor, Smith 'On Contract,' the whole overgrown library produced by the industry, the knowledge, and the verbosity of the family or clan of Chitty, were in some respects excellent works, from which, by dogged industry, it was possible for a learner to derive much valuable information. But they were not literature; they had no more to do with the world of letters than have Bullen and Leake's 'Pleadings' or Daniel's 'Chancery Practice.' They had, indeed, far less of literary flavor than have large portions of the law reports. It is in the great judgments of eminent judges that you must look for such literary gifts as have been offered on the shrine of law. There have never been wanting English magistrates who could express in admirable English the principles of English justice. The judgments of the late Lord Bowen contain the latest judicial contributions to the literature of England, but Lord Bowen was only not among the first of Englishmen of letters because he was quite among the first of English judges. But, as we have said, the writers of legal text-books have, with the exception of Blackstone, till quite recently contributed nothing to literature. The permanent reputation of Sir Henry Maine will, it may be suspected, rest upon his having shown that supreme literary skill could be applied to the discussion or elucidation of legal problems. Whatever be the defects of his 'Ancient Law,' it is one of the most charming of books. The idea that literary talent could be applied to the service of law was, when Maine's 'Ancient Law' appeared, new and original. It has also been preëminently fruitful. A whole series of works have, since 1861, been produced by authors who, though marked by great differences, have all given to legal treatises the character of literary works. Sir James Stephen's 'History of the Criminal Law,' Anson's 'Law of Contract,' Markby's 'Elements of Jurisprudence,' Holland's 'Jurisprudence,' Pollock's 'Law of Torts,' Pollock and Maitland's 'History of English Law,' and other works which might be mentioned, are all results of the same movement. The writers in each case follow, as every good writer ought to do, the bent of their own genius; but they each and all clothe clear thought about law in the form of lucid expression. The 'First Book of Jurisprudence,' small though it be in size, is in reality no mean addition to the series of which it in truth forms a part; it is the latest, though it will not be the last, result of the effort to take up again the work of Blackstone, and to make the literature of English law a part of the English world of letters.

A WOMAN ASTRONOMER.

Maria Mitchell: Life, Letters and Journals. Compiled by Phebe Mitchell Kendall. Boston: Lee & Shepard. 1896. Pp. 293.

THIS book presents a combination that one would not have expected beforehand to occur. It is the life of the first American woman who attained eminence in science, and it is also the perfect picture of the ideally happy life of the woman who devotes herself to scientific pursuits. Like the history of those nations which can be accounted happy, it is short, if one measures it by fulness of incident. The fortunate circumstance that Vassar College was founded within the active period of life of the one woman to whom a college professorship was due, secured for her the freedom from anxiety, together with the constant quickening of interest, that only a college professorship can give. With no unpleasant cares and responsibilities, with almost uninterrupted leisure for the prosecution of her work (for the number of students who chose to study astronomy was naturally never large), and with the inspiration that must have come from being the intellectual centre year after year of the cleverest of the college girls—what more favorable conditions can one imagine? Those who remember the expression of keen aliveness combined with perfect content of Miss Mitchell's later years, will easily believe that hers was one of the enviable existences of this poor world. How purely silly it is on the part of many unthinking reviewers to attribute the half-unhappiness (for it was no more than that) of Kovalevsky to the fact that she was a mathematician, and not to her fiery, unsatisfied Russian temperament, it is not worth the while to point out.

Maria Mitchell was born on the island of Nantucket in the year 1818, of a family which had been Quakers for many generations. Her ancestors had been obliged, on account of the intolerance of the early Puritans, to flee from Massachusetts and to settle upon this island, which belonged at that time to New York. Her father had been from his early youth an

enthusiastic student of astronomy, at a time when students of astronomy were few and far between. To the children, accustomed to seeing observing going on every pleasant evening, astronomy was the most important subject in the world. One by one, as they became old enough, they were drafted into the service of counting seconds by the chronometer; if any one had asked a little child in this family who was the greatest man that ever lived, the answer would have come promptly, "Herschel!" It was only in such an atmosphere that a girl could become a scientific woman in those days, but how much energy went still to the making of that rare creature is shown by the fact that of all the daughters of the scientific men of that day, this one alone devoted herself to her father's pursuits.

Another happy circumstance assisted in deciding her career, and gave her the recognition which is so indispensable an incentive to long-continued effort; before she was thirty, she had discovered a comet. Moreover, Frederick VI., King of Denmark, had offered a gold medal to the first discoverer of a telescopic comet; and although his son, who had now succeeded him, did not take the interest in science that his father had felt, he was nevertheless persuaded to carry out his father's design in this instance. There were difficulties, however, on account of certain formalities in regard to the announcement of the discovery not having been complied with, and as Miss Mitchell did nothing to urge her own claims, the whole thing would have fallen through had it not been for the energetic measures pursued by Edward Everett, who was at that time the President of Harvard College. Finally, the medal arrived, a year and a half after the discovery of the comet. She received letters of congratulation and friendly interest from many of the principal astronomers in Europe, and this sympathetic welcoming into the ranks of the real workers in her chosen subject was doubtless effective in fixing her interest in her career. No man can ever fully realize the feeling of isolation and repression which was the lot, up to thirty years ago, of those few active-minded women who were afflicted with an unnatural desire to aid in the accumulation of the world's store of exact knowledge.

At this same time (1848), Miss Mitchell was unanimously elected a member of the American Academy of Arts and Sciences—the first and only woman who has ever received this distinction. The following year she was invited to act as computer for the American Nautical Almanac, and she retained this position for many years, in addition to her other duties. Six years of her life were devoted to the unremitting care of an invalid mother. After the mother's death, Maria and her father removed to Lynn, and from there she was called to fill the chair of astronomy at Vassar College upon its opening in 1865. This appointment, which the trustees of the college, with rare good sense, rendered effective by the construction of an admirably furnished observatory, gave astronomy a prominence at Vassar which it has had in but few of the colleges for men. Some years before, Miss Mitchell had been presented, through the exertions of Miss Elizabeth Peabody, with an equatorial telescope—the gift of the women of America.

A large part of the volume before us is occupied with the diary and letters concerning Miss Mitchell's first and second European tours. Both times she met and enjoyed friendly intercourse with the most important scientific men of the day. There is a great deal of interesting anecdote and comment upon character, but we have space to give only a taste of it. She was surprised to find that the important rooms in Leverrier's observatory were the reception room and the ball-room; astronomy had to be made a feature in French social life in order that the Government might be induced to expend money upon it. There was much bitterness at this time between French and English astronomers on account of the rival claims of Adams and Leverrier to the discovery of Neptune, and Leverrier seems not to have needed this fillip to his natural moroseness. Lady Herschel said afterwards that he was one of the very few men whom she had ever asked for an autograph; he was her guest at the time and he refused. In view of the reputation of American children in Europe, it is interesting to know that his little boy of nine promenaded about the room with his hands in his pockets, and occasionally yelled and was ordered to keep quiet. In Rome Miss Mitchell was shown over the papal observatory, through intercession with Cardinal Antonelli (but she was not allowed to be accompanied by her maid). Mrs. Somerville had sought this privilege in vain. Father Secchi had no staff and no prescribed duties; in spite of the history of Galileo, which forms the background of Italian astronomy, "no bolder views emanate from any observatory than those which Secchi sends out." Miss Mitchell would gladly have waited until dark to see the nebulæ through the extraordinarily pure Italian atmosphere, but the father informed her that her permission did not extend beyond the daylight, and con ducted her to the door, adding, "But we live in a civilized country." Alexander Humboldt (alone of the Europeans she met) showed a minute acquaintance with American affairs, and was deeply interested in the question, which was then up, of the admission of Kansas as a slave State.

"He said that we had gone backwards, morally, in America since he was there [what would he say now?]; that then there were strong men—Jefferson, Hamilton, Madison. The three months he spent in America were spent almost wholly with Jefferson. He urged me to go to see Argelander on my way to London; he followed me out, still urging me to do this, and at the same time assured me that Kansas would go all right [would that he could give us that assurance now!]."

Admiral Smyth (the English Astronomer Royal) assured her that no family was quite civilized unless it possessed an encyclopædia and a telescope. The English gentleman uses both for his amusement. Frequently he hires some young astronomer of talent who comes to his observatory and makes a name for him. Then the Queen confers the honor of knighthood, not upon the young man, but upon the owner of the telescope. But Miss Mitchell's most delightful visit was at the house of Sir John Herschel. She found him an old man, much bent, and with perfectly white hair standing out in every direction, but full of clever talk, and "a better listener than any man I have met in England." Lady Herschel was a noble-looking woman, and exceedingly fresh and fair for a woman of her age. They were surrounded by eight of their twelve children, all fine-looking and remarkably intelligent.

"Lady Herschel is the head of the house—so is Mrs. Airy; so, I suspect, is the wife in all well ordered households! I perceived that Sir John did not take a cup of tea until his wife said, 'You can have some, dear.' Mr. Airy waits and waits, and then says, 'My dear, I shall lose all my flesh if I don't have something to eat and drink.'"

Miss Mitchell was much shocked at hearing Prof. Sedgwick say, regarding Miss Herschel's marriage to a Gordon, "Such a great match for her!" "What match can be great," she asked, "for a daughter of the Herschels?" When dining with Whewell, she found him very severe upon American writers; Lowell's comic poems she found that he took as representing the ordinary language of the American people. Wishing to say that something in the way of sight-seeing would be done thoroughly, he turned to her and said, "We'll go the whole hog, Miss Mitchell, as you say in your country."

"I thought his severity regarding Americans reached really to discourtesy. I got a little chance to retort, by telling him that we had outgrown Mrs. Hemans in America, and that we now read Mrs. Browning more. He laughed, and said that Mrs. Browning's poetry was so coarse he could not tolerate it, and he was amused to hear that any people had got above Mrs Hemans. He asked me if we had got above Homer; I replied that they were not similar cases. Altogether there was a tone of satire in Dr. Whewell's remarks that I did not think amiable. . . . Mrs. Airy said that Dr. Whewell and I *riled* each other!"

There are here and there remarks exhibiting Miss Mitchell's keen interest in psychological analysis which those who knew her were always struck with. Professor Bond (the elder) was showing her and his son the new planet Neptune, which he had already seen himself.

"It looked precisely like a small star, and George and I both asked, 'What made you think last night that it was the new planet?' Mr. Bond could only say, 'I don't know; it looked different from the others.' *It is always so—you cannot get a man of genius to explain steps, he leaps.*"

"When I was travelling with Miss S., who was near-sighted and kept her eyes constantly half-shut, it seemed to me that every other young lady I met had wide, staring eyes. Now, after two years' sitting by a person who never reasons, it strikes me that every other person whom I meet has been thinking hard, and his logic stands out a prominent characteristic."

It required no small measure of the grace of God to live for more than twenty years, as Miss Mitchell did, a Unitarian of the most liberal type, in an atmosphere where an orthodox belief was regarded as a matter of crucial importance—to be perfectly fearless and outspoken, and at the same time to preserve the unvarying affectionate regard of her colleagues. Towards the end of her diary she writes that she is "surprised to find how liberal Congregational preaching has become," not only theologically, but also as regards matters of practical aspect. "Dr. Lyman Abbott preached; he said he hoped and expected to see women at the bar and in the pulpit, although he believed that these would always be exceptional cases." This was indeed a change from that protest arousing sermon to the graduates of a former president of the college, in which he characterized the duties which awaited them as duties of "the home, the church, and society," absolutely ignoring not only the other occupations which Vassar women were already taking up (including Miss Mitchell's own), but also the entire profession of teaching. It is a change as regards women which Miss Mitchell's life has probably done more to bring about than any other single event of the time. This she accomplished even more by what she was than by what she did. The secret of her power over those who knew her is justly described in the words of the present president of Vassar:

"But it would be vain for me to try to tell just what it was in Miss Mitchell that attract-

ed us who loved her. It was this combination of great strength and independence, of deep affection and tenderness, breathed through and through with the sentiment of a perfectly genuine life, which has made for us one of the pilgrim-shrines of life her study in the observatory of Vassar College, where we have known her at home, surrounded by the evidences of her honorable professional career. She has been an impressive figure in our time, and one whose influence will live."

Eliza Pinckney. By Harriet Horry Ravenel. With facsimile reproduction. Charles Scribner's Sons. 1896. 8vo, pp. xi, 331.

It was a happy selection to make Eliza Pinckney the first representative from a Southern colony among the women of colonial and Revolutionary times. Not only does she belong to a very early period of Carolina's history, but she lived through the Revolution and was closely identified with the material development of the colony. While much of the interest in the book is of a social character, there is even more of an economic nature, which is unusual in the case of a woman. Left in charge of three plantations when she was sixteen years of age, she managed the complicated business as well as could any planter; and, possessing a spirit of initiative united to great perseverance, she was keen to undertake new cultures, and brought most of them to a successful issue through many disappointments.

The earliest glimpse caught of this practical farmer was about 1740, when she was settled seventeen miles by land from Charleston, in the midst of six neighbors, with whom she lived in great harmony, and in charge of her father's plantations. What society existed, and it must have been little, was "genteel"; but the poorer people she describes as the most indolent in the world and very wretched in their poverty. In the city it was better, and the occasional visit of a warship—for the troubles with Spain and pirates kept the colony in a state of suspense—added a pleasant feature of social activity. For this our young lady had little time, and her schedule of occupations points to the engrossing tasks intrusted to her charge. She studied music, French, shorthand, and law; neglected no detail of the plantation, taught her negroes to read, and maintained an extensive correspondence on social and business topics. But her great passion was gardening, and it is her engrossment in agriculture that gives a more than ordinary interest to her life. Through her care the cultivation of indigo was introduced into Carolina from the West Indies. After some years of experiment a little success was attained, and, according to the custom of the day, a bounty was asked of the Provincial Assembly, and a second bounty of Parliament. To spite the French, who were then supplying England with this product, a liberal bounty was granted, and the culture spread through the colonies, giving what had long been wanted, a staple for export to be raised on the highlands. Rice alone had given a large foreign trade, but now indigo rose to great importance. She also attempted to grow ginger, cotton, lucerne, and cassava, planted a fig orchard, having first reckoned her "expense and the prophets" to arise, and laid out a plantation of oaks.

In 1744 Miss Lucas married Charles Pinckney, called Chief Justice, though he never received a royal commission, who served as the colony's agent in England. Two sons, Charles Cotesworth and Thomas, were the issue of this marriage, and both attained to prominence in public life. After fourteen years of married life Eliza Pinckney became a widow, and, having returned to America, devoted herself to agriculture and the management of the Pinckney estate until her death in 1793. It was a long and useful life, and more could be made of it from the economic standpoint than Mrs. Ravenel has made of the social. One statement made by the biographer deserves attention. She pictures American slavery as a great and beautiful missionary enterprise: "Conscientious people did their best to transform the cargoes of savages brought to their doors into the decent, capable servants whom we remember. Of their wonderful success it is needless now to tell. In 1861 the men of the Confederacy left their women and houses in safety under the care of the Christian people whom they and their forefathers had rescued from a barbarous heathenism." And she returns to the subject on a subsequent page, dwelling upon the charge committed to Southern women:

"They had to train and teach a race of savages—a race which had never known even the rudiments of decency, civilization, or religion; a race which, despite the labors of colonists and missionaries, remains in Africa to-day as it was a thousand years ago; but a race which, influenced by these lives, taught by these Southern people for six generations, proved in the day of trial the most faithful, the most devoted of servants."

It is natural to ask why, if the slave-trade was "a rescue," the missionary enterprise was finally condemned and disowned even by South Carolina itself? But the more curious process is to compare Mrs. Ravenel's quiet delineation of "the decent, capable servants" produced by slavery with the severe denunciations heaped upon that very class by her kinsman, General Thomas Pinckney (son of the lady whose letters she is editing), in his 'Reflections,' issued in 1822; and to contrast her delineation of the "Christian people" whom it created with the frank statements of another kinsman, Charles Cotesworth Pinckney, in his "Address before the Agricultural Society of South Carolina" in 1829. What if she had written, as he writes, "There needs no stronger illustration of the doctrine of human depravity than the state of morals on plantations in general"? Then, after describing the pernicious influences which surround the younger negroes, he adds: "Their advance in years is but a progression to the higher grades of iniquity." Is this the Christian people whom Mrs. Ravenel describes as the result of slavery, and is this the "wonderful success"?

What was thus said by prominent men of South Carolina was simply repeated from the other slave States. Bishop Meade, in 1834, urges the religious instruction of those in bondage on the ground that they are degraded and destitute. The Kentucky Union for the Improvement of the Colored Race in 1834 characterizes the colored population as "semi-heathen." The Rev. Charles C. Jones of Georgia, in his book on the 'Religious Instruction of the Negroes,' published in 1842, says: "Such a general corruption of morals as would blast the reputation of any white community is known to exist among them, and yet how unaffected are we by it! Indeed, the habit of our minds is to consider them in a state of moral degradation." The simple truth is, that no comparison can ever be made between what the negroes were in slavery and what they were, or might have become, in freedom, because the very existence of slavery, and especially that in this hemisphere, practically degraded all Africa. The general testimony of African travellers, from Mungo Park to Stanley, was that wherever an African tribe existed that had not been reached by the slave trade it was apt to be—as in case of the Yorubas—modest, honest, industrious, ingenious, even intelligent; but that where the slave trade had reached, it crushed out all these qualities and left what Mrs. Ravenel calls a race of savages. That many Southern women and some Southern men labored devotedly to ameliorate this state of things is conceded by all; and they had fortunately to deal with a peculiarly affectionate and trustful race with much natural religious or at least emotional tendency. But that the institution of slavery was in itself essentially demoralizing, both for black and white—this fact rests on too long a series of testimonies from slaveholders themselves to be now disregarded.

An Examination of the Nature of the State: A Study in Political Philosophy. By Westel Woodbury Willoughby. Macmillan. 1896.

Mr. Willoughby's work is based upon a course of lectures delivered at Johns Hopkins University. It is a systematic treatise in which the nature and "justification" of political authority are examined. The problem of the justification of the State or of human sovereignty is one of those questions, inherited from the middle ages, which have really lapsed into insignificance, though for every writer on government, especially those, like Mr. Willoughby, of a metaphysical turn of mind, it still has a good deal of fascination. The first 118 pages of the book are occupied with a careful examination of the various attempts made to justify the State; the work is very well done. The author shows that the State rests on no basis but its utility. Its remote historical origin we have no means of tracing; its divine origin is a mere assumption; the theory that it rests on consent or compact is contrary to fact. Moreover, when we ask what *right* has the State to infringe upon man's natural freedom, we are involved in the difficulty that there are no rights, in the strict sense of the term, antecedent to the State. All rights that we know anything about are either legal or moral. The right of the State to govern man cannot be derived from Law, for Law is a creature of the State. If it is a moral right, it must rest on the same basis on which all morality rests, and this must be either conscience, or divine revelation, or utility. Of course, consent has nothing to do with morality. Now, conscience will not do as a basis for the State, for conscience does not enlighten us further than to let us know that we ought to obey the State if it is right to do so; revelation answered only so long as a direct and miraculous connection was believed to exist between human and divine authority. This leaves nothing but utility as the basis for the moral right of the State to interfere with man's natural freedom.

The author's argument—the foregoing is our paraphrase of it—deserves careful study. The whole matter might perhaps be rendered clearer if the State were left out of view altogether, and the problem were stated in what are really its true terms. What justifies human authority of any kind over human beings? The State is only one constant and conspicuous form in which this authority is exercised. There are several others. To take

a very simple case—how do we justify the despotism of the captain of a ship on the high seas? It is by no means clear that all captains of all ships in all ages of the world have had this power. Travellers describing voyages on the Mediterranean and Adriatic to-day speak, we believe, of the want of authority in the captain as a noticeable fact. But the great maritime nations of modern times early introduced absolute despotism as the rule on the high seas, and the position of the captain is the same on the ship of a democratic country like the United States as on any other. Why? Simply because on no other plan can a ship be navigated with complete safety.

Civil authority rests on no other basis. By no other means except the knowledge that there is a reserve of human force at hand to put down disorder is order maintained. The sheriff and his posse, the police, the militia, the army and navy, are merely agencies for preserving order against either domestic or foreign foes. All this is perfectly clear when we rest government on a utilitarian basis. A hundred years ago the whole problem was still involved in the utmost obscurity, partly because speculation on such subjects was still in its metaphysical stage.

Mr. Willoughby does not seem to us to have altogether freed his mind from the influence of metaphysics. He continually personifies the State, and talks about its having a will of its own. This is metaphor; it is this sort of personification of the State as a human being which is at the root of much of the flimsiest Socialist speculation. A State is a person only in the same sense that the Erie Railroad, or the Mormon Church, or a city or county is a person. The State consists of the persons who carry it on, and consequently the question whether business which concerns the public had better be transferred to the State is not a merely abstract question, but also a practical one, depending on the conditions and nature of the business and the character of the persons who constitute the State. Should the United States take over the transportation business? is a question capable of discussion. But to determine whether an abstract State, produced in an abstract community, should take over an abstract railroad, is another matter. No doubt the *tendency* of the absorption of private business in general by the State is a matter which may be discussed with profit; we know from observation that the concentration of power in the hands of officials tends to produce certain results, that as a rule business is best managed if managed by those who are directly interested in it, etc.

Mr. Willoughby's examination of Austin's system (which he generally adopts), and incidentally of the question of the *location* of sovereignty, is interesting, though we cannot say he advances matters much. For ourselves we feel no logical difficulty in the view held by most lawyers that a State in this country is sovereign as to some *subjects* within the same territory in which the Federal Government is sovereign as to others. A more difficult question is, What do we mean when we say that any State is sovereign? Do we mean that sovereign power resides in its *government*, or in the electorate which produces the government? Austin says we mean the electorate. Mr. Willoughby would have us believe that sovereignty is exhibited whenever the "will of the State" is expressed. To us this seems pure personification. The will of the State is expressed by the sheriff whenever he levies an execution, but nobody would contend that the sheriff had sovereign power.

A History of Banking in All the Leading Nations. Vol. II. New York: The *Journal of Commerce and Commercial Bulletin.* 1896.

THE second volume of this great work contains three treatises. The first, on the History of Banking in Great Britain, is by Mr. H. D. Macleod, and the comparative importance of the subject makes it not unreasonable that it should occupy two-thirds of the volume. So far as the facts of English banking history are concerned, perhaps no more competent narrator than Mr. Macleod could have been employed, although we have not observed that he has brought anything of importance to light that had not previously been known. But those familiar with Mr. Macleod's works do not need to be told that he could not resist such an opportunity as this to display his peculiar theories of credit and value at inordinate lengths. As these theories are already accessible to the public in Mr. Macleod's other works, it seems injudicious on the part of the editor of this history to give so much space to their repetition. Fortunately, however, these theoretical discussions are assigned a place by themselves, so that the reader can study the facts of banking history without being obliged to deal at length with the Macleod theory of credit. Perhaps, however, we should say that this is by no means Mr. Macleod's opinion, and that he is nowhere chary of expressing it.

The second of these treatises, which is on Banking in Russia, is by Mr. Antoine E. Horn, late editor of the *Journal de St. Pétersbourg.* It is in agreeable contrast to Mr. Macleod's rambling dissertation, and is in every respect a model of financial history. We can only say of this brilliant essay that it records the results of the delusive theories of money and banking that have prevailed in Russia as everywhere else. There is literally nothing new in it; the absurd and disastrous and dishonest expedients that have been resorted to in Russia have been repeatedly tried, many of them in our own land. The demand of the Populists that money should be issued by the Government directly to the people on the security of land and personalty has been complied with, and with the results that might have been expected. The complaints and outcries of Mr. Bryan have been heard in Russia, and the adoption of the gold standard there has been opposed in language with which we are familiar. The course of the Government, however, in its dealings with foreign creditors has been on the whole honorable, in modern times even punctiliously so.

The third treatise, on the History of Savings Banks in the United States, by Mr. John P. Townsend, appears to us to be quite inadequate. Like Mr. Macleod, he indulges too much in theorizing and in moralizing, and his array of facts is not only meagre but ill arranged. While we cannot praise this essay as history, it is just to add that it contains a valuable collection of statistics and legal principles and requirements. The subject, however, deserves treatment by a writer possessed of more literary skill than Mr. Townsend displays.

Have Just Ready:

Bevier's French Grammar.

By LOUIS BEVIER, JR., Ph.D., Professor in Rutgers College. With Exercises by THOMAS LOGIE, Ph.D. 341 pp. 12mo, $1.00 *net.*

This is a French Gramma for the use of the older students in fitting schools and for colleges, presenting the facts of the language with reasonable fulness and with the greatest possible fidelity to scientific truth.

The Exercises are from the first arranged to secure continuity of thought and as much of living interest as possible.

Hertwig's General Principles of Zoology.

By Professor RICHARD HERTWIG of the University of Munich. Translated by Professor GEO. W. FIELD of Brown University. 226 pp, 8vo, $1.60 *net.*

Traverses historically the chief problems of zoölogy, and discusses the main generalizations of the science without any detailed survey of the animal kingdom. Contents: History of Zoölogy, General Anatomy, General Embryology, Inter-relations of Animals and Plants, Geographical Distribution of Animals.

"*It contains the most comprehensive, readable, and critical summary of the main generalizations of zoölogical science now accessible to our students in the English language.*"—S. A. Forbes, Director of Illinois State Laboratory of Natural History.

"*I do not know of a more satisfactory presentation of its subject-matter.*"—Professor Jacob Reighard, University of Michigan.

"*To any reader who desires to become acquainted with the general principles of Biology, as to-day these are understood, I do not know where else these can be found so well set forth as in Professor Hertwig's book.*"—Professor G. H. Perkins, University of Vermont.

"*It is by all odds the best work on general Zoology in the English language.*"—Professor H. B. Ward, University of Nebraska.

"*I regard it as one of the clearest presentations of the matters discussed that we have in any language.*"—Professor J. S. Kingsley, Tufts College.

THE BOOKMAN.

AN ILLUSTRATED LITERARY JOURNAL.

The October number, ready to-morrow, contains:

JOHANNA AMBROSIUS. By Frank Sewall. This paper considers with great perspicuity and painstaking the claims of Johanna Ambrosius to be ranked as a great poetess, and contains a number of very interesting examples of her verse.

THE GENTLEMAN IN AMERICAN FICTION. By James Lane Allen, author of "A Kentucky Cardinal," "Aftermath," etc. A suggestive paper, deploring the absence, in American fiction, of any preëminent examples of the type of a gentleman.

THE NEW ENGLAND PRIMER. By Paul Leicester Ford, author of "The Honorable Peter Stirling," etc. This is perhaps the first account which we have had of the origin, authorship, and vogue of this remarkable primer, which, for so many years, was the most potent influence for good in the hands of New England parents and teachers.

A STORY by Ian Maclaren, author of "Beside the Bonnie Brier Bush," "The Mind of the Master," etc., etc., etc. A continuation of this author's first long novel.

PORTRAITS of Stopford A. Brooke, Anthony Hope, Clement K. Shorter, Johanna Ambrosius, etc., etc.

POETRY by Harry Thurston Peck, Paul Lawrence Dunbar, Louise Imogen Guiney, Stephen Crane, John B. Tabb, etc., etc.

A LETTER FROM PARIS by Robert H. Sherard, reviewing the current literary topics of the French capital.

CHARLOTTE BRONTE. An account by W. Robertson Nicoll of Clement K. Shorter's important work on the "Brontes."

REVIEWS OF RECENT BOOKS by Francis W. Bourdillon, H. C. Bunner, Laurence Hutton, Mrs. Betham-Edwards, etc., etc.

The Bookman is for sale on all news-stands, or will be sent, post free, on receipt of 20 cents for single numbers, or $2.00 for annual subscriptions.

No person laying claim to culture and wide reading can afford to be without it.

THE BOOKMAN, 151 Fifth Avenue, New York.

Rare American Periodical.

American Museum, or Repository of Ancient and Modern Fugitive Pieces, etc., Prose and Poetical, 12 vols, 8vo, recently half bound in morocco, very neat and substantial, Philadelphia, 1787-1792, 12 vols., $50.00. Complete sets of this once very popular periodical to which everybody in the early days of the Republic subscribed are rare.

The subscribers are classed under their respective States. This subscription is from Virginia: "His Excellency, Gen. Washington, late commander in chief of the armies of America, marshal of France, etc." Most of the honored names of the Revolution are on the list, which includes Signers of the Declaration of Independence, Statesmen, Soldiers, Divines, and Ambassadors to the Republic.

We have not seen a copy offered for sale in many years.

The Nation.

NEW YORK, THURSDAY, OCTOBER 1, 1896.

The Week.

THE New York Life Insurance Company's canvass of the political situation in the several States, by means of 12,000 letters from its own agents and correspondents, is but the latest of many such extra-political attempts to read the signs of the times. Like all the others, it points to the undoubted and emphatic triumph of the honest-money forces. The reason for this unusual interest of business men in the campaign is on the surface. Not even the Presidential election of 1860 was felt to be so momentous for the business of the country as is that of this year. If business men, bankers, employers, investors, captains of industry —all men with a stake in the stability of the country in the shape of a piece of property—have been stirred into extraordinary activity in this political contest, it is only what the nature of the campaign has compelled them to. Their eagerness to forecast the result is only the eagerness of men who have to plan their business operations, their manufacture of goods, their purchase of raw materials, their loans, months ahead. The general picking up of business and industry since the Maine election, together with the accumulating evidence of the utter demoralization of the Democratic canvass, prophesy eloquently of the prosperity the country may hope to enjoy in case the Bryanite assaults on property and confidence are beaten back crushingly.

Senator Butler, chairman of the Populist national committee, admits that the supporters of Bryan have no hope that he will get any electoral votes from Maine to Ohio, and the most that he claims for Delaware and Maryland is that they are in the "probable" column; which is a virtual admission that he expects them to go for McKinley, as does every intelligent observer. It is thus clear, weeks before the election, that the Populist candidate for the Presidency stands no chance in all that part of the country between Canada on the east and north and the Alleghanies, and the Potomac River on the west and south. This region casts nearly one-third of all the electoral votes —128 out of 447—and every Democratic candidate for President since the Republican party was formed has received some of these votes, even the party collapse during the Greeley campaign leaving Maryland outside the wreck. Four years ago the Democratic candidate carried five of these eleven States, which cast 63 electoral votes out of his total of 277 in the whole country.

The way in which the silverites have hailed Bismarck's coming to their rescue shows how willing they are to forgive one of their deadliest enemies, even without a hint of repentance on his part. They are none too scrupulous about the version of his letter they have used, or about the interpretation they put upon it; but, supposing that they were beyond reproach in these respects, what have they to say of Bismarck's record as "a friend of silver"? Do they attach more weight to what a man says out of office than to what he does in office? Talk of our criminals of 1873, they are the veriest pigmies beside Bismarck. Our criminal demonetization of silver affected less than $10,000,000, while Bismarck, in the course of seven years, demonetized the gigantic sum of $270,000,000, of which he actually and brazenly melted down $160,000,000 and sold it as bullion. Moreover, as we have been so often told, he did this hand in glove with our own conspirators. It was all a part of the huge conspiracy of the money power throughout the world. Bismarck was chief conspirator. His wickedness and malignity have been exposed over and over again by silver-tongued orators. Yet they now greet him as a brother in the silver faith, never suspecting, as less simple-minded mortals would, that his present desire to see something done for silver is due to a thrifty wish to get a higher price for the $107,000,000 of the article his country still has on hand and for sale. Never was there such joy over one sinner that repenteth not.

The funniest part of all is the way in which Bismarck's allusions to the suffering "farmers," as compared with the "drones," are taken to fit our case exactly. Bismarck's farmers are the great monopolistic landowners, Count Kanitz and the other leaders of the Agrarian agitators. They are the men who have tried to get up a war with Russia in order to retain their agricultural monopoly, and have succeeded in getting up tariff wars with Russia and the United States as well. It is to their efforts that is due the despite done the American hog in Germany, of which our Western farmers have complained so bitterly. These monopolistic, anti-American princes, counts, herzogs, and oberconsistorialraths are the suddenly discovered friends and fellows of the downtrodden American farmer. And yet there are some serious and sad-eyed citizens who deny that there is anything comic in this campaign.

The irregularity of the "regular" Democrats of New York State makes it somewhat difficult to follow their movements. It is never safe to assume in the morning that they will have a candidate for Governor in the field in the afternoon. They nominated Thacher knowing perfectly well that he had spoken against silver a few months before. They say that they did so thinking he would recant and come out for silver. He first wrote a letter saying he would accept, but he could not recant, though he could vote for Bryan. This they declared would not do, whereupon he wrote a second letter saying he could not accept because he hated free silver so incurably. They say they were "buncoed" by Thacher's friends, and that Senator Hill was the chief of their deceivers. Their latest choice is Wilbur F. Porter, and it is asserted with much confidence that he stands squarely upon the Bryan platform and is in no danger of repudiating it. Mr. Hill is credited with the selection and Tammany is satisfied with it. There was some natural regret that Mr. Danforth was not chosen, for he seemed to have special qualifications for the place. He helped count the illegal election return which enabled the Hill machine to steal control of the State Senate. Hill would have been forced, by ordinary gratitude, to support his candidacy, and the possible peril of Hill's support of Mr. Griffin would thus have been warded off, while the Hill machine would have been held together for the grand smash-up which awaits it in November. It is now thought that Mr. Black's majority will range from 250,000 to 300,000.

Not least among the factors now at work to checkmate the free-coinage agitation is the advance in wheat. A movement of this kind, based on entirely natural causes, and not on a shortage of the crop in the United States, has long been recognized by expert judges as a political influence of the first importance. Especially is this true of the present political campaign. Senator Teller and his associates have for months been declaring to the farmers that, under the gold standard, the price of grain not only cannot rise, but is bound to fall continuously. Mr. Bryan has supplemented this declaration by his assurance to the farmers that the retirement of redundant currency into the Treasury, under the loan of February, is certain to depress still further the price of every product. What are these gentlemen to say, now that the price of wheat advances? Friday's market touched a price nearly 9 cents per bushel above this year's low level, and 8¾ cents above the ruling price of a year ago this week. It is true, the outlook for the crop in some of the wheat-producing States is less favorable than it was two months ago. But the deterioration nowhere reaches to actual disaster, and the advance in price is all the more signi-

ficant in that it comes at the very time when growing confidence in the defeat of the Chicago ticket has caused an unmistakable improvement in every branch of industry.

The intelligent farmer knows perfectly to-day that well-sustained credit in the trade community generally plays no small part in finding a profitable market for his wheat. If grain is thrown upon the market through the urgent necessities of sellers, it must go at a sacrifice. This happened, as every farmer knows, during the three months' panic of 1893, within which time the price of wheat dropped 13 cents per bushel. It happened during the panic of 1873, when wheat fell 20 cents or more within the same period; in 1857, when the price dropped 60 cents along with the collapse of credit. No one has ever questioned the connection between the break-down of business confidence in these periods and the forced sales of grain at heavy sacrifice. But if this is once admitted, it must equally be conceded that restoration of public confidence and credit to a normal basis means, all other things remaining equal, a recovery from such declines. Such a recovery has in fact been witnessed invariably, in a greater or less degree, when trade depression has found its remedy. That the overthrow of Mr. Bryan and his party would serve in this direction, cannot be reasonably doubted. Such an event will not correct the normal influence of increased or decreased supply—nothing can offset that. But it will certainly bring to the agricultural producer precisely the benefit which it brings to every industry throughout the country.

Added evidence that the farmers of the middle West differ not materially from their fellows in Maine and Vermont in their views on money obligations and national finances, is furnished in a unique poll conducted by a Chicago firm of farm-loan negotiators. It was unique in the fact that it was limited to farmers who are mortgageors—the class of voters to whom Bryan has looked most confidently for support, and for whose alleged benefit he would split the mortgage-paying dollar. The result is what might have been expected except by those who have been too ready to believe that the farmers, as a class, are willing to be dishonest by statute. On the books of the Chicago firm were the names of 4,000 farmers in Illinois, Minnesota, Nebraska, Iowa, and Missouri, who are borrowers of money secured by mortgages. Each was asked to indicate on a postal card how he intended to vote this fall, and, to make the poll a secret one, each was instructed not to place his name on the card. Of the 1,267 who have answered thus far, 979 will vote for McKinley, 186 for Bryan, 48 for Palmer, and 33 for the Prohibition nominee, 21 being undecided. Eighty out of each hundred of these mortgage-"afflicted" farmers declare for sound money. A much smaller ratio than this through the farming districts of the West would roll up a phenomenal majority against the Chicago repudiationist. Of the number declaring for McKinley, 49 write that four years ago they voted for Cleveland; the sound-money Democratic vote thus splitting about evenly between the Republican and the Indianapolis nominees.

In the *Journal* of Tuesday morning was a picture of Lord Russell and his wife sitting in a box listening to Mr. Black's speech at Carnegie Hall. Lord Russell was not there. The picture was an invention, a harmless one, perhaps, but still an invention. It is not too much to say that two-thirds of the newspaper pictures are of the same character—that is, lies about somebody or something. Most of these lies do not do direct injury to any one. They seldom represent anybody in a discreditable position. The way they are injurious is in leading people not to care whether anything they see in the papers is true or not—in diffusing, in fact, the general feeling that it makes no difference whether printed news matter ever describes what really happened. As this news matter is the chief reading of the people, the land is gradually getting covered with an atmosphere of unveracity which certainly must have some connection with our enormous number of business frauds and defalcations. Lying is at the bottom of nearly all, and a man who has read newspapers for some years must get into the way of thinking lying a small matter. How this matter progresses may be inferred from two things. Fifteen years ago the forgery of extracts from foreign prints would never have been dreamed of as a legitimate device by managers of political canvasses. During the last three Presidential campaigns it was freely used by the friends of a high tariff, and their committee rooms sent out great bundles of sayings of English newspapers which were manufactured on the spot. This year the Popocrats have gone into the business, and even Senator Teller gravely repeated on the stump a wholesale forgery of a passage in the report of the Royal Monetary Commission.

The Bryanites are still clinging to that London *Financial News* forgery, but their falsehoods about it are very clumsy. As originally put forth, the forgery purported to be an extract from the *Financial News* of March 10, 1896. When on August 13 that journal published an emphatic declaration that no such article had ever been printed by it, either on March 10 or at any other time, the Bryanites asserted that they would prove the genuineness of the extract, which had come to them "certified by a London clipping agency," by producing the copy of the paper from which it was clipped. A short time later they announced that all their efforts to obtain a copy had been fruitless, that "no newsdealer has it, and the publishers announce that it is out of print." The conclusion which they drew from this state of things was: "The *Financial News* claims a circulation of 1,500,000, which makes the sudden and complete disappearance of the issue of a certain date all the more mysterious and wonderful. The common mind immediately concludes the issue in question has been called in." We supposed that this settled the matter, but we are now in receipt of a broadside, sent out from the Bryan headquarters in Denver, in which it is asserted that the "Democratic headquarters has now in its possession a certified copy of the article in question, clipped from the London *Financial News* of April 30, 1894." No explanation is given of this sudden change of date, but as final "proof of the authenticity of the publication" it is added that "Senator Teller of Colorado states that more than a year ago he was shown and read a copy of the London *Financial News* of April 30, 1894, containing the identical editorial." It is not worth while to chase this forgery any further, for forgers who can shift their dates two or three years without offering any explanation can be trusted not to do much harm among intelligent people. The Bryanite broadside upon which we now find it, gives almost an entire page to the repeatedly exposed forgery of a letter from "J. Francis Forsythe, banker, of No. 11 Wall Street." There is no such banker in existence, and the letter is a stupid invention from beginning to end.

The demise of the daily newspaper which Croker established a few years ago in order to give himself and the other Tammany leaders the pleasure of seeing themselves spoken of in complimentary terms as statesmen and thinkers, ought to serve as a warning to other like adventurers into the field of journalism; but it will not. The *Mercury* began life as a Tammany organ and met its death as a silver organ, passing from public view in a perfect cloud of bad debts and bad language, everybody concerned accusing everybody else in any way connected with it of swindling and lying. What the total loss on the venture has been, from the beginning to its death, nobody will ever know, but it reaches many hundred thousands of dollars. Nobody was ever benefited a penny's worth by it, and a more foolish waste of money could not be imagined. Yet it is only one of an innumerable list of ventures of the same kind which have been made during the past half-century, and will continue doubtless to be made during the next half-century. There are several of them struggling with death at this moment, at great daily expense, in the hope of getting on a paying basis at least

for a sufficient time to be sold out to somebody who is rich enough and vain enough to wish to "control" a personal organ. The public cares nothing for them, save as a temporary amusement. If they have a fine page of "crime" each day, or some other sensational "feature" which is in its way more alluring than other papers have, they may keep up a struggling existence for a time; but unless there be a silver mine or some other equally inexhaustible fund behind them, their fate is certain. They must go down, as the *Mercury* has gone, leaving behind them a lot of unpaid bills, forcing a considerable number of old and new journalistic experts "on to the sidewalk," and sending some of their chief promoters to jail under charges of swindling and other offences.

The English press is rather angry with the American public for not taking the great dynamite conspiracy more seriously. But the trouble is that the conspirators do not seem to be serious people. The *Daily News* account says: "Tynan passed Saturday evening in the bar of the Hotel Folkestone discoursing on politics and drinking very freely. He offered to stand drinks to different persons who entered the bar, and it was remarked that he was spending money very lavishly. He retired to bed intoxicated about two in the morning." Now we would ask respectfully whether this is the way desperate conspirators, with awful secrets to keep and dreadful designs on foot, pass their time. Do they make themselves conspicuous and talk politics in hotel bars? Do they get drunk nightly and go to bed about two A. M.? This used not to be their custom. They used to be quiet and reticent, and to avoid observation. If they had a tunnel to make, as Tynan had, across one of the principal streets of London, in order to blow up a palace and two royal families, they kept as much as possible out of the way of the police, and avoided liquor like poison. The reason they avoided liquor was that persons in liquor blab their secrets, or, as our phrase is, give themselves away freely, and nobody knows this better than dynamiters. Drunkenness is speedy ruin for them. It is the readiness of Tynan and Bell to take too much and to exhibit themselves as important personages, which has spread doubts here as to their being as dangerous as our English friends would have us believe. It may be all as described, but if so they are a new variety of the assassin, and not a quarter as dreadful as the old one. Drunken conspirators, charged with extensive tunnel excavation for explosive purposes, would be something novel in the annals of crime.

The late Trades Union Congress at Edinburgh has attracted in other countries less attention than it deserves, but it has made a very important change in the workingman's movement. In the first place, it rigidly restricted the size and has sobered the character of the body, by admitting only 340 delegates who actually represented working unions. This has shut out mere orators or men mainly orators like John Burns, and collectivists like Tom Mann and Ben Tillet. In fact, hardly any of the old agitators made their appearance, and politics was kept strictly subordinated to business. The committee on Parliament reported against the Ministry on the subject of its insufficient conciliation bill, its timid amendments to the stewardship bill, the failure of its mining legislation. In fact, it intimated that it had not fulfilled its preëlection promises. As there is no chance of the Liberals coming in, however, for five or six years, there was not much use in comparing the parties. The President, Mr. Mallinson, an Edinburgh shoemaker, made a strongly anti-Socialist address. He said the Socialists were very good in pointing out evils, but did little to suggest remedies. The result was a decided change in the position of the body. In 1893 it voted by a good majority that no parliamentary candidates should receive support who were not collectivists, and at Norwich, later, that the land and money should be "nationalized"; and Keir Hardie carried an amendment that "all the instruments of production, of distribution, and of exchange" should be nationalized also. At Edinburgh this year, they refused to go further than the nationalization of the mines and railroads. The congress also refused to vote for the payment of the electoral expenses of labor candidates. It also demanded the democratic reform of public education, in the direction of "equality of opportunity" for everybody.

The poverty of the English clergy has lately been the subject of vast numbers of letters to the London newspapers, and of much public discussion. As to the fact of the serious cutting down of clerical livings, in consequence of the decline in the value of Church endowments, there can be no doubt. At the last Church congress it was stated by the Dean of Norwich that 400 beneficed clergymen of the Church of England receive less than $250 a year, 3,500 less than $500 a year, 7,000 less than $650 a year. Yet the standard of clerical education and style of life has not been lowered, nor can it be, apparently, in the Church of England, where every clergyman is still expected to live like a gentleman. His daughters, as some of them have sardonically remarked, are expected to marry only with the gentry, though provided with neither the means nor the opportunities to make such marriages at all common nowadays. No effective remedy emerges in the course of the discussion—the one most in favor being a large sustentation fund upon which the poorer clergy may draw. When asked why the parishioners themselves do not come to the rescue of their distressed rectors, as the dissenting churches support their ministers without any endowment whatever, the Church organs give a rather involved answer. Such methods will not do for the Church of England, it is intimated, which is bound to keep a clergyman even in remote and unprosperous districts, where little or no money for his salary would be forthcoming. This seems, however, only a roundabout way of saying that the poorer folk in England have not exactly that enthusiasm for the Church that they have for their chapels. Doubtless, too, the fact that they have never had to contribute to the support of the Church makes them a little slow about beginning. The suggestion is sometimes made that the enormous incomes of the higher clergy might well be cut down for the benefit of their poorer brethren; but this is based on a misunderstanding. The incidental expenses of the fatter bishoprics are so great that it often requires a private fortune in the incumbent to support the dignity of the position. It was Tait, we believe, who, after his elevation to Canterbury, said he was glad to meet the Queen, as she was the first person he had encountered since being enthroned who had not asked him for some money.

Sir Joseph Lister's presidential address at the opening meeting of the British Association on September 16 was entirely devoted to illustrations of "the interdependence of science and the healing art." Departing thus from the usual custom of giving a survey of the entire field of scientific investigation and discovery, he confined himself to his own specialty. Yet for that very reason his account of the way physical and biological research and chemical analysis had advanced hand in hand with surgery and medicine was all the more impressive. Beginning with the Röntgen rays, he expressed the opinion that as yet only a start had been made in the application of that remarkable discovery to the work of the surgeon and the physician. The labors of Pasteur and Koch and of Lister himself in the study of fermentation and infectious diseases and antiseptic treatment are an older story, yet their summing up in the address serves to mark in telling fashion the great gain to humanity which has resulted. Sir Joseph lent the weight of his authority to a hearty endorsement of the anti-toxine cure for diphtheria—that achievement of Behring and Kitasato which was one of the most masterly pieces of purely scientific work, without any accident about it, ever done. When we add the light thrown on the defensive apparatus of the human system against disease by the remarkable researches of the Russian Metchnikoff on the white corpuscles of the blood, we get a total borrowing of medicine from science which is striking enough when thus massed.

THE ORIGINAL CURRENCY-TINKERS.

It is not amiss to point out to that portion of the public which has been profiting by the "campaign of education," that although the subject of currency appears intricate, it is not really the subject, but the history of the subject, which makes it appear so; and its history is chiefly the history of the experiments made in currency by various governments. Governments have in all ages been trying to do something to currency, either because they thought they could make something by meddling with it, or because they thought they knew more about it than anybody else. In other words, they have been all trying to do every now and then the very thing which the Bryanites are trying to do. The Bryanites are simply engaged in what the monarchs have been engaged in since the earliest ages—seeing whether something could not be made for somebody, by either adulterating money or in some manner altering its value.

The monarchs saw that everybody wants money, that nothing can be done without money, that everybody either owes or is owed money, and it, of course, occurred to them at once that something might be made out of "handling" anything so generally necessary. They accordingly have always been doing what we call "monkeying" with it. Sometimes they clipped a little off of the coin. At another they put more alloy in it. At others they made the coin of different metal. At others they changed the name of the coin, or changed its value, or called it by a different name. At others, as in the case of Wood's Pence in Ireland, they sold somebody the privilege of making some kind of money to suit himself. They were able to do all this because they had the people "cornered" by the laws against counterfeiting. The counterfeiters were always dreadful fellows, and were hanged whenever caught, though they were only trying to do what the monarchs were doing themselves—that is, trying to make something by supplying people with a medium of exchange. As a general rule it is the account of these things which makes currency seem mysterious—how at one time so-and-so tried paper money, how so-and-so tried clipping and "sweating," how another tried adulterating, and so on, and what followed.

It is a melancholy chapter in human history, and we must not pretend that the people never fell in with the monarch's delusions, and that he always succeeded in "fooling" them, and that they did not join him in trying to fool somebody else. But for the most part tricks with the currency have been confined to the governments. If the matter were left to the plain people, currency would really, as far as gold and silver and copper are concerned, have hardly any history at all, because what is desired by the mass of plain people, who are honest and are trying to earn their bread by the sweat of their brow, is simply a standard of value, something with which to measure the exchangeable value of other things. If these people had always had their way, they would simply go from one metal to another, in search of stability, not in search of an advantage over somebody else. They would not say, "My case is a hard one; I am not so well off as I used to be. I had better cheat some one, and the easiest way to do it is to steal into the Government Office, and shorten the yard measure or diminish the quart pot." It is when men get power, not simply when they are hard up, that they think of these things.

Consequently what we are witnessing in this country is simply an attempt on the part of Democracy to do what monarchy used to do for its own benefit. Finding that monarchs had legal tender and made a good thing of it, it must have legal tender too. Finding that monarchs used to make money out of paper, or leather, or anything that came handy, Democracy must make money too. Finding that monarchs had given out that nothing could be money unless they put a stamp on it, and that whatever they stamped was money, no matter what it was called, Democracy declared that it must have the same powers and privileges. In fact, the Supreme Court put this into the heads of Democracy by the legal-tender decisions. The court said: These old kings always made money when they wanted it. They said it was all "shucks" to say that money was simply a measure of value, and that no one had any right to manufacture it for his own profit; what was the use of being a Government if you could not manufacture it? What was called "sovereignty" necessarily included the money-making power, and if you could not make money, where was the sovereignty?

The Bryanites have learned this lesson thoroughly. They want to be sovereigns and get hold of the sovereignty, not for the benefit of their health, but to make something to "square" things. The power, they say, has passed to the people, and the people are not going to spend it on "toys, or lust, or wine." They are going to use it to enable every man to grow rich. Poverty has lasted long enough, and so has the use of collateral in making loans. What the Government now calls money will be money, and the hateful custom of loans will disappear from the earth. Why borrow when you can make? When a citizen feels "short," far from going to a banker and cringing for "accommodation," he will go to a printing-office, and say what sum he needs. This would at once bring about that equality of conditions for which the world has been sighing for ages, and would abolish taxation as well as loans, and then every dealer could charge what he pleased for his wares. It would be all one to the consumer whether he paid fifty cents or one hundred dollars for a watermelon, or five cents or a million for a pair of trousers. The only monetary difficulty would be the difficulty of transportation; but even this could be got over by raising the denominations, and printing notes of one million or one billion.

THE FAILURE OF FUSION.

Five weeks before the election, the Populist candidate for Vice-President proclaims the failure of the fusion which was the sole hope of Bryan's success, and virtually gives up the fight. In a despatch to the *World* of Monday, Tom Watson, with that characteristic disregard of the conventionalities which makes him so entertaining a public character, admits the utter collapse of the campaign for free coinage, and shows why this result was the inevitable consequence of the course that has been pursued.

A new political organization can be built up to success only by its devotion to some principle which attracts men who had been adherents of other parties until it includes a majority of the voters. This was the way in which the Republican party grew into complete dominance. Its founders made opposition to the further extension of slavery its one great aim, and all who sympathized with that aim were impelled to support the Republican party as the only way of accomplishing the desired result. Watson evidently believes that this is the sole way of making a new idea prevail, and he is quite right about it—although, of course, not every new idea which is pushed in this legitimate manner will succeed. The other way of building up a new political organization is by trades with existing parties or sections of parties. This was what the Greenback managers attempted when their idea had secured a wide vogue, nearly twenty years ago. Watson thus describes the result:

> "The Greenback party represented substantially the same principles for which Populism now stands. Its growth was sudden and colossal; its death was swift and sure. Springing up as a protest against both the old parties, its power increased as long as it kept the straight middle course and compromised none of its principles. The moment it began to fuse with the old parties and to put faith in the pledges of its political foes, it fell, never to rise again."

The Populist candidate for Vice-President declares that "Populism was but a second attempt to throw off the evil domination of the two old parties"; that "its cardinal policy was the union between South and West"; and that "the one thing absolutely necessary to the completeness of this union was that Populists should steer clear of both the old parties." What has actually happened this year has been the very opposite of this policy. The Democrats at Chicago, according to Watson, "purloined our platform, and nominated for the first place on the ticket a brilliant young man whose record and creed were more Populist than Democratic," while for second place a

man was named of whom most of the delegates had not heard before, and of whom "the more they learned after getting home, the greater was their inclination softly to swear." Shrewd Democratic managers arranged a "deal" with certain Populist leaders of the West before the meeting of the Populist national convention, by which "the Populists were to have the local offices, and the Democrats the national vote." But the convention, by nominating a Populist for Vice-President in advance of the Presidential nomination, served "notice that, in the proposed partnership between Democracy and Populism, Populism intended to be one of the partners." Nevertheless, Chairman Jones of the Democratic national committee concealed Bryan's telegram that he would not accept a Populist nomination unless Sewall were also nominated, and permitted the nomination of Bryan and Watson without protest; the Populists believing that the Democrats would meet them on half-way ground, withdraw Sewall, and unite the silver forces of both parties by naming a representative of both on the national ticket.

Watson believes that, "if the Democratic managers had recognized the necessary conditions to complete political union and accepted the compromise we offered, the fight would now be won." But a very different policy was pursued:

"Instead of meeting the Populists half-way and making them feel a hearty interest in Democratic success, they did everything possible to dissatisfy, discourage, and arouse the suspicions of the very men whose votes were essential to victory. Intent upon destroying Populism at the South and absorbing it at the West, the Democratic managers made the mistake of supposing that any deal they could arrange with our 'leaders' would be cheerfully supported by the rank and file. Hence fusion has become a sort of craze, like the chewing-gum habit, and there has been such a swapping and trading around of votes and offices as was never seen before. From the county tickets clear on up to the Presidency, the science of politics has been reduced to the good old business rule of 'How much have you got?' and 'What will you take?'"

Watson describes the absurdities to which this policy has led, among them that "in one State of this great and glorious Union the fusion goes half the distance between Populists and Republicans, and the other half between Populists and Democrats." The results of all this sacrificing of principles and trading of expected offices are thus graphically stated:

"Fusions of this kind are enough to give the man in the moon the jumps. As a grave-digger for Populism, fusion with Sewall on the ticket may as well be recognized as a distinct success. If not disturbed in his work, the digger will have the hole ready by the time the funeral procession arrives.

"I respectfully warn Mr. Chairman Jones of the danger Mr. Bryan is in. The Populist voters are dissatisfied and suspicious. They feel instinctively that the fusion policy which compels them to vote for Sewall is the beginning of the end of the People's party. They feel that the principles they love are being used as political merchandise, and that the Populist vote is being auctioned off to the highest bidder. They suspect that Populism has been bought and paid for, and is now being delivered to those who bought it. Is the full Populist vote necessary to Mr. Bryan's election? If so, the sooner Mr. Jones realizes that it cannot be had under any arrangement which compels the Populists to make a humiliating surrender of their principles in voting for Sewall electors, the better it will be for our campaign. Under present conditions Mr. Bryan cannot get the full Populist vote.

"Populist voters are men who have educated themselves on political topics. They will not stultify themselves by voting against their convictions. They will not vote for a man who, if Mr. Bryan dies, will make us another President after the fashion of Grover Cleveland. They may not be able to break up the fusion deal, but they can stay at home."

Sewall will not get off the ticket. He took occasion to assure the Bryan Democrats in Boston on Friday night that he was "still on the ticket," and that "you will have a nominee for Vice-President during this campaign, and he will not decline." Sewall believes, as he declared a few days ago, that "there could be no surer way of making Bryan's defeat certain" than his withdrawal, and he is probably right. There would then be no pretence of Democracy about the so-called Democratic ticket, since Bryan's "record and creed," as Watson says, "were more Populist than Democratic"—although Sewall, the believer in high protection, is not much of a Democrat himself.

The fusionists thus approach election in a state of utter demoralization, from which recovery is impossible. Each of the parties which entered into the fusion is disgusted with the other, and hundreds of thousands whose votes were counted upon by the traders will stay away from the polls. The result will thus prove a deserved defeat of those who sacrificed principle in the delirium of a surrender to demagogism.

THE ENGLISH HUMILIATION.

THE BERLIN TREATY.

"The Sublime Porte undertakes to carry out, without further delay, the improvements and reforms demanded by local requirements in the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and Kurds. It will periodically make known the steps taken to this effect to the Powers, who will superintend their application."

THE ANGLO-TURKISH CONVENTION.

"In return, his Imperial Majesty promises to England to introduce necessary reforms, to be agreed upon later between the two Powers, into the government and for the protection of the Christians and other subjects of the Porte in these territories; and, moreover, to enable England to make necessary provision for executing her engagements, his Imperial Majesty the Sultan further consents to assign the island of Cyprus to be occupied and administered by England."

WE place at the head of this article a section of the Treaty of Berlin, and one of the Anglo-Turkish Convention concluded between England and Turkey before the Treaty of Berlin. It will be seen that the Porte is, under the treaty, bound to all the signatory Powers to reform "without further delay," and to report periodically in detail what it is doing. Under the convention with England concluded by Disraeli and Lord Salisbury, the Sultan agrees separately with England to do the same thing, in return for protection promised him by England, and, to help England in preparing for this protection, assigns her the island of Cyprus. As one Englishman has remarked: "We have got the island of Cyprus, but the Armenians are mostly dead."

It will be seen from this that England has no more solemn engagement than her engagement to protect the Armenians and enforce reforms generally in the Turkish Empire. In fact, she has no engagement half so solemn. She put no ifs or buts into it. Mr. Gladstone underwent gross abuse at the hands of the Conservatives for making peace with the Boers after Majuba Hill, and for not rescuing Gordon; but if the worst construction that could be put on his conduct in these matters were true, his offences would be peccadilloes compared with the attitude now occupied by the Government with regard to the Christian population of Turkey. His very weakness was stronger than Lord Salisbury's strength. He fought two battles with the Boers, and tried to get to Khartum, merely for humanity and glory, but Lord Salisbury is allowing the greatest savage in Christendom to ridicule and violate under his nose the very agreement which he came home and told the English people was "peace with honor." There is peace, certainly, but, shades of Cromwell and Pitt! what about the honor?

The excitement in England, and in fact all over Europe, is growing every day. An immense meeting was addressed by Mr. Gladstone in Liverpool on Thursday, and his voice rang as clearly for justice as it did at the time of the Bulgarian massacres twenty years ago, when, too, the Conservatives were trying to poohpooh them. Part of the action he proposes to take against "the great assassin" is to withdraw the British Ambassador from Constantinople. Withdrawing an ambassador is the equivalent of "cutting" in private life; but any one who proposed simply to "cut" an assassin would be laughed at. The withdrawal of the British Ambassador, unless it were a preliminary to war, would probably delight the Sultan, as it would diminish the number of his critics, and he would go on killing with renewed vigor. It is just to Mr. Gladstone to say that he explicitly means it to be a preliminary to war.

From his own coreligionists the Sultan would meet with no disapproval. The only fault they probably find with his course is his tardiness. They think he ought to have killed all the Christians long ago. In fact, Europe, after fighting and praying against the Turk for four hundred years, is looking calmly on while he perpetrates horrors from which his predecessor, who captured Constantinople in 1453, would have recoiled and did recoil. We think with a shudder of the

massacre of St. Bartholomew—that is, the slaughter of his own subjects by a sovereign on account of their religion, three hundred years ago. We are witnessing to-day precisely the same thing, on a scale compared to which St. Bartholomew seems a mere street riot. Nothing like what is now going on in Turkey has happened since Tamerlane. It far outdoes the Greek horrors, for the Greeks resisted, arms in hand, and died fighting and killing their tyrants. The present victims fall like sheep and oxen, and nearly a thousand have fallen for every Greek who fell. It is something appalling when one thinks of it as occurring in the presence of Christian Europe, which has 5,000,000 of men under arms, and which could crush Turkey like an egg-shell.

What Lord Salisbury expects us to believe is, that the other Powers would go to war with him if he were to say that he made no pretence to possess and keep Constantinople or any portion of Turkey; that if he occupied any portion of it, it would be held in trust for united Europe and would be disposed of by general agreement, but that he could not stand by quietly in the presence of these horrors any longer; that he must stop wholesale massacre of unarmed men, women, and children; that monsters could not be permitted to go unchecked in the nineteenth century; that, come what might, Great Britain would stop wholesale murder. We do not believe it. But if any Power chose to go to war for such a reason, an English Minister ought to be able to answer, Let war come, and God defend the right. In a war like this man would, in the highest sense, die for man. In the long list of fratricidal contests in which our race has been engaged, there was not one which could be so boldly called a just war. A really great Minister, a man of firmness and courage, would not hesitate long in reaching such a decision. The foolish message of the Emperor of Germany to Paul Krüger seems a small matter, and yet it called out a fleet in battle array.

Mr. Gladstone does well to mention striking occasions on which the Powers acted alone against Turkey—Russia three times within the present century: once in 1828, once in 1853, and once in 1877, every time on behalf of oppressed Christians. France acted alone in 1840, when, for a similar purpose, she landed a force in Syria, and procured there most important reforms. England has interfered also with armed force twice within the century, but both times on behalf of the Turks. The battle of Navarino, fought in behalf of the Greeks in 1827, when the Turkish fleet was destroyed, was really a mistake wrought by the Admiral. The ministry at home condemned his action, as "an untoward event," though it had the good result of bringing the Greek war to an end. But the Crimean war and the demonstration of 1878 were both undertaken on behalf of Turkey—that is, for the purpose of perpetuating her domination in the Christian provinces; and this support of Turkey began when Russia began to push eastward. In other words, the Turkish misrule has been bolstered up in order to preserve India from an infinitely remote danger.

In 1878 Disraeli and Lord Salisbury had no hesitation whatever about acting alone. They never asked what France or Germany would do. They prepared to fight Russia on behalf of the Turk, and even brought troops from India for that purpose, and then they pretended they had agreed to defend Turkey against further attacks solely on condition that she would reform. She has never in twenty years since made the slightest attempt at reform, unless reforming people means cutting off their heads. She has in this way reformed nearly the entire Armenian nation. Lord Salisbury now says that this promise of Turkey's was illusory, that it cannot be enforced, and that the pledge of Cyprus was of no value, or was, in other words, simply a bit of Disraeli's charlatanry.

There can be little doubt that interference now is not a whit more dangerous than in 1878, or so dangerous. Russia is not armed and in the field as she was in 1878. She has three powerful States, Rumania, Servia, and Bulgaria, to say nothing of Greece, on her road, which would be unwilling to see her enter Constantinople. She has not now, as she had in 1877, an army flushed with victory and generals of proved ability and experience. In other words, she is much less ready for war on land than she was twenty years ago. Moreover, the English fleet is much larger and stronger than it was then. It is supposed to be a match for all the other navies in the world combined. The Turkish problem is mainly a naval one, and it is not at all sure that if England were evidently bent on solving it, she would not have the assistance of the Italian and American fleets.

The real trouble here is plainly the character of the Prime Minister. He is an accomplished writer and talker, a critic bred to say sharp things in the *Saturday Review*. But he is not the man "to face a lie in arms." He would far sooner let it run, and thank God he was well rid of a knave. He shrinks from action, but gives always a clever account of the reasons why he shrank. Not one bold or energetic measure has ever marked any of his administrations excepting the locking up of Irishmen. His reluctance to act, in fact, drew on him from Bismarck at Berlin the scathing remark that he was "a wooden lath painted to look like iron."

A NEW WRONG TO WRITERS.

Authors have long and justly complained of the outrages which they have had to suffer at the hands of critics. Their list of grievances has been often recited. Of course, no review of a book can have the slightest effect upon its sale, or upon the reputation of its writer. That is agreed, to start with. Only, if the critics will go on deceiving themselves into thinking that they are informing and directing the public taste, why in the name of the nine muses will they not do their work better? Why do they not once in a while produce as good a review as the author himself could write with ease? Reviews are horribly dull as a rule. This is a serious injustice to writers, since the public infers that if their works have such a stupefying effect on a critic who has carefully read them, purchasers in search of something to keep an elderly gentleman awake in the bosom of his family had better look elsewhere. But that is just it—the critics do not carefully read the books they write about. "Settling Comte unread" is an old trick of theirs.

As we say, these are all old and well-known charges of the writing tribe against the reviewing tribe. Judge, then, the surprise of patient critics, anxious to please, at learning now that their greatest offence consists in writing readable reviews, filled with all manner of brilliant things culled from the book under notice. So they are informed by an aggrieved English author, who calls upon the Authors' Society to take the field against all critics who write interesting reviews starred with witty sayings from the writer they are considering. The reason is plain. "A review which picks out and publishes all the 'plums,' obviously makes it unnecessary for the reader to buy the book." Why should a man pay $2 for what he can get the quintessence of for 10 cents? Any review, in fact, which evinces a low desire to produce interesting "copy" is on its face suspicious. It is basely written (insinuates the injured author) wholly for the benefit of the paper in which it appears, and is cruelly indifferent to the well-being of either author or publisher. Is it not well known that "many brilliant people derive almost their entire knowledge of current literature from extracts in so-called reviews"? It needs no argument, then, to show that if there were no such extracts, and if reviews were decorously stupid, the sale of books would be much increased.

A literary outrage so novel as the one thus exposed naturally requires a considerable readjustment of the traditional ideas about writers and reviewers and their relation to each other. Are we, then, no longer to believe in the great comfort of being an unpopular author? We thought all true geniuses were ambitious to belong to such a "Society of Unsuccessful Authors" as Daudet, Zola, and the Goncourts made up. What delight they found in not being read! What a joke it was on their publishers to be unable to get rid of even a first edition of 800 copies! As for the critics, if they had

said a good word for any one of the society, the others would have disowned him and cut him dead. It was a trying moment for Daudet—that night when he had to confess that his last novel had gone into a second edition. The startled and pained glances of his fellow-artists for art's sake were hard to bear. What they would have done when even the reviewers began to praise, one can imagine if their own novels had not begun to catch favorable breezes about the same time.

Then there is also the contempt for critics which all rising authors feel; is there something hollow about that too? Brilliant people who derive their knowledge from writers themselves, know that nothing helps the sale of a book like a sound damning of it in the critical journals. If an author can only get the authorities to say that he is an ignorant young fool, an absurd creature, an imitator or plagiarist, his fortune is made. The critic's worst is the author's best. Non-committal book-notices, faint praise, indifference—these are all bad; but a hearty cuffing down stairs and a rousing kick into the streets fill the writer's cup to overflowing. So at least the brilliant people who repeat what writers tell them have been in the habit of saying. But what are we to think when the opinion is boldly advanced, within earshot of the Authors' Society, that if reviews are not very important in helping the sale of a book, they are "potent in hindering it"?

It is clear enough, however, that the duties of a reviewer under the new order of things will be arduous in the extreme. He will have to titillate the reader's appetite without gratifying it, excite his curiosity without satisfying it, be by turns provoking, alluring, suggestive, inflaming, and yet never by any chance reveal the first thing about the author's style, plot, or *Tendenz*. He must devise a lifeless review which will yet make people furious to buy the book he is writing about. Otherwise he will fail of his chief end in life, which is, of course, to write a criticism that will be satisfactory in all respects to the author criticised.

A critic's first moving about in such a world half realized must naturally be rather clumsy and blundering; and so indulgence will have to be asked for the early specimens of the new style of reviewing. The plunge must be made, however, and readers be accustomed to book-notices which will run something like the following:

"We congratulate Messrs. Shelf & Counter on the handsome form in which they have brought out 'Stranger than Truth.' The unique color-scheme of the binding we should take pleasure in describing did we not fear it might keep a single one of our readers from buying and seeing for himself. As for the novel itself, we stake our critical reputation on the assertion that the plot is one which it would be little short of criminal to betray by so much as a hint, that there is a situation on p. 117 which will make the sourest reader laugh in spite of himself, that two epigrams occur in one paragraph (p. 43) which would be enough to make the fame of a writer less distinguished than Mr. Airy Nothing, and that those who make a practice of avoiding the tenderest and most genuine pathos had better skip the whole of chapter xiii. With these citations we leave the book (price $1.75) to our readers' undisturbed enjoyment, and if our critical remarks upon it prove the means of carrying it into one home where it otherwise might not have gone, we shall ask no other or more grateful reward."

FOURTH INTERNATIONAL CONGRESS OF CRIMINAL ANTHROPOLOGY.

BRIEG, September 1, 1896.

THE "criminal anthropologists" met in Geneva August 25 to 29. The meeting was not very well attended. As usual with these congresses for criminology, it was largely made up of Italians and Frenchmen, for, as everybody now knows, the subject of criminal anthropology first came forward with a claim to recognition through the work of the Italian school; and the most vigorous rivals of the Italians—opponents and critics of their results—have been French. Indeed, it would be difficult to find men of standing in other countries, except, perhaps, Belgium and Switzerland, who would admit that there is, strictly speaking, a science of criminal anthropology at all. The earlier congresses, held in Rome, Paris, and Brussels, have indeed been largely occupied with controversies over the very claim of the topic to scientific place, and to the clearing up of a workable concept in the minds of its advocates.

The progress of the topic has been, however, it seems to the present writer, continuous from the time that Lombroso brought out his first books; and this progress has been due rather to the discussions of the concept of criminology and of the method of investigation than to the actual value of the works so far printed. There is to-day a series of clearly formulated problems, all dealing with the criminal, and the tendency and direction of this congress was to put them in clearer light. Lombroso himself, while showing that lamentable weakness known as hasty generalization, has also shown a great merit—scientific "accommodation." He has remained at the head of the school by incorporating into his books, which have appeared in startling succession, points of view which modified his own most essentially. He began with his theory of atavism; then accepted Ferri's classification of criminals, although it deprived the theory of atavism of perhaps more than half of its range of application; then proved equally hospitable to the theory of "degeneration"; and now, at the fourth congress, applauds the proposition of the men who are seeking to substitute a criminal and social psychology for the anthropology with which he (Lombroso) started out. We cannot agree with those who sneer at a man of such flexibility, though it is not a virtue of a very high order. There can be no doubt that the setting of the problem of the criminal in the more adequate form which brings its elements into relation to each other (the factors of heredity known as atavism and degenerescence, and with them the factors due to the social environment, as the newer researches are endeavoring to find them out), got its first start from the work of Lombroso. Nor can we doubt that the *Gebiet* now marked out, and covered perhaps more adequately by the word "criminology," is destined to be one day really scientifically and fruitfully worked.

The congress was presided over by M. Ladame of Geneva, and was opened by the President of the Swiss Republic with a sensible speech. The meetings were well arranged, not too crowded; and the discussions were extended, oratorical, and interesting. I shall cite a few of the more important papers, more to show what seems to be the way of progress in this field than actually, in the space I have, to make an adequate note of the proceedings.

Lombroso's account of the recent history of criminal anthropology will be found by readers of the "Proceedings" to show his receptivity to newer points of view of which I spoke above. The résumé which he had in the *Popular Science Monthly* last year might be looked up for an account of the earlier phases of the movement, and the part played in it by Lombroso. Signor Ferri, who speaks as a jurist (being a Roman Senator as well as an anthropologist), presented what he called an "invitation" to the congress to a new programme; *i. e.*, he urged the consideration of the relation of "temperament" to crime. His paper was an attempt to show that too much effort had been given to minute questions, such as physical "stigmates," mental aberrations, alcoholism, etc., etc, and that the criminal should be considered *as a whole*, from the point of view of his temperament. The character of the audience may be inferred from the fact that such vague and general sayings as this, presented in loud tones and with genuine southern eloquence, carried such applause and begot such enthusiasm as no others in all the sessions, except, perhaps, other speeches of Ferri's. It is, of course, precisely what would be subversive of all that has been done in the way of exact research into special topics, and open all the vials of scorn which the psychologists and jurists are just beginning to close up, thus to chase generalities like "temperament." If there is one topic which psychology has not made much clearer since Galen, it is that of temperament. And after getting some sort of theory of temperament from psychology, the further difficult proposition would have to be made out that the social sense and the moral sense vary in some regular way with temperament. Possibly, on the contrary, we shall have to wait for a doctrine of temperament until criminology makes out its classifications of men with reference to the development of their social and ethical sense. But, at any rate, Ferri, the Roman orator, was the hero of the congress, and, as I said above, if Lombroso were not so broad-minded in his attitude to his disciples, he might fear for the leadership of the school.

A much abler and very judicious, calm, and penetrating paper was that by M. Dalamagne of Brussels on "Degenerescence and Criminality." He aimed to determine the concept of degeneration from biological and social data, to decide what part its signs or "stigmates," of physical, mental, and social sorts, should play in the theory of it; then to do the same for the concept of criminality; and, finally, to bring the two concepts into relation to each other. The emphasis which he laid on the social, as over against the physical stigmates of the Italian school, makes his paper notable.

A lively discussion also followed the paper on "Anarchism" by Van Hamel of Amsterdam. The discussion was very conservative from a legal point of view, although the author classified the professed anarchist as a *criminel-né*. In the discussion the point was raised that such a classification of the anarchist tended to produce anarchists, since it removed the responsibility of such criminals, opened the door to the plea of determinism, and so paralyzed the arm of law. The Italians had no trouble in disposing of this criticism by citing the greater effectiveness and humanity which have followed in the treatment of the insane since the types of insanity were more clearly made out and the *aliéné-né*, so to speak, treated as such.

Apart from general topics, of which those cited above may be considered fair examples, this congress paid much attention to practical questions. Two forenoon sessions were devoted respectively to *Applications légales* and *Applications administratives*. In these practical matters the warmest discussion was excited by M. Legrain's paper on "Alcoholism and Degeneration." He has followed through four generations, in 215 families, the effects of drink; and if his statistics of various forms of "degeneration"—seen in convulsions, epilepsy, hysteria, meningitis, high infant mortality, together with idiots, imbeciles, and insane persons—are reliable, the paper will be a veritable prohibition campaign document, as well as a contribution to social statistics. In the discussion which followed, a strong party made itself heard in favor of absolute personal abstinence from all alcoholic beverages, and of stringent legal restrictions, led by the well-known psychologist Prof. Forel of Zurich and by M. Legrain. This topic got some of its interest, no doubt, from the recent congress devoted to it at Basle, which has been much talked of in the Swiss papers. The statistics of national drunkenness, which were so impressively urged at Basle, came up again in Geneva, and this time with the practical question whether the congress—in view of the connection long ago made out between alcoholism and crime—should not declare itself officially on the subject. Forel gave some new and startling figures bearing on this relation between drink and crime. The outcome was that the congress adopted unanimously, though in the closing session, which was not largely attended, a resolution declaring it to be the business of the congress to further restrictive legislation of a stringent kind in all countries.* In this connection it may be of interest to refer to some "curves of drink" exhibited in the department of "Science and Education" in the National Exposition at Geneva, showing the relative amount consumed per capita per annum of various beverages in a dozen civilized countries. France and Italy are the most vinous; and France is, on the whole, the most alcoholic country. As to beer, Belgium is first; England, second; Germany, third; and the United States, fourth—a position which we have reached by a rapid advance since 1840, when we were at the very bottom of the list.

The acute opposition which showed itself so many times between the Italian anthropologists and the party which may be called psychological, and which grew so wearisome in this as in the earlier congresses, came to a lively issue on the third day, when a Russian delegate read a paper on the relation of criminal anthropology and law, in which he declared there was no relation because there was no such thing as criminal anthropology. This precipitated, of course, all the wrath of the Italians, and their retorts were as direct as those of the opposition, of whom one declared that he had asked the opinion of one of the greatest German neurologists (giving the name) as to the value of the work of Lombroso, and had got the reply that Lombroso himself was undoubtedly a degenerate. Such remarks as this, and such personal controversy as a whole, made the gathering very ridiculous. But, on the other side, who can wonder at the scorn of the psychologists and neurologists when papers are read on the peculiar character of the criminal's cerebral texture and the meaning of the wrinkles in the palm of his hand?

This will, no doubt, suffice to give the reader a sufficiently good idea of what was the subject-matter of this fourth congress. As to its personnel, it is interesting to know that all the following countries had official delegations: Argentine, Austria, Belgium, Brazil, Denmark, Great Britain, Hungary, Japan, Holland, Portugal, Rumania, Russia, Italy (city of Alessandria), Switzerland (city of Berne).

From the United States there were only two "adherents" on the list of members. The next congress is to be held at The Hague (on the invitation of the Dutch Government conveyed through the Department of Justice) in 1901—this rather than in Paris in connection with the Universal Exposition of 1900, which was the alternative proposition. Comparing the two congresses of this summer—that of Psychology and this of Criminal Anthropology—the former has abundant reason to congratulate itself.

J. M. B.

* In effect, I was not at this meeting and so follow the newspaper reports.

A NEW CHAPTER IN GERMAN ROMANTICISM.

CAMBRIDGE, September 13, 1896.

PROF. ERWIN ROHDE, the distinguished classical philologist, has done a good service to students of German civilization by recently publishing, from manuscripts preserved in the Heidelberg University Library, the letters relating to one of the strangest and saddest episodes in the history of Romanticism—the love tragedy which ended in the suicide of Karoline von Günderode.

Karoline von Günderode was a worthy representative of that brilliant activity displayed by women in the higher concerns of life which gave to German culture of the beginning of the nineteenth century such a decidedly feminine tinge. If she lacked the vivacity of her friend Bettina Brentano, she also lacked her coquettishness and theatrical mannerism. If she did not have the keenness of analysis possessed by Rahel Varnhagen, she was also free from Rahel's bent for fantastic and hair-splitting speculation. And to both Bettina and Rahel she was superior in sincerity of feeling, depth of passion, and true womanly charm. She was a genuine poet, not so much in what she wrote for the public ear (although her poems were admired even by Goethe) as in her every-day thoughts, her letters to friends, her whole manner of life. It is not surprising that her refined beauty and aristocratic bearing should have attracted the best men of her time. Savigny, the great jurist, devoted to her years of chivalric friendship. Clemens Brentano, editor of the 'Wunderhorn,' went into raptures over her. No man, however, understood her so well or stirred her so deeply as the one who was to lead her to her own destruction, namely, Friedrich Creuzer, the famous author of the 'Symbolik.'

Creuzer, also, is a typical figure of the period preceding the national catastrophe of 1806, a period which was as devoid of moral vigor as it was rich in æsthetic cultivation. As we see him in his public activity, in his far-reaching studies on the religion of the ancient Greeks, in his petty quarrels with scientific opponents, he appears as both a pathfinder and a perverter of sound methods of historical investigation; as a strange mixture of noble inspirations and selfish conduct, of mystic intuition and scholastic pedantry; as a priest of humanity and at the same time as a vain professor. One must keep all these conflicting qualities of his in mind in order to understand how his relations to Karoline von Günderode came to be what they were.

When Creuzer, in the spring of 1804, entered upon his Heidelberg professorship, he was thirty-three years old; for half a decade he had been united in childless marriage to a widow, thirteen years his senior. Is it surprising that when, on a beautiful August day of the same year, on the terrace of Heidelberg castle, he met Karoline von Günderode for the first time, he should have experienced an inner revolution such as Werther underwent when he for the first time saw Lotte? He feels at once that from now on there are only two possibilities: "Heaven or death; there is no mean between the two." He flies into the solitude of the forests in order to read her letters, and when he looks up to the sky from her pages, it seems to him as though he were looking into the eyes of his beloved. He hides her poems on his shelves in order to enjoy them alone in the stillness of the night. And at last—two months after the first meeting—he informs his wife "that he can no longer consider her as his wife, in fact, has never considered her as such, but that he will for ever cherish grateful feelings towards her"; whereupon the wife, in a fit of sudden magnanimity, declares that she approves of his sentiment, renounces her claims on him, and desires to be in future nothing but an older sister to him. In short, it seems as though the whole affair were to end in happy romantic fashion: husband and wife will peacefully separate and another union be established. Or, to adopt Creuzer's own inimitable phraseology, the wife will stay in the house "as mother, as the manager of the household," while the loved one will bring "freedom and poetry" into the husband's life—exactly the same situation, by the way, which forms the basis of the tragic conflict in one of the most remarkable realistic dramas of our own time, Gerhart Hauptmann's "Einsame Menschen."

In Creuzer's and Karoline's case, as in the modern drama, the serenity of those paradisaic dreams soon gives way to gloomy forebodings. Sophie, the wife, retracts her resignation; she is ready to leave the house, but in despair only, not in good part; she is not willing to tolerate Karoline by her side. And Creuzer, impulsive as always, and, theoretically at least, of a chivalrous frame of mind, realizes at once that he must not force his wife's actions; he is unwilling, in his own words, "to demand a human sacrifice." Recognizing his duty towards his wife so clearly, one would think that he must see with equal clearness his duty towards Karoline: a speedy and complete rupture of their relations seems imperative. But, far from feeling this, Creuzer is now all the more eager to retain Karoline's love. He speaks with the utmost disdain of

the "abyss of *Bürgerlichkeit*" which forbids a married man to think of other women. He talks of dying with Karoline. He beseeches her not to abandon his "beautiful soul." "I am like one of those wooden Silenus figures in Plato's 'Symposium' which, mean in themselves, serve as cases for beautiful images of gods enclosed in them. The divine image encased in my poor body is my soul, which was capable of feeling your worth." He compares Karoline to Raphael's "Poesy"; he glorifies her as the Virgin Mary hovering in eternal youth and freedom above the clouds:

"I often appear to myself criminal in wishing to draw you down into this domestic world, when I see how you, a Virgin, hover gloriously in the splendor of the stars, untouched by the burdens of life. And yet, when I think how once it was your own will to descend into this world of mine, then I rejoice again in the consciousness of my courage to die with you."

The result of all this reckless playing with fire is another meeting of the lovers at Frankfort, Karoline's residence. And this meeting, of course, gives added violence to the flame of passion. Karoline appears from now on in Creuzer's letters mostly under symbolic names, "The Friend," "The Saint," "Poesy," while his wife, to denote the hopeless philistinism of her character, receives the nickname "The Good-Natured One"; and a separation from her, or rather lamentations over the impossibility of a separation from her, become again the burden of Creuzer's talk:

"Is it right, or is it cruel, that a woman who has lived through the natural course of her history in the love of her first husband, in children who adore her, in children's children whom she is looking forward to—that this woman should insist that a young man is to find the aim of his life in brightening and warming a little, like a wintry sun, the late autumn and November days of her existence? It is right! He might have known it in advance. Still, my heart, still! It is right! Oh, if she only could be a little large-minded—or thoroughly bad! But this agonizing good-nature!"

It is not quite clear what ripened in Sophie for a second time the decision to give way to her favored rival. Enough that, in September, 1805, she took this decision: she wrote to Karoline sanctioning her relation with Creuzer, and expressing the hope that he soon might be entirely hers. Creuzer on his part even goes so far as to address Karoline as his "beloved wife"; he speaks of the formal dissolution of his marriage as soon to be brought about; he reports a plan to accept a professorship at the University of Moscow so as to spare his young bride the difficulties of living with him in the old surroundings: all the clouds seem to be chased away, the happiness of the lovers seems assured. All of a sudden there is a change in the tone of Creuzer's letters. He begins to feel that Karoline is too good for him, that he does not deserve her; he mentions financial difficulties that stand in the way of a speedy marriage; he seems to think that Karoline has no natural taste for the duties of a housewife; he has heard a rumor that Karoline does not intend to live with him as a wife, but plans to accompany him to Russia in men's clothes as a student friend; he has talked with his friend Savigny about the matter, who has convinced him that a separation from Sophie would be a moral wrong. In brief, only two months after his wife has expressed her willingness to release him, he has practically broken off with Karoline; and it is Karoline, not Sophie, who sends him the following letter of resignation:

"My whole life remains for ever consecrated to thee, beloved sweet friend. Nor time nor circumstance shall step between us. The loss of thy love I should not be able to bear. Promise me never to leave me. O life of my life, do not leave my soul.—See, I feel freer and purer since I have renounced all earthly hope. Into hallowed melancholy has the violent grief been dissolved. Fate is conquered. Thou art mine, above all fate. Nothing can take thee from me, since I have won thee in such a manner.—Try to gain Sophie's confidence. Tell her that we have resigned. I, too, shall write her, in order that peace may be restored to the household and she not disturb our relation, which has no longer any danger for her."

It seems incredible that Creuzer's sense of honor should not have been sufficient to make him respect the obligations laid upon him by such an appeal as this. Instead of helping Karoline to live up to her noble renunciation, instead of silencing once for all his own unruly longings, he now more than ever relapses into his habitual wavering between sentimental lamentations and passionate protestations of love. On Christmas eve he feels in the midst of his family "like a pilgrim who, on his way to the Holy Land, has been captured by a people that worships other gods." In the Christmas vacation he goes on with his 'Symbolik' in constant thought of the fair friend to whom, he hopes, this book will be something of a compensation for all the pain he has given her. In the following April (1806) he visits her in Frankfort, and after his departure he revels in ecstatic memories of their meeting and in mournful complaints about his present loneliness: "Ah, nothing will ever satisfy me but this dear, palpable nearness, from which I now have been torn away. The present stares blankly at me: back into the joys of the past my spirit longs to turn. *O sanctissima virgo, tecum moriar libens.*" In June he is in Mannheim and is taken by a friend to the point where the Neckar River flows into the Rhine. "It is a beautiful place, and I saw with deep emotion how the two rivers embrace each other. The impatient longing with which they hasten towards one another was to me a symbol of our life. Ah, the fortunate ones, I thought, to attain thus to the goal of their desires! Sadly I went away." And when, after all these appeals to the emotion, Karoline indeed seems to lose her self-control and to respond in the same passionate vein, how does he receive this?

"For heaven's sake, Lina, do not abandon yourself to such storms of passion! I have burnt all that you wrote to-day, praying for your tranquillity of mind while the flames were consuming your pages.—Beloved, I owe you a large debt, a debt equal to the value of my own life; but quiet you owe to me, and you will give me quiet when you see that you owe it to yourself."

We hasten to the end. On June 29 or 30 a last meeting of the lovers took place. With what feelings they saw each other, in what a frame of mind they separated, we are unable to tell. Immediately after it Creuzer fell into a violent fever. During his sickness his friends prevailed upon him to make a solemn declaration that he would completely and irrevocably break off his relations with Karoline. One of these friends took it upon himself to inform Karoline of this decision. In order to break the cruel news to her in as gentle a manner as possible, the letter containing it was addressed to a friend of Karoline's with whom she was at the time sojourning. These measures of precaution were frustrated. Karoline, who for weeks had been waiting for a letter from Creuzer, hastened to meet the messenger, took the letter, opened it in her room, and read—her death-warrant. She soon came back from her room, apparently undisturbed, took leave of her friend for a short evening walk such as she was in the habit of taking, but did not return. On the next morning her body was found on the banks of the Rhine. She had stabbed herself with the dagger which for some time previous she had been carrying about her.

Two months after the death of Karoline von Günderode the battle of Jena was fought. Little as these events seem to have in common with each other, it is yet true that the battle of Jena exerted a profound influence on the whole moral and intellectual atmosphere which determined the tragic fate of the romantic poetess. In the national breakdown, in the utter ruin of its political existence, the German people recovered its sense of moral dignity and discipline which had been obscured by the flighty conceptions of an exclusively æsthetic culture; and the Creuzers and Günderodes were superseded by the Steins and the Fichtes. KUNO FRANCKE.

Correspondence.

ORIGIN OF THE NATIONAL DEMOCRACY.

TO THE EDITOR OF THE NATION:

SIR: It will be generally admitted that without the organization of the sound-money Democrats of Illinois, the National Democratic ticket would not now be in the political field. In this view, the origin of that organization is important politically, and perhaps historically. Like many other movements, its rise grew out of a trivial circumstance. The Wau-ban-see Club, an association of Democrats in one of the divisions of Chicago known as the North Side, was, in the winter of 1894-'95 and the spring of 1895, short of funds. It was proposed by Mr. H. S. Robbins at a meeting of the directors of that club to give a dinner, to be known as a sound-money banquet, as a means of raising money. The proposition met with favor, a meeting of the club was called, and many hours were spent in the discussion of the very issues which are the burning questions of the present campaign; and, as the result of that discussion, those inclined to the free-silver view were either converted or silenced, for the proposed sound-money banquet was unanimously approved, in February, 1895. The banquet was held, and Senator Palmer was the principal speaker; and, as a result, the Illinois Honest-Money League was formed, with branches throughout the State, the members of which declared themselves unalterably opposed to the free and unlimited coinage of silver at the ratio of 16 to 1.

Mr. H. S. Robbins was the president of this league, and continued the work thus begun at the Wau-ban-see Club. The influence of the organization was such that, in the spring of 1896, the Democratic machinery of the State, under the leadership of Gov. Altgeld, fearing an honest vote in Chicago, refused honest primaries, and instituted what are known as "brace primaries," in order to disfranchise the Democracy of Chicago. This done, the rest of the State was easily carried for free silver. But, instead of meekly bowing to intimidation and repudiation, as the Democracy of other States have done, the sound money Democracy of Chicago replied by putting in the field, two months before the Chicago convention, a full county ticket, and then and

there elected delegates to a State convention, although none had at that time been called.

Subsequent events have justified that action. The intention to place national honor and prosperity above party was the keynote of the movement from the Wau-ban-see Club banquet to the hour the Auditorium conference called upon the Democracy of the United States to meet at Indianapolis to summon a national convention. Without the organization thus effected, it is highly probable that Democratic opposition to the surrender of the party to the new Populist principles would have resulted in nothing more than individual protests, and the Chicago convention would then have marked the grave of the party of Thomas Jefferson. LYNDEN EVANS.

CHICAGO, September 19, 1896.

McKINLEY AND BRYAN.

TO THE EDITOR OF THE NATION:

SIR: After McKinley's election—what? If times improve, protection will get all the credit, and that incubus will be fixed on us for another generation. If the millennium does *not* come, the reaction will make the silver craze stronger in 1900 than it is now. As I watch the elements that are gathering around McKinley, I doubt whether we have anything more than a choice of equal evils; or whether even the plunge with Bryan into free silver, and the sharp, decisive cure that would inevitably follow, would not be the shortest and best way out of the dilemma.

I have favored the single gold standard for forty years, and have been a subscriber to the *Nation* from its origin, but I am sorry to see my favorite paper copy the *Tribune* so closely in campaign methods and become blind to all the evils and absurdities on one side. For instance, you pay your respects to Bryan's canvassing tour, but I have not seen any characterization of the cheap-John tariff excursions to McKinley. But I hope that when political lunacy abates in November we shall have the old *Nation* again—clear, keen, merciless, but *fair*. WM. PITTENGER.

FALLBROOK, CAL., September 18, 1896.

[Nobody knows better than Mr. McKinley that his tariff talk in this campaign is pure buncombe, on which it would be a waste of breath to comment. If he were dumb on this topic, he would still remain the protectionist that we knew him to be on the day of his nomination, when we had to make up our minds to him as the saviour of society in the present crisis. There is doubtless a want of worldly wisdom in speaking out his views with a chance of offending Democratic supporters; but this is not, in our opinion, the feature of his utterances which justifies our correspondent in affirming "a choice of equal evils." It is rather that, at a time when men who have stolen a State Senate preside for Bryan in New York and at Buffalo, McKinley fulsomely praises to a Pennsylvania delegation Quay, who looted a State Treasury.—ED. NATION.]

GREENBACKS AND DEPRECIATION.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of September 24, p. 230, you say of "demand notes," in an editorial comment, that "they were never at par with gold." This I cannot gainsay; but, as an illustration of how demand notes passed in New York among the community, in the lesser affairs of life, I give this bit of personal experience:

In July, 1862, I returned from the front disabled. Not knowing of the financial changes which had come, I went into a shop and asked the owner to give me "change for a dollar." He did so courteously, remarking, however, that while it was a pleasure to do this for a wounded officer just back from the front, he wouldn't do it for a citizen. I asked why not, and he informed me that specie was at a premium. I offered to pay the premium, but that he flatly refused to take from a wounded soldier. I was in uniform, one arm was in a sling, and disabled soldiers were then a novelty in New York. Not wishing to get "change" in this way, I went into an exchange office on Broadway, nearly opposite the Astor House, threw down a ten-dollar greenback, and said that I wished to buy fractional silver. The broker handed me ten dollars in silver. I asked, in some surprise, if he did not mean to charge me anything for silver; and he answered no, that I had given him a demand note, and that demand notes were as good as specie. This was the first time that I had heard of "demand notes," and until then I had not known that the Government had issued two kinds of greenbacks. In December, 1862, I was again in New York, and then found that people were paying their omnibus fares with postage stamps. Silver had entirely disappeared.

An article showing chronologically the monetary changes in every-day life which took place in 1861-2—the disappearance of silver, the use of postage stamps, the substitution of postal notes, the advent of Treasury fractional notes, and the changing prices of ordinary things stated in both gold and greenbacks—would be an interesting article at this time to the younger generation of your readers.

C. C. N.

WILLIAMSTOWN, MASS., September 25, 1896.

[Our correspondent is doubtless correct in his recollection of the use of old demand notes in ordinary exchanges. These notes were necessarily at some premium, as compared with legal-tenders which were not receivable for duties. But the "custom-house demand notes" were never at par with gold. We transcribe the following market quotations from the New York daily papers of the period:

1862.	Gold.	Old demand notes.
June 30.....	109 @109⅛	104¾@105
July 15.....	116	107⅜
July 21.....	119¾	108
July 25.....	116⅝	106¾

—ED. NATION.]

BISMARCK AND SILVER.

TO THE EDITOR OF THE NATION:

SIR: Mr. Bryan appears to set great store by the letter which Gov. Culberson of Texas has received from Prince Bismarck. The "People's Friend" is willing to receive advice from the Man of Blood and Iron, and the "Champion of the American Farmer" listens to that famous friend of American agriculture who shut the German ports to American pork in 1884 and to American potatoes in 1885, who would gladly have united all central Europe in a customs league aimed directly against all American produce. Bismarck's rather diplomatic letter is taken by Mr. Bryan in his recent speeches to favor the free coinage of silver by the United States.

The devotion of Chancellor Bismarck to the cause of silver may be seen in the following historical fact, which appears to have escaped general notice: Under his guidance as Chancellor of the Empire and Minister of Commerce for Prussia, the equivalent of 1,080,000,000 marks (over $270,000,000) in silver was demonetized between the years 1874 and 1881, and over $160,000,000 worth of the bullion into which these were melted had been sold by 1879. In that year, finding that the price of silver was becoming demoralized, so that his remaining $109,000,000 was depreciating, he stopped sales by a decree issued in May, 1879. These points were frankly stated by his delegates to the International Monetary Conference of 1881, when Germany likewise offered to suspend sales for a time in order that the price might not be further depressed. With these assurances before the monetary powers, and with the decree of May, 1879, still in force, Bismarck saw an opportunity of dumping some German silver on the sly, and promptly proceeded to do so. In 1885 the Egyptian Government decided to change its coinage and invited bids for contracts to coin its silver piastres. The German mint secured the contract to make the coin, and incidentally furnished $2,189,600 of silver bullion to Egypt. The matter was kept very quiet or escaped general notice. Reference to it will be found, however, in the London *Economist* of December 4, 1886, which saw in it a proof of Bismarck's lack of faith in silver.

With all his faults, Bismarck is a sturdy patriot. To help the German distiller he was willing to see trichinæ in every American pig, and to protect the German farmer he smelt bugs on every American potato. Germany has to-day $107,000,000 worth of silver whose value is declining; if the United States could be induced to follow the example of Egypt, and give Germany a chance to do some more unloading, where is the harm, from the ex-Chancellor's point of view, in writing a letter of not entirely disinterested advice?

MORRIS LOEB.

NEW YORK UNIVERSITY, September 25.

VIRCHOW MISQUOTED.

TO THE EDITOR OF THE NATION:

SIR: While reading 'Evolution and Dogma,' a work recently published by the Rev. J. A. Zahm (Chicago: McBride & Co., 1896), I hit with great surprise on the following sentence (p. 210): "Virchow and others declared Evolution responsible not only for the attempts made by Hödel and Nobiling on the life of the Emperor of Germany, but also for all the miseries and horrors of the Paris Commune." There is no reference given. Having gone through most of Prof. Virchow's works, and not remembering any such utterance from the great German naturalist, I wrote to him, asking where the passage occurred, and if it occurred at all. Here is Prof. Virchow's answer:

"Was Sie mir als Aussage des R. F. Zahm schreiben, ist von Anfang bis zu Ende unwahr. Ich habe über die Verwerthung der Descendenztheorie durch die Socialisten nur einmal etwas gesagt. Es war das in der wahrscheinlich auch Ihnen bekannten Rede gegen Haeckel, die ich auf der Naturforscher-Versammlung zu München gehalten habe. Mit

dem, was der R. F. mich sagen lässt, hat es nicht die mindeste Aehnlichkeit."

Surely, popular writers ought to ascertain the facts before they attribute stupid and odious sayings to an illustrious scientist.

Yours truly, SALOMON REINACH.

SAINT-GERMAIN-EN-LAYE, September 11, 1896.

"PROFITABLE SCIENCE."

TO THE EDITOR OF THE NATION:

SIR: In a recent article under the above caption, you call attention to the clamor that is going up in England, the originator of so much that is great in science, for reorganization and extension of her schools of science. The cause of this agitation you point out—the appearance in English markets of a host of products bearing the legend "Made in Germany."

But what connection is there between science and "Made in Germany"? That you also point out. In her great universities, Germany has provided a home and breeding-ground for scholars and investigators, a place where they enjoy full and free scope for the exercise of their genius, secure of their footing and *daily bread*, and therefore little concerned whose "views"—prince's, Pope's, or pastor's—they may jostle. The universities train up and send out a never-ending procession of thinkers and investigators, many of whom bring their knowledge and skill to bear on problems of art, manufactures, and trade. Both in and out of the universities great discoveries have been made, and are being made, new processes invented, old ones improved; old industries have been revolutionized, new ones created. Hence it is that Germany is invading and capturing markets previously regarded as the perquisite of England. Thus it happens that the German scientist is doing what our bimetallists have longed to do but could not—bringing "England to her knees."

You very justly remark:

"Science is not merely a thing for spectacled professors to dabble in, but is profitable in mart and manufacture. It is the true transmuter of dross into gold. A near-sighted German professor works away in his laboratory for a few years, and comes out with an invention which has not only a fortune in it for himself, but a revolution in it for some great industry."

No one will begrudge the professor his good luck if, in the course of his work, he makes a discovery which has "a fortune in it for himself" and not alone for the other fellow. But it should not be forgotten that it is the chief glory of science in the German universities, as of true science everywhere, that it is not pursued primarily because it is profitable in the sense of there being a fortune in it. The most fruitful inventions and discoveries with which the "spectacled professors have come out" have rarely been *patentable* even, much less pecuniarily profitable, except in the long run and to mankind at large. Witness the great discoveries of Pasteur. Witness Kekulé's great invention, the Benzine Theory, given to the world in 1865. Of this latter it was said by one in the highest degree competent, both from a scientific and an industrial point of view, to pass judgment, "Mit Kekulé's genialer Theorie war auch für die Technik eine neue Zeit gekommen." It is known to your readers that the branch of chemistry called "aromatic," with its thousands of new compounds (including the coal-tar dyes and medicaments), is the outcome of that theory. It is also known to them that the manufacture of coal-tar dyes is worth to Germany alone many millions of dollars annually. Yet Kekulé, in all the long years of a laborious life devoted to science, gave no thought to the question of "profit." What he has said on that point has not, that I am aware, found its way into the newspapers; and even though it has, it is interesting, instructive, and "profitable," and therefore worth repeating.

In 1890 a great jubilee in his honor was held in Berlin. Delegates from all parts of Germany, from England, America, and other countries, assembled to pay him tribute. Among them were representatives of the coal-tar industries, who presented, along with their address, an oil portrait of the professor. In response to their congratulations, Kekulé said:

"I cannot deny that many of my investigations and also the benzine theory have been of benefit to the manufacture of the coal-tar dyes; but I can assure you that I have never worked for technology, but always for science only. I have ever had a great interest in technology, but have never drawn interest [income] from her. Precisely for that reason, I am doubly rejoiced and doubly thankful that the representatives of technology wish to recognize my small merit in behalf of technology."

Truly, science is *most* profitable when she is *least* profitable. J. M. PICKEL.

UNIVERSITY OF ALABAMA, September 21, 1896.

THE SCOTT KENILWORTH LEGEND.

TO THE EDITOR OF THE NATION:

SIR: Having this summer, during a short stay at Kenilworth, occupied the chamber at the "King's Arms" which is called "Sir Walter Scott's Room," I have been interested in the sceptical comments which your correspondent "W. E." makes upon a passage in Mrs. Navarro's 'Few Memories' (*Nation*, September 24, p. 231). The story at the inn is that Scott, coming there *incognito*, wrote there the first sketch of the novel. I will not defend a legend simply because I have seen its local habitation, especially when it appears to have two local habitations (for Mrs. Navarro speaks of "the humble little cottage which had sheltered Walter Scott," etc., and not of a conspicuous inn). It is also quite true that Lockhart mentions no such visit; and indeed none such took place in 1820. But it is perhaps worth while to point out that Scott did in fact visit Kenilworth not very long before he wrote the novel. In the 'Journal' (ii., 153), under date of 1828, he says: "We visited Kenilworth. . . . The last time I was here, in 1815, these trophies of time were," etc. Moreover, Charles Knight, in 1843, in his 'William Shakspere: A Biography' (p. 89), says, speaking of the castle: "Some twenty-five years ago a man of middle age, with a lofty forehead and a keen gray eye, slightly lame but withal active, entered its gatehouse, and, having looked upon the only bit of carving left to tell something of interior magnificence, passed into those ruins, and stood there silent for some two hours." His authority for the statement is cited in a footnote, thus:

"A few years ago there was a venerable and intelligent farmer, Mr. Bonington, living in the gatehouse at Kenilworth. He remembered Scott's visit, although he knew not at the time of the visit who he was; and the frank manners and keen inquiries of the great novelist left an impression upon him which he described to us. The old man is dead."

It seems, then, that Miss Anderson was not wholly victimized, even though legends have grown around the story. What Lockhart says respecting the genesis of 'Kenilworth,' though it cuts off the possibility that the first sketch was written in the Warwickshire village, still leaves it open to us to imagine that the first thought of writing a novel upon the familiar story of Amy Robsart came to Scott at the time of his visit in 1815.

J. F. JAMESON.

PROVIDENCE, September 28, 1896.

A NEWS CHRONICLE.

TO THE EDITOR OF THE NATION:

SIR: In your paper of August 13, Mr. Henry T. Terry of Tokio, Japan, asks for a journal of contemporary history in a form adapted for binding, and suggests that the *Nation* undertake such an enterprise. Permit me to suggest that there is already a quarterly magazine which substantially covers the ground. It is called *Current History*, and is published by Garretson Cox & Co., Buffalo, N. Y., at $1.50 per annum, as a supplement to their 'Columbian Cyclopædia.' Of this latter publication, in thirty-two small volumes, I cannot speak too highly, having tested it for over two years; and the *Current History* bears marks of the same diligent research, careful composition, and honest purpose.

Truly yours,

ISABELLA BEECHER HOOKER.

HARTFORD, CONN., September 22, 1896.

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: Will you kindly correct the statement which appeared in the *Nation* for September 3 that I made all the drawings in Mrs. Oliphant's 'Rome'? Even the title-page maintains that I did not.

And also may I be allowed, with all due deference to your critic, to state that none of the drawings were done from photographs, but that they were all made from nature in the city of Rome, whither I was sent by Messrs. Macmillan specially for the purpose?

Yours truly, JOSEPH PENNELL.

14 BUCKINGHAM STREET, STRAND, W. C., LONDON, September 18, 1896.

Notes.

HERBERT S. STONE & Co., Chicago, have in preparation 'Curious Punishments of Bygone Days,' by Mrs. Alice Morse Earle, with drawings by Frank Hazenplug; 'The Fatal Gift of Beauty,' short stories by C. E. Raimond; 'Miss Ayr of Virginia,' short stories by Miss Julia Magruder; 'What Maisie Knew,' a novelette by Henry James; 'In Buncombe County,' by Maria Louise Pool; a second series of 'Prose Fancies,' by Richard Le Gallienne; '*Chap-Book* Stories,' by Octave Thanet and others, and '*Chap-Book* Essays,' by T. W. Higginson and others—reprints from the magazine of that name; and 'The Land of the Castanet,' by H. C. Chatfield-Taylor.

A. C. McClurg & Co., Chicago, will issue 'Audiences,' apparently ready-made judgments in art; and 'National Epics,' a condensation.

The Open Court Publishing Co., Chicago, will soon bring out 'A Pilgrimage to Beethoven,' by Richard Wagner; 'Christianity and Patriotism,' by Count Tolstoi; 'Ancient India: Its Language and Religion,' by Prof. H. Oldenberg; a new translation of Lao-

Tsze's 'Tao-Teh-King'; Gustav Freytag's 'Luther'; and a 'History of English Secularism,' by George Jacob Holyoake.

Stone & Kimball announce 'Urban Dialogues,' by Louis E. Shipman, with illustrations by C. D. Gibson; and 'Grip,' by John Strange Winter.

Additional announcements by Charles Scribner's Sons are the Complete Works of George Meredith, in 34 volumes; 'Complete Poems,' by H. C. Bunner; 'The Out-of-Door Library,' angling articles from *Scribner's Magazine*, to be followed by a hunting volume, both illustrated; 'Periods of European Literature,' in 12 volumes, edited by Prof. George Saintsbury; a new edition of the Bryant-Gay 'History of the United States,' expanded from four into five volumes, and brought down to date by Noah Brooks, with 1,600 illustrations; a new edition of Dr. S. Wells Williams's 'History of China,' continued by his son, Frederick Wells Williams; 'The Near East,' by Henry Norman; 'Europe in the Middle Ages,' by Profs. Oliver J. Thacher and Ferdinand Schwill of the University of Chicago; Émile Bourgeois's 'France under Louis XIV.,' with profuse illustrations; 'My Village'—in rural France—by E. Boyd Smith, with the author's designs; 'An Illustrated Flora'—of the Northern United States and the British Possessions—by Prof. N. L. Britton and Addison Brown; 'How to Listen to Music,' by H. E. Krehbiel; 'Songs of Childhood,' by Eugene Field, set to music by Reginald de Koven and others; 'The Sprightly Romance of Marsac,' by Molly Elliot Seawell; 'That First Affair, and Other Sketches,' by J. A. Mitchell; 'Colonial Days in Old New York,' by Alice Morse Earle; 'The Sense of Beauty,' by George Santayana; 'John Gibson Lockhart,' by Andrew Lang; 'Jesus Christ before his Ministry,' by Prof. Edmond Stapfer; and an 'Introduction to Sociology,' by Arthur Fairbanks.

The Century Co. will issue directly 'The Metropolitans,' a satire of New York society, by Jeanie Drake; a romance of Louisiana, 'The Wonderful Wheel,' by Marie Tracy Earle; a Dutch-Indian novel, 'Gold,' by Annie Linden; 'Break o' Day,' by George Wharton Edwards; and 'A Shadow Show,' reversible color prints, by Peter S. Newell.

'Soap Bubbles,' ten stories by Max Nordau, and 'The Conspiracy of Carbonari,' by Louisa Mühlbach, translated by Mary J. Safford, are in the press of F. Tennyson Neely.

A popular 'Star Atlas,' by Prof. Winslow Upton of Brown University, is in the press of Ginn & Co.

Under the title of 'The Scot in America' (Raeburn Book Co.), Dr. Peter Ross has brought together, chiefly in the form of biographical sketches, a considerable amount of information regarding persons of Scotch descent who have attained more or less of prominence in this country. Some of the information is entertaining and some of it appears to be new; but although the author claims to have had access to "original sources," and has evidently been industrious, his book cannot be counted a very important contribution to the interesting subject of Scotch influence on American life. A plentiful use of slang fails to enliven Dr. Ross's style, while his fondness for moralizing on all sorts of themes, from the annexation of Canada to newspaper criticism of art, is at once irritating and wearisome. The index of names shows many omissions.

In his 'Studies in the Hegelian Dialectic' (Cambridge: University Press; New York: Macmillan), Mr. MacTaggart distinguishes himself among living philosophers as at once one of the most reverent of students, most ingenious of interpreters, and subtlest of defenders of Hegel. He sets out by expounding the "secret of Hegel," the real meaning of the Dialectic. According to him, it is the course of thought in restoring the concreteness from which the sciences have abstracted, and it is the experience of reality which constrains thought to do this. He next discusses, often with a subtlety worthy of the best days of scholasticism, the objections, ancient and modern, which have been brought against Hegel and all his works, and the Dialectic Method in particular. Hegel apparently emerges from this ordeal triumphant and unscathed. But the final chapters show that his disciple has been converted into a critic who proceeds to demonstrate, respectfully but firmly, that Hegel failed in the application of his own method, and to draw conclusions which, in spite of their Hegelian spirit, he has to admit are not Hegel's. The course of these last chapters sometimes raises doubts as to whether the interpretations "in the spirit of Hegel" do not depart dangerously far from his letter; whether the criticisms do not come inconveniently near to objections set aside before; and whether the further conclusions drawn do not follow more easily and naturally from philosophic principles quite other than Hegel's. But, for all this, there can be no doubt that Mr. MacTaggart's book deserves to be carefully studied by all who are concerned to make something more out of Hegel than a big catchword.

A remarkably vivid picture of the highest social life in France and Italy during the latter half of the seventeenth century is given in Lucien Perey's 'Une Princesse Romaine au XVII^{e} Siècle: Marie Mancini Colonna' (Paris: Lévy). Lucien Perey is the pseudonym of a lady already favorably known to the reading public as the author of 'Le Roman du Grand Roi,' in which the romantic love of the youthful monarch Louis XIV. for Marie Mancini, the beautiful and brilliant niece of Cardinal Mazarin, is described. This lady was eventually betrothed to Prince Colonna, High Constable of Naples, and married to him by proxy in the chapel of the Louvre, April 15, 1661. The marriage proved to be a comparatively happy one, but after a few years she left her home in Naples and led a rather itinerant and adventurous life. Her suspicion that her husband intended to poison her, which she gave as the reason of her secret flight, was first suggested by the intriguing Archbishop of Amasia, her husband's uncle; but the slander would never have taken root in her mind as a fixed idea, had it not been for an hereditary tendency to insanity in her family, which manifested itself still more strongly in her sister Hortense, Duchesse de Mazarin, of whose erratic career many curious details, derived from documents in the royal archives of Turin, are printed in the present volume. Marie Mancini Colonna died at Pisa in 1715 at the age of seventy-two.

'La Vie d'un Homme: Carl Vogt,' by William Vogt (Paris: Schleicher Frères; Stuttgart: Nägele) is valuable rather as a collection of biographical material chronologically arranged than as a complete and critical biography. It contains also two portraits of the celebrated naturalist by Otto Vautier.

The statistical and tabular survey of Italian libraries undertaken by the Ministry of Agriculture, Industry, and Commerce has just been completed by the issue of a third part. The first two dealt with Government libraries mainly; the third embraces such as belong to academies and high schools, seminaries, etc., circulating libraries (like the Frankliniana at Rome), and a few private (like our countryman Prof. Willard Fiske's splendid Petrarchan and Icelandic collection at Florence, numbering about 8,900 titles). Others which we may single out for mention are those of several Alpine Clubs, the Whist Society of Turin (dating back to 1841), the Liceo Filarmonico of Bologna (rescued by the French Republic in the year vii. from the break-up of the religious houses), the Dante house in Florence (the 364 volumes being nearly all modern), the École Française at Rome; and the Biblioteca Ferrari-Moreni, devoted exclusively to Modenese works. Perhaps by way of stimulus to better things, place is given to the Biblioteca Piccinni-Ricci at Maglie, though the twin bequests to the district have been neglected for two centuries, and lie in disordered and neglected heaps "in un gran salone della chiesa, di proprietà comunale." As in the preceding parts of this catalogue, the history of each library, its character, size, accessibility, etc., are set forth, and special pains are taken to record by title the chief incunabula. The work as a whole is an honor to the Government and invaluable to students in Italy.

The Consular Reports for August contain an account of the present condition of the pearl fisheries in all parts of the world, with especial reference to the prevailing scarcity of small pearls. This is attributed to various causes, the principal being an increased demand in India and Arabia, and the fact that many of the beds have been overworked. In some the fishing has ceased altogether in order to permit the oysters to grow. It will probably be five years before the Ceylon fishery is resumed. In the Red Sea the native fishermen say that the falling off is due to the want of rain (their belief being that "a pearl is formed from a drop of rain caught in the mouth of a pearl oyster") and to the increase of coasting steamers, which drive away the oysters by the disturbance of the water. Of the pearls sent to foreign markets, London practically takes two-thirds and Paris the remainder, the average annual value being about four and a half million dollars. There is also an exhaustive, but very pessimistic, report on Samoa and its future prospects, the result of a year's experience of Consul-General Mulligan. The character of its soil is such as to make agriculture, its sole resource, unprofitable in case of competition. The growing of coffee, for instance, has steadily declined, and the cultivation of cotton has been abandoned. Copra is practically the only article of export. The political outlook is equally discouraging. The evils which the Berlin treaty was to remedy still exist, and have in fact increased.

The principal article in the *Scottish Geographical Magazine* for September is a sketch of Ashanti by one of the officers of the recent expedition into that country. From it we gather that Ashanti itself contains little natural wealth, agricultural or mineral, and that the advantages gained by its conquest are the abolition of human sacrifice and the opening up a valuable trade with the Hinterland.

The *Geographical Journal* for September opens with two very suggestive articles on the Hausa territories in the Central Sudan, by a missionary and the agent-general of the Royal Niger Company. From their joint testimony it is probable that this is the most promising region in tropical Africa, Uganda not except-

ed. The greater part of the natives, numbering some fifteen millions, are industrious, loving work for the work's sake. The average daily attendance in the market of their commercial capital is from 25,000 to 30,000, and Kano cloth, made from native-grown cotton, is to be bought throughout northern Africa from Lagos to Alexandria. The chief obstacles to the development of this country, rich in natural resources, are slave-raiding, the currency, and the want of roads, all of which are curiously related. The only recognized currency consists of cowries, of which the equivalent of two and a half dollars "weighs something like one hundred pounds." Consequently large sums, as the tribute of a chief to the king, are paid in slaves, who are obtained by raiding, not hostile tribes, but their own villages. Then, from the lack of roads, everything has to be carried on men's heads, and the porters are almost universally slaves. It is estimated that the "slave population numbers at least five millions, or, to put it in another way, that one out of every three hundred people now living in the world is a Hausa-speaking slave." The agent-general says that he travelled through a district, once very populous, for a distance of seventy miles and did not meet a single human being, in consequence of slave-raiding. In the conclusion of Dr. Donaldson Smith's account of his journey through Somaliland (remarkable for his extraordinary natural-history collection, in which were twenty-four new species of birds alone), it is interesting to note that he ascribes the hearty welcome given him by a tribe to the fact that "they had heard of the kindness shown by Mr. Astor Chanler" to fellow-tribesmen living eleven days' journey distant.

We have received from J. L. Smith, No. 27 South Sixth Street, Philadelphia, a colored map of Cuba on a scale of twenty-five miles to the inch. Side maps represent the city and province of Havana on a larger scale, and "manifest destiny" is implied in two hemispheres showing Spain's shrunken possessions in America at the present day compared with a century ago.

Amongst the appointments for the year to science-research scholarships in Great Britain, made (from the 1851 Exhibition Fund) by Royal Commissioners, on the recommendation of the respective colleges and universities, it is interesting to note that University College, Bristol, is represented by a woman, Miss Emily C. Fortey. These scholarships have an annual value of £150, and are ordinarily held for two years ("subject to a satisfactory report at end of first year") in any educational institution in Great Britain, or on the Continent, approved by the Commissioners. The holders devote their time to study or research in some branch of science the extension of which has industrial or commercial value. As further illustration of the substantial way in which good work by women is being accorded recognition, we note that the London School of Economics and Political Economy has recently awarded three, out of five, research scholarships to women, of whom one has been trained at Somerville Hall, Oxford, and two at Girton College, Cambridge.

The next meeting of the Central Division of the Modern Language Association of America will occur between Christmas and New Year at St. Louis, Mo. Those wishing to read papers are requested to address Prof. G. Karsten, Bloomington, Ind., as soon as possible. Membership is open to any one interested in the study of modern languages. Further details will be announced later.

—A pamphlet issued by the Royal Society of Canada on 'The Discovery of America by John Cabot in 1497' (Ottawa, 1896) indicates the Society's purpose to celebrate in the summer of 1897 the four-hundredth anniversary of that event. The brochure prints commendations of the movement by Sir Clements Markham, Mr. Winsor, and the historian Harvey of Newfoundland. It also gives a report of a committee of the Society, by which it appears that the commemorative exercises will be held at Halifax next June, with a subsequent excursion to Cape Breton for the purpose of dedicating a monument. The committee wish it understood that, in erecting the memorial at the entrance of the harbor of Sydney, they do not commit the Society to any theory as to the landfall, but simply select a commanding headland, on the eastern coast of the Dominion, facing the broad ocean over which Cabot voyaged for the momentous discovery. The exact spot whereon he reared the royal standard in token of possession for Henry VII. is not likely to be determined to the satisfaction of everybody. Indeed, both the place and date of the landfall are in dispute. The discussion of these questions turns on the credibility of the legends found on the well-known Cabot map. This document places the discovery on June 24, 1497, at the island of Cape Breton. Before the unearthing of this map in 1843, the general belief had been in favor of the Labrador coast. To this older theory Harrisse now adheres, almost alone, and he charges deceit in the matter of the map in placing the discovery at Cape Breton, for the purpose of supporting the English claim to that region against that of France, then recently emphasized by the discoveries of Cartier. The Newfoundland theory of the landfall has been mainly advocated by the writers of that island, notably of late by Judge Prowse. The supporters of the Cape Breton theory have generally favored the northernmost point of that island, against which the legend on the Cabot map is placed. A year or two ago Dr. Samuel E. Dawson of Ottawa advocated before the Royal Society a belief in the southeastern point of that island as the true landfall, being the original *Cape* Breton of the early maps. In the present tract the same writer reinforces this belief in a new essay, and controverts the ground of Judge Prowse's opinion that Cape Bonavista, on the outer coast of Newfoundland, has the better claim to recognition. Steps have already been taken to have, on the same day, a similar commemoration at Bristol, England, the port whence Cabot sailed, with reciprocal exchange of communications by cable. This movement is under the direction of the mayor of that city, a gentleman who has long had commercial connections with America. The American Consul at that port, Mr. Lorin Lothrop, is lending his assistance, and the project is likely to interest the great body of American residents in England.

—A most amiable Neapolitan "publiciste," as he styles himself in his preferred language, Prof. Gabriel de Rosa-Rullo, domiciled at No. 52 in the Street of the Holy Sepulchre, appears, from his autographic correspondence before us, to have a "pull" on the Académie Littéraire et Scientifique du Hainaut. Of this institution we cannot speak with confidence, since it goes unnoticed in *Minerva*. But our publicist signs himself *délégué général* of it, and, on his proposing, the Academy appears to be in the habit of conferring degrees on persons unknown alike to it and to the proponent. A president of one of our Western universities was surprised the other day by a polite note from Prof. Gabriel, informing him that by the above process he, the said president, had been appointed "Président d'honneur et Professeur Emérite" by the "Conseil Universitaire" of the Academy, and at the same time awarded "la Medaille de Mérite de première Classe." From an entire stranger this was very handsome and unexpected, but diploma and medal are to be forwarded only on acceptance—which indicates a flattering doubt of American greed for titular distinction. Meanwhile, however, as an accompanying *printed form* shows, Prof. Gabriel de Rosa-Rullo is not above suggesting a little *quid pro quo;* for he says he would accept in return, "avec gratitude et par relation amicale," a diploma of Professor Emeritus or Doctor Honoris Causa from the American university, in any one of the faculties (the modest man!) of Law, Philosophy and Letters, or Social and Political Science. The exchange is incomplete, we regret to say for the credit of American manners; but perhaps the Minister of Public Instruction in Italy would do well to keep an eye on Prof. Gabriel, whose letter-sheet proclaims him corresponding member of five academies, institutes, and unions, as well as "Avocat de Saint Pierre, Jurisconsulte du Collège de Saint Ive de la 'Sacra Romana Curia.'" Is there no law against gluttony in Italy?

—The German habit of introspection manifests itself in numberless newspaper articles on newspapers. To the average American editor there is something amusing in these solemn attempts to fathom the mysteries of the profession, to expound the mission of the newspaper, and to draw the boundary line between journalism and literature. The latest attempt to grapple with the subject is made by a writer in the September number of the *Deutsche Rundschau*, who discusses "The Daily Press in its relations to Current Intellectual Life," without adding much that is new or valuable to previous expositions. It is, however, interesting to see him reinforce the charge that the newspaper stifles independent thinking, by the argument that too much prominence is given to the editorial article, which generally occupies the first place in a German daily, and thus provides the reader with a ready-made opinion before he has heard of the event on which the article is based. The news proper, which the American reader craves above and before everything, is relegated by the German newspaper to the inside pages. That the habit of newspaper reading interferes with book reading, and thus with the acquisition of exact knowledge, is as true of Germany as it is of this country; but probably few thoughtful newspaper readers on this side of the ocean will agree with the *Rundschau* writer that the daily press consumes an "appalling amount of talent" (*erschrecklich viel Talente*). It ought to be said, perhaps, that the writer of the article, Dr. Emil Löbl, is a Viennese, and doubtless had the *Neue Freie Presse* in mind in this passage: "He who knows what a large sum total of knowledge and experience, of wit and wisdom, is being dealt out daily, in small coin, in the columns of the press, cannot doubt that out of such a fund of intellectual power might be created most valuable and lasting works in literature and science, provided that power could be concentrated."

—On the other hand, American (and English) newspapers of the better class are not open to

the charge, so often brought against German newspapers, of corrupting the language in which they are written. German custom has never exacted from the newspaper writer strict adherence to classic canons. Nor, as Herr Löbl remarks, are loose stylistic practices confined to the newspapers. "Every reader whose sense of language is highly developed will admit that the number of correctly written books is constantly lessening, while those whose style may be called perfect have at all times been very few indeed." The problem of how to educate the educators of public opinion is touched upon but not solved by the writer. There will always be those who maintain that the true journalist is born and not made; to those who demand that "he who wields so pointed an instrument as the press should know how to use it," Herr Löbl commends the example of the Bulgarian Sobranye, which recently decreed that no one could become a journalist who had not at least passed through all the classes of a gymnasium. The journalists themselves evidently incline to the former view, for when the question of a special preparation for their calling was brought before the International Congress of Journalists at Antwerp, that body refused to discuss the matter. Nevertheless, an attempt to supply a few finishing touches to native genius, through the establishment of "professorships of journalism," has been made in Europe as in this country, the University of Lille having instituted a course of three lectures introductory to journalism—one on "the great English publicists," one on "press laws," and one on "duties and practice of journalism" (the last by M. Tavernier, editor of the Paris *Univers*).

—Prof. Shorey would not thank us for attempting a résumé of his study on 'The Idea of Good in Plato's Republic,' which is to appear among the "Studies in Classical Philology" of the University of Chicago. His essay might better be expanded into a volume than condensed into a paragraph. It is a very remarkable piece of work, evincing the scholarship, the wide grasp of speculative philosophy, and the literary taste which seem a necessary equipment for the interpreter of Plato. It really sheds light on the whole purpose of the 'Republic.' Plato's Idea of Good was criticised by Aristotle as a transcendental notion, the contemplation of which could benefit neither cobbler nor carpenter; and the rigid literal spirit of this criticism has been generally followed by later commentators down to Dr. Jowett, who regards Plato's ideal as a mystical, nebulous abstraction, that appears nowhere in the Dialogues outside of the 'Republic.' Dr. Shorey shows that in reality it is a conception which the minor ethical dialogues are intended to illustrate and define, sometimes negatively, sometimes by tentative approaches. It is, in one aspect, an ultimate rule or standard of life, embodied in the social ideals of the Republic, to be evolved, applied, and transmitted by the guardians of the State—the philosopher-statesmen. The virtues are "goods" in so far as they conform to this ideal of good; it is, in fact, the final canon by which the virtues must be tried and classified in the ethical science of Plato. For him and for his State the ideal represents the same sort of ultimate test which the will of God represented for Calvin, the greatest happiness of the greatest number for Bentham, the survival of the species for Spencer and Leslie Stephen. While the citizens of the Republic will practise the virtues "in unthinking conformity with the ethical type which the rulers impose," the rulers themselves "must know the idea of good"—that is, they must have before their minds that ideal of health, harmony, and happiness for the individual and the State which is embodied in the social organization. To these choicest spirits, moulded by a long and severe discipline, by softening and refining influences, by experience in practical affairs, is intrusted the vision of the good; they are the moulders and guardians of the social ideal. The final touch was to be given to their intellectual training by the mastery of the severest and most advanced science of their day—the study of geometry, of mathematics, and of mathematical astronomy. Perhaps, in the present day, Prof. Shorey remarks, Mr. Huxley or Mr. Spencer would substitute a training in Biology for this training in mathematics. "But in what sense," he asks, "is this doctrine less definite or precise than the teaching of modern evolutionist ethics?" Mr. Herbert Spencer virtually follows Plato in postulating an ideal social organism as the ultimate test and type of ethical truth. Leslie Stephen defines virtue as "conformity to the type defined by the healthy condition of the social organization." This is only a return to the doctrine of Plato, save that his idea of good appeals to a higher and nobler order of emotions than the evolutionist's "survival of the species." It is quite clear that Dr. Shorey owes the world a book on the Platonic philosophy; it is equally clear that if such essays, written in such a style, are often repeated, the University of Chicago will be unable to disclaim the imputation of culture which it officially frowns on.

A BAND OF SINGERS.

Story of the Hutchinsons (Tribe of Jesse). By John Wallace Hutchinson. Compiled and edited by Charles E. Mann. With an introduction by Frederick Douglass. 2 vols. Boston: Lee & Shepard. 1896.

THOSE who can recall the Hutchinson family in the beginning of their "concerting" are now passing off the stage. The name, however, is still a household word over the greater part of the North, and even on the Pacific Coast, for the "Tribe of Jesse," represented solely now by the author of these memoirs, has subdivided into the Tribe of John, of Asa, and of Judson, and bids fair to interest another generation with its rich gift of song. What can never return is the reformatory epoch in which the Hutchinson brothers and their sister Abby, "from the Old Granite State," "dared," in Frederick Douglass's words, "to sing for a cause first and for cash afterwards." The emotional side of the anti-slavery cause in particular they fostered as hardly any other instrumentality could, heightening the effect of the poetry of Whittier, and even capping the eloquence of Wendell Phillips.

"Phillips," reports N. P. Rogers (the scene is Faneuil Hall, Boston; the date, January, 1843), "had been speaking in his happiest vein. It was towards night. The old hall was sombre in the *glooming*. It was thronged to its vast extremities. Phillips closed his speech at the highest pitch of his fine genius, and retired from the platform, when the four brothers rushed to his place and took up the argument where he had left it, on the very heights of poetic declamation, and carried it off heavenwards on one of their boldest flights. Jesse had framed a series of stanzas on the spot, while Phillips was speaking, embodying the leading arguments, and enforcing them as mere oratory cannot, as music and poetry only can, and they poured them forth with amazing spirit, in one of the maddening Second Advent tunes. The vast multitude sprang to their feet as one man, and at the close of the first strain gave vent to their enthusiasm in a thunder of unrestrained cheering."

That conjunction can no more be revived than slavery. Phillips himself outlived the hardihood of any improvisatore seeking to gild the refined gold of his "poetic declamation," while "Brother John" has fallen upon times when not every cause is as singable as abolition. In 1867, on taking the field in behalf of woman's rights, he says (p. 438)—

"I had been requested to sing as many suffrage songs as possible in the coming campaign [in Kansas], but found on examination that the national hymnology was surprisingly deficient in that class of poetry. I therefore wrote to a large number of our American song-writers, asking contributions to the cause. The responses were not numerous, and so I decided that I must depend largely on my own resources."

Or, as the editor of the Ottumwa *Home Journal* presently put it (i., 454), "they [the Hutchinsons] were apparently hard driven to find poetry the sentiment of which could be made to sustain a proposition so hostile to poetic feeling as is female suffrage, and so their songs upon this subject were original." How successful, may be inferred from the opening lines of John's lyric—

"Who votes for woman suffrage now
Will add new laurels to his brow,"

though it was doubtless carried off by his melodeon and voice. And this qualification is not to be despised. Among the Hutchinson fraternity, Jesse was preëminently the song-writer, and while his verse was almost incredibly mediocre, it could be sung. Rogers went so far as to call him, in 1844, "the most gifted song-writer of the times," who "writes to sing rather than to read," and (since he "writes under the influence of song") whose poetry "*sings* so much better than Pierpont's, or Burleigh's, or Lowell's, or Whittier's, or any of the bards." There was the "Lynn Bard," for instance, Alonzo Lewis, a prominent figure in those fermenting times, and neighbor of the Hutchinsons after (following Jesse's lead) they had clustered about High Rock. "He composed several songs for us," says John (i., 320), "but they lacked the singable quality we desired, and none of them were ever given in public." Whittier, on the other hand, strange to say for the Quaker in him, could be sung, and, before the war, is said to have asked John at Amesbury, "Do you want to know the one desire I have above all others? It is this, that I may so write my verses that they may be sung" (i., 397–8).

He was, in fact, not a little indebted to the Hutchinsons for the popularization of his poetry, and it was his adaptation to the music of "Ein Feste Burg,"

"We wait beneath the furnace blast
The pangs of transformation,"

one of the most stirring lyrics of the war, that the Hutchinsons sang to the Army of the Potomac in January, 1862, under a general permission from Secretary Cameron, till General McClellan ordered them out of the camp almost under the shadow of the Capitol.

"What breaks the oath
Of the men of the South?
What whets the knife
For the Union's life?
Hark to the answer: *Slavery!*"

This was unpalatable truth to a political Democratic general, but it was, we must ad-

mit, a truth which the North as a whole was still dodging, Lincoln among the rest; nor must we overlook the fact in gauging our censure of McClellan. The incident was promptly noticed in Congress, but the Hutchinsons went no more among the camps, where they might have contributed powerfully to that unity of feeling which was the strength of the Confederate armies.

There is no other episode in these memoirs of like national importance or resonance, but more space is given to the *faux-pas* of our anti-slavery songsters (on the prompting of the impulsive Jesse) in knocking together a song to Henry Clay, "Brave Harry of the West," and seeking him out in a New York hotel to sing it to him, in February, 1848. What consternation this caused in abolition circles may be imagined, and one must praise Brother John for his candor and want of bitterness in the narrative of the censure and ultimate condonation, as well as for gathering in an appendix the contemporary documents in fine print. By this means, too, he distinctly enhances the value of his work as a contribution to the history of the anti-slavery cause—that cause of which Brother Joshua wrote in the name of the family, addressing its present biographer, "as having done more for *us* than we possibly could have done for *it*." But the woman-suffrage cause, as we have seen, and the temperance cause in the earlier and in the later years also find here a chronicler of their machinery, at least, worth the having; and the multitude of details which make the volumes in too large a measure unreadable give them a real value for reference, so many eminent personages on both sides of the Atlantic (for there was a famous trip to England, commemorated by Harriet Martineau in her best manner, and by Mary Howitt in a memoir) enter in. Nor can the history of music in America omit this highly original, rough-gifted band, whose particular genius, Judson, "while an infant upon the floor, was heard to hum distinctly the melody of old Greenville, 'Gently, Lord, O gently lead us.'" Finally, the Yankee character may be here studied to advantage in the annals of a large family, all farmers, who periodically abandon the plough to make a concert tour, then return to their rude occupation; who combine moral zeal and earnestness with the prankishness of boys; who are affected by all the passing speculations and aspirations and manifestations of the age, so that Jesse and Judson nearly lose their mental balance through spiritualism, though Jesse, failing to tunnel down to the pirates' cave in High Rock, is truly guided by a clairvoyant to a living spring. John has for many years made it his "motto to live in one world at a time," but also for years (since 1888) has seen "the good time coming" in Bellamy's Nationalist movement, and has "worked and talked, sung and voted with these reformers." The droll Judson would use the intervals of singing by the quartet to expatiate to his audiences on the evils of tobacco and pork and the virtues of brown bread. The chapter in the second volume which takes up the family in detail, is, in connection with the abundant likenesses of all, most readable and instructive for its types of character frankly delineated. In the appendix will be found some charming examples of Abby's (Mrs. Patton's) private letters, and Harriet Martineau cites a sonnet of Hartley Coleridge "To Alfred Tennyson" after hearing Abby sing the "May Queen." In all the travelling required for John's eleven thousand concerts, adventures were numerous and often most amusing, and the anecdotes scattered up and down these pages relieve many arid extracts from the diaries which form the substantial basis of John Hutchinson's reminiscences. There is some good character-sketching, but none more discriminating than this of Maria Weston Chapman (ii., 137):

"She was the handsomest, most faithful, and active woman who espoused the cause of the slave. I can see her beaming countenance now as she would sit in a prominent place at the conventions. We would go home, and, recalling her presence, the many committees she was placed upon, and her general air of activity, would say, 'Well, Maria Chapman did speak, didn't she?' As a matter of fact, she never spoke."

We cannot close without commending to Southern readers Frederick Douglass's Introduction, and the remarkable letter from George Latimer, who died in Lynn but a short time ago, completely forgotten as a fugitive slave of Union-wide notoriety in 1842, and who asked to use his ransomed freedom only in honestly and modestly earning his daily bread as a paper-hanger in Lynn, till his days in Virginia became "like a dream" to him. The lives of these two men—unequal in intellectual capacity, but alike useful and self-respecting citizens—point on our side of Mason and Dixon's line a moral against the system which made chattels of them, but on the other side will be used to justify the bondage from which they escaped, as a most efficient Christianizing and civilizing agency. *Come va 'l mondo!*

ELIAS BOUDINOT.

The Life, Public Services, Addresses, and Letters of Elias Boudinot, LL.D., President of the Continental Congress. Edited by J. J. Boudinot. Boston: Houghton, Mifflin & Co. 1896. 8vo, pp. xvii, 419; vii, 415. Portraits.

In two handsome volumes Miss Jane J. Boudinot has collected what she could gather of the papers of Elias Boudinot. A lawyer by profession, Commissary-General of Prisoners in the Revolution, Member and, for a time, President of the Continental Congress, serving in three Congresses under the Constitution, Director of the Mint, Boudinot was prominent, but never great. He was a sturdy descendant of Huguenots, very philanthropic, doing his duty with attention and ability in whatever line of action he served. His name is connected with no measure of public policy, but he must be counted among those who lent dignity and substance to the early years of the new Government. He was deeply religious, and in the votes cast for two Deists—Jefferson and Burr—and for Dr. Priestley, for chaplain of the House, he saw "substantial evidence of our degenerating from the zeal of our forefathers, who first settled this wilderness," and in consequence felt great alarm.

Such a career becomes interesting in the sidelights it throws upon Revolutionary and political history. Boudinot's letters, few in number, are very simple and natural expressions of facts, and the work has been swelled by the inclusion of his speeches in Congress and letters from William Bradford, who married Boudinot's daughter, and Samuel Bayard, who married his niece. From this correspondence, which consists almost entirely of family letters, little of public interest can be gathered. The basis of the first volume is a manuscript record, now in the John Carter Brown library, quoted as "Reminiscences of Elias Boudinot." This record must have been compiled after 1801, for it mentions Arnold's death. Many little statements, which could be examined critically, tend to prove that Boudinot's memory misled him, as was natural; and there is ever present a kind of detail that makes a "good story" rather than a record of fact. Take his account of the siege of Yorktown. After the French admiral had announced his intention to depart, Washington saw the necessity of storming the British works. Boudinot says that to avoid that necessity Washington sent Hamilton and other officers, with a flag of truce and "something to eat and drink," to meet British officers, and to tell them out of kindly consideration to them how much he disliked to storm and shed blood. The result of this courtesy was the capitulation. Boudinot entirely passes over the fact that the enemy's works were stormed, Hamilton distinguishing himself; besides failing to account for the sending of Hamilton, a lieutenant colonel and unconnected with the General's family, upon such a delicate mission. So, in the sketch of Arnold's treason, Washington is made to ride up to Arnold's door, call out his (Arnold's) aid, and, "drawing his pistol from his holster, solemnly declare he would blow his brains out if he did not instantly tell him where Arnold was." Such an incident would not have been overlooked in the many narrations of Arnold's flight. The whole account of the treason reads like an attempt to record impressions already fading into indefiniteness.

This indefiniteness colors the "Reminiscences," leaving an incomplete and doubting impression. However readable and interesting they may seem, some further proof of details is wanted. Boudinot tells much of a Frenchman who deliberately poisoned numbers of American prisoners in New York, receiving a reward from the British General. The same Frenchman confessed to poisoning the wells used by the Continental "Flying Camp," leading to the great mortality among the men in 1776. The subsequent career of this scoundrel is related, even his death in London. This is a circumstantial story, but leaves the reader unsatisfied. Such monstrous cruelty would have left a deep and lasting impression upon the mind of any American. Why, then, is not the name of this Frenchman given? Why assert the reward of his act by the British commander, something inconceivable? Why attribute the mortality in the Flying Camp to such an act when it could be more easily explained by intelligible causes? The medical service of the army was known to be poor and corrupt; and so notorious did it become that a removal of the head physician was made, leading, among other results, to Rush's joining in the cabal of 1777-'78 against Washington.

It was in his capacity as Commissary General of Prisoners that Boudinot would record his most valuable recollections, but even there one is surprised not to find more. He was in charge of the "intelligence" from New York, a dangerous duty and one that should be full of incident. He tells us of an attempt to deceive with false information (i., 68, 69) and of two handsome offers, from the British, for his defection (i., 103, 125). The account of Lee's return to camp has before been printed; but the account of the sufferings of the American prisoners in New York is new, and may be accepted as historical, for Boudinot was the only person to whom the privilege of visiting them would be accorded.

As he was connected with headquarters, he

must have enjoyed many opportunities of knowing the hidden motives of action, such as the visit of a committee of Congress to Washington in 1777, to urge upon him the "political" necessity of gaining a victory; but he gives few results of those opportunities, and is tantalizing where he might be expected to have a full knowledge from a personal connection with the event described. He was, for example, one of the commissioners appointed by Washington in March, 1778 (not, as Boudinot says, the "winter of 1778"), to frame a cartel with the British for a general exchange of prisoners. A committee of Congress, then in camp, wished to avoid an exchange of prisoners at the opening of the campaign, and advised that the negotiations "should be merely ostensible, for the purpose of satisfying the army & throwing the blame on the British." Washington promptly resented such a scheme, and in something of a huff the committee returned to Congress, and induced that body to pass resolutions censuring the Commander-in Chief—a censure which, Boudinot states, was afterwards expunged from the minutes. Meanwhile the commissioners repaired to Germantown, declared to be neutral territory during the sessions, and, after exchanging powers, began a performance more interesting than dignified. Grayson was selected to outdrink the British, which he did. Then the British objected to the powers of the Americans, but consented to submit a draft of a cartel. On the third day the English wanted to attend a ball in Philadelphia, and asked that business be suspended. The next day, on returning from the ball, the Americans were informed that the neutrality of Germantown ceased after the sessions of the commissioners, and a reasonable time was allowed "for us to return to our army"—a matter of sixteen miles. Charges of bad faith followed, and the English invited themselves to dine with the Americans. "We immediately perceived their Drift was to keep us engaged until it was too late to go or by drinking freely prevent us. We were on our guard & set Coll. Grayson to manage them. They accordingly sat after dinner with Grayson while we were preparing to go off, till they could scarcely sit upright." Upon a subsequent meeting at Newtown, O'Hara confidentially told the Americans that Howe was playing with them, that he had no authority to enter into a cartel, and intended to break off negotiations when every excuse for prolonging them had been exhausted. So both sides prepared a formal report and separated, but not till "the stores were exhausted." Something in this explanation needs explanation. It is now known that Howe was bound, by orders from Germain, not to effect an exchange of prisoners in such a way as to recognize the Americans in any other rôle than that of rebels. Would it have been decent for O'Hara to tell the American commissioners that his superior officer was insincere? Boudinot must have written his later impressions of the incident.

It is regrettable to find so many errrors in proof-reading and possibly in transcribing the letters. With the many sources of information available it was inexcusable to permit so many blunders to remain unnoticed. It required time to unravel the words "Dr. Gasper Jove Lanosabbe Guavia" into Don Gaspar José Llanos (& ?) Abbe Gavarra (i., 397). General Freidrell (i., 131) is probably intended for Reidesel, sufficiently prominent in history to be identified. Major Montorieff (i., 174) must be Montcrieff, and the martyred Col. Hayne is with difficulty found in Hamis (i., 243). Congress actually did direct Greene to retaliate for Hayne, but the General wrote that he held no prisoner of sufficient rank. Duguesin (i., 315) is more likely to be Duquesne. United States is printed "number states" in a letter to Carleton (not Carlton, as printed); and Wharton gives the word "enquiries" where our editor notes "(*torn*)" (i., 347-8). The second volume, being made up of speeches, contains few errors. The French names on pp. 93 and 96 have fared hard, and the Bishop of Llandaff is changed into Landall on p. 98. The letter to Madison (p. 155) is either misdated or printed out of its regular order. The editor frequently refers to "MSS. Archives." There is also some peculiarity in selecting letters for publication. In matter the two letters printed in vol i., pp. 281 and 283, are identical; but the important letter to the Ministers at Paris, of July 15, 1783, is omitted. Two letters of Boudinot printed in the 'Correspondence of Samuel B. Webb' are not noticed, though one of them is of high interest. The letter of Washington to Boudinot, April 1, 1777, offering him the office of Commissary-General of Prisoners and defining its duties, is only mentioned, though personal and pertinent to the story.

The Theory of the Divine Right of Kings. By J. Neville Figgis. [Cambridge Historical Essays. No. IX.] Macmillan. 1896.

Mr. Figgis's book is an expanded and rewritten prize dissertation. It is an attempt, on which great labor has been spent, to trace the natural history of the theory of the divine right of kings to its causes. Stated in a few words, what he wishes to show is, that the theory was originally a popular theory, set up at the close of the middle ages in opposition to the divine right of the Pope; that it contributed to the great revolution by which the supremacy of the church was subverted, and modern civil allegiance (and hence the modern state itself) rendered possible. He distinguishes between the causes which produced the theory and the reasons by which it was supported, the latter being to modern ideas confessedly absurd. The part of the essay which maintains this thesis is interesting and ingenious, but the conclusions with regard to the part played by divine right in the seventeenth century are startling. These seem to be that the doctrine was essentially anti-clerical, because it had been anti-papal; that a deep sense of the majesty of the law and of the duty of obedience is "the priceless legacy" bequeathed to our own day "by the believers in the divine right of kings"; that "the main tendency of the doctrine was beneficial." Holding these views, the author is inevitably led to the conclusion that the theory of an original compact (through its influence upon Rousseau) has been "infinitely more pernicious in practice than the notions of Indefeasible Right and Passive Obedience."

The essay comes before the public with the approval of the University, and is a curiosity as an illustration of the influences at work there. It is really a political pamphlet, written by a student under Sir John Seeley who has caught his master's manner to perfection. The reason why he desires to bolster up the reputation of Filmer and other royalist writers is evidently because he believes that the Home Rule bill and the London County Council are results of the compact theory, in the same way that many people think that Rousseau caused the French Revolution. But, as he himself says, the causes of beliefs should not be confounded with the reasons given for them, and so, too, it must be remembered that great political changes, though they may be advanced and defended by theory, are produced by facts. And if we wish to know why the divine-right theory, after doing its work in bolstering up king against pope, became so important in the seventeenth century in England, it is in the facts of English history that the explanation must be sought. If it was not a recrudescence of theocracy in the interest of reactionary kings against Parliament and free institutions, then history will have to be rewritten. The reader will look in vain through this book for facts showing that the theory of the divine right of kings performed any useful function in England in the development of the art of government after the Tudor period. The theory, which embraced divine hereditary right, non-resistance, and passive obedience, was an old weapon which the royalists furbished up and employed against their antagonists; but it was even then essentially outworn, and, as the author very naïvely admits, when James II. ran away, ceased to be of any use.

The superiority of the compact theory over the theological theory of government lay in the fact that, though founded on a false historical assumption, it marked a distinct advance in human thought; it recognized the necessity of accounting for the existence of government by natural causes. Although historical investigation has not confirmed the theory as an explanation of the past, experience has demonstrated the possibility of government as a result of compact, and the idea is realized in every government deriving its powers in theory of law from a paramount written constitution adopted by a self-governing community. Such a government rests, as governments always have rested, on force, but the force is exerted under the compact. It may be overturned by a conspirator or a mob, but a new compact is immediately resorted to to ratify the change through the suffrage. It is extraordinary to us that a great university should print arguments, however ingenious, which serve mainly to show a tendency in it toward perverted views of history. If the universities are to come to the rescue of the Crown, well and good; but this object will not be accomplished by trying to persuade us that the royalist writers of the seventeenth century were inspired publicists, full of ideas in advance of their time.

The Sonnet in England, and Other Essays. By J. Ashcroft Noble. London: John Lane; Chicago: Way & Williams.

It is clearly a misfortune, growing out of the profuse literary activity of London and of the ease with which mediocre books get themselves printed there, that the world receives from that quarter a steady stream of critical booklets, containing small studies, often of smaller authors; these studies having previously done duty, at any time within twenty years, in some magazine or newspaper. Thus the present volume opens with a study of the English sonnet, made and first printed sixteen years ago. Since that date, a series of compilations and monographs have appeared upon the subject, wholly superseding and often directly disproving much of what is here said. Some of Rossetti's best sonnets have been, moreover, published within the time elapsed; and all the author's discussion of this poet, both in

the opening essay and in that called "A Pre-Raphaelite Magazine," is rendered almost valueless by the flood of light since thrown upon the whole Rossetti family by themselves and others.

Again, in discussing Coleridge's sonnets and simply ranking them as inferior, on the whole, to Wordsworth's, the critic wholly ignores the extraordinary fact, to which attention has only been called within a few years, that when Coleridge's poems were published in 1797, with those of Lamb and Lloyd, he repudiated every conceivable standard of sonnet-writing, saying that, "respecting the metre of a sonnet, the writer should consult his own convenience—rhymes many or few or no rhymes at all"; and put this strange theory in practice by publishing a rambling poem of sixteen lines and calling it a sonnet. This is the poem which appears in later editions as "Lines composed while climbing the left ascent of Brockley-Comb." In various ways this first essay by Mr. Noble strikes the careful reader as something well enough in its way but superseded; suggesting Heine's description of the Cid's horse Babieca, to which steed no objection could fairly be made except the incidental fact that he was dead.

The subjects of the other essays in the book are respectively Leigh Hunt, Robert Buchanan, Hawker of Morwenstow (a "poet-priest"), and "The Poetry of Common Sense," namely, that of Pope. Several of these are more recent, yet in the essay on Hunt (dated in 1886), while giving many pages to refute a variety of "calumnies" against his author, Mr. Noble makes no sign of having even read the charges which are on the whole the most serious of all yet urged against him; those, namely, of selfishness and almost treachery, contained in the letters of Mrs. Shelley. Here, therefore, as elsewhere, appears the evil of a too tardy reprinting of what is practically superseded.

We have given more space to this volume than it perhaps deserves, because it represents a class, though of these it is among the least deserving. Le Gallienne and Alice Meynell—even Symonds, Gosse, and Lang—often send across the Atlantic matter which is trivial enough; but in their cases the work reprinted is usually more nearly contemporary, and offers themes that are important if the treatment is not. Yet much which they too offer is simply journalism decanted into volumes; collected, not selected; exhibiting anew the vast profuseness of London, yet lowering the average of its product. Many books of the same class are published in this country, but they fortunately seldom reach England, while the prevailing literary trade-wind brings many such hither from the other side, so that we waste our time in picking up the smaller book-gossip of that country, perhaps fifteen or twenty years old. To those for whom the dregs of yesterday's wine-glass bring pleasure, this book may perhaps be recommended.

Materials for the Study of Variation, Treated with especial regard to Discontinuity in the Origin of Species. By William Bateson, M.A. Macmillan & Co. Large 8vo, pp. xv, 598, illustrated.

THE variations to which the term discontinuous is here applied are those commonly designated as "sports." In these a new and transmissible character has suddenly appeared, causing them to differ from their parents and others of their race, and, by establishing a new point of departure, to make a real step forward in the evolution of a new species. This was the position of Galton, in 1892. No intermediates exist to graduate the differences between the sport and its parents, hence the discontinuity. By gathering a great number of data and studying them for what they yield, the author effectually discredits the practice of starting with a theory and searching for facts to support it, and his conclusions seriously impair opinions, more or less generally accepted, built in that fashion upon theories of adaptation, utility, and especially of natural selection. Species are discontinuous, and, if proved to originate in discontinuous variations (be the causes what they may), the continuous, minute, beneficial variations, so called, lose the great importance heretofore ascribed to them; and further, in view of the possible origin and establishment of a species without competition, the necessity of proof of the presence and effect of natural selection in every instance, just as in the case of any other factor, becomes sufficiently evident. If, in a particular species, an individual possessing an additional segment in the body or an extra joint in the leg transmits its peculiarity to its progeny, a new species is established, though the time when it will be called upon to compete for selection may be beyond calculation in the future.

As if timid, or not wishing to rouse opponents, the author disclaims any intent of attacking the Darwinism of Darwin, but the disclaimer avails little in presence of what he has gathered here. We commend the volume to all interested in the variation and origin of species. Its value will be more appreciated and its influence more felt in time to come, as it makes a good foundation for subsequent study in its line. The author's industry is noteworthy; his classification is simple and convenient; in the main his work is of good quality. For many of his data he of necessity relies upon facts reported by others, and here and there among the references a need of close revision and thorough verification is apparent. A paragraph concerning the two-tailed gold-fishes, on page 453, will illustrate: "Pouchet states that the evidence goes to show that this anomalous race is not maintained in China by any rigid selection. He quotes a Chinese encyclopædia to the effect that the double-tailed gold-fish is found in running streams, and gives the evidence of Kleyn, a missionary in China during the eighteenth century, who states that 'In fluvio Sleyn Cyprini sunt qui caudam habent trifurcam et a piscatoribus Leid-brassen vocantur, quasi diceres aliorum Cyprinorum conductores.'" Of the last sentence it may be said that the name of the man is incorrect, that he was not a missionary, was not in China, and was not writing of that country, that the statement was not his, and is not correctly given, that the name of the river was not (as appears) Sleyn, and the stream was not in China, and that the remarks were not applied to the gold-fish. Traced to its source, the citation refers to the naturalist J. T. Klein (Secr. Civ. Gedan. Soc. Reg. Lond. et Acad. Scient. Bonon. Sodalis) who, in his 'Historiæ piscium naturalis promovendæ,' Missus V., 1749, p. 62, quotes the following from Schonevelde, 1624, Ichthyologia, p. 33: "In Sleia Cyprini lati sunt, caudam incurvatam vel sinuatam gerentes, ac si ea bis fracta fuisset, Piscatores vocant Leidbrassen, quasi reliquorum duces, quibus conspectis fœlici omine amplam capturam sibi pollicentur." Under its modern titles, Schlei, Schleswiger Fiord, etc., the stream flows into the western Baltic a short distance north of Kiel, in Gottorp, Sleswick. The fish of which Schonevelde wrote was not the Chinese gold-fish, *Carassius auratus*, but the European bream, *Abramis brama*.

The Pith of Astronomy (without Mathematics): The Latest Facts and Figures as Developed by the Giant Telescopes. By Samuel G. Bayne. Harper & Bros.

THE qualification, "without mathematics," of the title will take with the public, but this little work would have been stronger, in the estimation of those who do care for them, if a little attention had been paid to the mathematics, and the author would have been spared such slips of the pencil as that which makes him assert that the mean distances of the outer planets from the earth are each ninety-three million miles less than the corresponding mean distances from the sun. This is a minor matter, and does not affect the principal intention of the book, which is to present facts selected from many different authorities. The good points of the volume are, that it brings together in compact form those facts and figures in astronomy which are of popular interest; that the information has been gathered in the main from reliable sources; that the selection of matter is judicious; and that the arrangement is convenient, while the literary style is reasonably good. The criticisms which may be urged against it are, that the author occasionally confuses hypothesis with fact, that once in a while he perpetuates the vagary of some reporter, like that which informs us that Mr. Lowell "has lately devoted his life and his fortune to the observation of Mars," and that once in a while he misses the most popular feature of the story, as when he neglects to mention the meteor streams travelling in the same orbit as Biela's comet, or that Keeler proves the meteoric nature of Saturn's rings by showing, by means of the spectroscope, that the motion of the particles is different in different parts of the rings. In the interest of accurate statement one must condemn the bit of sensationalism which announces on the title-page that the facts and figures in the book have been "developed by the giant telescopes." The work in which these telescopes are engaged does not appeal to those who are likely to be Mr. Bayne's readers, so that hardly one of his facts (excepting, perhaps, that Jupiter has a fifth moon) appears in support of his claim.

The volume is very neat in appearance, and contains a number of excellent illustrations.

Campaign Literature.

PUBLICATIONS OF THE
American Economic Association.

Several Monographs of special value at the present time: On Money and Banking, Monopolies, Wages, and Taxation. Note the following:

MONEY.

(1) The Relation of Changes in the Volume of Currency to Prosperity, by Francis A. Walker, LL.D. (2) The Theory of Economic Progress, by John B. Clark, Ph.D. 50 cents.
Appreciation and Interest. By Irving Fisher, Ph.D. 75 cents.
An Honest Dollar. By President E. Benjamin Andrews. 75 cents.
The Silver Situation in the United States. By F. W. Taussig, LL.B. 75 cents.
The Canadinn Banking System, 1817-1890. By R. M. Breckenridge, Ph.D. $1.50; cloth, $2.50.
Three Papers. (1) The Legal-Tender Decisions, by E. J. James. (2) Statistics in Colleges, by Carroll D. Wright. (3) Sociology and Political Economy, by F. H. Giddings. 75 cents.

MONOPOLIES.

The Railway Question. By Edmund J. James, Ph D. 75 cents.
The State Railroad Commissions and How they May Made Effective. By Frederick C. Clark, Ph.D. 75 cents.
Relation of the State to Industrial Action. By Henry C. Adams, Ph.D. 75 cents.
Municipal Ownership of Gas in the United States. By Edward W. Bemis, Ph.D. $1.00.
The Relation of Modern Municipalities to Quasi-Public Works. By H C. Adams, George W. Knight, Davis R. Dewey, Charles Moore, Frank J. Goodnow, and Arthur Yager. 75 cents.

WAGES.

Contributions to the Wages Question: (1) The Theory of Wages, by Stuart Wood, Ph.D. (2) Possibility of a Scientific Law of Wages, by John B. Clark, Ph D. 75 cents.
(1) The Manual Laboring Class, by Francis A. Walker, LL.D. (2) Mine Labor in the Hocking Valley, by E. W. Bemis, Ph.D. 75 cents.
(1) The Chicago Strike, by Carroll D. Wright, LL.D. (2) The Modern Appeal to Legal Forces in Economic Life, by John B. Clark, Ph.D. (3) The Unemployed, by Davis R. Dewey, Ph.D. (4) Population and Capital, by Arthur T. Hadley, M.A. (5) The Pope and the Encyclical on Labor, by John Graham Brooks. $1.00.
The Adjustment of Wages to Efficiency. Three papers; Gain Sharing, by H. R. Towne; The Premium Plan by F. A. Halsey; A Piece-Rate System, by F. W. Taylor. 50 cents.

TAXATION.

On the Shifting and Incidence of Taxation. By Edwin R. A. Seligman, Ph.D. $1.00.
Progressive Taxation in Theory and Practice. By Edwin R. A. Seligman, Ph.D. Cloth, $1.50.

POPULISM.

The Populist Movement. By F. L. McVey, Ph.D. 50 cents.

The Nation.

NEW YORK, THURSDAY, OCTOBER 8, 1896.

The Week.

MR. BRYAN favors the *Journal* by telegraph with his personal forecast of next month's election. In one sentence, among his reasons for expecting victory, he says; "The gold standard makes a dearer dollar, a dearer dollar means falling prices, and falling prices mean hard times." These catchwords are designed as usual to influence the farmer, and so they perhaps would have done five or six months ago, when grain prices were falling under the promise of especially large crops the world over. But they must ring curiously in the ears of a Kansas or Nebraska farmer, when the wheat market is bidding him, for immediate delivery, 12 to 13 cents more than it bid two months ago, with nearly as great a rise in the price of contracts for later months. Mr. Bryan may not have heard of this advance in wheat. We venture, however, our prediction that many a Bryanite orator, repeating Bryan's words on the Western stump this fall, will hear from his audience the ominous interpolation: "What about wheat and corn?" The orator will not say the truth by answering that the chief cause of the rise is shortage in the foreign crops, because, if he answers thus, he is well aware that the "dearer dollar" sophistry must cease. In short, since the advance in grain, the free-coinage orator, even on the farms, must devote his energies to explanations and apologies—precisely the kind of argument which now makes up the substance of his speeches elsewhere. The rise in grain is undoubtedly a final blow at the frail structure of the Bryan canvass.

Our own views about the political situation at the present time and the outlook for the election do not need to be restated. We regard the situation to-day as most encouraging for the advocates of sound money, and the prospect for the 3d of November as altogether hopeful. The defeat of Bryan by an overwhelming majority seems to us as well assured as any future event ever can be. We reach this conclusion, not on the basis of "claims" by politicians who support McKinley, or of "canvasses" by Republican committees, but on the basis of great and, in our opinion, absolutely irresistible forces which are working against the Populistic candidate. No man has ever yet been elected President of the United States who was not supported by a large proportion of the character, ability, and statesmanship of the nation; Bryan has in the whole country hardly one advocate who commands the confidence of the people, while his most prominent supporters are such discredited politicians as Tillman, Altgeld, and Weaver. No man has ever yet been elected President whom the business interests of the country—including in that term the great mass of bankers, merchants, manufacturers (on a small scale as well as a large), storekeepers—distrusted and opposed as unsafe; these interests in the controlling states are substantially unanimous against Bryan. No man has ever yet been elected President, since the growth of the anti-slavery sentiment gave the Republicans their victory in 1860, when he represented a cause which enabled the moral issue to be raised against him; the proposal of the free-coinage men to repudiate half of all debts, public and private, makes Bryan the representative of the cause of dishonesty.

A striking proof of the extent to which the intelligence of the country is arrayed against free coinage is furnished by a canvass of college and university presidents in the South and West made by the Philadelphia *Press*. Every one of the fifteen heard from is opposed to Bryan's election. Most of them will vote for McKinley, although more than one has been a Cleveland Democrat; but the Chancellor of Central University at Richmond, Ky., and the head of Trinity University at Tehuacana, Tex., support Palmer. Every member of the faculty in these last two institutions will vote the same way as their heads, and the reports show a near approach to unanimity against Bryan everywhere. Such a showing as this in States of the West and South where free-silver sentiment has been very strong, is far more significant than similar unanimity of sentiment among the faculties of educational institutions in the northeastern part of the country. The truth is that there has never been a campaign in which the educated men of the nation were so overwhelmingly for one side as they are for sound money this year. It is also true that there has never been a campaign in which one party received so little support from the press as the Bryan fusion gets this year, a large proportion of the ablest Democratic newspapers openly opposing it, while the perfunctory support given it by many party journals in the South is so contemptuous as to be little better than open opposition—the Mobile *Register*, for example, saying that it knows the policy which Bryan advocates would ruin the country, but that it does not believe he would carry the policy out if he should be elected! Equally striking is the absence of any support of the Populistic cause on the stump from Democratic speakers of character and standing; nothing like it has ever been seen. The success of a movement which finds so little favor with the intelligence of the nation would set at defiance all the laws that have governed elections.

The results of the Connecticut town elections on Monday are no less significant of the drift of public opinion than those of the State elections in Vermont and Maine last month. While local issues have their influence upon these contests, experience has shown that, taking the 163 towns together, the Republicans carry an unusually large proportion in the October of a year when that party is to sweep the country in November, while the Democratic proportion is swollen when the country is preparing to render a verdict in favor of that party. Thus in October, 1892, the Democrats carried 51 towns to 73 Republican and 40 divided, and in November Cleveland carried the State by 5,367 over Harrison; while in October, 1894, with 30 towns divided, the Democrats carried only 32 against 102 for the Republicans, and the latter party the next month elected its candidate for Governor by 17,688 plurality. This was supposed to be high-water mark for the Republicans, but they made a still better showing on Monday, and the indications now are that McKinley will have anywhere from 20,000 to 30,000 more votes than Bryan next month in a State which, since the Democratic split of 1860, has gone Democratic in half of the eight Presidential elections, and which gave Grant only 4,758 plurality in 1872, when Democracy collapsed under the Greeley candidacy.

Minnesota is one of those Western States which ought to go for Bryan if there is anything in the Populist alliance, for in 1892 a combination of the Democratic and Populist parties would have left Harrison more than 8,000 short of a majority, and, even with the "tidal wave" setting toward the Republicans so strongly in 1894, they would have had less than 6,000 majority if their opponents had successfully "fused." But even the chairman of the Bryan Democratic State committee can say nothing more encouraging to the New York *Journal* than that "at best, under present conditions, we can only consider it doubtful"—which is virtually an admission that McKinley will carry it. The reasons for this distrust on the part of the Bryanites are to be found in a canvass of the State that is being made by the St. Paul *Globe*, which shows that sound-money sentiment is very strong among those voters of foreign birth and parentage who constitute about three-fourths of the whole number. Nearly half of this foreign element is Scandinavian, and almost half of the remainder German.

The authenticity of the circular to the silver-mine owners, calling upon them to contribute to the Bryan campaign fund because his election would enable them to make a clear profit of 64 cents an ounce upon all their silver, seems to be undisputed. It throws a glaring light upon the spectacle of Mr. Bryan as a daily denouncer of Trusts and syndicates, for it puts him before the country as the candidate of the most shameless syndicate this or any other country has ever known—a syndicate of mine-owners who are endeavoring to delude the country into paying them double the market price for their product, at the cost of national honor, business and industrial stability, and the general welfare. No such "friend of the the people" as this has ever before run for the Presidency. One of the largest of the mine-owners, J. J. Hagerman, has written a letter declining to contribute, for these reasons:

"After mature deliberation I have concluded that the danger likely to follow the success of the Democratic-Populist combination would outweigh any possible benefit, and I can't contribute to the Democratic campaign fund, either personally or through the companies in which I am interested."

It may be that refusals of this kind have made the Bryanites so desperate that they have put forth the appeal in the hope of convincing the mine-owners that they do not understand their own business, and that in the midst of financial, industrial, and commercial chaos, silver would rise in price to double its present figure and remain there indefinitely.

It cannot, of course, be demanded that all Republican orators and leaders in this campaign should have a clear record on the silver question. Entire consistency is too much to expect in politicians who take their opinions from vacillating party platforms. But we do think that Republicans who have done their best within two years to encourage the silver madness and profit by it, who have thrown away their convictions and tried to outbid the maddest demagogues in attempts to win the cheap-money vote, should either be kept off the stump altogether, or ordered to talk only about the Supreme Court and the Monroe Doctrine, or compelled to preface their remarks on the silver issue by a profession of hearty repentance for their own wicked mischief-making. Here, for instance, was Senator Lodge at the meeting in Carnegie Hall on September 28, receiving, according to the *Herald's* account, "the ovation of the evening," for his "terse and scathing arraignment of the sponsors of the silver movement." He should have included himself in the arraignment, for no man has been more reckless or shameless in pandering to the silver party and inflaming it to the point of desperation. His bad record, which we have repeatedly set forth, has been, we believe, so often flung in his face in Massachusetts that even he has not had the hardihood to do much speaking there. He ought not to appear on a platform in New York or anywhere else to "arraign" the free silver movement, except in the garb of a penitent, with sheet and candle, and repeating the penitential psalms.

Prof. John L. Morris, director of the machine-shops of Sibley College, at Cornell University, a life-long Democrat, was recently travelling in the far West, when a man in the seat beside him exclaimed, "I am a Democrat and I am for free coinage. We want more silver dollars, and we are bound to have them." Thereupon Prof. Morris grasped the man by the hand most heartily and said, "My dear friend, I am with you; I am a Democrat, too; I want more dollars, too; you are just the man I have been looking for; for I want to know how you and I are going to get them. I see how the owners of the mines are going to get them coined by the Government free of expense; and how the governments of Europe that have old silver to sell are going to get them on the same terms, and how they are to make a big profit out of us; but where do *we* come in? How are *we* going to get them? The mine-owners and foreign governments won't give those dollars to us after the Government has coined them; you and I are too proud to beg them, and too honest to steal them; how are we going to get them? What I want to know is, what your plan is to get them from these mine-owners without working for them just as hard as we do now. You and I have both worked a great many years, and pretty hard too, I judge; and now how are we to get our share of all this silver, after the Government has coined it free for the big silver-mine owners?" At this Prof. Morris's new friend seemed much embarrassed, and, after trying to discuss the subject for a little time, gave it up, and confessed that he couldn't see where anybody but the mining monopolists and the foreign governments with old silver to sell came in for any profit. Prof. Morris expressed his regret to his friend at not receiving any enlightenment, and said that he didn't feel able to pay taxes to enrich silver-mine monopolists, and that, though a life-long Democrat, he saw no way but to vote this fall for McKinley.

There is nothing surprising in the Government's very unfavorable revenue statement for September. The month's expenditures exceed the revenue by $1,995,291, as against a surplus revenue of $2,771,000 in September, 1895. Most of the deficit last month was caused by the heavy shrinkage in receipts from customs. Last year September's revenue from this source aggregated $14,654,000; this year it barely exceeds $11,000,000. We say that no one will be surprised at such a shrinkage, because the majority of observant people are familiar with the forces recently at work to affect the customs revenue. Last month's report of the Bureau of Statistics showed a decrease for the month of August, in dutiable imports, of $6,647,939. In September there is reason to believe that the decrease from 1895 was even heavier. It does not need the intellect of professional economists to discover that if taxable imports decrease heavily in volume, the tax receipts will decrease also. We notice, however, in the *Tribune* and other oracles of protectionist philosophy, a different interpretation. The decrease is not, according to these authorities, a matter of exceptional trade conditions; it merely tells "the same old story that has been told by these statements nearly every month since the Wilson-Gorman tariff bill became law."

Now, we do not suppose that any one defends the so-called Wilson act as a model revenue measure. The handicaps and obstacles with which its authors had to deal are recent enough in history not to be yet forgotten. A properly regulated sugar duty, for example, would have more than cancelled all this deficit, when our raw sugar imports have increased, this season, upwards of $20,000,000. But there is some element of humor in the effort of protectionists to throw the blame of last month's deficit upon a low-tariff measure. All readers of protection literature are aware that the chief purpose of protective tariffs is to keep out foreign products; in other words, to cut down the annual aggregate of importations. Very well; their wish has been achieved. During the eight months ending August 31, total imports of merchandise decreased $64,500,000, or nearly 14 per cent., from 1895. Could the protectionist ask a greater boon? It is true that this reduction cuts away the tariff revenue, and that so far the law under which the foreign importations fell will be popularly looked on as a factor in the deficit. But what else can protectionists expect from a radical tariff measure of their own? They tried their own experiment in 1890, and have often told us what beneficent results and what unparalleled public and private prosperity came with the first two years of the McKinley law. Well, the customs revenue of the United States, which was $229,668,584 during the fiscal year 1890, dropped to $177,452,964 in "the year of prosperity," 1892; and before 1893 had fairly opened, the Republican Secretary of the Treasury was defaulting on his legal payment into the sinking-fund.

The grave and urgent nature of the Treasury embarrassments which the next session of Congress and the next administration will have to confront is indicated in the statement of receipts and expenditures for the first quarter of the fiscal year. For the three months a deficit is shown of $25,000,000. At least $10,000,000 of this is due to the increased

expenditures voted by a Congress which refused to vote a dollar of increased revenue. But it is idle to waste time in apportioning responsibility. Here is the Treasury running behind at the rate of $100,000,000 a year. That means infallibly in time the drawing down of the Treasury's gold to pay its debts, or the issue of more bonds. Has either party, either candidate, the glimmerings of a financial programme to meet this situation? Has Speaker Reed a plan to throttle congressional extravagance? Has McKinley any idea of how he is going to get a revenue bill through Congress? If so, no one has heard of it. We agree that the first duty is to kill repudiation, to sustain the standard of value; but the really critical question after November 3 will be, What is to be done with the national finances? To that question neither party appears to have the faintest notion of what answer to give.

Cuba is furnishing a near-by example of the beauties of government regulation of the value of money on the Bryan plan. Captain-General Weyler had a deficient supply of cash, and so he had the Banco Español put out a lot of paper money, and issued a stringent edict that everybody should take it at par with gold. As the island is practically under martial law, here was Government control of the currency at its best. If you didn't take the bank bills at par, you were liable to be shot. Even Bryan couldn't do more for silver than that. But did the edict keep the banknotes at par? Not for a day. Almost instantly they were at a discount, which soon amounted to 20 per cent. Even with guns and bayonets you cannot make 80 cents equal a dollar. Weyler has had to give up trying. He has finally allowed the Havana Stock Exchange to quote the value of the bank-bills in gold. We were going to say that this proves the powerlessness of law to establish the value of money, but we remember in time that Cuba has less than 2,000,000 population to our 70,000,000, that she never put down the greatest rebellion of modern times, that her inhabitants are not the richest, proudest, most intelligent people on earth, and so we are not so sure. Her case is only a part of universal experience, but we have changed all that.

The frantic and completely unprecedented reception given to the Emperor of Russia in France shows, not the love or respect of the French for Russia, but the popular craving for a strong ally. As such it is likely to send a tremor through the Germans. This is further indicated by the failure to send invitations to the foreign diplomatists to some of the leading events of the fête. This is ascribed by the well-informed correspondent of the London *Times* to a desire on the part of the French to keep the Czar entirely to themselves, and not let the foreigners have any part in influencing him or in appearing to influence him. As a display of greediness this is likely to create bad feeling. The effort of the French is, of course, to give the affair a political bearing, of other nations to keep it purely social. The Czar himself seems by his visit to Berlin and Balmoral to wish to appear to be everybody's friend, but the French seem determined by the fury of their reception to try to frustrate this design. Why should they make such a tremendous fuss about him if he was not their special friend?

The London *Daily News*, speaking of the difficulty England has had in coming to any agreement with Russia about Turkey, makes the pregnant remark that England "has never bid high enough"—that is, has never frankly offered what Russia notoriously wants—Constantinople. There is not a doubt that if this offer were made the Turkish horrors would soon cease. That the idea of settling the Eastern question in this way has begun to enter the English mind is a good sign, even if it does not bring about this result at once, because it indicates the renewal of friendly relations with Russia after seventy years of suspicion. But if Lord Salisbury is not willing to throw Constantinople into Russian hands at once, he will have much to say in favor of delay. It is hardly possible that Russia could be long at Constantinople without menacing the independence of Bulgaria and Greece, and annexing a large portion of Asia Minor—without, in short, substantially restoring the old Greek Empire. All this territory has gone with Constantinople for nearly two thousand years. Constantinople is its natural capital. It is still to the mass of the people "Room," or Rome. With a strong absorbing power at Constantinople it would be almost impossible to prevent these young communities from being swallowed up by it. It must be remembered that they all enjoy representative government, and are acquiring, little by little, the art of self-rule, after four hundred years of frightful oppression, and have a free press. With the advent of Russia to Constantinople, great as would be the gain for civilization, we fear this new-born liberty would take its departure. It must not be forgotten that Russia is the only despotic country left in Europe, the only one without some sort of constitutional government, without free speech or representative institutions, or in which a man can be condemned by "administrative order." So that although it would be a great gain to have her take hold of the Turks and all barbarous countries, her predominance in countries which are learning to govern themselves by discussion, would be a doubtful good.

Austria has shown very great ability in civilizing a Turkish province by her administration of Bosnia and Herzegovina since 1878. There was no more disturbed portion of the Turkish Empire, or one in which the treatment of the Christians was more ferocious. Since Austria has taken possession, it has really been civilized. Law and order have been established, schools have started, railroads have been made, all creeds have learned to dwell together in peace if not amity, and the executive is assisted by a rudimentary parliament in the shape of a council of ecclesiastical dignitaries and twelve popular representatives. So that we might fairly hope that if Austria could get to Constantinople, the city would rapidly become again, as it was for one thousand years, a great centre of civilization. But whether she ever can or not, whether she would not have to force her way sword in hand, whether the city can ever belong to any one but Russia without a war, are the secrets of the future. We mention them as showing how reasonable it is for an English statesman to think twice before he says to Russia: "Take Constantinople and call it square."

The latest rumor about a settlement of the Armenian question is that a special region is to be assigned the Armenians within which their safety is to be guaranteed by the Sultan, with the Powers ready to enforce it if necessary. This is a copy of the pale of Jewish settlement in Russia. But to call this a solution of the difficulty is absurd. The Treaty of Berlin guaranteed safety to the Armenians throughout the whole Turkish Empire, and the Powers were to see that the Sultan's pledge was made good. It is evident now that that pledge was worthless from the day it was given. So was the Sultan's promise last fall to begin "reforms." Any piece of paper to which that name is now put ought to be protested on sight. If the Powers wait to see this new guarantee executed, they will simply be waiting for new massacres "paraded," as Mr. Gladstone said, "under the eyes of every court in Europe." Even if the Powers propose at once to take hold, ignore the Sultan, and protect life and property in the Armenian zone, what hardships for the Armenians and humiliations for Europe would be involved. The Armenians are among the most enterprising of the Sultan's subjects, and are now settled and engaged in business in various parts of the empire. Under the new plan they would all have to be deported to a single section. Moreover, what would this new protection amount to but the drawing of a sort of dead line? Inside it the Armenians are Christians and gentlemen, whom Europe will not allow the Turk to touch; but outside it they are vile dogs, whom he may hack to pieces at his ease. The effect would not be much better than the talk about withdrawing Ambassadors from Constantinople.

BRYANITE UNTEACHABLENESS.

Any one who heard Bryan speak at Tammany Hall on Tuesday week must feel that both he and his followers are now beyond the reach of discussion. In a democracy it is a serious matter to have any large portion of the community in this condition, because the Government is carried on by discussion, and Government by discussion implies that those who know most of any subject shall at least have a hearing, and that their arguments shall be answered. If it should prove that Bryan's supporters are a large body, the opening of their minds, not so much to our views as to all views from which they differ, should be the work of reformers for the next ten years. All democracies or quasi-democracies which have had any measure of success, have owed it to the custom of giving attention to employing their ablest men, and treating each question through those who have most familiarity with it. In fact, politics succeeds, just as business succeeds, by the use of the greatest knowledge and the best talent. Nobody expects a weak man, ignorant of the business, to make a fortune in shoes or dry goods. If a man were to tell us he was going to make a fortune in either because he was poor or could make a good speech, we should laugh at him. It is so in all other occupations. Knowledge and ability carry the day. The man who thinks he knows when he does not know, and thinks he is able when he is not able, and will not listen to what any one says to him, goes to the wall; that is, speedily makes an assignment or absconds.

In all previous campaigns there was a question which had two sides, and both sides were listened to, and as a general rule the facts were agreed on. The existence of slavery, the prospects of the war, the continuance of the army at the South, the desirableness of greenbacks, the necessity of a high tariff, were all controversies fought out on the stump and at the polls on acknowledged facts. The peculiarity of this campaign is that the Bryanites have a set of facts of their own, of which their opponents know nothing, and they will not listen to anybody who does not admit these facts to be true. Bryan, for instance, gave at Tammany Hall an account of the causes for the flow of gold to and from this country, not one word of which would be admitted by anybody who had the slightest familiarity with the operations of trade or commerce or exchange; and yet if a merchant or a banker were to have got up, immediately after Bryan, to present his side of the subject, he would not have been listened to. He would have been howled down as an interested person, as a "gold-bug," who was himself engaged in "cornering" or "draining away" the gold. Bryan also made the statement that "bankers" run or rule this country; but if a banker had risen to ask for details, or to show that this could not be true, he would not have been listened to, for the simple reason that he was a banker. In other words, his competency to discuss the subject through knowledge would to Bryanites have proved his incompetency.

If, as we have said, the Bryanites should prove to be a large body of voters, this would be a very serious matter. Their very existence would be a standing menace to the Government, because it would indicate that a large proportion of our population not only are ignorant, but are unwilling to be taught. Ignorance which knows itself to be ignorant and is willing to be taught, is not a very dangerous thing. English, French, German, and Italian ignorance is all of this character. The ignorant in those countries acknowledge their ignorance, and, when they have to deal with public matters of importance, simply designate by their votes the persons to whom they wish to confide them, and, in making this designation, assume, in a general way, that these persons have some special knowledge. In all civilized countries bankers are consulted about public finance, engineers are consulted about roads and tunnels, soldiers are consulted about war, lawyers about law, and electricians about electricity. This is the only way, in fact, in which government in our day can be carried on. The knowledge required for the administration of a great state is now so varied and so complicated that it is only by taking the opinions of specialists that civilization can be maintained. The Bryanites have started the theory, however, that all you need in order to be a political philosopher is to be short of money and to honor silver. Not only this, but every man who is not poor, and looks on silver as on iron or copper, as a metal, is excluded from all authority on public affairs. But no matter what the rights and wrongs of any public question may be, no state can remain civilized and progressive which makes no use of learning and experience.

We have seen from the beginning in Bryanism the consequences of the folly, or neglect, or rash utterances of people who are now very much alarmed by Bryanism, and wish it could be got rid of. In listening to the Bryanites, therefore, about foreign exchange and the need of a purely "American" system of finance, made up of paper or cheap metal, we cannot help believing that their wild notions are largely due to the protectionist teaching of thirty years, with the accompanying aspirations for a Chinese wall around the United States, and deep-seated hatred of foreigners. Only in 1890 Republican orators of repute were on the stump preaching that one of McKinley's strongest claims to fame and confidence rested on the assumed fact that foreigners hated him. In fact, we were told that foreign hatred was the American statesman's glory. We had to sell more than we bought and get our price in gold. The departure of gold was a public misfortune. Foreign commerce was apparently an inevitable calamity. In fact, nearly all the doctrines about foreign exchange which were deemed necessary to uphold the tariff led naturally to Bryanism, after being thrown promiscuously for a few years into the minds of ignorant men, pressed by misfortune.

THE BYGONE OPINIONS OF PUBLIC MEN.

The Hartford *Courant* says:

> "What Major McKinley thought and wrote half-a-dozen years ago is a matter of not the slightest present consequence. He stands squarely upon the St. Louis platform. His speeches on the money question leave nothing to be desired. He is avowedly and unequivocally for the maintenance of the gold standard."

This is pushing the doctrine a good deal too far. We have agreed to consider what Mr. McKinley said six or eight years ago as of small or no consequence compared to what Bryan is saying now, but we have not agreed to consider what Mr. McKinley has been saying about silver for the last eight years of no consequence at all. The persistent utterances of any public man on any great public question ought to be of great consequence, and must be, as long as utterances are expressions of character and thought. Any man who talks about finance for eight years, and promulgates decided opinions about it, is supposed to have thought and read about it. In other words, his utterances are in every country something in the nature of public instruction. He who has studied the subject is supposed to communicate the result of his investigations to people who have not had time to do so. If he has not studied it, does not understand it, and has no fixed convictions about it, he commits a fraud on the people. This is what makes it of consequence what a public man said six years ago publicly about anything, unless he was at that time a very young man. If he believed what he said then, and what he said then is totally different from what he says now, and he has no explanation to offer of the change, something must be wrong with his mental or moral apparatus. Of course a public man, like any other man, may change his mind. But when he does, he owes it to the world to say he has changed it, and explain why, as Sir Robert Peel did with regard to the tariff, or Mr. Gladstone with regard to Irish home rule. If the *Courant's* doctrine were generally accepted by the public, it would strike a terrible blow at public morality, for it would release every politician from all responsibility for his utterances. Anybody might say anything he pleased about anything, knowing that he might the next week say something entirely different, and not suffer for it. We, then, might as well pick up young men in the street and make statesmen of them on the sole condition that they were glib. What would soon become of a government carried on in this way?

To our minds the Bryan performances are not by any means the only serious thing in this crisis. The things he is able to quote from McKinley, Sherman, Reed, Lodge, and nearly every Republican public man are full as serious. They have all been saying by fits and starts for twenty years very much what he is saying now, knowing they could say something else, as they are now doing, whenever the occasion called for it. This is one of the sorrows of our position. Nearly all our champions have long been supplying the enemy with ammunition, and only left him when he took the field against us. We could reconcile ourselves to this better if they would now come out honestly and retract and explain, say they have changed their minds, seeing where their doctrines would lead us and what arrant nonsense they were conniving at. We do not mean to say that all were equally guilty. Some told lies knowing well they were lying, and meaning to tell another story by and by. Some, on the other hand, told untruths from mere stupidity and ignorance. The mixture of protection and free coinage of which Mr. McKinley was guilty in 1890, and his determination to "honor" silver, were the consequence simply of having no clear knowledge of what he was talking about. He did not know that money was a measure of value; he thought it was simply an American product that badly needed protection. He is not to be blamed, we admit, if the turn of events has converted him into an advocate of sound money and the gold standard. He has always said to "the party," "I think what you think about everything under the sun, only, for heaven's sake, don't change your mind too often."

The best thing to be said for Mr. McKinley is that he was not much worse than the others. Even Mr. Reed, who managed to keep so discreetly silent about finance for six months before the nomination, produced in June, 1894, in the *Fortnightly Review*, a scheme for union among the bimetallic nations, to persecute the gold-standard nations, or, in other words, to fix on "such a scale of high tariffs against those nations which reject the monetary agreement as will go far to insure us a favorable balance of trade." He got this crazy scheme apparently from Senator Lodge, or Lodge got it from him; but no one who reads it can help asking why is Bryan considered such a silly fool, for Mr. Reed is now one of our best gold-standard champions.

We, for our part, cannot help hoping, nay believing, that the fright Bryan has given these reeds shaken in the wind by showing them in black and white the results of twenty years of demagogy and insincerity and false teaching, will have a salutary effect. It will do something to impress on them the necessity either of keeping silent about things they do not understand, or of speaking their honest thought. We see now what compromising, placating, and deceiving lead to. On no subject is it more dangerous or mischievous than finance, for finance is largely arithmetic. The only way to meet a lie is, as Lowell says, to meet it "in arms." It will not do to say that it is a pleasing lie, or only a lie sometimes, or an inopportune lie, or a people's lie, or a good lie to tell to foreigners. A lie is a lie wherever met, and humbug is humbug.

SILVER COIN AND BULLION IN COMMERCE.

Some attention has been called to the export figures of silver, and a curious and very misleading conclusion drawn from them. The domestic exports of silver in 1895 were $40,073,222, and in 1896, $52,518,575. Therefore, say the silver men, "Our silver is demanded abroad, and a silver dollar moves as freely outside of the country as within it. Were it otherwise, no American silver coin would be exported. Yet look at the amount sent abroad!" Like other of their assertions, this statement contains a mustard-seed of truth and a large tree of misapplication. The export of bullion is confused with the export of coin. The Treasury figures throw some light upon the fallacy involved in the confusion.

In 1895 the exports of American silver coin were $40,609, and in 1896 $393,611. All such coin is returned by collectors at its face value. A dollar is a dollar, and a half a dollar, fifty cents. This is the general rule for valuing all domestic exports. To the custom-house the silver is worth what the stamp of coin announces; to that point a gold and a silver dollar are worth the same in our domestic exchanges. The silverites claim that this parity continues beyond the borders, and that the American silver dollar will pass at 100 cents in the country to which it is exported, and therefore is nowhere "discredited."

Of the $393,611 in coin exported in 1896, the greater share—$241,441—was sent to Canada. Now, the Dominion Government will not receive American silver coin, any more than our own Government would receive Canadian pieces—except at their bullion value. The geographical distribution of the exports shows that $9,813 was sent to British Columbia, and $231,628 to that immense border territory which includes Ontario, Manitoba, Rupert Land, and the Northwest Territory. It is safe to assume that those regions are in a temporary want of circulating coins, and, marketing their produce in the United States, are willing to receive in payment American silver—only temporarily to receive it, for it is in part reëxported to the United States. The movement is thus based upon a twofold motive. The one is a local need for currency, and the other is the settlement of exchanges. An American merchant having a debt due in Manitoba pays it in silver dollars, and the Canadian bank accepts the coin, knowing that it can return the coin to the United States in payment of a debt due to an American merchant. To assume, as the silverites do, that the coins circulate in Canada at their face value in any quantity is directly opposed to the fact. In truth, the Canadian Government seeks to discourage the introduction of American coins. Not only has it placed the circulation of them under ban, but it levies a customs duty of 25 per cent. on them as a manufacture of silver. The result is shown in the trade returns. In the twelve months ending June 30, 1895, our export figures gave $35,133 in silver coin of the United States sent to Canada. The Canadian returns reported for the same period an import of $1 in American coin, on which a duty of 25 cents was paid!

What applies to the Canadian import of American silver coins applies with equal force to similar trade transactions in other directions. Our pieces are sent to countries having no, or very imperfect, coinage systems of their own, and are received in precisely the same manner as are the Mexican dollars, as coins of convenience and commercial usefulness. Reverting to the exports in 1896, we give the destination of the coins, and also the amount in American silver coins returned to the United States:

To or from	Exports.	Imports.
Germany	$ 00	$2,859
Mexico	13,370	7,795
West Indies, British	500	5,552
West Indies, Haiti	22,000	
Ecuador	98,000	111
Hawaiian Islands	17,500	

Imports were also made from France, $1,870; United Kingdom, $7,441; Danish West Indies, $3,180; Colombia, $30,659; and Samoa, $975.

A mere glance at this compilation of countries establishes the fact that this export and import of coin is a movement comparatively unimportant, and based upon intelligible commercial or financial reasons in nowise connected with the 16-to-1 propaganda. No one can draw from it the conclusion that the silver dollar passes current outside of the United States, and that its free coinage would bring it into such favor as to make its circulation abroad larger than it now is. Wherever it is taken, it is because of the want of local currency, or in the ordinary settlement of a trade balance. Wherever it is received, it is liable to be sent back to the United States on the first opportunity. Wherever it passes at its face value, it is on sufferance, and this toleration is subject to recall at any time—as recently in Canada. To confuse the export of coin with the exports of silver bullion is to commit a serious blunder. The export movement of domestic bullion in 1896 was $52,124,964, of which $41,578,367 went to the United Kingdom, $3,377,126 to France, $3,009,983 to Japan, and $3,283,710 to China.

It is in this commercial movement of silver bullion that the best interests of

silver may be conserved. It is free from every restriction, as the silver passes at its market value, like the wheat, corn, or mineral oil that is sent abroad. No nation of any commercial importance imposes customs duties on bullion, and all ports are open to its unrestrained import. In no one year have the exports of silver from the United States been so large as in 1896, and the total has steadily increased in late years, with less fluctuations, indeed, than any other item of the same moment. The exports of wheat, cotton, oil, and provisions have shown wider variations than have the exports of silver. Every ounce of silver produced in the United States finds a market at home or abroad, and finds it in the same manner as does the corn, cotton, iron, or any other domestic product of agriculture, mining, fishery, or manufactures. In 1895 the product of American silver mines was 55,727,000 fine ounces. The exports of silver bullion were 62,783,792 ounces of varying degrees of fineness. Not only had the demand for silver in the arts been met, but a profitable sale of every ounce beyond that want had been made as well as of what came in from Mexican mines. This must have been a profitable export; otherwise it would not have held its own and increased from year to year, as it has done.

To give an artificial value to silver, as is proposed by the Bryanites, would cut off this trade at once. No one would export bullion, for he could find greater profit in coining it at the United States mints, using the coin to cheat his creditors and depreciate the currency. No one could export the coin except at the bullion value, and silver would sink from fifth or sixth place in importance among the domestic exports to a very unimportant position.

THE BIBLE AS A TEXT-BOOK.

THE promotion of Bible study in ways and places out of the ordinary has been much labored for of late years. Publishers have lent themselves to the movement, and series of books like the "Modern Readers' Bible" have been devised to supply what was thought to be the new demand. The American Society of Religious Education has made it one of its aims to secure the introduction of the Bible as a text-book into the curriculum of colleges. President Rankin of Howard University reports in the *Independent* the results of inquiries addressed, in the name of this Society, to college authorities respecting the place occupied by Bible study in the religious life or the regular academic course of their institutions.

Nearly all of them speak of the interest of students in Bible study, which, on the whole, is thought to be on the increase, or "certainly not declining," though but few colleges require it. Elective courses are offered, but their typical fate seems to be shadowed forth in the experience at Williams College, where, says President Carter, "the gentleman who conducts it required rather severe work of his class the first year, and the students have been shy of it ever since." In other words, if not "a soft snap," an elective course in Biblical study has not the attractions for collegians that their elders might hope. All told, it does not appear that the Bible has been extensively introduced as a text-book into the college course, as a result of the efforts of the American Society of Religious Education.

There are some good reasons why it cannot be successfully introduced. One of them is that the intentions of those moving in the matter, while most excellent, are not entirely clear or entirely serious. When they argue for the study of the Bible, what do they mean? Do they mean to urge students, as Jowett used to urge his, to study the New Testament just as they would any other Greek book? We doubt it greatly. There is, in fact, an entire field of Biblical study, and that the most interesting of all, which we presume there is not the slightest thought of having taken up in the colleges. We mean, of course, the modern investigations into what may be called the natural history of the Old and New Testaments—the catching up of oral and popular traditions into manuscripts, their blending and transmutations and taking of color from different hands; all the fascinating methods and results embraced in the new discipline of Biblical Theology. If one means by Bible study the study of what throws the most light on the Bible, all these things should certainly be included in it. But few or none of them are included, we venture to say, in the plans of those who are urging the colleges to make a text-book of the Bible.

Now, college students, or at least the older of them to whom most of the Biblical electives are offered, are more or less aware of the truncated nature of the Bible study proposed to them. They know that the highest authorities are not as naturally appealed to in this department as in all others. The results arrived at by the most masterly investigations are not freely laid before them. They have only to remember the case of the *Sunday-School Times*, a few years ago, in engaging the first Old Testament scholar in England, Canon Driver, to write on the Bible for its columns, and then in taking fright at what he wrote and cancelling the engagement; they have only to recall the frequent troubles into which ministers and theological professors get as a result of *their* Bible study, to make them feel that a subject which has to be studied so very circumspectly is a good one to leave alone. The number of the *Independent* which followed the one giving the account of the effort to make the Bible a college text-book, recorded the dismissal of a professor from Colgate University for having studied and taught the Bible in a way distasteful to the trustees. With such facts before their eyes, thoughtful students must be slow to believe that it is really the frank and fearless study of the Bible which is proposed to them.

The real aim of those urging the required study of the Bible in colleges is, of course, not knowledge, but edification. They wish not so much to expand the minds of students as to improve their characters and safeguard their morals. This is an end with which all must sympathize, but that it can be attained by any kind of indirection may be doubted. The old way was more straightforward. You were a child of wrath in danger of hell fire, and here was the book to tell you the only way of escape. Neglect its daily and terrified reading at your peril. But nowadays you are an amiable youth, much given to athletics and other frivolities, having a mighty good time on your way through college, whom it would be well to persuade that the Bible is a very interesting book to study, with the idea of making you take a little more serious view of life. That kind of net is commonly spread in vain in the sight of any bird, especially when the bird is a college student. He will be apt to make his own the opinion of an *enfant terrible*, that the Bible is fine reading provided one is allowed to skip the religious parts.

The whole question is only a part of a much larger and older one—the relation of knowledge to piety. Are the wisest men the best men? If not, are ignorance and superstition conducive to true goodness? Abstractly, these questions have been answered, and are still answered, both yes and no. But practically there is no longer any use in putting them at all. For better or for worse, the world has chosen the side of knowledge, is committed to free inquiry, whatever the results in thought or life. We are in for it in respect of Bible study, as well as all other study, and must stand the consequences as best we may. An obsolete and unscientific way of studying the Bible cannot any longer be excused on the ground that it makes our boys good. Least of all can such a way be excused in a college course, or the slightest substantial good be expected to come of it.

THE STUDY OF THE NOVEL.

VAGUE rumors have long been afloat to the effect that novel-reading—once, at best, a venial sin—is now regarded by leaders of opinion as a serious and elevating occupation, and that the commendatory phrase "diligent student of the novel" has supplanted the old, contemptuous "inveterate novel-reader." The rumor gains credibility from the works of many contemporary novelists, which, whatever may be their design, is certainly not to encourage the pursuit of transient pleasure or to abet the profligate killing of time. Further verification appears in the prosperity of literary clubs, noted appreciatively by foreign observers and making Sir Walter Besant hopeful of the approach of a brilliant era of

literary production in America. The lists for study by these clubs generally include a good many novels.

A year or so ago, Dr. Moulton, Professor of English Literature in the University of Chicago, prefacing an account of "The Backworth Classical Novel-Reading Union," warmly advocated the study of fiction. Now, in connection with the "Programme for 1896-'97 of the Modern Novel Club of St. Louis, Mo.," Mrs. C. H. Stone issues an impassioned appeal to "Reading Clubs and Students of Fiction." Dr. Moulton and Mrs. Stone agree perfectly that the study is of vast importance, but are sadly at variance as to the kind of fiction to be studied and the kind of people qualified to expound and illuminate. Dr. Moulton counsels recourse to the world's great literature, reading and rereading of the great masters, and absolutely doubts whether anything should be read which is not ten years old. He thinks directors of the study should be authoritative persons, of a class described by him as literary experts. Mrs. Stone is quite of another mind, and would probably hold it better that all novels (and therefore novel-clubs) should perish than that the study should be pursued in the pastures and under the auspices advocated by Dr. Moulton.

It is sad to behold an infant science torn by the aged quarrels of the schools, and horrible to learn from Mrs. Stone that "the path of life to-day is strewn thickly with the wreck of youthful souls" because of the neglect of the study of "modern novels of realism, analysis, and purpose, the only existing key to the riddle of human nature and motives." She is confident that much of human misery should be ascribed to a traditional devotion to "literature," and that critics are always conspiring to lead, coerce, drive the public to read vain and frivolous fiction because by some unholy means (probably the direct prompting of Satan) it has come to be called literature. Her views are so extreme that no hope of compromise with the classics can be rationally entertained. Dr. Moulton, if reasoned with, might come down, but Mrs. Stone could not conscientiously treat with Apollyon. Assuredly nobody can wish to be implicated in the wrecking of youthful souls, and the dread of becoming innocent participators in crime may lead the St. Louis Club and the other clubs, once made cognizant of peril, incontinently to destroy all their books tainted with suspicion of being literature. Let them reflect, for the day may come when a youthful soul, steering safely to port by the light of 'George's Mother' or 'Tom Grogan' (both works are on the current Programme), may capriciously demand 'The Arabian Nights' or 'Paul and Virginia,' but, demanding in vain, desert to Dr. Moulton's ship and thus be for ever lost.

Mrs. Stone is apparently the Southwestern apostle of Modern Novel Science, and her disciples may naturally feel a delicacy about criticising her judgment. But, for the health of the science in other regions, they might at least tactfully proffer their good offices. No one need allude to Mrs. Stone's tacit assumption that "modern fiction of the more serious grades" is not literature; a controversy on that point would be most edifying if left to her and the authors of some of the books studied by the St. Louis Club during its eight years of existence. All the clubs could assent to her assertion that "the term fiction has a greater significance than the term literature," with a rider declaring that they don't know why any more than she does. There is no need to strain relations by inquiring too closely into the justice of her abhorrence of professed critics, including teachers and clergymen. If literature is that corrupt and deadly product of the human brain which she says it is, then undoubtedly the incompetence, laziness, insincerity, and viciousness of its avowed admirers and teachers have not been overdrawn by her. No! To proceed dispassionately and with dignity befitting serious students, it is only necessary to consider quietly whether Mrs. Stone shows enough acquaintance with literature to justify her wrath, and whether, indeed, she has any clear notion of the meaning of the word.

"Human rights," she says, "are greater than literature," and so are "truth and human nature"; and, further, literature is quite inadequate to explain modern character and conditions, or to be helpful in this "great, seething present," this "great, throbbing, happy or aching life of to-day." Literature has something to do with beauty of form and skill in phrase-making, and to these trivial decorations Mrs. Stone is half-willing that modern novelists should make discreet concessions. But literature has nothing to do with ideas except those of a sensual and vicious order, and "it is the stronghold in which impurity is most firmly intrenched." In brief, since man put pen to paper, nothing fictitious has been written, survived, and been admired except more or less pleasing delineations of "passion not love," and descriptions of "the coarsest passions and sensualism"; and these compositions have become literature for these reasons and no other. Moreover, literature is apparently one of those mysterious institutions hostile to truth and humanity; and from certain dark references to "the unprincipled money power," it would seem that Mrs. Stone may even suspect it of secret alliance with wealth, and may believe that the critics are munificently bribed to shout that it is the only thing in the world just as good as gold! Considering the bitterness of Mrs. Stone's feelings, the clubs ought not to burn their 'Rasselas' or 'Vicar of Wakefield' hastily, and they might perhaps go so far in the quest of truth as to examine for themselves the only specimens of fully accredited literature which Mrs. Stone is able to bring herself to mention. Naming in the way of duty to youthful souls such names as "Twelfth Night" and 'Tom Jones' must have given her a "turn" quite as bad as the "turn" which untimely accidents in the way of her profession used to give Mrs. Gamp. Therefore, let no one depreciate her courage. The pain inflicted on her by the use of the former work in the schools of her town (presumably St. Louis) leads one to suppose that an epidemic of the Elizabethan sweating sickness would be more wholesome for the citizens than an epidemic of Shakspere.

There is something hopeless in a movement to cure the universal infatuation about Shakspere, but no harm could be done if the clubs should try to determine whether the madness is to be accounted for solely by his supreme facility in beautiful expression and his unparalleled depravity. If a few of those "valuable ideas" which extend sympathy and "broaden understanding of life" should be found, Mrs. Stone might be persuaded to take a more lenient view of his performances. It is not probable that she could be got to budge an inch from her position towards 'Tom Jones.' She perhaps knows very well that the history of that bold, bad young man has not become literature because sensual seductions lurk in Mr. Fielding's formal eighteenth-century periods. This is the triumph of license, a signal example of the "strange power of the magic word literature to dwarf the value even of purity"; and a justice of "one of our courts" gave the case for the classics away when he allowed the issue of a new edition "because 'Tom Jones' is a part of our glorious system of English literature." Mrs. Stone says the judge was constrained to this decision, and gave it reluctantly, but she does not say who saw him wink. There is no certainty that Mrs. Stone was in court, but, if another application should be made to dress the sinner out in parchment and gilt, it is to be hoped she may be there and see a judge with her address in his hand and hear him grant the application because, "in spite of its being literature, 'Tom Jones' so nearly approaches that glorious thing of uncertain birthday and no antecedents, the modern novel of realism and purpose as described by a learned authority." Of course, no judge could be sure that Mr. Fielding wrote "with the purest of motives," as Mrs. Stone declares that Mr. Hardy wrote 'Tess of the D'Urbervilles,' but the court is more concerned with results than causes, and as between the fiction which is literature and the fiction which Mrs Stone thinks is not, would probably find the former more worthy of consideration by persons of sense and more likely to promote the practice of many virtues.

These reflections and suggestions are offered to the clubs solely in the interest of harmony, and with a desire to shield the young science from enfeeblement by schism. Unless some sort of reconciliation should be patched up, it is much to be feared that the novel may be degraded and become again a cherished instrument of idleness and frivolity—a tragic circumstance for both Dr. Moulton and Mrs. Stone.

THE CONSTANTINOPLE MASSACRES.

ATHENS, September 18, 1896.

TWELVE HUNDRED Armenian refugees, nearly all of them men and boys, are now here and at the Piræus, a few in houses hired for the purpose by the Local Relief Committee, but the majority huddled together in army tents which the Greek Government has provided, and which have been set up in the open fields at New Phalerum. At Syra there are 300 more, at Patras some sixty or seventy. Only 250 of those here have found work; the rest are entirely dependent upon the local committee, which draws its funds from private philanthropy.

Each refugee's account of what he himself saw during the first three days of the massacres throws abundant light upon the complicity of the Turkish authorities in the atrocities committed. One, a coal heaver, relates how he escaped from the coal depots at Lower Pera, when all his fellow-Armenian coal-heavers, some forty-four in number, were suddenly surrounded by a Mussulman mob, headed by some twenty-five policemen, and butchered to a man. The mob then rushed to their victims' lodgings, which they plundered and destroyed. Another was in a house opposite Fundukli's Khan, a large four story building, which was besieged by a crowd of over four hundred Softas, headed by soldiers. The iron gates were forced. Some fifteen Armenians, who were employed in the building as porters, sought safety on the roof, but were pursued even there, and each one, after receiving several stabs, was hurled down from the roof into the street, while the crowd below yelled, "Long live Sultan Hamid!" Two refugees depose

that they saw two other Armenians caught by a Turkish butcher and his assistants, and, after being suspended by the feet from the meat-hooks in front of the shop, literally hacked to pieces by the butchers with their meat knives. Another eye-witness relates that an Armenian priest, while walking in the street, was followed by a Turkish mob, and, on attempting to take refuge in the house of a Frenchman, was dragged out by his robes. When the inmates of the house expostulated in his behalf, a Turkish officer in the crowd replied that the Government had issued an order that all Giaours should be slaughtered. The priest was therefore dragged off towards Galata-Seraï, but, after only a few steps, his head was split open with an axe by some one in the crowd. A well-dressed Armenian was eating in an open restaurant when the night-patrol passed; the officer in command, knowing him to be an Armenian, ordered him to come to the police-station. He asked to be allowed to finish his food, but was dragged out promptly, and bayonetted to death on the sidewalk in front of the restaurant At Babdjè-Kapoù. two Armenians were discovered hiding on a roof; the policemen rushed into the house and hurled them down into the street, crying, "Long live Sultan Hamid!" At Feri-Kŏï, a well to-do Armenian on horseback was seized and knocked off his horse by the police, who then told the mob to cut his head off, which was promptly done.

In many cases Turks accepted money from the Armenians to hide them, took them to their own houses, and then hastened to inform the police, who never failed to come and drag them off to slaughter. Two of the refugees saw thirty of their fellow-countrymen slaughtered in quick succession, in the space of a few minutes. An Armenian was knocked down by a Bashi-Bazuk and left insensible, whereupon an officer approached, drew his sword, and stabbed the fallen man through and through the body, until he was sure that he was dead. In front of the Swiss Legation a young Armenian milkman was butchered. A passing corpse cart refused to take the body, on the ground that, according to orders, it must first be dragged by the feet to the nearest police-station, as an example to Giaours. The day before the outbreak an eye-witness relates that, in front of his shop, a water seller was asked by a policeman for a glass of water, which was given; but when the man asked for payment the policeman glared at him, and went away without paying. Next day the same policeman returned with several others, caught the water seller, and hacked him literally to pieces before the shop, crying, "Giaour! yesterday you wanted money for a drink of water; now we will drink your blood!"

Testimony of special importance was given by another refugee. He was sitting in a café with some Greek friends when a servant of the Grand Vizier came in and, being personally acquainted with one of the Greeks, sat down with them and related how his master's cook, an Armenian, had been summoned on the day when the troubles broke out, and paid, and told that he must leave. The poor man begged to be allowed to remain a few days longer, until quiet should be restored, but the Grand Vizier refused. The man then begged for at least a safe-conduct, upon which his master gave him in charge of a Turkish fellow-servant, who, acting upon orders, conducted him to the Galata-Seraï, where, at a sign from him, the policemen cut the Armenian down and rifled his body.

Another eye-witness, who was employed in the Feri-Koï beer-garden, on the road leading to the Armenian cemetery, testifies to having counted, from 10 P. M. on Wednesday until Thursday noon, 28 ox-carts and 136 ordinary carts full of dead bodies, passing up the road from Galata and Pera alone, while 71 cartloads came from the Haskoï road. Near the cemetery there were some ice-houses, with great trenches, where the ice is stored in winter, and now empty. Here the bodies were thrown in pell-mell, by a force of 58 Turks (according to witness) who were employed by the authorities, who forbade any Armenian or Christian to have any share in the work. Another witness testified that on Wednesday and Thursday nights, from dark until morning, a continuous file of carts full of dead bodies was moving up the road to the cemetery heights above Pera.

The refugees speak enthusiastically of the friendly attitude of the Persian Mohammedans of the Shiz sect, who protected and succored many an Armenian at peril of their own lives, against the infuriated Softas. The Jews, on the contrary, were zealously engaged in marking with a cross all doors where Armenians were to be found. It is noteworthy, that, according to the unanimous testimony of all the refugees whom I interviewed, the Turkish mob, while engaged in slaughter, and even the Turkish officials at Galata-Seraï would cry out, at each act of butchery, "Long live England! See what England does for you! Take that from your friends the English!"

But the crowning testimony is that of a young Armenian of barely twenty-one, whose splendid physical proportions and frank, ingenuous face attracted my notice. I found that I had, to use Cicero's words, "stepped into a history." This young fellow belonged to a body of twenty-five firemen and porters attached to the Galata Seraï (the chief police station of Constantinople). Only four of their number were Kurds and Turks, and they disappeared just before the outbreak; the remaining twenty-one were all Armenians. When the massacres began, only eleven of them happened to be at the café, or public house, near the entrance to the Seraï, where they lodged. My informant was among the eleven. About 2 P. M. on Wednesday, when cartloads of dead bodies began to arrive at the Seraï, the Chief of Police sent for them, and set them to sorting the dead Turks from the Giaours, as the Moslems consider it unclean to handle a dead Giaour. In this first instalment of dead only five or six were Armenians, the remainder being Turks, probably soldiers, but all were naked. When this task was over, the porters were ordered back to the public house, and told not to stir out on pain of being shot. At the same time strict orders were given and guards posted about the public house to prevent these men from being molested.

From this tavern the porters could see all that passed in the Seraï, and counted over 300 Armenians brought in under arrest by the police and troops. Soon they were sent for again from the Seraï, and found a horrible piece of work awaiting them. The arrested Armenians were all crowded into a large hall; a door opened into a broad passage, terminating at a steep flight of stone steps leading down into a courtyard. Each of the arrested Armenians was called out by an officer into the passage, which he found lined with officers and soldiers, the latter carrying fixed bayonets on their muskets. He was ordered to walk forward, and as he reached the top of the steps he received a stunning blow on the head with a cudgel, and a bayonet thrust on either side, through the ribs. The body falling down the stairs was taken by the Armenian porters, who were waiting at the bottom, and dragged out into the courtyard and down into the cellars. This butchery lasted for three hours and a half, an uninterrupted succession of blows and bayonet thrusts, the bodies falling down the steps almost without a groan. The porters were soon covered with blood as they had to pile up the bodies in the cellars; one of them, the captain of the fire brigade, fainted away at the fifth corpse that he lifted, and a Turkish officer standing by gave orders to have him removed and restoratives applied. When the sickening work was over, the porters were ordered to wash themselves, but they were so saturated with blood that the soldiers had to turn the fire-hose on them to wash them off. My informant showed me his broad linen girdle, which, though washed since then, bore distinct traces of blood. Then they were ordered to wash down the steps and the courtyard, after which they were ordered back to their tavern, and told to be on hand for night-work. After their return to the public house, they saw a large number of carts loaded with dead bodies brought to the Seraï.

In the evening they were again sent for, this time to drag out the corpses which they had piled up in the cellars that afternoon, and to load them upon carts. Nineteen cartloads of eighteen or twenty bodies each were thus sent off successively, each under charge of one porter and two soldiers, to the Armenian cemetery. My informant said: "While piling up the corpses we saw many an eye open and close, and heard an occasional groan or sigh, but it was night, and we were working with a band of sentinels and officers over us, and could do nothing for any unfortunate wretch who was not quite dead." At the cemetery each cartload was emptied into the trenches, and the cart drove back at once with the porters and guards, leaving the rest to the Turkish laborers stationed at the cemetery, no one else being allowed to approach. Everything was under strong military surveillance. The Seraï was crowded with troops under the command of higher officers in full uniform. After the carting was finished, the porters once more washed out the courtyard and were dismissed for the night. Next morning (Thursday) very early they heard the noise of fighting and killing in the neighboring streets renewed. They were soon called out under strong military escort to drag into the Seraï the corpses with which the Grande Rue de Pera and the adjoining streets were thickly strewn. My informant saw his sister's son, a youth of eighteen, set upon by the police and cut down, but not before the lad had drawn a revolver and shot two of his assailants dead. Our friend had been obliged to drag his nephew's body by the feet into the Seraï like all the rest. The bodies were again piled up in the cellars, awaiting transportation by night. This bloody work lasted from early morning until about half an hour before sunset; then the porters were once more dismissed and not called out again that night.

During the following twelve days they were employed in various less outrageous ways about the Seraï, but were never allowed to go one step beyond the outside sentinels, while within strict orders had been given that no one should lay hands upon them. Finally, my informant, who was trusted more than his fellows, was given a letter by the head commis-

sioner to carry to one of the islands, and, after delivering it, he determined to escape. A police officer of the Seraï was at his heels who had a long-standing grudge against him, and it was evident that he was bent upon getting the porter into some corner and killing him. As the Armenian was passing the Greek embassy, he succeeded in darting through the open gate, in spite of the cries of the policeman. He was kindly received by the Greek Ambassador, who himself had him put into a carriage and sent, under charge of a cavass, to the Greek steamer, which brought him and many others safely to Piræus. I may add that I have succeeded in obtaining a list of the Turkish military and police officers who assisted at this infamous butchery in the Galata Seraï, but must refrain from publishing it, out of regard for the safety of the other ten Armenian porters who are still imprisoned there and employed about the premises. Besides, it is only too evident that all these officials, high and low, were but executing the orders of "the great assassin."

D. Kalopothakes.

AMHERST ECLIPSE EXPEDITION.—IV.

Yacht Coronet,
Yokohama Harbor, August 31, 1896.

The little town of Esashi, in northern Hokkaido, temporarily raised into prominence by a total eclipse track having seen fit to traverse its domain, has now returned to its normal quiet, echoes of the great world growing fainter in the distance as the various scientific expeditions retreat further from the Sea of Okhotsk towards more frequented regions. Our own expedition and that from the Paris Observatory under Prof. Deslandres, as well as Prof. Terao's party from the Imperial (Tokyo) University, used about a week after the eclipse in taking down instruments, packing apparatus, and dismantling the stations generally. We had the sad satisfaction (I use the expression advisedly, for if the circumstances had been different I should have had to say "the happy exasperation") of hearing from the Astronomer Royal of England in Akkeshi that at his station the sky was heavily clouded and nothing was done. Even yet we have not heard how the European parties fared; but that this corona was one of unusual brilliancy was evident from its brightness through the thinly drifting clouds which obscured its detail.

The Ainu, however, were obscured by no clouds of any sort during the sojourn in their vicinity, and very fine opportunities for studying this interesting race were afforded. There are no roads in northern Yezo, no jinrikishas, no kagos, no carriages, but plenty of horses and no side saddles. So the country had to be explored in a rather primitive but perfectly effectual manner, on horseback through the narrow and often bewildering footpaths through the thickly growing scrub bamboo, or along the hard sand beaches at low tide. In these rides I was fortunate in having the company of a Japanese gentleman, formerly a governor of one of the Hokkaido provinces, who knows the Ainu thoroughly, and their language as well, and who, still better, is well known to them for many miles in all directions. In a way they are a shy race, almost hermit-like so far as foreigners are concerned, and any casual traveller visiting the villages alone, or with a Japanese guide who is strange to them, sees little of their life or customs, and can rarely purchase any of their implements or articles of dress. The fact that foreigners were in the region had interested them greatly, and that for the first time a foreign lady was near by aroused much curiosity, and at all the villages they seemed as glad to see me as I was to see them. So, mutually in exceedingly good humor, and able to communicate easily by my helpful acquaintance, our study of each other progressed finely.

The elder women have elaborate ornamentation around the mouth in tattooing of a blue-black color, which gives them a peculiarly barbarous appearance; but the young girls are attractive, and often pretty, for the tattooing was forbidden by the Japanese Government several years ago, and, while not entirely suppressed, is far less frequent than formerly. These young girls have generally a clear brown skin, showing a warm russet red in the cheeks, with beautiful brown eyes shaded by long and thick eyelashes. In the younger generation, too, the luxuriant black hair is often simply coiled at the back of the head, instead of being cut in the strangely awkward native way, to stand out thickly on each side of the head, like an overgrown hearth brush, and perfectly short at the back of the head, nearly half-way to the top. Their teeth are even and white, and altogether they look little like the cruel heathen race they were formerly supposed to be. But the Ainus have no literature, no written language even, and their arts are of the rudest. Contact with the cultivated Japanese for a thousand years has apparently taught them little or nothing, and even now they would be scarcely beyond the stone age except for the easily obtained implements of Japanese make.

The native Ainu utensils are primitive and very interesting. The bows with their poisoned arrows, the tobacco pouches, the knife handles and sheaths, the apparatus for weaving elm-fibre into cloth—all of wood, often very well carved—have sometimes been handed down from parent to child through several generations. Frequently a family has but one of each article, and that one highly prized, which accounts largely for their dislike of selling their possessions. My Japanese friend, however, prevailed upon some of the Ainu to sell their dearly loved heirlooms, by the promise of unlimited saké as well as the purchase money. I was fortunate enough to find a garment of salmon skin, quite elaborately decorated, made in the same shape as the more ordinary elm-fibre kimono, and the only one of its kind encountered during the summer. Some of the beads and ornaments used for the great bear festivals are brought from Saghalien, and are quite odd enough to have originated in a region so remote.

In one of the horseback rides within a few miles of Esashi, I visited an Ainu house where a very old man lived, with many children and grandchildren. The roof was thatched thickly with scrub bamboo, and the general plan within was much like the usual type of Japanese house—one end having a floor of earth trodden hard, and the remainder, raised a foot or more above, covered with the straw mats. A square hole was filled with burning fagots, the smoke from which was supposed to find its own way out of a small hole in the roof, but seemed to prefer loitering about the room. The rafters hung several inches deep with soot, and even the fish drying above was similarly ornamented. Lying on the floor, with one arm thrown over his eyes, lay an Ainu man sound asleep, his bushy hair and beard standing out weirdly about his face. Two or three shy children were eating rice near the fire, over which an iron pot, full of an indescribable stew, was suspended, and bubbling vigorously. A pretty young girl sat sewing dark-blue Japanese cotton upon an elm fibre apron in fanciful figures, and an older woman, curled into a tiny heap, looked up at us from beneath her arm with bright and rather alarmed eyes. Round the room were piled the family treasures, in a rather chaotic mass, but conspicuous among them, as always, were two or three large round boxes of old Japanese lacquer, in which the choicest things are kept, and which, if dire poverty or misfortune come, are parted with the last. There is a legend to the effect that when Yoshitsune, in disgrace and obliged to flee from the main island during the shogunate of his brother Yorimoto, many hundred years ago, took refuge in Hokkaido, he escaped from his enemies in one of these boxes caused miraculously to contain him. He is in a sense the god of Hokkaido, and his memory is devoutly worshipped. Kakimonos representing him are found in many places, always brought out and reverently hung on feast days.

The old man we had come to see stood in the low doorway of the house, and the interior was so dark that his face was hardly seen in detail. He was an impressive figure, with a magnificent brush of white hair and beard. But the soot, the smoke, the close air, the dim light, the huddling family, the mental as well as the physical atmosphere, was oppressive, and a full breath of outer oxygen and sunshine was an intense relief. The first object I happened to see upon emerging was the fine French cruiser *Alger* lying off in the harbor outside Esashi, in attendance upon Prof. Deslandres. Such are the sharp contrasts in this world that, coming instantly from an Ainu hut and a near-at-hand study of one of the most primitive races in the world (rapidly dying out from sheer inability to maintain itself in the face of another nation), into the clear air outside, it should be possible to see in a single glance an epitome of that world's best civilization: one night a French dinner party upon a man-of-war representing one of the most cultivated of countries, the next morning a call in a house within plain sight, where books were never heard of, where furniture is unknown, where lives, eats, sleeps, and weaves on the floor around a boiling pot of dreadful herbs an entire family, whose one relief from an intolerable monotony is the annual bear killing and feast, and to whom no thought or knowledge ever came of a possible civilization beyond.

In another village an old woman was the most picturesque figure. Wrinkled and brown, she was bent nearly double, as she hobbled along leaning on a stick. Her bushy hair was snow-white, her mouth elaborately tattooed. Huge hoops of German silver weighed down her ears, and a brass bracelet was conspicuously worn above a score of bracelets done in tattoo. Her daughters and granddaughters stood or crouched about her when she rested, with babies strapped upon their backs after the Japanese fashion. She was so interested in her odd caller that she managed to get to the edge of the river near the house, in order to watch my horse step upon the flat bottomed ferry-boat, which a shock-headed Ainu boy was pulling across by a rope. Some of the rivers had no ferry, in which case we forded them, but on one occasion in the deepest place our horse deliberately lay down, to the discomfiture, temporarily at least, of his rider.

Could the stay in these curious regions have

been prolonged another month, the great interest ethnologically (and geologically and botanically as well) would have been by no means exhausted. But each time on returning from these excursions I found a few more instruments taken down and carefully packed, a few more tents gone, a few more boxes piled in the old school house ready for transportation, and a few more long pieces of silk and satin and paper, brought in by our kindly Japanese friends, upon which we were asked to paint poems or pictures for kakimonos.

MABEL LOOMIS TODD.

A POLISH SUMMER RESORT.

ZAKOPANE, GALICIA, August 25, 1896.

FOUR or five hours after leaving Cracow, in a wearisome train which crawls to the west and south, the traveller may get off at the little station of Chabówka and bargain with a crowd of clamorous peasants, in white costumes, for a conveyance that shall take him up into the hills. Then comes a rather uninteresting ride of nearly six hours more before his destination is reached, and he finds himself in the village of Zakopane, at the foot of the Tatra, "the only lofty mountain range among the West Carpathians," according to Baedeker. The settlement is, of course, centuries old, and was mentioned in a royal document in 1578, but only within the last twenty years has it become a summer and even winter resort of increasing popularity. A Warsaw physician discovered that it had a good climate for consumptives, owing to its pure air, sheltered position, and few extremes of heat or cold. Consumptives came, accordingly, followed by healthier tourists; soon new streets were laid out, a hotel, boarding-houses, villas, hydropathic establishments, a casino, etc., were built; the natives found it profitable to hire themselves out as guides, their poaching propensities having given them a very good knowledge of the region; in short, Zakopane has developed into a full-blown summer resort, which attracts some five thousand visitors every year, and hopes to attract many more when connected by rail with Chabówka, as it seems likely to be in the near future.

The peculiarity of this mass of strangers is that, though some of them come from long distances, they are not in the least cosmopolitan. Occasionally a stray German, Hungarian, or other foreigner passes through, but, as far as the present writer can learn, he has been the only visitor, not of Polish blood or connections, who has stayed for any length of time. The place is a meeting-ground for Poles from all the lands where they are to be found. More than half of the people are from "the kingdom of Poland," Lithuania, or elsewhere in the Russian dominions; others from Posen or West Prussia under German rule; others from hereabouts (the Austrian province of Galicia), and some, finally, from countries like the United States, where there are Polish emigrants. It is true that this gathering does not usually include many members of the highest aristocracy or most fashionable society, but there are enough even of them to make the crowd a representative one, well worth the study of any lover of national characteristics. The tie that unites all here is intense patriotism, however quiet and at times despondent; a feeling of national unity unaffected by present political conditions. Although we are in Austria, one rarely catches a word of German—yet many must speak it perfectly; whereas one not infrequently hears passers-by conversing in French, or even occasionally in English, for the number that know it more or less is surprisingly large. Life goes on much as at similar centres in all parts of the world. When the weather permits, for rain is frequent, there are excursions into the mountains; there are two or three dances a week, often to raise money for some church or Polish school; there are likewise charitable bazaars and other such methods of killing time; and there is, of course, not a little gossip, heart-burning, and strife.

Besides the transient visitors, more permanent ones come regularly to stay for a considerable time, and others even remain and settle down in houses they have bought or built. Thus, it is said that in winter, the dead season, Zakopane can still boast of twenty-two eligible widows, with more family than fortune. Of the people that live here for a large part of the year, the best-known is the novelist Sienkiewicz, several of whose books have been translated into English, and one of them particularly, 'With Fire and Sword,' has been widely read in America. By his compatriots he is looked upon as their greatest writer today, a master of style, who ranks with the first of contemporary authors anywhere. Naturally his acquaintance is much sought, but, in order to avoid being lionized to death, he is chary of meeting his countrymen, preferring to let himself be admired at a distance. At present he is at work on a novel whose scene is to be laid in the beginning of the fifteenth century, at the time of the decisive struggle between the Poles and the German order of the Teutonic Knights, which ended in the triumph of the former.

The proprietor of most of the land in the township is Count Z——, a member of one of the greatest Polish families, who has travelled in the United States and Australia, and who, as not being a German citizen, was expelled from Prussia, where he owns an enormous estate, at the time when Bismarck, in order to further the process of Germanization, suddenly put out of the country some forty thousand foreigners, many of whom had been settled there for years. Although the estate is decaying in the enforced absence of its master, he refuses to sell it, for it would be bought up by the Government committee which has charge of the fund to promote German colonization in the Polish parts of Prussia. The Count's mother has founded and is at the head of a manual training-school for girls, which she transferred hither when obliged to leave her former home, after being arrested in the middle of the night. The girls are divided into three classes, according to what they pay, the first class usually being daughters of the nobility, who come for a year to learn practical housekeeping; the second belong to families in moderate circumstances; the third, by far the most numerous, are peasant children, who often remain for many years, learning domestic service in all its branches, while, instead of paying anything for their education, they are in most cases supported by the Z—— family with the help of stray gifts from outside. Although the three classes eat and sleep separately, they work together at the same occupations. The teachers, who are of various nationalities—one of them even being an American—get little more for their services than the reward of good consciences. The whole institution is a noble undertaking that does much good, and reflects the greatest credit on the generous and devoted people who have given up their lives to it.

The natives of Podhale, as this district is called, are an interesting race, different in many respects from the ordinary Polish peasants. As the land here formerly belonged to the crown, serfdom was unknown; also, the wild character of the region made it a refuge for those who had got into trouble elsewhere. Fifty years ago these mountaineers were little better than brigands; even now they are inveterate poachers, and more than one of them has killed his man, generally in feuds with the Slovacks who inhabit the Hungarian slope of the range. All this has developed a type far more manly and independent than is to be found in the neighboring plains. The visitors to Zakopane cannot get over their astonishment at meeting peasants who actually shake hands and expect their hands to be shaken, instead of kissing the hand, or even the foot or the hem of the dress of the upper classes, as is the custom not many leagues away. These Górale (mountaineers) are a fine-looking lot, rather small and slight, but frequently handsome, and most graceful in movements and attitudes. Their costume, too, is very picturesque. When in full dress they wear moccasins, tight-fitting embroidered trousers of a stuff like white felt, and over the shirt a sleeveless waistcoat called a serdak, made of lambskins, which is usually worn with the wool inside, while the exterior is often embroidered; but in case of rain, or merely for greater coolness, the garment is reversed so that the wool is on the outside. Although the serdak does not protect the arms, it makes a good shooting or tramping jacket, much in favor with the tourists as well as the natives. Over it the mountaineer may put on, as a cloak, a long coat of the same material as the trousers, though not always white. The hat is of black felt with the brim turned down, and with a band made of a string of small shells. For their part the women are plainer and harder-featured; their dress is not peculiar or attractive. They are said to rule the men with a strong hand. The chief families are able to trace their ancestors for centuries; they are frequently quite well off, and they have plenty of natural pride. These peasants are also gifted with a good deal of artistic perception, as is shown by the style of their houses, which has fortunately been copied in the "villas," and they display in their woodcarving much original taste and skill. They are fond of merrymaking, especially of dances, the most striking of which is one that takes place outdoors at night, by the light of a great fire and pine torches, and goes by the significant name of "the dance of the brigands."

As for the nature of the country, the Tatra are too low to be compared with Switzerland; there are no snow peaks, glaciers, or real lakes. The highest mountains in the Polish part are about 7,500 feet, though across the Hungarian border, in the "High Tatra," some are over 8,750. Unfortunately, too, many of the woods have been cut down or thinned out. Still, we find much attractive scenery, mountains that are beautiful when looked at from below, and that offer grand views to those who take the trouble to climb them (and are fortunate in their weather), rocky gorges, clear streams, numbers of lovely little ponds in the midst of the wildest desolation, pastures where cows and sheep feed and are milked far away from any permanent habitation, now and then a glimpse of chamois, and plenty of chances of getting air and exercise, rest and health. To be sure, one can find these without going to Poland to look for them, but they are none the less to be appreciated, nor is it everywhere

that we can see a sort of summer capital of a gifted people who, though for a century they have had no independent or united political existence, have never for an instant ceased to feel that they were one nation.

ARCHIBALD CARY COOLIDGE.

Correspondence.

CHAUCER'S FIRST ITALIAN JOURNEY.

TO THE EDITOR OF THE NATION:

SIR: Chaucer scholars, following Ten Brink, have designated the year 1372 as marking the beginning in Chaucer's literary development of a period characterized by the imitation of Italian literary methods. The date 1372 was chosen because it was that of his first Italian journey. Towards the end of that year Chaucer went to Italy on the King's business. Since a pension payment "per manus proprias," November 22, 1373, has been the first indication of his return, most biographers have felt, with Prof. Lounsbury, that Chaucer "may have been, and very likely was, absent about eleven months." In so long a stay, during which he may have met Petrarch, he must certainly have come under the influence of Italian literature. The lack of any works showing Italian influence, and written shortly after the first Italian journey, was made good by assigning *ad hoc* certain of the Canterbury Tales to this period. Prof. Skeat, for instance, has assigned the date 1374 to the 'Clerk's Tale' for no better reasons than its strophic form and his theory that Chaucer must have had it directly from Petrarch. I should hardly venture to dispute this generally accepted division of Chaucer's literary activity, were it not that I am fortunate enough to have new evidence to offer, which will prove that the first Italian journey was of much shorter duration than we have supposed.

Dr. Furnivall, with other kind assistance, first told me that there were unpublished entries with regard to the first Italian journey at the Record Office. A reference to the Oxford Chaucer showed me that Prof. Skeat had information, as it turned out to be, of an insufficient sort, of the contents of this document. It was, then, rather led by an irresistible desire to see any unpublished matter relative to Chaucer than with any hope of new light upon his life, that I visited the Record Office on the last day of a summer vacation and read the roll for myself.

To my surprise, I found that to the knowledge of this journey which we had had already from Chaucer's commission (printed *Foedera* iii., p. 964), the "Compotus" added the exact extent of his absence reckoned in days—one hundred and seventy-four; that, instead of an absence of quite eleven months, from December, 1372, to the 22d of November, 1373, we must deal with an absence of less than six months, from December 1, 1372, to May 23, 1373. There is no need of burdening these columns with the whole document, since I shall print it in full in the forthcoming number of *Modern Language Notes*. Suffice it to say that Chaucer, having started "in nuncio Regis," with an advance of £66 13s. 4d., and receiving on the 23d day of March £35 on the King's account from his colleague Jakes de Prouan "milite," found on his return to England that there was still due him for his pay and expenses £25 6s. 8d., for the payment of which sum the document is an elaborate voucher. The said sum represents unpaid wages due him "for journeying in the king's behalf"—"proficiscendo in dictis negocijs Regis, a predicto primo die Decembris anno xlvi° [Edw. III] finiente, quo die iter suum arripuit de London versus partes predictas [*i. e., Janue et Florencie*], usque ad xxiij^{m} diem Maij prox' sequentem, quo die rediit London, per clxxiiij dies: scilicet, eundo, morando & redeundo, utroque die computato."—*Roll of Foreign Accounts* 42-51, Edw. III., fol. 41.

From the one hundred and seventy-four days of the entire journey we must, guided by the pilgrim itineraries, deduct at least one hundred and twenty for the journey to Genoa and return, about twenty more should be allowed for the trip from Genoa to Florence and return—that is, at most, Chaucer spent something like fifty-four days in Italy, something more than the average Cook's tourist of to-day, while for errands of his own, such as the rather doubtful visit to Petrarch at Padua, he had a trifle more than a month, presumably in February and March, 1373. I hope to treat of this possible visit to Petrarch at another time.

It is of course possible that, in a visit of less than eight weeks, during which time he was engaged "in secretis negocijs Regis," he might have received the impulse that appears in his works only after the lapse of seven years and an intervening visit to Italy—it is possible, but it is also wholly improbable. Those of the Canterbury Tales, showing Italian influence, which have been assigned to the time immediately following 1373, have been placed there without sufficient internal or external evidence. After the second Italian journey of 1378 the case is far different. Within six years follow 'Troilus,' 'Palamon and Arcite,' 'The Parlement of Foules,' and the 'House of Fame'; *anni mirabiles* these, and unmistakably *anni Italiani*.

Is it not reasonable, and even necessary, to begin the "Italian period" with 1379, and to limit it to those six marvellous years in which Chaucer's development was so rapid, in which his assimilation of his Italian models was so complete? Unless we have lost considerable portions of Chaucer's work, we must, I think, regard the years from 1369, the 'Boke of the Duchesse,' to 1379, as largely given to official business of one sort and another, and thus lost to direct literary production. We may conceive that Chaucer had outgrown the conventional French ideals of his first period, without as yet having developed for himself the new ideals so prominent in his "Italian period." We must, I think, rearrange these periods so that the "Italian Period" shall extend only from 1379 to 1385, and while we shall thus have limited the time through which this influence worked, we shall have arrived at a truer recognition of the intensity with which it worked—we shall have established a more perfect harmony between our external chronology for Chaucer and the internal facts of his literary development as they appear in his works.

Finally, the American student of Chaucer will be inclined to query whether, after these many years, the resources of the Record Office have been fully utilized for Chaucer chronology—a query which, we trust, our English fellow-workers will not leave long unanswered.

FRANK JEWETT MATHER, JR.

WILLIAMS COLLEGE, September 28, 1896.

AMERICAN STUDENTS IN FRANCE.

TO THE EDITOR OF THE NATION:

SIR: You were kind enough to insert a gratifying review of my article on "Les Universités de France et d'Amérique" (*Revue Internationale de l'Enseignement*, June 15, 1896), in your issue of July 9, for which I beg you to accept my thanks. May I ask space for a few additional remarks on the same subject, suggested by divers newspaper articles to which my attention has been frequently called of late? These notices, which seem to have appeared in journals all over America, are invariably of the nature of a personal advertisement. If only such, however, I should not trouble you with this letter; but, unfortunately, they are always combined with misleading statements, which ought not to pass unnoticed. Inasmuch, then, as my name has appeared in your columns as supporting a movement which these notices also purport to further, I think it my duty to explain my feeling in regard to them.

In the Chicago *Tribune* of Sunday, August 23, for example, under the heading, "Privileges for American Students," appears the following:

> "A Chicago man, ———, has been instrumental in securing *great privileges* for American students desiring to pursue a university course in France. . . . Dr. ——— maintains that France offers equal advantages [to those in Germany], and [he] has *by strenuous efforts* obtained *unusual privileges* for young American students desiring to pursue a course of study in France, where the universities of Lyons, Lille, Dijon, Toulouse, Bordeaux, and Montpellier offer *extraordinary opportunities* to the seekers after knowledge."

Permit me, Mr. Editor, to take exception both to the tone of this extract and to the statements therein contained. In the first place, the writer of the article represents our self appointed advocate as begging for us certain privileges, which it required "strenuous efforts" on his part to obtain. If this statement is true, then it is evident that we have been put before the French public in a position as unfortunate as false. We all, I know, protest against being made to occupy the rôle of suppliants in this matter; for such we have not been. The *official* initiative has been entirely on the part of French university authorities. All that we have done has been to accept their outstretched hands and to assure them of our sincere sympathy; and, indeed, there was no other dignified way for us to act. It is true there is a reaction setting in in America against extreme Germanization, and it has certainly not come too soon. Many of us feel that the influence of the French should be greater in our universities, and we therefore welcome their advances gladly, and are willing to aid them as far as possible by directing the attention of American students to their seats of learning. But this is far from begging admittance with solicitude; and if we have been misrepresented, it is well to have the error corrected as soon as possible.

The article informs us, moreover, that one American, single-handed, has already been "instrumental in securing great and unusual privileges" for his fellow-countrymen in French universities. This, I regret to say, is not true. I have tried to keep *au courant* in this matter; but, so far as I know, no peculiar or special privilege has as yet been accorded American students in France, nor has any really important change in educational arrangements been made in order to attract them there. The only alteration of any significance of which I have learned is one in the require-

ments for the *licence* in natural sciences, which permit it to be taken by any one who cares to comply with certain not unreasonable conditions. This is a move in the right direction; but it is very limited in extent, nothing similar being allowed for "letters" (including literature, history, philosophy, philology, etc.); and, moreover, the kind of students we should encourage to go to France are certainly not anxious for the title of *licencié*, their own degree of A.B. being of equal value. No change has as yet been agreed to in the nature of the doctorate or in the conditions necessary to obtain it; and no change, it is hoped, will ever be made which will render its acquisition easier for American than for French or other candidates. We have, it is true, suggested certain modifications in the nature of the present doctorate, but we expect them to be universal in their application. Only such have been proposed, moreover, as are, to my knowledge, desired by a large number of the French candidates themselves.

We know only too well how often Germans speak in derision of their Ph.D. tossed over, as they say, to foreigners for a consideration. We do not want to hear such a cry in France. If an unofficial representative has made "strenuous efforts" to obtain "unusual privileges" for us, we regret it exceedingly. Let the formal barriers to admittance to candidacy for the higher degrees in France be swept away, alike for one and all; let the many distinguished professors in French universities offer desirable courses, and no one need then exert himself unduly to lead Americans to Paris. They will go gladly, and in ever-increasing numbers, of their own accord. Excellent courses rarely go begging hearers. "Extraordinary opportunities" seldom wait long for recognition.

No, Mr. Editor, while many of us are indeed anxious to see friendly, reciprocal relations established between the universities of France and America, we are unwilling to see our cause furthered by false and extravagant assertions. Abroad we desire such representatives only as know something at first hand of the best university education in America, men who are not flatterers, nor do what they do to gain notoriety. At home our advocates should be ever candid and sincere, conscious of the importance their words may have in shaping the careers of those students who follow their advice.

However, because I have suggested that it may be the French system, or rather, lack of system, which has itself to blame for the comparative smallness of the number of American students in France, no one will, I hope, imagine that I therefore sympathize wholly with the German methods of instruction, which have proved to be more successful in the rivalry. Far from it. To speak frankly, my experience has led me to believe that in general the young graduate is far better off in one of the leading graduate schools of America than in any foreign university, until he is able to work entirely on his own responsibility, and has been fully initiated into the ways of scientific research. It is time that the idea was given up that a man who has done all his advanced study in the universities of the Old World must necessarily have had a better training than one who has been hard at work for as long a time in America. As a rule, the opposite is more likely to be true. If a student can arrange to spend some years abroad, in addition to those at home, by all means let him do so. His life in foreign countries will certainly broaden his sympathies and widen his horizon. Once in Europe, moreover, let him not fail to spend at least part of his time in Paris; but let him not go there with the expectation that he is to be treated with special distinction because he happens to be an American. The American students in Paris during the past winter had no "unusual privileges"; but I know of no one of them who regrets having spent a year there.

Hoping that I have not imposed too much upon your kindness, I have the honor to be, sir, Very sincerely yours,

WILLIAM HENRY SCHOFIELD.

CHRISTIANIA, September 15, 1896.

A QUESTION OF ETHICS.

TO THE EDITOR OF THE NATION:

SIR: I seem to have lagged behind the rest of my contemporaries. There are certain actions which I see people engage in who are otherwise deserving of deep respect, but which seem to me to be wholly incomprehensible. I should be glad if some of your readers would sacrifice a little time to trying to make me understand why they are not incomprehensible to every one.

As a glaring instance of the sort of action that I have in mind, I take the fact that Mr. Howells had, in a recent Sunday issue of the *World*, a long article on literary topics of current interest, accompanied by a picture of himself of enormous size, taken from a photograph by Cox (which did not deserve so base a fate). The *World* is beyond question one of the most degrading influences of the time. The mere fact that it treats every revolting murder and every scandal of no matter what degree of indecency as matter of equal interest with all the real news of the day, and as deserving the same close attention to all its sickening details as any intricate question of politics, is alone enough to show that it is demoralizing beyond conception. It does not enter a single household where it does not insensibly set the tone in the direction of vulgarity. It is impossible to read it day after day without gradually but surely losing the instincts of a gentleman. *Life's* scathing cartoon of its unsavory progress through the town is thoroughly well deserved. How, then, is it possible for a man like Mr. Howells to write for it?

Whatever one may think of the justice of some of his opinions, Mr. Howells is through and through a reformer. How can he reconcile it with his conscience to write for the *World?* One cannot have recourse to mercenary motives as an explanation in this case, and it only remains to suppose that he has some theory of life or morals which makes it a desirable thing to do; probably he thinks his words reach a wide audience in this way. But in what way do they reach it? The same number of the *World* contained an editorial in which Mr. Howells was ridiculed, on account of his liking for finding genius in unknown writers, in a way that would be considered as grossly insulting by any one who had the feelings that have always been supposed to belong to the literary man. As far as Mr. Howells is concerned, this can only be regarded as a proper consequence of bringing his wares to such a vulgar market, but it also makes the theory that what he has to say may have a good effect somewhere a ridiculous one.

The only safeguard against such a contaminating influence as that of the *World* and the *Journal* is that there should be a "remnant" whose opinion is respected, and who are known to despise them; unless, indeed, it shall be decided that newspapers must be licensed, as physicians are already, to prevent their poisoning off a once healthy population. The great majority of people, who do not think for themselves, have not yet discovered that it is a disgrace for these newspapers to be seen in their houses, and how shall they discover it if a man like Howells, for whom they must have a profound respect, sees no reason why he should shun their company?

C. L. F.

ARGUMENT WITH FARMERS.

TO THE EDITOR OF THE NATION:

SIR: During my vacation I took every opportunity to talk quietly with the farmers of New Hampshire on the silver question. Such missionary work is, of course, unnecessary in New England, but I was struck with two points which may be of interest to those who are trying to combat error in places where it is more prevalent.

In the first place, I found that if I used any of the terms of political economy—even such simple ones as "medium of exchange" or "intrinsic value"—I failed to be thoroughly understood; secondly, that the statement, "there is as much money to-day in mining silver at 63 cents an ounce as there is in mining gold at $19 50 an ounce," never failed to make an impression, especially if followed with some explanations how mechanical and chemical inventions have affected the cost of mining. Our farmers are familiar with the effect of improved tools and methods in ploughing, sowing, and harvesting. They are familiar with the use of dynamite in blasting, and can readily see how high explosives, the machine-drill, and compressed air have lowered the cost of getting out rock, and are willing to admit that silver must be cheaper than it was before these inventions were applied. They readily appreciate how chemical methods have made it profitable to mine and sell silver at the rate of 63 cents an ounce, and that these inventions have not affected the amount of labor necessary to produce 1-63 ounces of gold. They see that it is impossible to make silver again as scarce and dear as it was before, and they see at once the utter futility of coinage in the ratio of 16 to 1. If any doubt remains, a reference to the Molly Gibson mine and several others which produce silver now at a cost of 21½ cents removes it.

Of course it is hardly worth while to argue with Eastern silver farmers. They are too few to affect the vote—a negligible quantity. But in the West it is perfectly natural for a farmer to say, "Everything has been protected except wheat, and that I have to sell at a price made in England. Now, if making silver money will reduce the burden of taxes and interest, it will do the farmer some good, and he ought to have his chance with the rest." It can be made quite clear to such a man that silver is cheap by reason of the lessened cost of its production, and then he sees at once that the persons to be benefited by free coinage are the original producers of bullion, and appreciates at once that abominable greed lies at the bottom of the silver movement, and that it seeks to exploit the honest fanaticism of the Populists.

Our people do not and cannot understand the currency question, but they do understand how improved machinery cheapens a product. A short pamphlet in plain language

describing "How silver is mined and how gold is mined," with a few statistics of cost—labor, fuel, etc —would make more converts than the soundest and most elaborate argument on the principles of political economy. Possibly it might convince even a bimetallist.

It may be too late to bring out such a pamphlet for use in the present campaign, but the question will not be entirely laid at rest next November. CHARLES F. JOHNSON.

HARTFORD, October 5, 1896.

THE THOMAS BOOK.

TO THE EDITOR OF THE NATION:

SIR: Your issue of September 17 contained a notice of 'The Thomas Book,' in which the reviewer spoke of the volume as a "monument of money wasted." If the rest of the book is as inaccurate as that portion concerning the ancestry with which I am related, and of which the reviewer says, "Two pages are given to the noted Thomas family of Marshfield, as an excuse for putting in a portrait of Gen. John Thomas," the work might be said properly to be "a monument of money worse than wasted."

In the pedigree there given, which the compiler professes to have made up from Marcia Thomas's 'History of Marshfield,' it is stated of Col. Anthony Thomas, the elder brother of the General, that he "married Abigail *Tilden*, and died July 14, 1781"; the name of the wife, as well as of the husband, being given (in order to emphasize it) in the largest and blackest type at the disposal of the compiler, which only serves to make the blunder more conspicuous. Instead of Abigail *Tilden* it should be Abigail *Alden*, who was born February 27, 1727, and was the great granddaughter of John Alden, who came over in the *Mayflower*, and who was the last survivor of the signers of the compact. There are plenty of books, such as the 'Alden Memorial Book,' published at Randolph, Mass., several years ago, that will verify this statement, to say nothing of the records of Marshfield and the gravestones in the burying-ground.

The compiler of this valuable production also states that Anthony Thomas left a son, Briggs; the necessary implication being that he left no other sons, whereas he had two others, Waterman and Judah, the former of whom moved to Waldoborough, Me., on his appointment by President Washington as "Collector of Customs for the district of Bath and Penobscot," an office which he held till his death, and in which he was succeeded by his son-in-law, Joseph Farley, who was appointed by President Jefferson.—Yours very truly,

WILLIAM F. PECK.

ROCHESTER, N.Y., September 27, 1896.

Notes.

DODD, MEAD & Co.'s autumn publications include autobiographies of Augustus J. C. Hare ('The Story of My Life') and of Mary Cowden Clarke ('My Autobiography'); 'My Literary Life,' by Mrs. E. Lynn Linton; 'The Life of Adeline, Countess Schimmelmann,' a Scandinavian philanthropist, edited by the Rev. W. Smith Foggitt; 'Charlotte Brontë and her Circle,' by Clement K. Shorter; 'The Memoirs of Signor Arditi,' the Italian musical conductor, with portraits and facsimiles; 'Historical Briefs, with a Biography,' by James Schouler; 'Lyrics of Lowly Life,' by Paul Lawrence Dunbar, a young negro poet one generation removed from slavery; a new volume of literary essays by Hamilton W. Mabie; and 'Travel and Talk,' about the United States, by the Rev. H. R. Haweis.

Francis P. Harper, New York, announces a 'History of the American Theatre, 1749-'97,' by George C. Seilheimer; 'Walt Whitman, the Man,' by Thomas Donaldson; and 'The Greatest Cavalry Ride of the Rebellion; or, General Thomas at Nashville,' by Gen. H. V. Boynton.

In connection with Chapman & Hall, London, Charles Scribner's Sons will issue a Centenary edition of the Works of Thomas Carlyle, at a low price for good workmanship, with new portraits and some pieces not before published in a collected form. A beginning will be made during the present month.

'Reminiscences of Old New York, 1810-'60,' by Charles H. Haswell; Poultney Bigelow's 'History of the German Struggle for Liberty'; and a 'Dictionary of Classical Literature and Antiquities,' by Prof. Harry Thurston Peck, are in the press of Harper & Bros.

We were inexact in naming the title of the first volume of Dr. Edward Eggleston's forthcoming 'History of Life in the United States,' to be published by Messrs. Appleton. It reads, 'The Beginners of a Nation.' We should also have mentioned that Mr. Charles Howard Shinn's 'Story of the Mine' is the second volume of the "Story of the West Series" of the same house, edited by Mr. Ripley Hitchcock.

Henry Holt & Co. will have ready at no distant date a 'History of Latin Literature,' by Prof. H. T. Peck.

Dr. George Hodges's Lowell Lectures for 1896 are on the eve of publication by Thomas Whittaker, under the title, 'Faith and Social Service.'

George D. Sproul, No. 156 Fifth Avenue, New York, will bring out next month, in connection with Hutchinson & Co., London, a sumptuous work, 'The Book of Beauty,' late Victorian era, consisting of portraits of the Princess of Wales and a large number of peeresses and other ladies of distinction and beauty, mostly by celebrated artists; some children's pictures, both sexes; with original text, musical compositions, and drawings—the whole in two imperial quarto volumes. The American edition is limited to 300 numbered sets.

The Joseph Knight Co., Boston, have undertaken a new edition of Lady Jackson's historical writings on France ('Old Paris,' 'The Old Régime,' 'Last of the Valois,' etc.), in fourteen volumes, and 'Three Children of Galilee: A Life of Christ for the Young,' by Prof. John Gordon.

A. C. McClurg & Co., Chicago, will publish immediately 'From Avalon,' poems by Mrs. Emily Huntington Miller, and 'Blue and Gold,' verses by William S. Lord.

Prof. A. Furtwängler returns to the Tiara of Saïtapharnes in his new volume of 'Intermezzi: Kunstgeschichtliche Studien' (Leipzig: Giesecke & Devrient; New York: Lemcke & Buechner). Other chapters relate to an antique Greek bronze head belonging to the Duke of Devonshire; the Medici torso and the Parthenon; the Munich Poseidon frieze and the Neptune temple of Domitius; and the monument of Adamklissi and the earliest representations of Germans.

Charles Scribner's Sons have been well advised in beginning a "Library of Contemporary Exploration and Adventure" with four well-known narratives—Whymper's 'In the Great Andes of the Equator,' Lumholtz's 'Among Cannibals,' Hornaday's 'Two Years in the Jungle,' and the late Capt. Bourke's 'On the Border with Crook.' All these are reprinted from the plates of previous editions, but they are bound uniformly in an agreeable green cloth, and will, we trust, mutually assist each other in securing an extended reading. They offer a wide diversity of scene, incident, adventure, style, and interest, and are all illustrated more or less freely.

Two little volumes bearing the imprint of Preston & Rounds, Providence, R. I., revive the ancient reproach of Rhode Island against Massachusetts for persecution of the smaller colony's citizens for conscience' sake. One, by the Rev. Henry Melville King, a Baptist pastor, retells the story of his co-sectaries, Clarke, Holmes, and Crandall, on their memorable 'Summer Visit of Three Rhode Islanders to the Massachusetts Bay in 1651'—"its innocent purpose and its painful consequences," to Obadiah Holmes in particular. The late Dr. Dexter, along with other Puritan apologists, is again successfully refuted; at the same time, recently discovered evidence of Roger Williams's having been banished on account of "his different opinions in matters of religion" is advanced out of the mouths of his half-relenting persecutors. Part of the original narratives is given in an appendix, with other documents; there is a bibliography and a good index.

The second volume is equally a compilation. It is concerned with 'Mary Dyer of Rhode Island, the Quaker Martyr that was hanged on Boston Common, June 1, 1660,' and is from the pen of Horatio Rogers, one of the justices of the Supreme Court of Rhode Island, himself a descendant of a persecuted Quakeress. It is rather less fair to the Puritans than is Mr. King's arraignment, and the occasional fanatical disturbances by Friends bearing "testimonies" are quite overlooked. Nor does the author take a hint from the intimation on p. 80 of the disquietude of the Rhode Island authorities with regard to Quaker scruples against "trayninge, watchinge, and such other ingadgements." The footnote on p. 18, as to the discipline of married persons for "impropriety before marriage," ignores the fact that the same custom prevailed among Friends for the same offence, which was confined to no denomination. Judge Rogers, like Mr. King, supplies the pertinent original documents, and both these volumes convey a needful lesson even for to-day.

It will doubtless be alleged that Mr. George Ade's 'Artie' (Chicago: H. S. Stone & Co.) is but a Chicago "Chimmie Fadden." Where Mr. Ade got his nudge we cannot say, but his study of office-boy and street-wanderer's slang is evidently from the life. Nor is all the fun of his book in the efforts of "Artie" to add piquancy to a used up language; he has his insight into life, viewed from Chicago, which is not without humor and wisdom.

The Century Company is early in the field with a number of illustrated books for children. The humorous division is easily led by Mr. Peter Newell's 'Shadow Show,' a very ingenious series of metamorphoses attained by viewing colored pictures through the leaf *en silhouette*. In this way a pair of Japanese wrestlers becomes a rampant hippopotamus; twin monkeys, a bull-frog; a man putting on a coat, Fido, etc., with generally very little hint of the impending transformation. Another sort of shadow pictures is displayed in 'Gobolinks,' for which Ruth McEnery Stuart and Albert Bigelow Paine are sponsors. Fantastic symmetrical figures, in which design plays but a small part, are made by ink splotches doubled

by folding the paper upon itself. Imagination detects a resemblance to man or beast or elf, and the muse is called in to tell the story. But a bookful of these "cathodes" cannot escape monotony.

'Oceanic Ichthyology: A Treatise on the Deep-Sea and Pelagic Fishes of the World,' based chiefly upon the collections made by the steamers *Blake*, *Albatross*, and *Fishhawk* in the Northwestern Atlantic, with an Atlas containing 417 figures, by the late George Brown Goode and Tarleton H. Bean, is a 614-page quarto special bulletin of the Smithsonian Institution. Among recent ichthyological publications none are more important or more useful than this one. It is the outcome of earnest and long-continued researches by authors who, fortunately for their science, were in possession of the great collections made by the different vessels during years of dredging and trawling. The multitudes of descriptions drawn from the specimens are of unusual excellence, the illustrations are fair, and the synopses make the book especially convenient for reference. As is to be expected in a work of such comprehensiveness, there are points liable to criticism. Besides the faults of the proof-reader, we notice some inaccuracies in classification or identification, some neglect of quotation-marks, and some confusion of dates. The volume is published in 1896, it is dated 1895, and on its pages genera and species are given as new which had been published by the authors in 1894.

The Yearbook of the United States Department of Agriculture for 1895, an octavo of 656 pages and numerous illustrations, is a valuable addition to the library of any one depending on the soil for a living and disposed to profit by the experiences of others. The range of topics is so wide that all classes of producers must find something of particular interest and benefit. Most of the authors are very practical; occasionally one shows traces of too much mental cloudiness. In the article on oleomargarine, for instance, conclusions are set forth that apparently are based on experiments with only one of the substances compared, and the author presents a couple of analyses, said to show that oleomargarine, if pure, is quite as digestible as butter, which few besides this authority will be able to compare.

As in his 'Mirage Oriental,' so in his last book, 'La Sculpture en Europe avant les Influences Gréco Romaines,' M. Salomon Reinach combats the notion that Europe owes its civilization to the Orient. In this volume he discusses some hundreds of primitive figurines, statuettes, and ornaments, and in particular such specimens as have been taken to bear witness of a derivation from Egyptian or Babylonian forms, and demonstrates how, in every instance, the resemblance is due not to an historically improbable borrowing, but to the uniform course taken by all art forms at their origin. In the course of his discussion M. Reinach insists upon two points of extreme importance. He does not hold, with many students of primitive art, that animal forms change into geometric patterns He believes that the geometric design came first and was turned into the representation of man or beast only when the transformation could not help suggesting itself. His other point is that attitude and gesture in primeval art are *positively* void of dramatic intention or of any expressiveness.

Of great value to the special student of religion in the Far East is a pamphlet of seven leaves (four pages of text and three of illustrations) by Mr. Jos. Schedel, which is printed as manuscript on the press of the *Eastern World*, at Yokohama, Japan, on Phallus Cultus in Japan. Though small, it is a rich addition to the pamphlet of Dr. E. Buckley of the Chicago University and of Griffis's 'Religions of Japan,' giving new proofs and testimonies, regarding widely separated parts of Japan, of this once prevalent form of early religion, which seems difficult to eradicate despite the severe regulations of the present Japanese Government. Several scholars have assisted the author in collecting his specimens.

So rare is high, interpretative criticism that it is especially pleasant to call attention to the article by Prof. Josiah Royce on "Browning's Theism" in the September number of the *New World*. Not for a long time have we seen an analysis so penetrating as this. Like the great critics, Prof. Royce possesses the creative quality. In analyzing the three-fold nature of current Christianity, and in stating Browning's attitude towards it, he in a measure shows our time in epitome; just as Carlyle, in his essay on Samuel Johnson, showed the characteristic features of eighteenth-century England. Very significant is his presentation of the way in which Browning rises from the conception of the universe as embodied Power, to the conception of cosmic Love as the origin and director of that Power. In short, this essay cannot fail to influence readers who think, and so come to influence those who ordinarily furnish criticism to the daily and weekly press.

It is not too late to turn back, for pure enjoyment, to the issue of the London *Telegraph* for August 31. A city magistrate had the day before discharged a prisoner charged with a statutory offence, under a recent act, upon finding by the dictionary that the word used in the law did not cover the case: "Webster," comments the *Telegraph*, "when a lawyer, 'got off' many defendants in his day, and his Dictionary still continues the good work." There are many anecdotes which embalm this British confusion of the statesman and the lexicographer, but perhaps few to which a definite date can be given, as above.

The most venerable of Scotch Universities, the University of St. Andrews, in its current advertisement, in the London *Academy*, for the session of 1896-97, sets an example of educational chivalry. Of the seventy three bursaries announced as open to competition, "forty-three are tenable by men only, twenty-nine (of which twenty are restricted to medical students) by women only, and two (the Berry Bursaries of £40 each) by either men or women." In the course of the session eight scholarships will be competed for, five of which are open to both sexes; they range in value from £100 to £34. But the most suggestive incident in connection with this same University of St. Andrews is the official notification which its Rector, the Marquis of Bute, has given of his intention to move at the next meeting of the University Court, that "a woman be appointed Assistant Professor of Medicine and Lecturer in Physiology."

An English confectionery and preserving firm, Messrs. Clark, Nicholls & Coombs, Hackney Wick, London, employing 2 000 hands, of which 1.400 are women, reports an experiment in profit-sharing sufficiently established and successful to give value to its details. "Clarnico's" (as the firm is called), having paid interest on its debentures (bonds) and dividends on its preferred and common stock, divides the residue of profits into two parts. Of these, one is distributed among the common stockholders and the other among the workpeople, "so far as these are eligible for it," one year's service being the first requisite. A varying amount, left unappropriated among the workpeople, is invested in shares or bonds of the company, and is set aside as a provident fund, to which fund "the managing directors make considerable private contributions." Out of this provident fund are paid to the workers, when sick, allowances up to two-thirds of a man's or woman's wages; to the family of any qualified worker dying in the company's services, £5 for funeral expenses; to the widow of an employee under certain circumstances, a grant of £5, and £5 to any female employee who marries after five years' employment. Since 1890, when this bonus to labor was instituted, the annual sum paid to the workers has steadily increased. It was in 1890 and also in 1891, £1.400; in 1892, £1,550; in 1893 and 1894, £1,700, and in 1895 £2,762, or some $52,000. The first year, the bonus was distributed to only 536 persons, making an average of about $13 per person; last year 988 workers came within the line, with an average of about $13.90 per capita.

Under the auspices of a committee of the American Library Association, a fund is being raised to erect a memorial to the late Dr. W. F. Poole, probably in the form of a bronze bust to be placed in the Public Library or the Newberry Library in Chicago. An opportunity is offered to all (and their name is legion) who have found occasion to bless the man who invented 'Poole's Index,' to contribute to this memorial. A list of the contributors will be published, but without the amounts given. Contributions should be sent to the treasurer of the committee, Dr. G. E. Wire, No. 1574 Judson Avenue, Evanston, Ill.

We understand that the library of the late Dr. Reinhold Rost of London, the eminent Orientalist, is for sale in bulk. Most of the library relates to the Malayan Archipelago, for which reason efforts are making to secure it for the Government of the Straits Settlements at Singapore; but it is to be hoped that it may be bought by or for some American institution. It is described as being probably the largest and most valuable collection of books relating to the Malayan Archipelago and the Far East now existing in private hands. It is abundant in works on geography, ethnography, and natural history of regions which are of exceptional interest in these respects, and is especially rich in the lexicography and literature of the Malay, Javanese, Achinese, Dayak, Macassar, Bugis, and the other languages of the Archipelago, of Burmese, Siamese, and other languages of Farther India, and of the languages of India proper. An American institution possessing this library could boast of having not only the best, but almost the only important, Malayan collection in the western hemisphere. A classified catalogue of the books, prepared from copy furnished by Dr. Rost's son, is in the hands of Charles P. G. Scott, Radnor, Pa., who will answer inquiries, and will lend the catalogue for examination.

—We have already noticed Sir Joseph Lister's presidential address at the Liverpool meeting of the British Association. Prof. Poulton's opening address in the zoölogical section dealt with the still unsettled quarrel between the zoölogists, the geologists, and the physicists as to whether ten millions or five hundred millions of years is the age which may be assigned to our planet as the theatre of the evolution of species. As a zoölogist,

Prof. Poulton naturally criticised the position of the physicists, and endeavored with considerable success to point out alternative lines of argument which physicists might adopt with a prospect of establishing a *modus vivendi* with and for the zoölogists, and he made it seem reasonable to hope for an adjustment of this scientific *impasse*, upon which Lord Salisbury so vividly insisted three years ago in his inaugural address as president of the Association meeting at Oxford. There was not, however, the same promise of ultimate agreement held out by this year's proceedings of the anthropological section. The opening address of Mr. Arthur Evans, its president, and keeper of Ashmole's Museum at Oxford, dealt with "The Eastern Question in Anthropology." The now widely known discovery of Mycenæan characters which were borrowed in Crete by the Phœnicians, who refashioned them and gave them back in the shape of an alphabet to the West where they originated, has been strikingly confirmed by Mr. Evans's latest find—a steatite table of offerings found in the Dictæan Cave of Cretan Zeus, and inscribed with nine Mycenæan characters and two marks of punctuation. The certainty that our alphabet ultimately goes back to the Mycenæan civilization raises in a more acute form the already pressing question presented so brilliantly by M. Salomon Reinach in his 'Mirage Oriental.' Mr. Evans does not go so far as M. Reinach in emancipating the West from its traditional subservience to Eastern influences, but both of them bid us say farewell to the long-accepted notions associated with a primitive seat of the Aryans.

—That there is as yet no consensus of expert opinion as to the Mycenæan civilization, even among anthropologists, appeared when Dr. Montelius read his paper on the Pelasgians and Tyrrhenians in Greece and Italy. Under these names he recognized phases of the Mycenæan civilization, which he derived through Asia Minor from the Hittites. Just here it was objected by Mr. Myres that, as the result of a most exhaustive search in Caria, he knew there were absolutely no traces of Mycenæan art or civilization to be found there. The same was true, Mr. Evans urged, of all other portions of Asia Minor, excepting the site of Hissarlik. Mr. Myres had previously read a paper on the prehistoric trade-routes of the Mediterranean and the Danube, recognizing Hissarlik as a Mycenæan outpost planted with a view to the Dardanelles and the Danube line of communication. Thus it appears there was no line of contact between the Hittites of Cappadocia and the Mycenæan civilization, and Mr. Evans's contention would be borne out, that the Mycenæan civilization in the West derived little or nothing from Cappadocia, Egypt, or Assyria until it had reached a brilliant and independent maturity.

—With August the first number of the *Journal of the Society of Comparative Legislation* made its appearance in London. Up to this time the *Bulletin* and *Annuaire* of the Société de Législation Comparée and *Zeitschrift für vergleichende Rechtswissenschaft* have served as the chief vehicles for the publication of studies in that subject (the former dealing mainly with legislation and the latter with customary law), though important legal material often finds its way into the Transactions of learned societies of the Orient and of Europe. There has hitherto been no specialized periodical in the English language—a lack that has been regrettable, not so much because English and American students need to be informed through their own language, as because it indicated an absence among us of concerted interest in the subject and an indifference to the profit of its pursuit. Under the auspices of the Lord Chancellor and the Lord Chief Justice, and at the suggestion of Sir Courtenay Ilbert, in December, 1894, a Society of Comparative Legislation was formed, "with the object of promoting knowledge of the course of legislation in different countries, more particularly in the several parts of her Majesty's Dominions and in the United States"; and the *Journal* is to be its mouthpiece. The annual fee for membership is one guinea, and the fee for life-membership is ten guineas; and the Honorary Secretaries are Thomas Raleigh, Esq., Privy Council Office, S. W., and Albert Gray, Esq., 2 Paper Buildings, Temple, E. C. The Society's main work will of course rightly be with the rich mass of data furnished by the sixty-odd legislatures and the heterogeneous peoples of the British Empire. The articles of the first number are: Legislation of the British Empire in 1895; Modes of Legislation in the British Colonies; The German Civil Code; The Application of European Law to Natives of India and Ceylon; Notes on the State Legislation of America in 1895. But, as this list shows, the *Journal's* pages will also include contributions not dealing strictly with affairs of the British Empire; and in particular "it is desired to enlist the aid of the Bar Associations and Statute Revision Commissions of the United States." The two-score jurisdictions of our own nation furnish in themselves a rich opportunity for comparative study, and the time may come when we shall have a journal of our own (not that we need forget the pioneer work begun by the New York "State Library Bulletin"—now at No. 6—in chronicling our legislation systematically). The time is already ripe for a Juridical Society, of which one branch should devote itself to the study of comparative legislation at home and abroad. But meanwhile Americans will do well to join the English Society and encourage the cause.

—If one is to judge from the recently published Guide for intending candidates for the new research degrees at the University of Cambridge, this matter seems to be on a more definite and satisfactory footing than it is as yet at Oxford. Certainly, distinct inducements are offered to such students with better standing and fuller recognition of their previous work than at the sister university. The formalities and requirements both for admission and for the degrees are in most respects similar. At Cambridge, however, students are eligible, after producing satisfactory evidence of age, former work, and fitness for admission, not for the degree of B.Litt. or B.Sc., as at Oxford, which has at present no higher degree equivalent to the M.A. of the arts course, but, after three terms' residence, are entitled to a Certificate of Research, and, after six terms' residence, are entitled to go in for the regular examinations leading to a B.A., and thereafter, under the usual conditions, to proceed to the degree of M.A. and the other University degrees if they so desire. The Certificate of Research is granted in the third term of residence after the student has presented a satisfactory dissertation to the Degree Committee, "containing an account of and embodying the results of his research," and taking as well an examination in the subject, oral or otherwise. Such a student is regarded *in statu pupillari*, and must be duly entered as member of some College or Hostel, or as a non-Collegiate. "The course of advanced study may or may not be such as to qualify him for passing one of the Tripos (Honor) Examinations. The course of research may or may not be pursued with a view to the acquisition of the University Certificate." The terms are three in number, the University year beginning October 1; and residence of three-fourths of a term counts for a term. The convenient little pamphlet compiled by Dr. Donald MacAlister of St. John's College can be obtained from the University Press, Cambridge (price 6d.), by those who are desirous of fuller information, and the University Calendar (price 6s. 6d.) from Deighton Bell & Co., Cambridge. Intending students should apply to the Registrary of the University, Registry, Cambridge.

—The spread of the English language over the world seems to make steady progress, though the phenomena of the movement are those of recession as well as procession. Education by means of the English language in the Government and private schools of China, Korea, and Japan does not make the progress expected by sanguine prophets of a decade ago. Nevertheless, English still holds its own in those schools where it has always been taught thoroughly rather than superficially. Furthermore, in each of the three countries, there are journals which are bilingual, giving the Asiatic script on one page and the Roman on the other. In Japan there is at least one paper published in English by Japanese, the matter being furnished almost entirely by native scholars. The *Far East* comes to us in a neat pamphlet form containing forty pages of body articles and notes, in which almost every phase of Japanese and Oriental life is discussed. Unusual ability seems to be shown in treating those questions and problems which belong to Japan as a comparatively new member of the family of nations governed by much the same rules of intercourse. The *Sun*, a semi-monthly review of politics, economics, science, literature, and art, which seems to be a sort of combination of the *Century* and the *North American Review*, comes freighted with illustrations and papers on science, fiction, education, history, literature, and commerce, by men who occupy the highest literary ranks in the empire. The latest number in our hands, dated July 5, is vol. ii., No. 14, and the signs of prosperity in the advertisements and otherwise are patent. One of the most striking articles is entitled "The Labor Problem in Japan." It is written in English by Mr. S. Takano. This is but one of nearly a dozen articles already published in the same language in the *Sun*.

—Mr. Takano's article is brief but strong. He protests strenuously against the inhumanity shown, on the part of the leading men in Japan, in a total disregard for the interest of the laboring people. In their greedy, almost ferocious ambition to forge ahead in the race for the prize of supremacy in foreign commerce, they have forgotten the common duties of humanity. He insists that Western civilization in its best sense is limited in Japan to the higher classes only. The working people are sacrificed, physically and morally, to the ambitions of influential men who bitterly oppose legislation for the protection and im-

provement of factory operatives. Even in June of this year, at a general convention of delegates from the chambers of commerce throughout the country, a proposition to advise the Government to enact a law for the protection of factory hands was unanimously rejected, on the ground that such protection was not necessary at present and would be a *hindrance to the greater growth of Japanese industry*. (The italics are ours.) When it is considered that there are now nearly fifty cotton mills in Japan (there being none in 1878), which run on an average twenty-two hours a day, and 10 per cent. of the male spinners and 23 per cent. of the female spinners are children under fifteen years, with an average of eleven working hours a day, the danger is evident. It is not astonishing that in Osaka, which has fifteen of the largest mills, ninety-four out of one hundred applicants in the city for enlistment in the army were rejected on the ground of physical disability. There are other dangers in this violent change in the conditions of Japanese life. Those who work on alternate weeks at night get no extra compensation for their labor. Furthermore, the mill operatives are under police espionage, and are not allowed to meet or combine for public discussion and action. A "hand" discharged from one mill for bad conduct cannot, within a year, get work in another factory. The mill-owners are amply protected, while the working people have, under existing conditions, little possibility of sharing in the general advance of the country. Though Mr. Takano, who seems to be familiar with the history of labor and modern industrial methods in other countries, treats only of the cotton industry, he adds, "Low wages, long working hours, child labor, black list—such are the conditions existing in the cotton-spinning industry, and similar conditions are confronting the workers of other trades which are run under the modern system of industry. . . . But how long will the workers remain in their semi-conscious condition?" He calls on the leaders and statesmen to avert what he calls "the impending disaster."

RECENT POETRY.

DON QUIXOTE, in discoursing with a youth who is to compete for a prize of poetry, advises him to "contrive to carry off the second prize, for the first always goes by favor or personal standing, the second by simple justice." This wise counsel seems to have ruled the terms of competition among recent poets, in both England and the United States, except that Mr. Swinburne, in venturing on the ground of Lord Tennyson, probably has higher aspirations, certainly not destined to fulfilment. The new metre he has devised for his 'Tale of Balen' (Scribners) has ingenuity for a merit, and that alone; it misses the simple vigor of the ballad measure, yet attains to nothing more, and is in marked contrast to the sustained vigor and rhythmic sweetness of the Tennysonian idyls; while to compare it with the honeyed melody which is identified with Swinburne himself, or with the salt-sea vigor of his "Song in Time of Order," is to apply a test too pathetically severe. The mere story of the twin heroes is told as well as Tennyson told it—and more at length, if that be a merit—but they jog along side by side, through many pages, at an unvarying canter like this (p. 2):

> "And glad in spirit and sad in soul,
> With dream and doubt of days that roll
> As waves that race and find no goal,
> Rode on by brush and brake and bole
> A Northern child of earth and sea,
> Radiant: the heavens of night and day
> Shone less than shone before his way
> His ways and days to be."

Here we have Swinburne's old mannerism of alliteration; his initial letters jingle a little, like the trappings of a knight, but they cease to charm, and in no other respect do we recognize the old time master of melody. But the metre itself suggests hopelessly that of "The Lady of Shalott," with this difference, that Tennyson's poem under that name is far briefer and more highly dramatic, and, moreover, that the delicate ear of its author relieved it by the variation of such lines as

> "In the stormy east-wind straining
> The pale yellow woods were waning,"

which wholly balance the jog-trot inevitable where the octosyllable alone is used. The truth is, that it took all Tennyson's unequalled resources to save even "The Lady of Shalott" from becoming monotonous; and how much less can the present poem escape that fate? Swinburne never once, like Tennyson in the lines above quoted, passes from the iambic to the trochaic measure; and the only case in which he seems to be really trying to put a little lilt into his cadence is in the following, which can hardly be called euphonious (p. 16):

> "Strode Balen in his poor array
> Forth, and took heart of grace to pray
> The damsel suffer even him to assay
> His power to set her free."

Here the damsel can hardly be said to be "radiantly attended" by the syllables linked with her in this third line. It is to be counted for righteousness to Mr. Swinburne that he dedicates this later work, not unpoetically, to his mother. We cannot recall that 'Laus Veneris' had any such filial and pious inscription.

The sonnets grouped in a thin volume under the name of 'The Purple East: A Series of Sonnets on England's Desertion of Armenia,' by William Watson (Chicago: Stone & Kimball), do not, like one or two of Milton's sonnets, win the double crown of heroism and poetic triumph, and will not, perhaps, increase Watson's fame in the latter direction; but they show a heroic philanthropy and a superb fighting quality. Perhaps the latter gift is a little too manifest in the direction of personal attack on the Laureate in the preface, and in the three sonnets of rejoinder beginning with that called "The Bard-in-Waiting." But, after all, it is that kind of excess of which Emerson wished that the American Abolitionists might never rid themselves, and we demur only because Mr. Austin seems rather too fragile a butterfly to be broken upon so very vigorous a wheel. Another of the three sonnets especially addressed to the Laureate is the following (p. 33):

> LEISURED JUSTICE.
>
> "She bides her hour." And must I then believe
> That when the day of peril is o'erpast,
> She who was great because so oft she cast
> All thought of peril to the waves that heave
> Against her feet, shall greatly unconceive
> Her purblind son who dreamed she shrank aghast
> From Duty's signal, and shall act at last
> When there is naught remaining to retrieve?
> At last! when the last altar is defiled
> And there are no more maidens to deflower—
> When the last mother folds with famished arms
> To her dead bosom her last butchered child—
> Then shall our England, throned beyond alarms,
> Rise in her might! Till then, "she bides her hour."

Mr. and Mrs. William Sharp, who have done good service to both English and American verse through their volumes of selections, afford a little disappointment in their 'Lyra Celtica,' and this, indeed, seems to have been anticipated by the former of the two when he apologizes, in the very first lines of his preface, for having to "deal cursorily with a great and fascinating subject." The editors cover too much space in the geographical and chronological boundaries of their selection—including, for instance, Ossianic, Armorican, Cornish, and Breton poetry—and yet giving greater space in proportion when they pass to modern and very accessible lays. Then the principle of selection is puzzling; it bewilders the brain to open a Celtic Lyre from which Burns and Scott and Moore are excluded, while Byron is let in; and this is not relieved even when explained, because the explanations themselves are contradictory. Thus, on p. xxiv of the introduction, we are told that "Scott was of the ancient stock, and not the typical Lowlander he is so often designated," and that "it is still a debatable point if Burns was not more Celtic than Lowland—that is, by paternal as well as maternal descent"; and it is only claimed for Byron that, although "far more British than Scottish, and again more Scottish than Celtic," he had yet "a strong Celtic strain in his blood." The question naturally arises, if a minimum of Celtic strain admits Byron, why should a maximum leave Scott and Burns excluded? Then, on p. xliii, the editor seems to take back his own words, and says, "To avoid confusion, the editor has refrained from representing poets whose Celtic strain is more or less obviously disputable; hence the wise ignoring of the claims even of Scott and Burns. Byron was more Celtic in blood than in brain, and is represented really by virtue of this accidental kinship." Mr. Sharp undoubtedly knows how to reconcile these statements, but we confess ourselves unable to do it; we only know that it will appear to the general reader that the part of *Hamlet* has been omitted from the tragedy.

Again, even among distinctly Irish writers, we look in vain for various well known favorites, as for instance, Father Prout's "Bells of Shandon," or that vigorous poem "Gougane Barra," by poor Callanan, who vainly thought that he alone had waked Erin's harp from her slumber. But we have instead a good deal that is attractive from the Bodley Head poets, and Mr. Sharp crosses the Atlantic to include Mr. Carman and Miss Ellen Hutchinson, on the ground that the latter is "descended from old Highland stock." Are there many American bards, great or small, who have not somewhere on the family tree a Scotch or Irish twig? The effect of the whole book is somewhat hasty and hap-hazard, though the biographical notes at the end are perhaps to be excepted from this criticism.

'Poems and Ballads by Robert Louis Stevenson' (Scribners) is what seems a final and definitive collection of this author's poems, made up of 'A Child's Garden of Verses,' almost always charming; of 'Underwoods,' frequently so, but very unequal and occasionally unpleasant; and of 'Ballads' of Scotland or the South Sea Islands, which, although usually grim, have a vast deal of local and poetic interest. On the whole, the effect of the book is rather sad, as suggesting a slight insecurity in the tenure of the author's fame, which seemed but yesterday so certain. Perhaps this little blank-verse fragment, which suggests the brief felicities of Landor's verse, is a profounder summary of the author's career than any which the most sympathizing friend could have framed (p. 268):

> "We uncommiserate pass into the night
> From the loud banquet, and departing leave
> A tremor in men's memories, faint and sweet
> And frail as music. Features of our face,
> The tones of the voice, the touch of the loved hand,
> Perish and vanish, one by one, from earth;
> Meanwhile, in the hall of song, the multitude
> Applauds the new performer. One, perchance,
> One ultimate survivor lingers on,

And smiles, and to his ancient heart recalls
The long-forgotten. Ere the morrow die,
He, too, returning, through the curtain comes,
And the new age forgets us and goes on."

Among minor American poems, 'My Rosary,' by Gustav Kobbé (Richmond), and 'Lays of a Wandering Minstrel,' by Anne Virginia Culbertson (Lippincott), are both apparently compilations by public readers of those among their own poems which have found favor with hearers. For the first-named the author justly claims in his preface that the book is a very little one; and the latter contains a variety of dialect poems—negro, Irish, and rustic American—which have probably had success with audiences easy to satisfy. 'Songs without Answer,' by Irene Putnam (Putnams), is of a different and more meditative strain; and while some of it is trite, there are some fine and sympathetic delineations of humble, outdoor things, as this (p. 53):

THE MAIDEN-HAIR.

O Maiden-hair, that in this covert place
Dost float on air thy fronds of circled grace,
Where forest sunbeams, golden-green with gloom,
The fairy life net of thy veins illume;

Thou wing-like form, thou sweet poetic plan,
Divine, self-poised, beyond the search of man,
How frail thy raiment from the mould is wrought,
How strong in thee shines Beauty's perfect thought!

Thou hangest like a sign upon the door
Of unknown realms, while entrance, nothing more,
Thou makest on the dim, material scene—
Oh, tell me of that Inner World's serene!

My dull, dark thoughts, like satyrs round the feet
Of heavenly Una, list for knowledge sweet;
I crave new sense of Beauty, Law, and Good.
Oh, teach me, gentle fern-soul of the wood!

In 'The Lamp of Gold' (Chicago: Way & Williams), Miss Florence L. Snow takes the seven branches of the candlestick, to which Hawthorne's Hilda attached such mystic meaning, and gives to each seven sonnets, making forty-nine in all. The work is thoughtfully and even beautifully conceived and carefully executed; but very few poets can venture on a sequence of sonnets, and she has chosen the Shaksperian form, which is now less in favor than the Petrarchan, and really—which is more important—admits of less richness and variety. Her seven symbolic branches are The Sacred Fire; Daybreak; Mid morning; Noon; Western Windows; Eventide; The Perfect Light.

The junior editor of Emily Dickinson's poems (Mrs. Mabel Loomis Todd) has been induced by the popular interest in previous series to select still a third volume, this being facilitated by the discovery of an unexpected deposit (Boston: Roberts Bros.). The curious fame of this author is something unique in literature, being wholly posthumous and achieved without puffing or special effort, and, indeed, quite contrary to the expectation of both editors and publishers. No volumes of American poetry, not even the most popular of Longfellow's, have had so wide or so steady a sale. On the other hand, the books met with nothing but vehement hostility and derision on the part of leading English critics, and the sale of the first volume, when reprinted there, did not justify the issue of a second. The sole expressed objection to them, in the English mind, lay in their defects or irregularities of manner; and yet these were not nearly so defiant as those exhibited by Whitman, who has always been more unequivocally accepted in England than at home. There is, however, ample evidence that to a minority, at least, of English readers, Emily Dickinson is very dear. Some consideration is also due to the peculiarly American quality of the landscape, the birds, the flowers, she delineates. What does an Englishman know of the bobolink, the whippoorwill, the Baltimore oriole, even of the American robin or blue-jay? These have hardly been recognized as legitimate stock-properties in poetry, either on the part of the London press or of that portion of the American which calls itself "cosmopolitan." To use them is still regarded, as when Emerson and Lowell were censured for their use, "a foolish affectation of the familiar." Why not stick to the conventional skylark and nightingale? Yet, as a matter of fact, if we may again draw upon Don Quixote's discourse to the poet, it is better that a Spaniard should write as a Spaniard and a Dutchman as a Dutchman. If Emily Dickinson wishes to say, in her description of a spirit, "'Tis whiter than an Indian pipe" (p. 156), let her say it, although no person born out of her own land may ever have seen that wondrous ghost of a flower (*Monotropa uniflora*, or Indian pipe) which appears on the cover of her volumes, but unhappily in a blaze of gilding that makes it meaningless. Perhaps, in the end, the poet who is truest to his own country may best reach all others. An eminent American librarian, lately visiting England, made it a practice to inquire in the country bookstores what American poet was most in demand with their customers, and was amazed at the discovery that it was usually Whittier.

It is needless to say that Miss Dickinson's poetry achieves its success, in spite of all its flagrant literary faults, by what Ruskin describes as "the perfection and precision of the instantaneous line." She is to be tested, not by her attitude, but by her shot. Does she hit the mark? As a rule she does. Is it a question what a book represents to a human being? This is her answer—only eight lines, but they tell the story (p. 29):

A BOOK.

There is no frigate like a book
To take us leagues away,
Nor any coursers like a page
Of prancing poetry.
This traverse may the poorest take
Without oppress of toll;
How frugal is the chariot
That bears a human soul!

Again, how many a heart has been vaguely touched in some old and neglected country cemetery by the thought so tersely uttered here (p. 157):

THE MONUMENT.

She laid her docile crescent down,
And this mechanic stone
Still states, to dates that have forgot,
The news that she is gone.

So constant to its stolid trust,
The shaft that never knew,
It shames the constancy that fled
Before its emblem flew.

The "docile crescent" may be supposed to imply that the life commemorated was immature, and ended while yet expanding.

It is known that Miss Dickinson very rarely gave a title to her poems, and it is to be presumed that in this volume, as in the others, these are supplied by the editor. The fourfold division, "Life," "Love," "Nature," "Time and Eternity," is that preserved in the earlier volumes, and the tolerably equal distribution of the poems into the four departments suggests that this strange, secluded life, seemingly wayward, had in reality a method and balance of its own. It is noticeable, also, that in a few of the poems (as on pp. 79, 200) there is an unexampled regularity of form, beyond anything to be found in the earlier volumes, and perhaps hinting at a growing tendency in her mind. This "Song," for instance (p. 79), surprises the reader, trained to the Dickinsonian muse, with an almost startling commonplaceness of melody. It was apparently sent with a flower:

SONG.

Summer for thee grant I may be
When summer days are flown!
Thy music still when whippoorwill
And oriole are done!

For thee to bloom, I'll skip the tomb
And sow my blossoms o'er;
Pray gather me, Anemone,
Thy flower forevermore.

THE MINERAL INDUSTRY.

The Mineral Industry: Its Statistics, Technology, and Trade, for 1895. Edited by R. P. Rothwell. New York: Scientific Publishing Co. 1896.

THIS is the fourth of a series of annual volumes, which, as their title indicates, not only deal with the statistics of the world's mineral industry, but contain papers by eminent miners and metallurgists, which describe and discuss the latest inventions and most improved practice in those important branches of human activity. They therefore cover a wider scope than such publications as Wagner's *Jahrbericht* and other compilations and summaries of scientific progress. They occupy, however, substantially the same field as a series of annual reports which have been issued by the United States Geological Survey since 1883 on the 'Mineral Resources of the United States.' It seems as if the publication annually of two such voluminous and costly works involved a waste of energy. On the part of the Government it is argued, that the failure at any time of the private publication would occasion a gap in the continuity of information on an important national subject which it is its duty to supply. Moreover, the Government compilers contend that information is confidentially vouchsafed them which would not be intrusted to a commercial editor and publisher. On the other hand, the editor of the 'Mineral Industry' may point to the fact, in justification of his duplication in part of the Government volume, that the great demand for his work warrants its publication, and that the greater promptness with which it is issued adds infinitely to its value as a body of statistics, by which prices and the current of trade are to a certain extent regulated. It is curious that governments, not only our own, but those of Europe, with unlimited money and human brains and hands at command, are so dilatory in the issuance of such documents that private enterprise invariably outstrips them in priority.

Though statistics are looked upon as the very dry bones of literature, and in truth are so, nevertheless, being such, they are the skeleton upon which every economic argument and conclusion is based. And to-day, when the most vital and intricate questions of political and social science have been removed from the calm atmosphere of the schools into the noisy arena of party politics, a volume of statistics and technical information becomes of necessity a handbook for all who would judge for themselves, and who hesitate to accept either the figures or the deductions of the campaign orator. Looked at from this point of view, the statistics of iron and steel and of gold and silver are of peculiar interest; as the manufacturers of the former are the principal instigators and main financial supporters of the party which advocates a high protective tariff, and the two precious metals are the counters with which the most reckless game of politics ever indulged in by a great people is being played.

We stood in 1895 at the head of the iron and

steel producers of the world, having made 9,597,447 tons of pig iron as against 8,022 006 tons made by Great Britain, and 6,212,671 tons of steel, as against only some 3,000,000 tons made by her. We manufacture our iron, with insignificant exceptions, from domestic ores. Our chief rival draws her ores in great measure from foreign sources. That we have made such rapid strides within a few years as to overtake and then forge far ahead of all competitors is, not without warrant, attributable to the high protective duty which secured such enormous profits to the large manufacturers, who were favorably situated, as to stimulate their activity, if not their cupidity, to an inordinate degree. Under that stimulus our production has outstripped that of any other people, and the cost of production, by reason of the more complete and universal substitution of machinery for hand labor, and the possession of extraordinarily rich and large deposits of raw material, has probably sunk to, if not below, that of any other of the fraternity of iron and steel-making nations. Not only do our bridge companies, by the more scientific and skilful economy of material, carry off most of the large foreign contracts, but it is no secret that one of our large rail manufacturers has shipped steel rails to our neighbor and to Japan during the past year at a figure many dollars below the combination price, and therefore below that at which Great Britain or Belgium could supply them. Nevertheless, these manufacturers seem still to be dissatisfied, and anxious not only to perpetuate but to increase the duty, and thus, if the combination continues to hold together, extort a still more exorbitant tribute from our railroads and the public.

How autocratically this powerful Trust conducts its business, one may judge from the following extract:

"On June 30 a meeting of the rail-makers was held, and as the growing business improvement was then manifest, an increase to $24 per ton at mill was ordered. To this, perhaps, no serious objection would have been offered, as prices of other descriptions of iron and steel had begun to rise, though the cost of fuel and raw materials to most of the rail-makers was practically unchanged. The combination was not yet satisfied, however, and three months later, in September, another meeting was held, at which the price was raised to $28 per ton at mill. This action was taken in face of the fact that orders for rails continued to be much lighter than had been expected, and its direct effect has been to discourage purchases. The combination, in its eagerness for profit, probably overlooked two important facts: first, that the recovery in earnings had not yet passed the point which required strict economy in expenses; and, second, that the railroad tracks are now very largely laid with steel, and that renewals can be postponed for a certain length of time without seriously compromising the safety of operation. The result has been that the rail business has not shown the same growth as other branches of the trade. A few of the great companies—like the Pennsylvania—have placed their orders, though on a restricted scale, while many companies have held out altogether. With regard to the rate, it must be remembered that rails are almost the simplest and least costly form in which finished steel can be put upon the market, and that the profit upon their manufacture at the present price is out of all proportion to that obtained on other products under normal conditions. The rail combination continues to control the trade absolutely."

It will, however, come about, in the natural course of events, if our capacity for production continues to grow with the same vigorous rate of speed as of late years, that our actual production will so largely overreach home consumption that the bulk of our iron and steel, probably in finished manufactured form, will enter the competitive market of the world. When that stage is reached, as it has already been in the copper trade, a high tariff will have to adopt some other epithet than "protective," and its continuance be supported by other arguments than those which satisfy the mass of people to-day.

The statistics of gold and silver reproduce simply those of the Director of the Mint. They confirm the fact that though the gold production of the world in 1895 was the largest in history, that of silver was also greater than has ever been recorded for a single year, even when silver was at 16 to 1. The world's production of gold in 1895 was 1,010,166 ounces in excess of that in 1894, and of this excess 341,993 ounces are to be credited to this country. The world's production of silver in 1895 was 3,182 630 ounces in excess of that in 1894, though this country fell off 3,465,640 ounces. The main increase came from Mexico, and this fact might be used as an argument for free silver were it not that in Bolivia, which is the third largest producer in the world and is also a silver country, there was nearly as great a loss in production as there was a gain in Mexico. Australasia showed a gain of 1,794,825 ounces of silver, though its currency is on a gold basis. It would therefore be difficult to draw an argument for either mono- or bimetallism from the statistics of the past year. The truth is, the statistics and experience of mining and metallurgy leave little doubt that what has happened in the case of all other metals will come about in the case of silver. The lower value will necessitate increased production by the large mines, so as to secure a large gross profit on a small margin per ounce. It will also demand the introduction of improved machinery and the invention and adoption of better methods of treatment. Small mines will pass out of existence. The large mines will be worked more actively and economically, and the yield of silver as a by-product from copper and other metals will steadily and notably increase. A lower price will thus augment rather than diminish production, once recovery has been made from the sudden shock of the rapid fall in price. This, however, it must be borne in mind, has been no greater than has befallen iron, copper, and lead. It was more rapid and therefore more startling, and has derived exaggerated importance from its political bearing.

The Life of James McCosh: A Record Chiefly Autobiographical. Edited by William Milligan Sloane, with Portraits. Charles Scribner's Sons.

Dr. McCosh was born at Carskeoch on the Doon, a few miles from Ayr, and his reminiscences of the Burns country are among the most interesting portions of a book which bears in every part the marks of careless preparation. How the social life of the region helped to make Burns what he was, and how he helped the social life to sink to lower levels—these things are well brought out. The reticence and repression of the Scot are illustrated by the response of a heart-broken father bending over the coffin of his son to some well-meant words of consolation: "This is a fine day, sir." At Edinburgh University young McCosh came under the influence of Chalmers and Sir William Hamilton, and his subsequent life was little more than an attempt to reconcile in himself and for others the religious temper of the former with the philosophy of the latter. His first parish was at Arbroath in the presbytery of Ayr, and took the side of the new Evangelicals in opposition to the Moderates. One of his painful duties was to break the news of their husbands' death to the wives of sailors and fishermen in his parish. This he did by engaging them in prayer or reading them the chapter describing the raising of Lazarus; but they generally discovered his drift before he finished the chapter. His second parish was at Brechin, after declining overtures from Grey Friars Church in Edinburgh and so making clear the way for Guthrie's proof of his ability to hold that great position. McCosh was at Brechin from 1839 until 1851, a period coinciding with the "Great Disruption" and the establishment of the Free Kirk. Actively interested in the secession, it is strange that he could write of it with so little feeling and add so little to our previous impressions. In his own parish eight hundred members joined the Free Kirk and six hundred remained in the Established Church.

In 1850 he published a book which had much popular success, 'The Method of the Divine Government, Physical and Moral.' Chalmers was more in evidence in it than Hamilton, and it was ultimately superseded by Dr. McCosh's later works; but in its day it had one notable result for its author: it made him Professor of Logic and Metaphysics in Queen's College, Belfast. He held the chair from 1851 until 1868, when he was made President of Princeton College. Thackeray honored his coming to Belfast with a poem in *Punch*, "The Last Irish Grievance," significant of the wrath of the Irish public over the importation of a Scotch professor. In 1855, collaborating with Prof. Dickie, a colleague in Queen's College, he published 'Typical Forms and Special Ends in Creation,' a strong statement of the theistic argument from design. "What really ruined the run of this book was the appearance, soon after its publication, of Darwin's 'Origin of Species,' which carried the whole controversy into new regions." Prof. Dickie, already irritated by McCosh's taking the lion's share of credit for the book, was spoiled by Darwin's sudden fame from following his lead, though, like Agassiz in America, he was one of the most obvious of his forerunners. Dr. McCosh, on the contrary, yielded to Darwin in course of time a qualified assent, and his place in the history of theology is among the most ingenious of those who have endeavored to reconcile the Darwinian science with the traditional theology. Probably at no stage of the development was the reconciliation such as to commend itself to any thoroughly consistent scientist, and even the theologians have discovered that terms so favorable to themselves could not be expected; but those who soften the jolt of the transition from the old ways to the new are useful members of society if, as purveyors of pure thought, they are not much esteemed.

A chapter on Dr. McCosh's travels in Germany is surprising from a certain feebleness of stroke where he is writing of Humboldt, Bunsen, and others famous in the walks of science and theology. An amusing circumstance is that we have three different and widely varying accounts of one and the same matter. Dr. McCosh had worked out a theory of correspondence between the venation of leaves and the ramification of trees. In his autobiographical notes he tells us that he brought the matter to Humboldt's attention, who said he had noticed the correspondence but had found two exceptions; but upon McCosh's explaining these exceptions in conformity with his theory, he declared himself thoroughly convinced and said, "You may say that I think

so to any one." "On getting this sanction," says Dr. McCosh, "I stopped giving so much time to my botanical observations and turned towards psychical studies, which were ever my favorite ones." In a letter, however, written at the time, he says that when Humboldt mentioned the exceptions, he was "on the point of disputing with him, but thought better to stop." In a third place he writes that when, in Germany, he found that Dr. Braun and others had anticipated his discovery and given it a mathematical formula, he was somewhat mortified and turned away from botany and gave himself to metaphysics.

His own account of his philosophical career is extremely slight, as if his mind had lost its grip on the studies which had formerly engrossed it, and it is a pity that Prof. Sloane did not bring to his aid the pen of some acknowledged master in the metaphysical school. His eleventh chapter deals with the Doctor's philosophy and teaching, but with the former much too hastily. We are told frankly that he never understood Hegel. If he had done so, he would probably have been strongly attracted to his epistemology, for to make sure that we know reality, and know that we know it, was "the main region of his song." It was at this point that he broke with Hamilton, Mansel, Spencer, and Mill. "It was impossible, he felt, to accept the relativity of knowledge and construct a sound philosophy of life; to accept evolutionary empiricism on the one hand, or idealism in any form on the other, and avoid drifting into agnosticism." It was in defence of this position that in 1860 he published 'The Intuitions of the Mind Inductively Considered.' It fought a losing battle (at the time) with much vehemence and eloquence, but it does not seem likely to rank high among the books that are significant in the philosophical development of its time. It is impossible to avoid the impression that Dr. McCosh was from first to last a theologian by first intention, and that his scientific and philosophical opinions were always subject to the desires of his mind as a Presbyterian clergyman.

We have four autobiographical chapters on Dr. McCosh's presidency at Princeton. They are written with great simplicity and with becoming modesty. They reflect a vigorous material development, and the shrewdness of the Scotch divine in loosening the purse-strings of rich men whenever a new building was wanted or a new department of instruction. The number of students more than doubled under his administration. He began with ten professors, four tutors, two teachers, and ended with thirty-five professors, with several tutors, lecturers, and assistants. That the methods of teaching and administration showed a corresponding gain is probable. But it is evident that we cannot expect a critical estimate of Dr. McCosh's collegiate work from his own hand, and for his biographer to furnish it would perhaps have been ungracious, if not impossible. His book, as a whole, must be accounted a memorial of loyal affection, making its appeal to Princeton men, as such, rather than a final judgment of the ability and performance of a gentleman and a scholar who tasted the joy of both work and battle with an equal mind.

The Winning of the West. By Theodore Roosevelt. Vol. IV., Louisiana and the Northwest, 1791-1807. G. P. Putnam's Sons. 1896.

THE years embraced in the scope of Mr. Roosevelt's latest volume were important ones in the history of the West, and they have an especial interest at the present time. The author points out that, in the last decade of the eighteenth century, the acute friction was not between North and South, but between East and West. The closing years of the nineteenth century seem to show once more that "East is East and West is West." The period was marked by such events as the attacks on the Northwestern Indians—a contest into which the frontiersman drew the reluctant Eastern authorities—and by the final aspects of Western disaffection in the struggle for the navigation of the Mississippi.

This struggle furnishes continuity to much of Western history in these years, and it has various interesting phases. It revealed itself in the renewed Spanish intrigues; in George Rogers Clark's attempt to organize a Western expedition in order to carry out Genet's plan of seizing Louisiana for France; in Pinckney's treaty; in Senator Blount's intrigue to replace Spain in Louisiana by England; in the Louisiana purchase, and in Burr's conspiracy. Mr. Roosevelt makes an excellent point when he emphasizes this "current of tendency" in the winning of the West. He calls attention to the fact that Burr's conspiracy was merely one of various Western conspiracies in which men like Wilkinson and Sebastian bore a part; and that the conquest of Texas did not stand apart from the general current of Western history. Its significance is misunderstood when treated solely in relation to the plans of the slaveholders:

"The feats performed by Austin and Houston and the other founders of the Texan republic were identical in kind with the feats merely attempted or partially performed by the men who, like Morgan, Elijah Clark, and George Rogers Clark, at various times either sought to found colonies in the Spanish-speaking lands under Spanish authority, or else strove to conquer these lands outright by force of arms. Boone settled in Missouri when it was still under the Spanish Government, and himself accepted a Spanish commission."

Mr. Roosevelt has drawn on the manuscript sources noted in his previous volumes for material not before used; but he does not seem to have made an effort to use foreign archives for the purpose of giving an independent treatment to the diplomatic history of the West in this eventful era. The most significant event of the period was doubtless the purchase of Louisiana, but Mr. Roosevelt adds nothing to the work of Henry Adams on this topic, and he relies upon Coues for his account of the explorations of Lewis and Clark and Pike.

The volume has excellent material on the economic and social aspects of the "men of the Western waters." The author seems to have modified the views expressed in his previous volume with regard to a lack of unison between these communities, and he now exhibits the solidarity and homogeneity of the West. Even more interesting than the pictures of frontier society are the brilliant accounts of St. Clair's defeat and Wayne's victory. Mr. Roosevelt sees the impossibility of restraining the backwoodsman's advance, and he deals with the Indian relations with a leaning, if any, toward the forces which, with all their grimness and harshness, were advance-guards of civilization.

The author's enthusiasm for a vigorous foreign policy leads him to devote considerable space to denunciations of "the cowardly infamy" of Jefferson and Madison, for their failure to put the country on a firmer military basis; and he takes occasion to deliver a warning to Americans of the present day "that, as a nation, they have erred far more often in not being willing enough to fight than in being too willing." Jefferson also receives severe treatment in respect to Genet's Western intrigue. Mr. Roosevelt believes that while openly he supported Washington's policy of neutrality, "secretly he was engaged in tortuous intrigues against Washington, and was thwarting his wishes so far as he dared in regard to Genet." He asserts, without evidence, that it is "impossible" that Jefferson should not have known that Michaux was Genet's secret agent to promote the French expedition in the West, when he gave him an introduction to Governor Shelby of Kentucky. This is, in effect, charging Jefferson with complicity in Genet's purpose to seize Louisiana for France. The probabilities are against such a view, and the charge is too grave a one to be made lightly and without adducing evidence. In this connection it may be added that Mr. Roosevelt fails to show how far the authorities in France authorized Genet's plans for the seizure of Louisiana, and what the real status of George Rogers Clark was in relation to the French Government.

Mr. Roosevelt's treatment of Jefferson illustrates the impetuosity and recklessness of assertion which occasionally mar the pages of a work that for the most part exhibits real power of historical criticism, an insight into relations, and sound judgment. There are marks of hasty publication in this volume, as in the prior one of the series, shown in careless proof-reading, loose citations, and so on. It is an error to map the Louisiana purchase, as the author does, with "vaguely defined boundaries," following, nevertheless, in part the lines of the treaty of 1819, and including the Oregon territory while omitting Texas. No mention is made of so important a subject as the Whiskey Insurrection and its connections with the Mississippi question and with the earlier new-State movements in western Pennsylvania.

BOOKS OF THE WEEK.

Ashton, John. When William IV. was King. Appletons. $3.50.
Balzac, H. de. The Country Parson. London: Dent; New York: Macmillan. $1.50.

HENRY HOLT & CO.'S

Newest Text-Books in

German and French.

GOETHE'S DICHTUNG UND WAHRHEIT.

Aus Meinem Leben. Selections from Books I-XI. Edited by Prof. H. C. G. von Jagemann of Harvard. xvi+373 pp. 16mo, $1.12, *net.*

Those portions that are most interesting to the present generation and to those beginning the study of Goethe. The introduction compares the autobiography with the main facts of Goethe's life, and treats of the peculiarities of his prose. The notes, while not explaining simple grammatical or lexical difficulties, are very full on historical, biographical, and literary allusions, and on rare constructions and idioms. *This is the only edition for American students that gives a survey of the whole work.*

WENCKEBACH'S DEUTSCHE SPRACHLEHRE.

By Prof. CARLA WENCKEBACH of Wellesley. xx+404 pp. 12mo. $1.12 *net.*

For beginners somewhat younger than those studying *Wenckebach and Schrakamp's Deutsche Grammatik* ($1 *net*). The lessons proceed slowly, simply, and carefully, each beginning with a little dialogue, and further colloquies develop the vocabulary necessary to make German the language of the classroom. English-German themes are also included.

GERSTÄCKER'S IRRFAHRTEN.

Edited by MISS M. P. WHITNEY of the Hillhouse High School, New Haven. 145 pp., 16mo. Boards, 30c. *net.*

A brisk, amusing story of a painter's Rhine trip, giving much practice in the conversation necessary for a tourist.

ECKSTEIN'S PREISGEKRÖNT.

Edited, with the author's assistance, by PROF. CHARLES BUNDY WILSON of the University of Iowa. 83 pp., 16mo. Boards, 30c. *net.*

A highly amusing story of a would-be literary woman. Scene, Eigersburg in the Thuringian Forest.

COPPEE AND DE MAUPASSANT: TALES.

Edited by Prof. ARNOLD GUYOT CAMERON of Yale. With two portraits. 1x188 pp. 16mo. 75c. net.

The stories, each complete, are: COPPÉE—Le Morceau de Pain, Deux Pitres, Un Vieux de la Vieille, Les Vices du Capitaine, Scenario, La Robe Blanche, La Remplaçant, Un Enterrement Dramatique, La Vieille Tunique. DE MAUPASSANT—La Peur, La Main, Garçon, un Bock, En Voyage, Apparition, Les Idées du Colonel, La Parure, and Tombouctou. Prof. Cameron has written interesting and appreciative essays on the two authors and furnished all the annotation necessary for pupils advanced enough to read their works.

BEVIER'S FRENCH GRAMMAR.

By Prof. LOUIS BEVIER, Jr., of Rutgers, with Exercises by Dr. THOMAS LOGIE. 341 pp. 12mo, $1.00 *net.*

A Grammar for the use of the older students in fitting schools and for colleges, presenting the facts of the language with reasonable fulness and with the greatest possible fidelity to scientific truth. The exercises are from the first arranged to secure continuity of thought and as much of living interest as possible.

COPPEE'S ON REND L'ARGENT.

Edited for class-room use by T. B. BRONSON of the Lawrenceville (N. J.) School. With eight illustrations. 184 pp. Narrow 16mo. 60c. *net.*

A novel giving vivid pictures of the Paris of to-day.

BRONSON'S FRENCH VERB BLANKS.

30c. *net.*

Books of To-day and 'Belinda' Supt.

The Best Monthly Review of English Books for American Readers.

Annual Subscription, 3s. 6d., post free.

HAVE JUST PUBLISHED:

TRAVEL AND TALK.

My 100,000 Miles of Travel. By Rev. H. R. HAWEIS, author of "Music and Morals," etc. Small 8vo, with two portraits, 2 vols., $5.00 *net.*

These two attractive volumes are a cultured observer's records of a hundred thousand miles of travel, and they include such diverse experiences as a conversation with Oliver Wendell Holmes and a talk with a Fiji cannibal, a discourse on music and morals and an estimate of Mormonism, a eulogy of the learned girls of Vassar College and an appreciation of the swarthy belles of Honolulu. He gives much information that is new and personal concerning Emerson, Holmes, Longfellow, Phillips Brooks, Lowell, Howells, Mrs. Bigelow, Mrs. Stowe, and other eminent persons in whom his numerous readers will be interested. It is altogether an exceedingly diverting, refreshing, and instructive work.

COUNTESS SCHIMMELMANN.

An Autobiography. With numerous illustrations. Crown 8vo, $1.50.

This is a remarkable book by one of the most remarkable women of the day, who has become widely known as an advocate of reforms among the poorer classes, notably prisoners, drunkards, etc. Her mission in life was one of religion and of human pity, and for vicissitudes of a tragical sort her life was well nigh unexampled in recent times.

MY LONG LIFE.

An Autobiography. By MARY COWDEN CLARKE. Illustrated. Small 8vo, $2.00.

Mrs. Clarke, the author of "Concordance to Shakespeare," and many other books, was a daughter of the celebrated musician Vincent Novello. She was born in 1809 and married to Charles Cowden Clarke in 1828. Her recollections include so many of the notable literary and musical people of the last century that every page is interesting. Both Charles Lamb and Leigh Hunt she knew intimately. Her story is told in a charmingly artless manner which is very delightful.

A WINDOW IN THRUMS.

By J. M. BARRIE. Crown 8vo, in handsome binding, $2.00.

Illustrated with about seventy-five photographs taken in "Thrums" (Kirriemuir) by Clifton Johnson. Mr. Johnson was fortunate enough to meet Mr. Barrie in Kirriemuir, who expressed approval of this plan of illustrating *A Window in Thrums.* He has since written, "I like your pictures very much." We believe the time has now come when an edition of "this immortal book," as it has been truly styled, illustrated in this way, will find a warm welcome.

LETTERS TO THE CLERGY

on the Lord's Prayer and the Church. By JOHN RUSKIN. Edited by the Rev. T. A. Malleson. 12mo, handsomely printed, $1.50.

This work comprises a number of interesting and characteristic letters from Mr. Ruskin to the editor, and at the same time the letters of the clergy and laity will be considerably abridged, so that the interest in Mr. Ruskin's own portion of the work will be greatly enhanced.

THE OLD TESTAMENT

and Modern Life. By the Rev. STOPFORD A. BROOKE, Author of "Tennyson, his Life and Work," "A Primer of English Literature," etc., etc. Crown 8vo, $1.50.

"A serious and arrestive contribution to the literature of the old Testament."

MENDING AND REPAIRING.

By CHARLES GODFREY LELAND. Illustrated. 12mo, cloth, $1.50.

PARTIAL CONTENTS:—Mending Broken China—Repairing Woodwork—Restoring Books—Directions for Binding Books—Repairing Leather-work—How to Mend Hats—Invisible Mending of Laces, Embroideries, Garments—Restoring and Repairing Pictures, etc., etc.

A KNIGHT OF THE NETS.

By AMELIA E. BARR. Cloth, 12mo, $1.25.

In this story Mrs. Barr returns to sailors and sailor life, in which she is so much at home. It is a story of the North Sea.

CAPTAIN SHANNON.

By COULSON KERNAHAN, author of "A Dead Man's Diary," "A Book of Strange Sins," "God and the Ant," etc. 12mo, cloth, $1.25.

A detectiv estory of absorbing interest, but having withal a fine literary quality which is unusual in works of this character.

TALES OF OUR COAST.

By S. R. CROCKETT and others. With 13 full-page illustrations by Frank Brangwyn. 12mo, cloth, $1.25.

A collection of sea stories by such well-known authors as S. R. Crockett, Gilbert Parker, Harold Frederic, W. Clark Russell, and "Q," each one of whom contributes a tale written in his happiest vein, that by W. Clark Russell being especially noteworthy.

Send for complete and descriptive list of our new and forthcoming books.

DODD, MEAD & COMPANY,

5th Avenue and 21st Street, New York.

YALE MIXTURE.

The choicest tobacco made, and pre-eminently a gentleman's smoke.

The Nation.

NEW YORK, THURSDAY, OCTOBER 15, 1896.

The Week.

THERE is no better sign of Bryan's fatuity than his failure to use extensively and almost exclusively, from the beginning, the rambling talk of Republican orators and politicians about silver during the last twenty years when they were trying to "placate" the silverites and were holding out lying promises of "international agreement," and buying up their wares for storage. If he had gone round the country with these utterances in his hand and read them to his audiences, without saying one word of his own, we seriously believe that he would have made far more headway and have done far more damage to the country than he has. He was foolish enough to substitute for them a great deal of nonsensical anarchism which has been ruin to the silver cause. No one who has heard him read from Lodge, or Reed, or Sherman, or Harrison can have failed to notice how much more effective his quotations were than his oratory. We think, too, by making these quotations he has been doing the only service he has ever done to his native land. He is bringing demagogy, trickery, ignorance, and time-serving in public men to such shame as has never before overtaken them.

In a speech at Seymour, Ind., on October 6 he read an extract from President Harrison's message to Congress in December, 1890, immediately after the passage of the Sherman law, which ran as follows:

> "The enlargement of our currency by the silver bill undoubtedly gave an upward tendency to trade, and had a marked effect on prices, but this natural and desirable effect of the silver legislation was by many erroneously attributed to the tariff account."

President Harrison had probably never at this time given any attention whatever to currency or to the effect of currency on prices. When he came into office in 1888, he acknowledged himself to be an "uninstructed political economist"—so uninstructed that he thought a "cheap coat made a cheap man," extolled dearness, and did not know that civilization was another name for the cheapening of all the commodities of life. He is speaking now effectively in favor of sound currency, but he would speak tenfold more effectively if, laying his hand on his heart, he would publicly say: "My friends, when writing and talking about silver between 1888 and 1892, I was writing and talking about a subject I had not studied and did not understand. In fact, I was not talking about currency at all. I was simply getting votes for the party the best way I could. I had no idea of the mischief I was doing. I had no idea of the construction some of you would put on my words, that they would be the means, in part, of creating a party of confusion and folly in this country of ours. I confess my mistake. I bitterly repent. I have looked into the currency matter since then. I understand it now, and I tell you the road we have all been travelling since 1873 is the road to ruin and disgrace, and I advise you to get out of it, even across lots."

Nothing could be more welcome to sound-money men than the announcement that Gov. Altgeld of Illinois is making himself more prominent than ever in the cause of the Populist candidate as the end of the canvass approaches. Hardly less gratifying is the news that Eugene V. Debs, the "President Debs" who disputed the government of the nation with Grover Cleveland for some days during the railroad strikes of 1894, is to be Altgeld's chief assistant. The boy orator who is running for the Presidency was personally unknown to the country when the canvass opened, and it was of the first importance to learn what sort of men were to be the chief advocates of his election. We have found that they are Altgeld, Tillman, Debs, and Weaver—the worst and most dangerous of men who ever took the stump to champion a candidate. Not one of the eminent men who have upheld the cause of Democracy in previous campaigns favors the election of Bryan. In their places we have Altgeld, Tillman, Debs, and Weaver. Next to Bryan's own speeches, nothing is doing so much to secure his overwhelming defeat as the character of his chief advocates.

Senator Teller has at last discovered certain inconveniences in campaigning under an undisputed charge of forgery. On September 17 the *Evening Post* republished part of his speech of September 7 at Morrison, Ill., and showed that a series of statements which he then professed to quote verbatim from the British Gold and Silver Commission's report of 1888 did not occur in that report, and were contrary to all the Commission's well-known findings. He now owns up to a Detroit audience that the Commission of 1888 never made the statements ascribed to them in the above speech. The Commissioners did not say that "every country that has gone to a silver basis is in a better condition than the countries on a gold standard," but they presumably would have said so if they had expressed their secret sentiments, and in fact "the report of the Commission was not favorable to the gold-standard nations." All this is very shallow talk, but it is worth a moment's notice, chiefly because the report of 1888 is explicit on some very important points. The Commission was appointed, as every one but Senator Teller knows, primarily to discover what was the trouble with India. As to India's actual condition under free silver coinage, there was no dispute. Not only was its demoralized condition admitted, but the Commission did not hesitate to find analogies in all the other silver-using countries. In the part of the report signed by all the C missioners—even by Houldsworth, whom Mr. Teller quotes with special approbation—occurs the following: "Such [silver-using] countries are in themselves usually poor, and the capital required for their development must generally be attracted from gold-using countries" (Report, Part 1, paragraph 84). In the introduction to that part of the report signed by the silver Commissioners alone, the further plain assertion follows that the fall in silver serves to "discourage investment of capital in, and consequently retard the development of, silver-using countries" (Report, Part 3, Introduction). This statement sounds uncommonly like the New York "gold-bug" argument that "free silver coinage in the United States will break down all our industries through the wholesale expulsion of invested foreign capital." Yet this is Sir William Houldsworth's particular affirmation.

That some of the Commissioners did, in a very doubtful and hesitating way, and with frequent qualifications, suggest that British trade depression in 1888 might be connected with the fall in silver, is entirely true. Had Senator Teller confined his citation to this, nobody would have found it worth disputing, for silver has fallen vastly lower since 1888, and British trade and industry have revived astonishingly. This puts the argument finally at rest. Moreover, there is an interesting statement in another British Commission report made in that very season of reaction. The Royal Commission on the Depression of Trade, reporting in 1886, admitted frankly that business was in bad condition. They could not then foresee the subsequent revival. But in reviewing trade and price movements of preceding years the Commission said (paragraph 81): "There is no feature in the situation which the Commissioners have been called to examine so satisfactory as the immense improvement which has taken place in the condition of the working classes during the last twenty years." Of the twenty years referred to, fifteen were embraced in the period subsequent to Germany's demonetization of silver.

Mr. Reed said nothing truer at Bridgeport on Thursday than that "if there is anything in this silver question, it is because it is a disease of the whole world. If it is a disease, it is because it is a world disease." The disease is caused by the unparalleled improvements in the means of communication within a quarter of a century. This has brought all the agriculturists of the world into competition with each other in every market, and the result has been a great fall in the value of the earth's produce. This has fallen, too, on a world laden with leases, mortgages, contracts, and settlements made under another set of conditions, and as the agriculturists are the majority of the human race, they have uttered piercing cries and driven many "thinkers" crazy. The only remedy is to wait for time to set things right, as it always does; for the prices of things we have to sell to adapt themselves to the prices of things we have to buy, as they always do in the long run.

"Canvasses" and "claims" put forth by party committees are always subject to a large discount, but the straightforward report of his observations made by an investigator who is not in politics is entitled to pass at its face value. Two professors of the University of Wisconsin at Madison recently started out for a bicycle trip of five days. One is a believer in the gold standard; the other is a silver man. They went with the wind, changing their course as the wind shifted, and travelled in all about 250 miles in southern Wisconsin, passing through Dane, Rock, Walworth, and Jefferson Counties, all great farming counties. Simply to gratify their own curiosity, they stopped every man they met or passed on the highway, hailed every man they saw in the field or farmyard, and asked him how he was going to vote for President. When they got back to Madison, they reported that in all those 250 miles of Wisconsin roads they found not one lone man who was going to vote for anybody except William McKinley. At first they thought that the explanation must be that they were passing through a region where the farmers were remarkably free from mortgage burdens, but inquiries showed that there were the average number of mortgaged farms in these counties. The mortgaged men were simply not laboring under the delusion that free silver would lift the mortgages.

It has been generally assumed that the Venezuelan Commission can report in only one of two ways. It was directed to ascertain the true divisional line between Venezuela and British Guiana, and any such historical line, once ascertained by it, must put either Great Britain or Venezuela in the wrong. Neither alternative would help on a speedy and pacific settlement of the controversy. If Great Britain is right, our demand for arbitration is uncalled for; if Venezuela is right, she imperils by arbitration a position decided by us to be just. A correspondent of the Springfield *Republican*, however, points out that a third course is open to the Commission, which, in connection with the approaching arbitration of the matter, would avoid the difficulties presented by either extreme, and he predicts that it will be adopted—*i. e.*, a report that the data obtainable do not make it possible to establish the true historical boundary; that the country is a vast unexplored wilderness; and that, in fact, there never has been any boundary. It follows that there never can be any boundary by historical inquiry only, nor any whatever except as established for the purpose by negotiation or abitration. Hence the matter ought to be settled in one of these two ways.

Such a report, if made, would have the advantage over any other of not only avoiding the difficulty already mentioned, but of being strictly true. A true boundary line is not a line which this or that explorer or geographer lays down on a map, nor a line including such and such settlements mentioned by missionaries and priests, but a line delimited by somebody who has *power* to fix it. Until such a line is fixed by authority there is really no boundary whatever. This is true of all boundaries, even under municipal law. When two settlers in the West have a dispute over the line between their respective quarter-sections, they call in the assistance, not merely of a historian or a geographer, but of a court of justice, which not only marks out the line, but makes each party keep on his own side of it for the future. It is still more true of a boundary line between two nations running through an unexplored wilderness, because here there is no court of justice to appeal to, and the question is generally in great measure a question of actual occupation. Where no such line has been surveyed or fixed by proper authority, what is wanted is some authority to fix it. Occupation is marked by no visible line, and, what is more, does not remain the same from year to year. Moreover, occupation is a vague and elastic term, which means much under one set of circumstances and little under another. The occupation of the Essequibo valley may mean the banks of the river or its whole watershed. Which is "true"? One or the other, according as it is decided by competent authority, with power to enforce its decision. Consequently, for the commission to report that the "true" line was so and so would be to report an absurdity. No true divisional line was ever ascertained until it was adopted by authority, with a view to binding both parties. That is what makes a boundary. The commission by drawing a line would only add a new opinion to dispute about.

The collapse of the *Recorder* after nearly six years of desperate struggling to gain a foothold is one more lesson in journalism that silliness, vulgarity, crime, and filth are not an adequate basis upon which to construct a successful newspaper. There have been many experiments of this kind made in this city during the past ten or twenty years, and all of them have failed, costing their projectors many thousands of dollars. John Kelly's *Star* ran through the bank accounts of several millionaires, changing its name with each new owner, never getting on a paying basis, and during its varied career, which we believe is not yet ended, has been the means of sinking several millions of dollars. It was in all its different forms "spicy," "newsy," "brainy"; which means that it was silly and more or less vulgar all the time. The *Recorder* was projected and edited on the same plan. Its leading idea was that the people as a whole were too much interested in scandal, crime, tittle-tattle, and twaddle to care for anything else, and that a newspaper given over entirely to this sort of "news" would have a roaring success. All the leading lights of this style of journalism, the "inimitable" producers of sidewalk and barroom gossip, the "Strollers" and "Loungers," were retained, and they poured forth a wonderful flood of their "best work." All sorts of inducements were offered to buy the paper—coupons, colored supplements, chromos, and trips across the continent and around the world. Crime and scandal and twaddle were served up as they had never been served before, but, in spite of all these attractions, the public did not respond. The expenses steadily exceeded the receipts; one millionaire after another, now a steamboat proprietor, now a tobacco manufacturer, now a silver-mine owner, took his turn at paying the bills, but it was the same story with all. After dropping a good many thousands, each grew tired of the business, and when there were no more millionaires to be found, the paper went into the hands of the sheriff and soon ceased to appear.

The necessity under which Temple Houston, the son of the famous Gen. Houston, found himself of killing Judge Jennings in Oklahoma Territory on Friday is regrettable, but it is still a necessity. Having killed Judge Jennings's son a year ago, Temple naturally felt that he ought, within a reasonable time, to kill the father, too, on proper provocation. Judge Jennings is "an Iowa jurist." The provocation he gave Houston is not often given by jurists in the older parts of the world, but every locality has its customs and needs. He met Houston's little son coming home from school, and the little fellow spoke to him, whereupon the Judge did the only thing a jurist could do under the circumstances, he spat in his face. The penalty for spitting

in children's faces in Oklahoma is, it appears, death, which seems to us unduly severe, and it fell to the lot of Temple to execute it. So he "buckled on his gun" and sought the Judge, not in his library or in a courtroom, but in a bar-room, and shot him dead. Temple's hair, we understand, is long, he is a fine shot, and one of the finest Bryanite speakers in the West. He is hostile to the Supreme Court, the money power, and the punctual payment of debts in these times. He is now "in the hands of the authorities." What the authorities will do with him remains to be seen, but they will hardly dispute the propriety of Temple's action. Suppose Iowa jurists could with impunity spit in our children's faces as they returned from school, where should we be? There may be discussion as to the necessity of inflicting the death penalty for such offences, but the Jennings family appears to be an unusually depraved race, for Temple has already had, as we have seen, to kill Jennings the son.

The Hawaiian plank in the Republican platform, declaring simply for American "control" in the islands, was a great disappointment to the annexationists now in power there. They had hoped for better things, after the Republican ardor for annexation in 1893. But they are now greatly cheered by an interpretation of the plank which they have got from Joe Manley, and which leads them to hope that they have not lied and cheated in vain. The Honolulu *Advertiser* publishes with great display, and in facsimile, a letter which it had received from Augusta, Me., and which runs as follows:

> "Have just returned from Joe Manley's office. He informs me emphatically and without equivocation that that Hawaiian plank was Harrison's—just what he advocated while President, and just what the Republican party really believes in—annexation pure and simple. It was Harrison's idea and the party's idea, and they mean it. If McKinley is elected, that's what will result. Joe was very earnest about it."

Joe was very earnest about a great many other things connected with the St. Louis convention, but his earnestness did not seem to count. His assurance that the weak Hawaiian plank was Harrison's seems very dubious. Mr. Harrison was not a great power at St. Louis. His Administration was endorsed there only as a sort of pitying afterthought. Moreover, would the fearless Harrison say "control" when he meant annexation? That would look perilously like trying to deceive all the people all the time, which we know, from having been so assured by reputable orators, is impossible. We have no doubt that the Maine sympathizers with the Hawaiian adventurers are still of a mind to strike hands with them for mutual benefit. We have no doubt that much other rascality and jobbery is being plotted by some of our most eminent saviours of the country. The election of 1892 foisted an awful lot of rascals on us, and we expect to get an equally fine assortment this year. But we think the country (and even politicians) has learned something about the unwisdom of surrendering to them.

The process of "explaining it" to the English has been extremely arduous in this campaign. Ignorance for ignorance, American innocence in regard to English politics is doubtless able to hold its own with anything that foreigners can produce; but we do think that Americans are not quite so solemn as Englishmen, or quite so credulous, in seeking or accepting light in their darkness. The rubbishy and misinformed letters on the situation which the London *Times* has published can be accounted for only on the supposition that, as Pascal's Jesuit maintained that *any* opinion of a Father must be valuable, the *Times* was convinced that any writer signing himself "An American" must be wise, accurate, and bursting with confidential information. The *Spectator* has, as usual, led all the other owls in sage blinking over American politics. At the beginning, it saw in Bryanism a new crusade, touched with supernal light, and discovered the profoundest religious sentiment in the Western farmers who were going to spend their last cent in order to avoid paying their debts. About Bryan himself it knew little, but was sure from a study of his jaw and shoulders that he was just the man to do Apocalyptic things. Later on it seemed to discover that the crusade was petering out, as it were, but still thought that Bryan would be elected if he could carry New York and Pennsylvania. It admitted, in the best style of *Spectator* superiority, that all the American despatches represented New York as absolutely certain to go for McKinley, but that was before the New York Democracy had endorsed Bryan, which, of course, changed the situation entirely. The Vermont and Maine elections meant nothing, for in November the honest-money Democrats would be "compelled" to vote for Gen. Palmer, and so Bryan and McKinley would be left "face to face," which was an awful thing to contemplate.

Nine months ago the first news of the Armenian massacres had just reached this country, and it was the confident expectation of most people that the Powers would find the means of preventing a repetition of these horrors. The Jingoes in Congress were just then "on the rampage" looking about for a war, and were ready to fight England for not fighting Turkey. We pointed out then the absurdity of any action alone, or any armed meddling on our part, although much American property had been destroyed and much American terror caused, inasmuch as the case was in what we considered competent hands. We preferred our bill of damages to the Porte; it was politely received and payment promised. It has never been paid. The massacres, far from ceasing, after the first wild outburst, have continued in all parts of the empire, ending quite recently in Constantinople, on a considerable scale. It is calculated that 100,000 men, women, and children have been butchered in cold blood during the past year—a very large proportion (there is abundant proof for this) by the instigation or "instructions" of the Sultan himself. Nothing like this has occurred in history. The present Sultan has outdone all the slaughters of the most slaughtering and cruel ages. The Powers have not restrained him up to this moment, and Lord Rosebery has just announced his opinion that interference on the part of England might cause her total destruction. Now the massacres of the last nine months and the great destruction of property have enormously increased the amounts due by the Sultan to other people. They have rendered it less and less likely that he will ever be able to pay us. We do not know whether anything, and if so what, has been said or done to remind him of his obligations to us, but surely something strong and trenchant ought to be said. If he were an honest man struggling with difficulties not of his own creation, we should owe him forbearance. But where there is steady nine months' persistency in the very crimes which created his debt to us, and when every hour renders it less likely he will ever pay us a cent, what do we owe him?

That free silver is in this country logically and historically the child of protection there is a great weight of evidence to show. Its lineage in Europe is not, perhaps, so easy to trace, but the recent congress at Budapest, where the agricultural section was almost wholly given over to bimetallic talk, was highly significant of the way things have gone. The protection nostrum has failed, and the bimetallic panacea is now making the running. The very men who a few years ago were calling for duties on foreign imports as the cure of all their woes, are now for bimetallism. The other quack medicine was shown to be worthless, but this one will infallibly go to the spot. Luckily the agrarian bimetallists at Budapest did not have everything their own way. They had to listen to a masterly address by M. Levasseur, in which, after upsetting their alleged facts and demolishing their arguments, he told them flatly that an international agreement was the idlest of idle dreams. He affirmed that there was not the slightest reason to hope that Austria or Germany or the Scandinavian countries would ever retrace their steps away from silver. As for England, said M. Levasseur in a happy phrase, she will never regard bimetallism as anything except "an article for export, not for home consumption."

THE GRAVITY OF THE CRISIS.

Archbishop Ireland, one of the most distinguished prelates of the Roman Catholic Church, has been moved by his sense of duty as a citizen of a self-governing country to address a few words to his fellow-citizens on the present crisis in political affairs. He considers the existence of free government threatened by the Bryan movement. He concludes his address with these words:

"I may of course be mistaken. But I have come to look upon the present agitation as the great test of universal suffrage and popular sovereignty. Can the people defend public honor and the institutions of the country at the polls, as they have done on the field of battle? Can they be so calm and deliberate in their judgment, so careful to weigh all things in the scale of reason, and to avoid all rash experiments, that they can be trusted with the settlement of grave social and political problems? That is the question that is before us at the present moment."

Archbishop Ireland has here uttered the thoughts of a very large majority of the educated classes in the United States. Why is the present crisis so grave? It is not merely because a panic and a vast deal of business trouble would ensue from a change in the standard of value. It is not because many people would lose money, and social disorder would ensue, from the disturbance of wages and contracts. A remedy can be found for all these things in time. We have had business disturbances before, and yet we pulled through to a brighter day because we all had confidence in our institutions. But the case now is vastly different from any other crisis in our history. It involves the nation's good faith, without which the motive power that impels the whole machinery is gone. A republic cannot perform its work after it has forfeited the respect of its citizens. The sense of honor is absolutely necessary to its life, because it has no other reliance in times of danger than the devotion of its citizens. Strip it of this and it falls at the first shock.

Now the issue which presents itself to the mind of Archbishop Ireland and of nearly all persons of intelligence is this: whether a country that repudiates its debts in whole or in part can ever again command the devotion of honest men. This is the most serious question that has ever been put before the people, not excepting that which involved us in war thirty-five years ago. At that time the republic could and did command the unreserved devotion of its citizens. They were willing to pour out blood and treasure to any extent in the service of their country, because they loved and honored it; because it represented everything that makes citizenship precious and life worth living. But a country that repudiates its debts—what claim can it have on the affection of any self-respecting soul?

Some people say: "Why not give silver a trial? If it does not work well, we can go back to gold." If the matter could be so easily disposed of—if it were a mere question of expediency and of losing dollars more or less—we could look forward lightly to the election of Bryan. We have faced other campaigns in which feelings were powerfully enlisted, and in which it seemed to some of us as if an adverse result could not easily be borne, but we have never seen one where a false step was so void of remedy and recall. The election of Mr. Bryan is a step that can never be recalled, because it is a lapse from virtue. Undoubtedly we could go back after much tribulation to the gold standard if silver did not work well, but in the meantime we should have repudiated both public and private debts to an extent beyond the possibility of restitution. We should have produced a new state of affairs, political and financial, the most deplorable feature of which would be the encouragement of rogues and the despair of honest men. To talk about retracing such a step is like attempting to put new life into a corpse.

Instead of going back to the gold standard if silver should not "work well," the course of things would be altogether in the opposite direction. The Bryanites would say that the trouble was a lack of money, that silver was too costly and too slow of production. Mr. Bryan himself would lead the way to a more rapid issue of the circulating medium. In fact, he is already committed to the issue of new greenbacks for the building of public works. It is a very short step from this kind of an issue to the Ocala platform, the "sub-treasury plan," and everything that Coxey's army requires to make money plenty. This would be the natural and inevitable outcome, because there would no longer be any resisting force. Those who have hitherto held the Government in the path of honor would despair of making any successful resistance to the down-hill course. Those who could leave the country would do so. Others would possess themselves of real estate or anything that would probably survive the crash, speculators would thrive, and the poor would be pinched worse than ever because they would not know which way to turn to avoid the miseries of a depreciating dollar. In the end we should be where the French republic was when the assignats became worthless, and the people would turn gratefully to any strong man who should offer them security in return for liberty. We should go back to the gold standard at last, but the pathway would lie over the ruins of a republic.

SOUTHERN SIGNS OF THE TIMES.

The last State elections to occur before the voting for President next month were those which took place in Florida on October 6 and in Georgia on October 7. The result was in each case precisely what had been expected—the success of the Democrats by a good majority over the opposition, which in Georgia was united upon the Populist ticket, and in Florida was divided between the nominees of the Republican and the Populist parties.

No such significance attaches to the size of the Democratic majority in either State as to the size of the Republican majorities in Vermont and Maine last month, for the reason that no proper basis of comparison with results in previous years exists. In the last election of Governor in Florida, four years ago this month, the Republicans ran no ticket, nor were any Harrison electors in the field the following month. In the Georgia State election four years ago, as this year, the only opposition ticket was that of the Populists, but nobody can tell what proportion of Republicans supported that ticket in either year. It is an utter waste of time and space, therefore, to speculate as to the bearing of the Democratic majority in either Florida or Georgia upon the condition of public sentiment regarding Bryanism.

In each State, however, the canvass exhibited features which deserve attention as signs of the times. The admission is freely made by the white Republican leaders in Georgia that, although they sent out orders for the members of their party to support the Populist ticket, a large proportion of the negroes voted for Gov. Atkinson, the Democrat who was running for reëlection. W. A. Pledger, the most prominent colored politician in the State, and many other leaders of the race openly advocated the Governor's reelection, on the ground that his administration had been excellent and that his treatment of the negroes had been all that could be asked. Col. A. E. Buck, the white Republican boss, who appealed for support of the Populist ticket, based his argument chiefly on the claim that "defeat of the Democratic State ticket would discourage their party throughout the country and greatly aid in carrying the North and West for McKinley." Of Gov. Atkinson he says:

"I do not pretend to criticise Gov. Atkinson or any member of the Democratic State Administration in the slightest degree. The Governor has made an able, honest, and impartial executive, and we can say nothing against him on account of any act or any policy. Pledger and his associates, who are working so diligently for Gov. Atkinson, are too honest and sincere in their positions to be distracted. They conscientiously believe that Gov. Atkinson is the best friend to their race that has been raised up since Abraham Lincoln, and nothing that I could do or say would cause them to desert his cause."

Throughout the State the white politicians sought the support of the black voters, and each faction was ready to fight to secure an honest count of the negro votes which it secured. Although some complaints of fraud are made against both the Democrats and the Populists, in counties which they respectively controlled, there is no doubt that the election showed a nearer approach to fairness than any previous one. It was held under a law which, for the first time,

required registration, and in a large proportion of the counties the dominant element voluntarily granted the other representation among the election officials. Public sentiment is now calling for action by the new Legislature to make a division of election managers between the parties compulsory.

The Florida election was the first one held under the Australian ballot law. The fact should not escape notice that the adoption of this system in that State, and the passage of the registration law in Georgia, are steps toward securing honest elections which have been taken since the repeal of the federal election laws. The national Government accomplished nothing by all its efforts in this direction except to establish the race line in politics and to solidify the whites. No sooner, however, had the national election laws been repealed and the fear of a force bill vanished, than the whites began to divide among themselves, and each element to seek support among the blacks, while both insisted upon an honest count of the votes thus secured.

One feature of the Florida election, which is barely mentioned at the end of most dispatches, and will make no impression on the mind of the average reader because he does not understand it, is really of the first importance. It is the statement that the constitutional amendment changing the time of State elections was ratified by an overwhelming majority. Formerly State elections were held in November. In 1888 Harrison and a Republican Congress were elected on a platform which threatened the passage of a force bill. The Florida Legislature thereupon, in 1889, voted to submit to the people an amendment to the Constitution changing the time of the State election to October, so as to escape the presence of federal officials at the polls. This amendment was considered by the voters in November, 1890, after the force bill had passed the House, and was ratified by 14,121 yeas to 7,511 nays. Early in 1894 Congress rejected the federal election laws. The Florida Legislature chosen the next autumn decided to submit an amendment changing the time of State elections back to November, and the proposition was endorsed by the voters on Tuesday week almost without opposition. The consolidation of elections was always advisable on grounds of convenience and economy; but so long as federal interference was feared, the people gladly took the trouble and stood the cost of an otherwise unnecessary election. They now recognize that the last fear of such interference has vanished.

These are the real lessons of the Florida and Georgia elections, and they are full of encouragement. They show that the tendency of things at the South is setting strongly in the direction of fairer elections and a more normal division of the voters, white and black alike, than have been seen since the negroes were enfranchised.

THE RESIGNATION OF LORD ROSEBERY.

Lord Rosebery's retirement from the position of Liberal leader ought really to have occurred when the party was turned out of power in 1895. His assumption of the place was said originally to be due to Mr. Gladstone, and one of the best arguments in its favor was that there was no one else for it. During Mr. Gladstone's administration, Lord Rosebery had acted as Foreign Secretary, and the idea had somehow sprung up, not only among the Liberals, but among the Conservatives, that he was a peculiarly "safe" man. Moreover, he was a peer and very rich, and his presence in the Administration was reassuring to a great many people who had grown afraid of the Radicals and the Irish. To put him, therefore, at the head of the Ministry when Mr. Gladstone went out, seemed a good stroke of policy. It did not turn out so, for various reasons. One was that the change from a very serious Prime Minister, who wrote on the Scriptures and a future life, to a young man of fashion, who raced horses, was too sudden, especially for as sober-minded a constituency as the Liberal party is. More than this, Lord Rosebery was not serious for his kind. He was the Melbourne or Palmerston type of minister, who did not think anything mattered very much, and was not very sure of any of his convictions. His last speech before the election in 1895 was, it is true, not jocular, but it was plaintive and apologetic, which is never the tone for a leader to take.

Worse than all, his right to lead at all was disputed by the strongest man the Liberals had, after Mr. Gladstone, namely, Sir William Harcourt. Sir William believed himself entitled to the succession, and he was entitled to it if powerful debating and skilful legislation in the House of Commons could give any claim. He was the ablest debater the Liberals had, and was a very successful second to Mr. Gladstone. But his manners were unpopular, and his continued fidelity to the Liberal party had undergone some sort of eclipse in 1874, and he was on very bad terms with the press. He accordingly continued to lead the House of Commons, but not the party, but his relations with Lord Rosebery were said to be decidedly acrimonious. He was met by Lord Rosebery with a politeness and good humor which ought to have disarmed him, but it did not. While Lord Rosebery was enjoying a sort of gilded leisure in the House of Lords, Sir William was bearing the brunt of the battle in the House of Commons, and throwing some sunset glory over the last hours of the Liberal party by such exceedingly difficult measures as the death-duties act, which, much as the Tories denounced it, they have not ventured to repeal. When the party went out of office, in fact, Harcourt was the man to whom more than any other except Mr. Gladstone the party was indebted. His fame and credit have been added to greatly by his leadership in opposition, which has been both judicious and powerful.

It is but fair to Lord Rosebery to say that the lesson of the crisis is rather that none but a very powerful and influential man like Lord Salisbury should venture to lead the Liberal party from the House of Lords, than that he himself is not competent. In this house it is very difficult for any man to make a figure, or keep himself before the public eye, or exhibit his best qualities. He must, therefore, be a man who, independently of these things, already occupies such a commanding position in his party as Lord Salisbury does. If he has still any reputation to make, the House of Lords is not the place to make it. But in this difficult position Lord Rosebery was placed; he had to show himself worthy of his office there, being, in fact, rather a "rising hope" of the Liberals, as Macaulay once said Mr. Gladstone was of the "stern and unbending Tories," than a tried leader. Nobody knew what kind of leader he would make, but the chances seemed to be in his favor. Moreover, he has the misfortune to find himself for the second time in opposition to, or out of sympathy with, his party on an exciting question. His sincere adhesion to Irish home rule was always a little doubtful, and now he finds he cannot agree with the bulk of the party and with Mr. Gladstone about the course the nation should take touching the Turkish atrocities. The reappearance of Mr. Gladstone, armed and equipped, is the most extraordinary incident of the crisis, and furnishes Lord Rosebery with a graceful and comfortable reason for quitting the scene.

What will happen next, it is hard to say. There are three men in the House of Commons of any one of whom it might be said that he is worthy to lead the party —Sir William Harcourt, Mr. Morley, and Mr. Asquith. Sir William Harcourt is already in the place, as far as the House of Commons is concerned. Out of doors, with the country, Mr. Morley carries more weight, owing to his character, while Mr. Asquith, though a powerful debater, is not so well known. There will be, and there need be, no haste in filling Lord Rosebery's place.

THE VAGARIES OF LITERARY FAME.

Mr. Du Maurier's rather pitiful death, which has left everybody a little sad, will bring to many, with its record of the years he had run, fresh wonder at the extraordinary literary success he won so late in life. To have first turned his hand to fiction when he was well past fifty, and to have produced one of the

most deservedly popular novels of the century when he was fifty-nine, is alone enough to give him a peculiar place in literary annals. At first sight his career seems to make the art of novel-writing appear a little ridiculous. Here were Hardy and Black and Besant and Hall Caine, here were Howells and James, serving a long apprenticeship and perfecting their art in book after book, when along came this impetuous and unpractised youth of fifty-nine and laid them all flat on their backs. What should we think of the art of fencing if an inexperienced cadet could thus lay low a lot of *vieux sabreurs?* And will any man maintain, after Du Maurier, that training and long years of experiment in the writing of fiction go for anything beside the happy chance which, after all, is the secret of literary fame?

It must be admitted that the fame of a writer is essentially a mysterious thing. The best proof of this is that writers who become famous, so often wake up and find themselves so, much to their own surprise. No one, in fact, is so poor a judge and prophet concerning his own writings as the author himself. Goethe had his doubts whether 'Faust' would prove antiseptic against the decay of time, but was absolutely certain that he should be immortal on account of his theory of light, which all modern physicists consider a series of hopeless blunders. Southey thought that he had taken a bond of fate with those portentous poems of his which nobody can read, and never suspected that his literary reputation would rest so largely upon the despised historical and biographical work he did. But there is literally no end to the self-deceptions of authors in this kind. Montaigne reproaches Cicero for thinking his poems worth preserving,and, in our own day, we have seen the philosophic Lecky gravely make a bid for fame with a volume of wooden verse.

If writers themselves, brooding on things to come, go so far astray, they are no more out than are the publishers and the critics. Men bred to the business of picking the winner in the great literary handicap, go as egregiously wrong as the veriest gaping rustic risking his dollar. There is no wisdom which can say in advance, "This book will sell 50,000 copies. This writer will make a fortune." It is not only the Miltons and the Cervantes who hawk their wares about, and find publishers refusing the immortality thrust upon them. Mr. Barrie, to take a current instance, records with a certain pathetic satisfaction that the Scotch sketches which have made his reputation were rejected by *all* the magazines—or, at least, if there was any editor to whom he did not offer them, he cannot remember it now. All this is an old story. Such experiences, marking almost every page of the history of book-publishing, taken together with such unforeseeable successes as Du Maurier's, certainly give color to the pessimistic view that literature is a lottery, and that fame is only another way of spelling luck.

But without professing to be wise above all our contemporaries, and without denying that a great reputation in literature, as in many other fields, is often mysteriously won, we venture to say that there was nothing whatever of the happy-go-lucky about Mr. Du Maurier's success. There is not the slightest encouragement in his example for any reader of these columns who, at the age of fifty-nine (or any other nine), may feel like saying to himself, "Go to, I also will write a novel and get much gain." There are apprenticeships and apprenticeships, and Du Maurier had served one of the very best of them for many years, if all unconsciously. He had made it his life business to observe—to observe and interpret human beings. By the time it first occurred to him to try his hand at writing, he had accumulated a vast store of material and had done it in the best possible way. That is to say, he had not made a lot of dry, Zolaesque notes on men and things for the specific purpose of cataloguing them in a book that would read like an inventory, but had made a wide experiment of life, and kept his impressions in that fine compartment of the imagination where they become softened and clarified with time, and so best fitted for artistic use. He was thus no mere romancer when he began, no light-hearted gentleman sallying forth with "facetious and rejoicing ignorance," as Lockhart said of the Edinburgh Reviewers, but one of those fortunate men whose whole life had been unconsciously fitting them for the great stroke when the great opportunity came.

Nor has it been sufficiently noted how, in the mere craftsman's part of writing, he had really had the happiest training. The little legends under his caricatures are often as artistic as the pictures they go with. Crisp phrase and dramatic retort and gentle humor were the things required here, and they are the things that mark his later writing, the style of which he had all along been unwittingly forging. Then think what his life-long association with artists and wits must have meant to him in the way of acute perception and the ready word to convey it. His life was really all of a piece, in these aspects, as one may see from the delightful glimpses given of him in his Bohemian days by Felix Moscheles.

When we add that Du Maurier was an unsparing worker, not trusting to lucky flashes so much as to patient and dogged labor, we have gone far towards making his literary fame much less mysterious than many would like to think it. He is perhaps as good an illustration as we have recently had of Dr. Johnson's definition of genius as great natural powers accidentally turned in a certain direction. His powers were turned first to art and then to literature, but they were the same powers, and their product was alike in both departments. The moral for literary workers to draw from his life is not that literary fame is purely a gambling affair, but that it depends upon knowing something better than anybody else and conveying it to the public more attractively than anybody else.

"THE GROWING ILLITERACY OF AMERICAN BOYS."

THE Committee of the Overseers of Harvard College on Composition and Rhetoric last year very severely criticised the examination papers of the entering class, as indeed they had done three years before, and published specimens of them which were admitted on all hands to be deplorable. This was done on the ground that students came up from the leading preparatory schools in such a condition of unfitness, as regards their own tongue, that it was necessary for the college to spend much time, energy, and money in teaching them what they ought to have learnt already. To use Prof. Goodwin's language on this subject, "There was no conceivable justification for using the revenues of Harvard College or the time and strength of her instructors in a vain attempt to enlighten the Egyptian darkness in which no small portion of her undergraduates were sitting."

This report naturally excited a good deal of dissatisfaction among the schoolmasters, which has been much increased by the proposal of the Committee to print this year the papers of all the candidates presenting themselves for admission to college from particular schools or academies—the Boston Latin School, for instance, and Mr. Noble's, and Messrs. Brown & Nichols', and the Roxbury Latin—thus at once bringing into contrast the methods pursued and the results achieved in those schools.

The principals of these schools have accordingly filed the following protest with the Board of Overseers:

"We, the principals of the schools named in this report, wish to protest against the action proposed therein, for two reasons:

"(1.) Such a comparison as is suggested, of papers of candidates from specified schools, would establish a dangerous precedent, and is a new departure for Harvard College, which has been scrupulously careful in the past to treat all fitting schools alike.

"(2.) We contend that sight translations from Latin, Greek, French, or German made in a limited time, under a great nervous strain, are not evidence of a candidate's general ability or inability to write good English.

"While we regret the growing illiteracy of American boys as much as your committee does, we cannot feel that the schools should be held solely responsible for evils which are chiefly due to the absence of literary interest and of literary standards in the community.

"No school shuns a discussion of plans and methods of teaching or a comparison of results achieved, but no school is willing to carry such discussion and comparisons before the general public, which, from the nature of the case, cannot appreciate the true value of the evidence submitted, and must therefore draw false inferences.

"If your committee wishes for the sake of the common good to examine the methods pursued and the results achieved in our schools

under existing conditions, it is welcome to make a most thorough examination, and we promise it our cordial assistance, with full liberty to make any proper use of the results of its investigation."

This protest was referred back by the Board of Overseers to the Committee on Composition, who have reported on it to the Board. The report sets forth that the object in proposing the publication of the examination papers was not to make an invidious distinction between schools, but, by a comparison of the methods pursued in a few of the best schools, to get, if possible, some suggestion as to the improvement of the whole system. But this is a minor matter. What is most serious in the protest is the teachers' way of accounting for the deficiencies of their pupils, and their objection to the public display of the result of the tests to which they are submitted.

The signers object to the publication of the examination papers on the ground that the public is not competent to judge them. The public in this case, of course, means mainly graduates of colleges, parents of graduates, and generally persons interested in the subject of education. It is only these who would be likely to pay any attention to the papers. If it be true that this class cannot form an intelligent opinion as to the manner in which their sons and other relatives are taught to write and speak their own language; if the choice of methods and the estimate of results must be left entirely to the teachers themselves, the matter is indeed very grave. It would place these gentlemen in a much better position than any other profession in the community. Every other practitioner is judged by the results of his work—the lawyer by the results of his advice and conduct of cases, the doctor by the effect of his practice on his patients, and the minister by his influence on sinners. In no case is it left to him to say whether he has succeeded or not, though his art may be much more obscure and technical than the teaching of English.

The reasons why the teachers are not to be held responsible are, however, graver than the fact of non-responsibility. They say they cannot prepare the boys in the use of their mother tongue because of the "growing illiteracy of American boys," and they ascribe this again to "the absence of literary interests and of literary standards in the community." The way of accounting for evils, and relieving individuals from blame for them, by ascribing them to general causes, is a very old one. In the early days of the civil-service agitation there was a very widespread opposition to the passage of any civil-service law, on the ground that civil-service reform must be accomplished by "the slow uplifting of human nature." The same agency was to be relied upon for the abolition of slavery. In fact, nearly every abuse has at some time in its history been defended in the same way. If it be true that "illiteracy is growing among American boys," and there is "an absence of literary standards and interests in the community," the remedy would seem to lie in greater efficiency and energy on the part of the institutions which are specially charged with the duty of combating illiteracy among youth. It would seem as if the preparation of the schools should be made sterner than ever, and the standards of the college higher than ever, so that everybody who meant to go to college should, from the time he put off petticoats, have in his mind the fact that not good athletics but good English was essential to his getting into college at all and having "a good time" while he was there.

Moreover, publicity is the great modern remedy and stimulant, and if this evil be as great as the schoolmasters say, it seems to us that publicity should be made to help us in its extinction. Schools should be made ashamed of their boys, and boys made ashamed of their English, by asking all men to listen to them. It is in this way that the best results are obtained in all walks of life. We should think ambitious schoolmasters whom the English of their pupils shocks would welcome it. We do not believe that any agencies can do as much for reform as exposure. As long as boys and their parents remain under the impression that English is of secondary importance in school and college, and that defects in it will be carefully covered with the veil of secrecy or anonymity, so long will the illiteracy of American youth continue to increase, composition continue to be ungrammatical and ill-spelt, letters ill-written and ignorant, handwriting scratchy and uneducated. It appears to be now acknowledged by the schools themselves that they are unable to deal with the emergency. They appear by their own admission to be baffled by the negligence of the boys and the indifference of the parents and guardians. Is it not time that some new plan were tried? It has long been notorious that teachers of English in America were much hindered by bad habits of speech at home. Ought they to protest against having the public called to their assistance?

FRENCH CANADIANS IN MAINE.

BRUNSWICK, Me., September, 1896.

IN the annual report of the Massachusetts Bureau of Statistics of Labor for 1881, Mr. Carroll D. Wright, then chief of the bureau, in summarizing the results of an investigation of the attitude of employers and employees in New England and New York towards the ten-hour day, said:

"The third objection to ten hours is the presence of the Canadian French. Wherever they appear, there their presence is urged as a reason why the hours of labor should not be reduced to ten. The reasons for this urgency are not far to find. With some exceptions the Canadian French are the Chinese of the Eastern States. They care nothing for our institutions, civil, political, or educational. They do not come to make a home among us, to dwell with us as citizens, and so become a part of us; but their purpose is merely to sojourn a few years as aliens, touching us only at a single point, that of work, and, when they have gathered out of us what will satisfy their ends, to get them away to whence they came, and bestow it there. They are a horde of industrial invaders, not a stream of stable settlers. Voting, with all that it implies, they care nothing about. Rarely does one of them become naturalized. They will not send their children to school if they can help it, but endeavor to crowd them into the mills at the earliest possible age. To do this they deceive about the age of their children with brazen effrontery." [They have] "one good trait. They are indefatigable workers, and docile. . . . To earn all they can, by no matter how many hours of toil, to live in the most beggarly way so that out of their earnings they may spend as little for living as possible, and to carry out of the country what they can thus save: this is the aim of the Canadian French in our factory districts."

While, as was said, the language of the report did not profess to be anything but a summary of the testimony taken by the Bureau, its sweeping assertions met, as the report for 1882 says, "the earnest and patriotic condemnation of the Canadian French of New England." Whether the statements of the report were justified or not is not the object of the present inquiry; it can hardly be doubted, however, that views very similar to those there expressed are still, after a lapse of fifteen years, widely held in different parts of New England. I have recently had occasion to note the extent to which such a characterization, if made to-day, would have any application to the French Canadians in Maine.

Although the French Canadians are by far the most numerous class of foreigners in Maine, no authoritative statistics of their number and condition are, so far as I am aware, available. The national Government does not keep separate records of the immigration from Canada, nor are the returns to be found in the census of 1890; reliance must be had, therefore, on unofficial publications and private inquiry. According to the *Guide Français de la Nouvelle-Angleterre* for 1891, there were at that time in Maine 52,986 French Canadians; and while this figure is probably not the result of actual enumeration, it is no doubt accurate enough for practical purposes. The French population has increased somewhat since 1891, though not so rapidly as in previous years. A conservative estimate would place the present number at not far from 55,000. About half of these are found in six manufacturing centres. Biddeford and Saco have, in round numbers, about 11,000; Lewiston and Auburn, 11,000; Waterville, 3,500; and Brunswick 2,500. Probably 10,000 are settled in the extreme northern and western parts of the State, in the region along the Canada line; the rest are, for the most part, scattered, a few hundred in a place, among the larger towns and cities. It is at once apparent that the distribution of the French is by no means even—they are massed at a few points, and, as a rule, are not found in any numbers in the seacoast towns. The *Guide Français*, already quoted, gives a list of but thirty-three places in Maine in which there was an appreciable French population in 1891.

The stream of French immigration that for many years has flowed into Maine shows a continual, but not steady, increase, with at times a noticeable return movement. Nearness to the Province of Quebec has favored immigration, while the slower industrial development of the State, as compared with some other parts of New England, has pre-

vented the influx from reaching at any time very large proportions. Since the passage of the national law prohibiting the importation of contract laborers, the French have ceased to come in parties under the influence of agents of manufacturing corporations, the impelling motives now being rather the meagreness of opportunity at home and the reported success and satisfaction of relatives and friends already here. What gives the movement its irregular character is partly, I think, the especial sensitiveness of the French to changes in business conditions. As a class they are little disposed to wait, and a period of business depression, with its usual accompaniments of lower wages and lessened employment, is pretty certain to turn the tide and send considerable numbers of them back to Canada until the return of better times. Even at its height, however, the French "invasion" of Maine is plainly on a very moderate scale; the highest estimate does not give the French element 10 per cent. of the population of the State.

There are two points at which the French Canadians come into vital touch with an American community. One is as laborers, the other as citizens and voters. In neither of these aspects is the attitude of the French in Maine what it was formerly. Fifteen or twenty years ago they could have been not inaptly dubbed "the Chinese of the East"; to day any such epithet would be neither fitting nor just. That the presence of a large and growing number of French in the manufacturing centres tends to overstock the "labor market" and keep down the general level of wages seems probable, though inquiry has disclosed no unanimity of opinion on this point; it seems clear, however, that the influence in this direction is no longer so great as it used to be. It has to be remembered that the Frenchman almost invariably arrives here poor, often penniless; he comes from a farm, knows nothing of any other employment, and speaks no language save the barbarous Canadian French; he must have work at once, and is usually glad at first to take any wages offered him. So long as this class was in the majority, "cheap labor" and its attendant evils prevailed. But the class of skilled, or at least somewhat practised, laborers is now very considerable, and is increasing faster than the new arrivals of the unskilled; the result is a steadying of the labor supply, a greater diversity of occupations, a disposition to demand higher wages, and a willingness to strike. The passage and general enforcement of laws restricting the employment of children in factories have removed one of the worst causes of disturbance; and while everywhere in Maine the French are the predominant operative class, they are, as a rule, well paid, they have profited largely by labor legislation, and commend themselves to their employers by the quickness with which they learn, as well as by their industry and docility.

As regards permanent residence and citizenship, there can no longer be any question but that the French are in Maine to stay. Years ago, when the first parties of immigrants arrived, it was almost always with the intention of remaining only temporarily, earning as much money as possible, and returning to Canada in the near future; and this intention was for many years carried out. Thousands of dollars earned in Maine were expended upon Canadian farms, and many of the French themselves returned, as years went by, to their old homes. But as the French population increased with better wages and more certain employment, and as children born here grew to be themselves wage-earners, American life came to seem more and more attractive, until at the present time it is practically only the older people, and by no means all of them, who cherish the hope of an ultimate return to their native land; for a rapidly growing number of the younger people, the native land is not Canada, but the United States. At the two points at which this inclination to permanent residence chiefly manifests itself, namely, property-holding and voting, I have again failed to obtain adequate statistics, but estimates avowedly conservative show some rather striking results. The number of French-Canadian voters in Maine must now run into the thousands, and the rate of increase is more rapid than at any previous time. There are between three and four thousand owners of real estate, with property valued at not far from $2,500,000; and the number of property-holders is also increasing. Much the larger part of this real estate is residence property. Figures such as these, imperfect and general as they are, are hardly found among an alien people who care nothing for American institutions and hold themselves obstinately aloof from American life; for even the most ignorant Frenchman knows that neither citizenship nor the ownership of property adds very much to his wage-earning power. To be sure, large sums of money are still sent to Canada regularly, as will doubtless be the case for many years to come; on the other hand, larger and larger sums are retained for expenditure in the communities where they have been earned.

While, however, these indications point unmistakably to the permanent residence in Maine of a large number of French Canadians, one must not exaggerate their importance, or assume a greater assimilation of American ideas than has actually taken place; for, notwithstanding the large number of naturalized citizens, native-born children, and property-owners among them, the French in Maine are still, in some material respects, aliens and foreigners. Even after English has been mastered, they retain French as the language of common life, while many of the older people know no word of English. They read French newspapers and French books. They have the clannishness of strangers in a strange land, for the most part live by themselves in a distinct section of the town or city, and prefer their own stores, their own mechanics, and their own physicians. They keep tenaciously many of their own customs, have their own clubs and social organizations, and make much of weddings, funerals, and festivals of the Church. Persons who know them well have assured me that their dwellings, even in the tenement-house districts, are remarkably clean, but I am unable to think that the casual observer would form such an impression. Marriage comes at an early age, and families are large. Intermarriage with native Americans is, however, infrequent. As regards general morality, the French do not appear to be sinners above all others; but drunkenness is the predominant curse, while petty thieving and larceny are, for some, besetting sins. In general, the French keep to themselves, associate little with people not of their own race, and, if they think of the matter at all, seem content to be thought a distinct class in the community.

This tendency to isolation, always dangerous in a foreign population, is strengthened in the case of the French Canadians by the fact that they are, almost to a man, members of one religious denomination, the Roman Catholic. The membership of a French Catholic parish in Maine is practically the same thing as the total French population of the community; in the parish of St. Peter's, Lewiston, for example, with a French population of about 11,000, I am told that there are less than fifty upon whom the Church has no hold. While large numbers of Irish immigrants in other parts of New England drift away from Church and priest, the French hold unwaveringly to the faith of their fathers. And the controlling and humanizing effect of the Catholic Church upon them is immeasurably great. The parochial schools, teaching both French and English, are largely attended, while the amount of parish work done by the priests is enormous. In all matters of general concern the influence of the Church is on the side of law and order and public progress; in labor disputes the priests have often been successful in preventing strikes and adjusting differences. It is undoubtedly the intention of the Church to keep the control it already has, and, with French priests everywhere, there is no longer much talk of "repatriation," so much discussed a few years ago. That the Church maintains so perfect a hold upon its members is no doubt due in part to the great docility of the French, as also in part to their ignorance; but no unprejudiced person, living at peace in a Maine community a large proportion of whose inhabitants are French Canadians, can, I think, fail to admit that it is to the Catholic Church, more than to any other single agency, that are to be ascribed the general good order and absence of crime.

No one who has seen much of the French Canadians in Maine can maintain that they will bear comparison in all respects with the average of native Americans; but that they are a permanent element in the population, and that they are making rapid progress in the direction of useful citizenship, is beyond question. There are discouraging and retarding influences on both sides. The French are not always faithful and reliable, they are prone to overestimate the value of their labor, they are an easy prey for the agitator and demagogue, they cling to a language which to most Americans is jargon, and they send money out of the State. On the other hand, useful and indispensable as they have become, they are nowhere received with cordiality, or commonly referred to save as an inferior class; even their religion is denounced as un-American, and the influence of the Church little regarded or else misconstrued. The law requires them to send their children to school, but the public schools offer scanty advantages to children who can neither speak English nor read French. As a class, they are treated considerately in public because of their votes, disparaged in private because of general dislike, and sought by all for the work they do and the money they spend. Yet it is plain that they are making for themselves a place, not only as factory operatives, but also as skilled laborers in many trades; here and there some hold public office, and a few French have sat in the State Legislature. In the State as a whole they are being steadily, though slowly, worked into the conglomerate that we call the American people.

WILLIAM MACDONALD.

THE OPENING OF THE DANUBE CANAL.

ORSOVA, September 27, 1896.

THIS has been a day of special rejoicing in

Hungary. The proud Hungarians celebrate the completion of a work which will for a long time hold preëminence in the annals of engineering science—a work which interests Hungary not alone, but nearly the whole of South-Central Europe. The Danube Canal, so called, through the Iron Gate (Vas-Kapu) is a *fait accompli*, and the thought and energy which have surrounded its making for the better part of 2,000 years are fittingly sealed with the triumphant passage this morning through the new channel of the steamer *Ferencz-József*, conveying their Majesties the Emperor of Austria-Hungary and the Kings of Rumania and Servia.

The day has been a singularly beautiful one, and the drenching rains of yesterday, which fairly turned festive Orsova into a mud-hole, and amply sustained the Emperor's characterization of the weather on his arrival as *miserabel*, have left little evidence of their existence. Everything is gay and animated. Bunting streams from hundreds of poles, masts, and triumphal arches, and almost every house, whether large or small, the abode of the wealthy or the kennel of the lowliest peasant, Hungarian, Rumanian, or Servian, is decked out in colors or hung with illumination glasses. With many others who did not wish to plod through three miles of national mud and rain—there being an enormous carriage demand and but a limited service—I passed the night at the railway station and walked into Orsova in the gray of the morning. There was as yet hardly a sign of official life, and but few of the loungers on the river front seemed to know that the chief figure of the coming celebration was on board the trim steamer that bore the Emperor's name, and from which passed out a long carpeted gangway to land. In front of the *Ferencz-József* lay a small monitor, and alongside were a number of other vessels that were to form part of the royal cortège.

From Orsova to the head of the canal is three miles, and the passage down is rapidly made by small passenger-steamboats, most of which (manifestly with a view of meeting the difficulties of the return journey) are constructed with four paddle-wheels. There is nothing strikingly beautiful in the scenery of this portion of the Danube. The gate of Kazan, with its almost vertical walls of rock, has been left behind, and the river opens out into a landscape with perhaps more graceful, even though less imposing, outlines. Hills of a few hundred feet elevation, here and there badly scarred by falls of rock, and covered from base to summit with that lovely forest vegetation which, almost everywhere in Europe, clings to the mountain slopes and gives to them an incomparable green, are the distinctive features of the two banks; between them the Danube rushes on in its mad course, as yellow and muddy as in the region where it has fantastically been termed the "blue Danube."

The canal or new ship-channel is on the Servian (southern) side of the river, and naturally to it have flocked the many who have come to take part in the official opening. The visit to this side has been greatly facilitated by the free entry which at the present time exists in the kingdom, no passport being required, whereas on the Rumanian side the demand for papers of nationality is rigidly enforced. Looking into the water which wells foaming through the canal, one is constrained to ask: Wherein lie the results of the great work that has just been completed, and to which an expenditure of some 18,000,000 florins or more has been put? The river is a race, and I should say, if my eyes do not deceive me, that the waters still plunge forward with a velocity of not less than six or seven miles an hour, and perhaps more. I timed the royal steamer on its return, and found that it took just sixteen minutes to beat against the current over a length somewhat exceeding one mile. It is in the depths, however, that the improvement lies. The rocks and crags that but a few years ago rifted the river, and in fact overlooked it for most of its width, have for the greater part disappeared, and in the new channel the water boils over a smoothly paved floor. Down it one descends with refreshing swiftness; up, it is merely a question of power and slow progress, for the passage is clear and safe. On the inside lies the great breakwater or dam, a gently curved construction of rocks and masonry, pleasingly symmetrical to the eye, which parts off the main waters of the Danube.

With the arrival at Salaria of the first passenger steamer from Orsova, the people began to gather on the bank, and at about eight o'clock could be seen a long file of humanity heading for the point of observation. The gay Sunday attire of the Rumanian and Servian peasantry was a charming feature in the landscape, and if in all cases the wearer did not quite come up to the habit, the quiet and dignified association of this simple folk with the event of the day was not the least interesting or picturesque part of the celebration. From far and near they come trundling along in their small wicker wagons, with horses so small and so emaciated that one wonders how they could come at all. It is the picture that we see from here well into the heart of Poland, with hardly a variation.

At about 9:40 a cannon-shot announces that the royal squadron is nearing the round of the river, and the knife is raised ready to cut the improvised chain which spans the opening to the canal. On the Rumanian side we see a body of infantry stretched along the bank, with a few pieces of artillery prepared for possible service; on the Servian a few unmounted police (carrying more the air of military service than that which we habitually associate with the peace-wardens of our cities) patrol the lines of visitors, neither infringing upon their rights nor unnecessarily intruding with that officiousness which so generally marks official duty. They realized Servia's honor in having the larger share of the occasion, but they did not abuse it.

There could hardly be a finer or more inspiring picture than that of the entry of the royal vessel into the canal. The sun shone brilliantly on the trim white craft as she ploughed into the turbulent waters, tearing through the mock chain that had been stretched between the breakwater and the Servian shore. Emperor Francis Joseph, King of Hungary, stood beside the Kings of Rumania and Servia—well to the front, and in full view of everybody. A chorus of *éljens* and "Magyarország a haza" added its voice to the thunder of cannon as the official passage was begun, and to each following vessel, carrying the rank of nobility, the army and navy, ministers and invited guests, was meted out a proper share of greeting and welcome. Hardly had the Servian cannon ceased to shake the mountains with their swelling strains when the Rumanian artillery opened out, sending forth long lines of smoke over the distant waters. This scene will not soon be forgotten by those who were witness to it, for it is not to be repeated. From now on begins a new era in the commercial development of South Central Europe.

ANGELO HEILPRIN.

RENÉE DE FRANCE.—I.

PARIS, September 23, 1896.

AMONG the illustrious ladies who first adopted the ideas of the Reformation, Renée de France, who became Duchess of Ferrara, stands foremost. Her life has recently been written by E. Rodocanachi, a Greek who has made himself a Frenchman, and who has devoted himself to the study of French history and French literature. He has conscientiously used all the documents which concern the Duchess of Ferrara. The archives of Turin furnished him the precious collection of the account-books of the Duchess, which form no less than fifty-four volumes; in Rome, he used the collection of the reports of the Pontifical agents accredited in Ferrara and in France: he found many interesting letters and documents in Venice, in the French National Library, in the libraries of Geneva, St. Petersburg, and Simáncas. He has thus been able to add much to the valuable works of Bartolomeo Fontana and others concerning Renée de France and the part she took in the great movement of the Reformation in France and in Italy.

Born on the 25th of October, 1510, Renée was the younger daughter of Louis XII., King of France. Her eldest sister, Claude de France, was married to Francis I., who became King at the death of Louis XII., as Louis had no direct heir. Renée became an orphan at the age of five years, and remained under the care of the mother of Francis I., Louise of Savoy, who did not like her, as she had much disliked her mother, Anne of Brittany. Little is known about her education; she received lessons from the celebrated theologian Lefèvre d'Étaples, who afterwards became a fervent partisan of the Reformation and produced a French translation of the New Testament. It was the liberal period of the reign of Francis I.; a number of high personages were in sympathy with the movement which began to pronounce itself in Germany against the abuses of the Church. "The world," says M. Rodocanachi, "was not yet divided irremediably into adversaries and partisans of the Holy See." A certain spirit of criticism was the fashion. Louise of Savoy preached by her own example; she wrote in her Journal: "In the year 1522, in December, my son and myself, by the grace of the Holy Spirit, began to recognize the hypocrites, white, black, gray, of all colors, from whom God, in his infinite goodness, preserve us."

Renée de France had many suitors. After Francis I. came to the throne, Don Carlos, the future Charles V., who was master of the Netherlands, but who did not yet dream of the Empire, thought of marrying her in order to become, some day, Duke of Brittany. He sent an embassy to Francis I., but the negotiation dragged on, and the combinations which followed the battle of Marignano put an end to this project. Francis thought a moment of giving Renée to the Duke of Savoy, then to the Elector of Brandenburg, afterwards to the Constable of Bourbon. Wolsey was sent to Compiègne to treat for the marriage of Renée with Henry VIII., but the King of England, fortunately for her, got enamoured of Anne Boleyn, and this preference perhaps saved her life. Finally, it was decided that she should marry Hercules of Este, the son of Alphonso I. of Este, Duke of Ferrara. Italy was at this

time the centre of the political intrigues and combinations of Europe; the Pope, the Emperor, the King of France were all courting the alliance of the Duke of Ferrara, who had made himself important by his conquests. The future of Hercules seemed brilliant; his father had made himself master of Modena, of Finale, of Reggio; he was designated as captain of the people at Florence, a function which almost made him master of the city; he could hope, with the help of France, to become Duke of Milan, perhaps king of northern Italy. The young prince came to France with a large and brilliant retinue; the marriage was celebrated with great pomp on the 25th of June, 1528, in the Sainte-Chapelle, and the poet Marot recited an epithalamium at the banquet which followed. The young couple made the journey to Italy by short stages, accompanied by a small army of retainers. Renée had 158 persons with her, Hercules as many as 300; and it is difficult to imagine how so many people could be accommodated in the poor villages along the road.

Renée, in her contract, had to renounce all her rights to the duchy of Brittany; she received in exchange the duchy of Chartres, the county of Gisors, and the château of Montargis, where she was, long afterwards, to end her existence, and where she stopped a moment on her way to Italy. Renée had a triumphal entry at Ferrara, but she found herself quite lost at first in her dilapidated palace, not knowing a word of Italian. Her thoughts always turned to France, and she wrote to Francis: "I never had and never will have any other will but yours, and my ambition is to do you service in the way in which you command me." This was not an empty phrase, and she really always tried to influence her husband in favor of Francis I., and to defend the French interest against the interests of the Emperor and the Pope.

The marriage was not a happy one. Renée had not the gift of beauty, so common in Italy, and Hercules quarrelled with her incessantly because she would keep a few French attendants, particularly Madame de Soubise, who was a clever woman and had become her intimate friend. Duke Alphonso died on the 28th of October, 1534, and, Hercules having become his successor, made a journey to Rome to render homage to the Pope, and to Naples to solicit the protection of Charles V. On his return he ordered that Madame de Soubise should leave the court and return to France. He had bound himself very closely to the party of the Emperor; Renée remained attached to the French interest; she received at her court several Frenchmen who had been attracted by the reputation for liberalism of the University of Ferrara. Among them was the poet Clément Marot, who had been suspected of heresy, his name having been put on a list of proscripts, and he had fled first to Nérac, near the Queen of Navarre. He was called to Ferrara by Madame de Soubise. Hercules fortunately knew little about him, and Renée was allowed to place Marot on the list of her secretaries, with the small salary of 200 livres a year.

In the spring of 1536 Calvin resolved to go himself to Ferrara, hearing of the good reception which the Duchess gave to many who were united by a common hatred of the abuses of Romanism. He had just published his famous treatise on the 'Institutes of the Christian Religion,' dedicated to King Francis I. His preface had for its object to disarm Francis, who had been much alarmed some time before by some placards which had been posted on the walls of Paris and even in his own room (it was after this incident of the placards that Marot fled to Nérac). Calvin left Bâle for Ferrara in company with Canon du Tillet, his confidant and ardent disciple. Du Tillet was a canon of Angoulême; he had been captivated by the eloquence of Calvin, and had preached the Reformation till he was obliged to leave France. I hoped to find more details on the sojourn of Calvin in Ferrara in M. Rodocanachi's work, but he candidly admits that he found but little on the subject. "Several times," he says, "Renée received him at night and conversed with him. We know nothing precise about their relations. What is indubitable is that the preacher then obtained and always afterwards preserved a powerful influence over her; Renée made him her spiritual director."

Calvin knew that Italy was a ready ground for his doctrine; but sympathy for the new ideas was felt only in the higher classes, in the universities, among some dignitaries of the Church, some illustrious preachers, some cardinals, even some inquisitors. The people remained attached to the old Church, to its pomp and ceremonies. Certain incidents attracted the attention of the inquisitors, provoked the intervention of the Duke, and determined the departure of Marot. Some of Renée's servants and attendants were arrested and thrown into prison. Renée was of Breton origin, and consequently was obstinate; Hercules had in his veins the blood of the Borgias. The arrest of the prisoners became a great affair, and the French Ambassador claimed them as Frenchmen; the governor of Bologna claimed them in the name of the Pope; one of the prisoners was Renée's treasurer, Jean Cornillan, who had accompanied her from Paris to Ferrara. Renée put everything in motion to save her friends, and finally the prisoners were placed in the hands of the French Ambassador. Meanwhile Calvin, who had been arrested, was rescued by a troop of horse while he was being transferred from the prison of Ferrara to a prison in Bologna.

In 1537 Renée entered into relations with the famous poetess Vittoria Colonna, widow of Avalos, Marquis of Pescara, one of the best generals of Charles V. Vittoria Colonna was well disposed towards the Reformation. She became a friend of the Duchess; they saw each other every day. Vittoria was the elder, being then forty years old. She obtained, during a long absence on the part of the Duke, who had gone to Venice for the carnival, permission for the "Brothers of the Strict Observance," the *fraticelli* of the order of Saint Francis, to establish themselves in Ferrara, notwithstanding the opposition of the Franciscans. In the quarrel between the opulent and satisfied monachism and humble and poor monachism Vittoria and the Duchess took sides with the former. Curiously enough, on his return from Venice the Duke introduced the Jesuits into Ferrara.

Vittoria Colonna quitted Ferrara in 1538. The Duchess, left without a spiritual friend, consoled herself with her French attendants. The daughter of Madame de Soubise married M. de Pons, with whom the Duchess had become very intimate. During a mission of M. de Pons to the French court, she wrote to him daily, and the tenor of this correspondence was sometimes such as might explain some discontent on the part of the Duke. The letters of the Duchess were at times intercepted by the Duke; he exiled his wife to the castle of Consandolo, situated in the mephitic delta of the Po. The letters, preserved in the Ducal archives, and cited by M. Rodocanachi, while they show a childish kind of sentimentality, seem to me very innocent; there is more caution in a guilty correspondence. Calvin consoled the Princess in her exile by his letters, some of which are very remarkable; more and more he took possession of her mind. This did not prevent her from going to see the Pope, Paul III., who paid a visit to Ferrara; she obtained from him a brief which exempted her from any other ecclesiastical jurisdiction than that of the Roman Holy Office.

She still reconciled her respect for the Holy See with her Calvinistic ideas. Oddly enough, Renée had the Pope as a protector, an ally, and Calvin as an adviser, an inspirer, a councillor. M. Rodocanachi justly remarks that

"everywhere, but chiefly in Italy, respect for the Roman Church still accommodated itself with the desire to abolish its abuses; the limits between orthodoxy and heresy were most undecided. The violent repression of which Paul IV. was the initiator, and the excesses committed in Protestant countries, had not yet thrown an impassable barrier between the Catholic religion and the Reformed religion. More than one prelate of the Court of Rome professed, without any scruple, to hold ultramontane doctrines [the word ultramontane was then applied to the region north of the Alps], and many an ardent Reformer did not consider it a crime to pay respectful homage to the Sovereign Pontiff. . . . Renée, no more than Vittoria Colonna, no more than the Queen of Navarre, thought herself a hypocrite in proclaiming herself on the one hand 'the most humble, most obedient, and most devoted daughter' of the Pope, and in taking, on the other hand, as spiritual guides Luther and Calvin, who thought of nothing but of abolishing his authority. . . . At any rate," adds M. Rodocanachi, "women, who are less subtle than men, and are less vigorous reasoners, know very well how to ally things which to us appear irreconcilable, and can resolve the most repugnant antinomies."

Correspondence.

THE LABOR VOTE AT THE WEST.

To the Editor of The Nation:

Sir: I saw yesterday at Joliet, Ill., a farmer selling potatoes by the basket from a car. He had paid Wisconsin growers nine cents a bushel, nine cents to the railroad, and was retailing them for thirty cents. I asked him if he was a silver man. "Yes," he said, "I am for Bryan or anything else that will make it pay to raise any sort of crop." He made no pretence to any theory. "Times is bad and something's got to be done." I asked him if the Wisconsin farmers whom he knew held his opinions, and he replied, "I don't know another one in the county, and I know lots of 'em. They are all for McKinley." I was assured, upon very trustworthy evidence, that the overwhelming majority of farmers about Joliet were strong anti-Bryan men.

Some fifty miles further to the southwest is Ottawa, a town of perhaps fifteen thousand. There, upon two evenings in the week, were imposing parades distinctively of *town wage-earners*. The most picturesque part of the procession was made up of a large and powerful trade-union—the glass-blowers. One of them told me, "We are almost to a man against Bryan." This seemed quite as true of the terracotta workers, who were out under McKinley banners in great force. I talked here too with a farmer. He confirmed to the letter what had already been told me by the president of the Farmers' Congress, that "through this region at any rate the farmers are not going to vote free-silver." This farm-

er was poor and one of the plainest of his class, and yet he had read very widely upon the money issue. He said, "You folks don't know how we're all reading on these subjects." I asked him what argument had impressed him most. He surprised me by his reply: "Wall, how can you back on a man who tells us that if we have free silver we can pay our debts a great deal cheaper, and at the same time tells us that the law will raise the fifty-three-cent dollar to a hundred-cent dollar?"

Besides the railroad employees, it is very certain that organized labor in many of these towns—Davenport, Rock Island, Moline—will give a heavy vote against Bryan. The evidence of this has been the more unexpected to me, as I have not been able to find a single labor paper in the country that is not for free silver. There was not a shred of evidence in Ottawa that the laboring men had been in any sense, directly or indirectly, "coerced."

This evidence is only local, and I draw from it no conclusions. That it has, however, some significance, cannot, I think, be denied.

JOHN GRAHAM BROOKS.

CHICAGO ATHLETIC CLUB, September 12, 1896.

THE NEGRO VOTE.

TO THE EDITOR OF THE NATION:

SIR: In the London *Spectator* for September 19, in an article called "Mr. Bryan's Chance," it is said: "The farmers of the West and South will be supported by the negroes, who will this time be permitted to vote." This is not the case in this part of Virginia, at least. Recently an intelligent negro was asked whether he would vote for gold or silver; he replied, "For gold." Being asked how their leaders were instructing them to vote, he said, "All of 'em is for gold. Mr. B—— sent out a *history* to teach us, and it says if they have free silver and you got sixteen dollars in your pocket, it won't buy more'n the worth of eight; but that *do* seem hard to understand." Another said he knew only one colored man who was going to vote for Bryan, and that was because he was "ignorant"!

Respectfully, M. C. O.

NEAR RICHMOND, VA., October 10, 1896.

BRYANISM ON THE PACIFIC COAST.

TO THE EDITOR OF THE NATION:

SIR: In your editorial in which you compared Mr. Bryan to Dennis Kearny, you carried out a comparison which the Popocratic candidate for justice of the Supreme Court in the State of Washington made some time ago. He said that the sound-money men made a mistake in trying to estimate the strength of the silver movement. It is the same as that which swept California when she adopted her Constitution in 1878. In that year he was a resident of that State, and while he was opposed to the new Constitution—not openly, of course (these are his words)—he saw that the forces at the back of the movement came from the classes who never visited hotels, never rode on trains, never took any part in business enterprises, yet were sufficiently numerous to outvote all others. So now, he continued, the same men are going to carry the country.

It must be admitted that the only hope of the Populists even in this State lies in the same class, as is shown by a vote taken on trains visiting our State Fair. The result shows about four McKinley men to three Bryan men. In Yakima County there is a list of sound-money Democrats who will vote for McKinley, and say so openly, amounting to 12 per cent. of the Democratic vote in 1894, while Seattle and Tacoma will do much better. If the campaign lasted until December 1, there would be no doubt about the result in this State, while, as it is, 2,000 for Bryan is the highest claim you now hear made by conservative men, as against 10,000, which was confidently predicted in August.

MCKINLEY DEMOCRAT.

NORTH YAKIMA, WASH., October 1, 1896.

BRYAN AND BISMARCK.

TO THE EDITOR OF THE NATION:

SIR: The letter of his Serene Highness of Lauenburg to his Excellency of Texas has disclosed by indirection that the free coinage of silver by this country would be of especial benefit to Germany, if not to all Europe, in furnishing a market for her demonetized silver. If this really be so, could we not "bring Europe to her knees" most effectually by closing our mints entirely to silver, and is it not about time that Mr. Bryan's true position—that of travelling-agent for the European Powers—was made known to the "common people"? Yours "in gold I trust,"

X. Y. Z.

THE DELPHIN CLASSICS.

TO THE EDITOR OF THE NATION:

SIR: It has fared ill with the Delphin classics in some of our standard works of reference. The amount of definite information concerning them to be found in any one place is very small, and slight inaccuracies of statement are rather numerous.

The new edition of 'Johnson's Universal Cyclopædia,' ii., 712, devotes seven and one-half lines to this famous series, referring the reader to two authorities: "Hallam, Introduction to the History of Europe" and "Baillet, Jugements de Savans." The first reference is probably intended for "Hallam, Introduction to the Literature of Europe" (in the fifteenth, sixteenth, and seventeenth centuries), the second, for "Baillet, Jugemens des Savans (sur les principaux Ouvrages des Auteurs)," an ancient and voluminous work which is practically inaccessible.

The same paragraph of the 'Universal Cyclopædia' states that the Delphin classics were "prepared under superintendence of Bossuet and Huet"; the new 'Standard Dictionary' has "prepared by Bossuet and others"; the 'Century Dictionary,' "under superintendence of Montausier, Bossuet, and Huet." All these statements are misleading. The preparation of the series was first suggested by the Duke of Montausier, and the polymathic Huet was editor-in-chief. Bossuet seems really to have had very little to do with the work.

The 'Encyclopædia Britannica,' xii., 335, says that Huet "edited with the assistance of Mme. Dacier the well-known edition of the classics," etc. This statement gives a false impression as to either scholar's share in the work, and does not inform the reader that only Latin authors were included in the series.

'Johnson's Universal Cyclopædia,' ii., 636, says that Madame Dacier "was employed by the Duke of Montausier to edit several Latin authors for the use of the Dauphin," and that André Dacier was the "editor of the Delphine Horace." These two statements (with the spelling "Delphine") are reprinted from the old edition of 1856. Madame Dacier seems to have been employed in this work by Huet, the editor-in-chief, and the Delphin editor of Horace was Louis Desprez (or Des-prez).

The 'New English Dictionary' says, in explanation of the name "Dauphin," that the last lord of Viennois to bear this title was "Humbert III." The histories of France by Guizot and Duruy (at least in the English translations) call him "Humbert II."

The traditional description of the Delphin classics is that they were editions of the principal Latin authors prepared for the use of the Dauphin, *ad usum Delphini*. This Latin phrase occurs *passim* in Didot's 'Biographie Générale,' and consequently (?) in the 'Encyclopædia Britannica'; it is found in Sainte-Beuve, 'Causeries du Lundi,' ix., 481, in the 'Century Dictionary,' and in the 'New English Dictionary.' The title-pages of the Delphin editions announced that they had been prepared *in usum serenissimi Delphini*, as Steele's schoolboy seems to have known: "All the Boys in the School, but I, have the Classick Authors *in usum Delphini*, gilt and letter'd on the Back," *Spectator*, No. 330, 1713.

An article in the *Quarterly Review*, xcvii., p. 302, quotes from Huet's own account of his studies in anatomy: "I can safely affirm that with my own hand I have dissected more than 300 eyes taken from the heads of animals of every species." This article is reprinted in Essays by the late Mark Pattison, i., 244 ff. Didot's 'Biographie Générale,' xxv., 383, professes to quote the same passage: "Il disséqua, dit-il, plus de huit cents yeux de divers animaux," and Didot's quotation is reproduced in the 'Encyclopædia Britannica,' xii., 335: "In this pursuit he made more than 800 dissections."

W. P. M.

HAVERFORD, PA., October 3, 1896.

Notes.

HENRY HOLT & Co. have just ready 'Modern [English] Political Orations,' from Brougham (1837) down, edited by Leopold Wagner.

By arrangement with Messrs. Macmillan, Appleton, and the Century Co., Charles Scribner's Sons will issue a collected edition of Rudyard Kipling's works to be sold only by subscription, with the customary set on Japan paper.

The Morse Co., New York, have in preparation 'Massasoit: A Romantic Story of the Indians of New England,' by Alma Holman Burton.

'The Story of American Coals' will be told by W. J. Nicolls in a book announced by J. B. Lippincott Co.

Lamson, Wolffe & Co., Boston, are about to bring out 'Ex-libris: Essays of a Collector,' by Charles Dexter Allen, with twenty copper-plate prints after Bewick and others; 'A Book of the Native,' the collected poems of Prof. Charles G. D. Roberts; and 'Magnolia Blooms,' poems by Edna Procter Clark.

Prof. Karl Knortz of Evansville, Indiana, has written a work in his chosen field, 'Die wahre Inspirations-Gemeinde in Iowa [Ebenezer and Amana],' a contribution to the history of Christian pietism and communism, which is in the press of Otto Wigand, Leipzig.

An 'Encyclopædia of Indo-Aryan Research,' edited by Hofrath Georg Bühler of Vienna, with a wide collaboration, one-third in English and two-thirds in German, is to be published in three volumes of about 1,100 pages

each, royal octavo, by Karl J. Trübner, Strassburg (New York: Lemcke & Buechner).

The Riverside Edition of Mrs. Stowe's writings (Houghton, Mifflin & Co.) begins with 'The Minister's Wooing,' 'Agnes of Sorrento,' and 'The Pearl of Orr's Island.' These uniform volumes are tastefully bound in green cloth, and have each an etched frontispiece and a vignetted title-page, together with an introductory note relating the genesis and history of the story. The typography corresponds to the name and fame of the Press in its ordinary issues. No better manufacture is needed for an edition popular in price yet handsome for the library; but a limited large-paper edition, as our readers have already been informed, keeps pace with this, and bears the autograph of the author.

Mr. Barrie's visit to this country falls in with a liberal and elegant uniform American edition of his works—the only one with his sanction—by the Messrs. Scribner, of which two volumes, in green cloth, gilt-edged and with the Thistle stamp, are before us. The first embodies 'Auld Licht Idylls' and 'Better Dead' ("Better not Included" is the author's preference), and has for frontispiece a portrait of Mr. Barrie; the second is wholly occupied by 'When a Man's Single,' and the frontispiece is a clever illustration. Mr. Barrie contributes two propitiatory introductions, in perfect temper and in very felicitous phraseology, and will do likewise by the six remaining volumes. The De Vinne Press has had the making, and the bold letter used is a delight to eyes that need the aid of glasses. The typography and presswork, indeed, are models of handicraft.

The same firm continues its uniform edition of Dr. Holland's writings with 'Seven Oaks' and 'Arthur Bonnicastle'; and its "Stories by English Authors" with two volumes, having Germany and the Low Countries for the bond of unity in one instance, and the Sea in the other, with portraits of Beatrice Harraden and of Clark Russell respectively. A second volume of selections from the writings of Edwin L. Godkin consists of eleven magazine articles, ranging from "Aristocratic Opinions of Democracy" in the *North American Review* for January, 1865, to "The Expenditure of Rich Men" in the current *Scribner's*. The intervening themes are such as have interested the past decade, and touch on politics, the tariff, socialism, political economy, in various lights and interrelations. Finally, a concession by the Scribners of a reissue at a popular price of Villari's 'Life and Times of Savonarola' in one volume is much to be commended. The paper for a not bulky book of 800 pages must needs be somewhat thin, but the handsome and readable plates are unchanged, and the portraits and illustrations not withheld.

The plates of De Amicis's 'Constantinople' in Messrs. Putnam's "Stamboul Edition" show some signs of wear, and the handsomely bound volume is rather showy than fine. The illustrations are a mixture of "process" from the life and of copies of time-honored engravings. But as the present order at Constantinople seems on the verge of crumbling away, this poetic Italian impression of it should gratify a present curiosity. Two volumes of Mayne Reid's juvenile stories, 'The Bush Boys,' 'The Boy Hunters,' in an entirely new dress which becomes them well, initiate a "Nimrod Edition" of this author's better productions for the young, and also bear the Putnam imprint.

Macmillan Company add two more volumes to Mrs. Garnett's version of Turgeneff's novels, since 'Virgin Soil' will not be contained in one. Had "Stepniak" survived, no doubt he would have been asked to furnish the introduction to this tale of the rise of Nihilism, in default of which the task has fallen to Edward Garnett. Those who like to philosophize may read or reread the sombre story while the Parisian acclaim to the Czar is ringing in his ears. A fourth volume of Björnson's novels in their uniform reprint consists of 'The Fisher Lass,' which has had a merited vogue for nearly thirty years. In the Dent-Macmillan output we must mention Balzac's 'Country Parson,' first in importance and in beauty of attire, then Daudet's 'Robert Helmont,' a good second, and "Pericles" and "Cymbeline" in the dainty "Temple Shakspere."

The Sunday-School Teachers' Edition of the Bible which comes to us from the newly established American agency of Henry Frowde and the Oxford University Press, is well adapted for its purpose in respect of open type, flexible binding, and the customary apparatus of "illustrations," glossary, subject-index, etc. The old version is here adhered to.

Captain Younghusband is a well-known traveller who has distinguished himself by his explorations in remote and difficult parts of Asia. His 'Heart of a Continent' (Scribners) contains an account of his wanderings in Mantchuria in 1881, and of his remarkable overland journey from Pekin to India in the following year; also of his visits to the Hunza territory in 1889, and to the Pamirs in 1890, and his stay in Chitral as resident in 1892. His most famous adventure was in the Pamirs, where he was arrested and turned aside by the commander of a Russian expedition in those regions. The Russian officer, who was only obeying orders from headquarters, seems to have acted as politely as possible, but the affair created quite a diplomatic sensation, which was calmed by an apology from the Government of St. Petersburg. Since the settling of the Pamir boundary last year, the incident has lost all importance. We should have been glad of a fuller description of Chitral and of the author's experiences than can be found in the scant twenty pages which he devotes to the subject; indeed, this would have made a much more interesting ending for the work than his actual last two chapters on "The Missionary Question in China" and "Impressions of Travel," in which he gets rather vague, rambling, and rhapsodical. In fact, we do not understand the object of these two chapters at all. They are so unnecessary as to raise a suspicion of padding, and they force us to close with a criticism what is otherwise a well-written book. Capt. Younghusband has a clear, interesting style that inspires sympathy as well as holds the attention; he makes it evident that he is a good observer who can describe what he sees.

'The English and Dutch in South Africa,' by Hartley Withers (London: Clement Wilson), is a brief history of the relations between the English authorities and the Dutch colonists in South Africa. Although only an outline is given, it is enough to form a pretty severe arraignment of British policy, or, rather, shifting policies, for nearly a century. The sympathies of the author are evident enough: he condemns one act after another of the home Government or its representatives; he expresses much admiration of the Boers; he believes that, when not meddled with, they have on the whole treated the natives wisely and well, and he is very severe against the London Missionary Society. Even if his statements on these subjects can hardly be accepted as final, they are worthy of attention, and form a forcible presentation of facts which too many people in England are glad to overlook.

Part X. of *Bibliographica* (Scribners) maintains a high level of excellence and has a marked English interest. Cyril Davenport supplies a readable paper on the bindings of Samuel Mearne and his school; the early English writing-masters, some of whom acquired fortunes by their manuals and otherwise, are reviewed by Edward F. Strange; Alfred W. Pollard treats of some pictorial and heraldic initials, especially English; and Henry R. Plomer and Edward Arber have kindred themes—the one in his "References to Books in the Reports of the Historical MSS. Commissioners," and the other in his "Contemporary Printed Lists of Books Produced in England." Mr. Arber seeks to convey some idea of the bounds of knowledge of English book production, of which so much has perished altogether, and arranges chronologically such lists as early controversial writers indulged in, and such attempts as were from time to time made to record the current issues of the press. He thus enumerates to the present century upwards of fifty bibliographies, the first serial being a solitary half-yearly catalogue for 1618–1619. Extraordinary value attaches to the Thomason collection of Civil War Tracts, 130,000 in number, now in the British Museum, all exactly dated and catalogued in manuscript, but never yet "adequately worked, whether for historical or for bibliographical purposes." With the Term Catalogues of books printed in England, 1668–1709, we begin to "smell land," in Suffolk idiom. Two papers, on "Little Books" and on "The Books of the Carthusians," are both important and attractive.

The initial part of vol. iii. of the Proceedings of the Huguenot Society of America (New York) furnishes much interesting reading, though, with perhaps one exception, there is no historical contribution of a high order. A frontispiece portrait of the late John Jay foreshadows a memorial by Dr. A. G. Vermilye, and various sections of the country are taken up, respectively, in the Rev. M. C. Julien's lantern lecture on the "Huguenots of Old Boston," in Dr. James Le Fevre's "Huguenot Patentees of New Paltz, N. Y.," James B. Laux's "Huguenot Element in Pennsylvania," Dr. John H. Edwards's "First Home of the Huguenots in North America [present United States]," viz., Florida, and R. H. Tilley's "Huguenots of Rhode Island." None of these papers implies exhaustive research, but all are full of useful suggestion. After making Priscilla Mullins (Molines) a Huguenot maiden, Mr. Julien endeavors to bring John Alden into the fold, and does at least show alliances of English Aldens with Blancard and Du Prier. Prof. Baird, discoursing on the recovery of religious liberty by the Huguenots, by no means does justice to Rousseau in censuring him for not intervening on behalf of the persecuted Protestants as did Voltaire. Rousseau truly declared that his letter on behalf of toleration to the Archbishop of Paris had brought upon himself fresh persecution from the Protestants, on account of his "heresies," and he had no mind for more, or to expose himself to an obvious Catholic retort. The whole of his letter of July 15, 1764, of which Prof. Baird cites a part, should be read together with that of May 25 of the same year.

Volume xv. of the Bulletin of the United States Fish Commission, of 475 pages and numerous plates, in small quarto, includes among other matters summaries of the results of efforts in the introduction and propagation of fishes, lobsters, oysters, etc., on the Pacific slope of the continent, which, together with reports of investigations looking towards further introduction and conservation, make a very fair exhibit of the purposes and accomplishments of the Commission, or of the reason for its existence. The bulkiest paper is that on the American Lobster, which contains some fine illustrations. In this portion of the text the display of the personal pronoun, the great *I*, and its scientific importance are somewhat out of proportion.

The Annual Report of the Pennsylvania State College for the Year 1895 is a satisfactory volume in various respects. It is an illustrated octavo of 433 pages. Treating of analyses of soils, fertilizers, fruits, and grains, and of dairy, garden, and field products, etc., it possesses an interest transcending the borders of the State. Four-fifths of the book relates to the work of the Agricultural Experiment Station. A paper of special geologic attractiveness is that on "A Phosphate Deposit in Juniata County."

None of the reports of the Agricultural Colleges or Experiment Stations excels that issued by the University of California, for the year 1894–95, in amount, diversity, and importance of practical suggestions and of scientific researches. It contains 481 pages, is profusely illustrated, and, from the special investigations of Director Hilgard and others, has a value for reference that will be increasingly appreciated in years to come. Its pages are highly suggestive of the variety in Californian climates, soils, and productions.

The October Bulletin of the Boston Public Library contains a list of books on the currency question, supplemental to that published in September, together with titles of books on political science and political economy.

The bibliography of geographical literature for 1895, just published by the *Annales de Géographie*, is an improvement upon those of previous years. The number of collaborators has been increased to forty-nine, an index of authors has been added, and nearly every entry has a clear and comprehensive analytical note. This causes the size of the volume to be the same as last year's, though there are only 1,087 entries against 1,590 for 1894, many references to short articles in the periodicals being omitted. We remark a large increase of works on Africa.

The *Bibliothèque Universelle*, a monthly review now published in Lausanne, Switzerland, has just celebrated the hundredth anniversary of its foundation. It was originally established in Geneva, under the title *Bibliothèque Britannique*, by Frédéric Guillaume Maurice and the brothers Marc Auguste Pictet (pupil and friend of the famous naturalist Saussure) and Charles Pictet de Rochemont, diplomatist. At that time Geneva was making a desperate struggle for political independence against the intrigues of the French Republic, and the chief aim of the new periodical, as its name implied, was the diffusion of English ideas and scientific researches in France and Switzerland. It numbered among its earliest contributors Sir Humphry Davy, Edward Jenner, Sir Joseph Banks, the physicist Charles Earl of Stanhope, Maria Edgeworth, and, at a somewhat later period, Sir John Herschel. In 1816 it enlarged its scope so as to include especially the results of philosophical inquiry and scientific investigation in Germany, and changed its name to *Bibliothèque Universelle*. Since 1893 it has been published in Lausanne, where the centennial festival was held on September 7. It is from the addresses delivered on this occasion by Profs. Ernest Naville and Philippe Guye that our information concerning the review is derived.

Recent issues of the *Beilage* to the *Munich Allgemeine Zeitung* (Nos. 210–212, 216, 218, 220, 221), contain a series of seven articles by Prof. E. P. Evans, entitled "Die Bücherschätze eines Amerikanischen Bibliographen," and giving a full historical and critical account of Prof. Willard Fiske's Icelandic and Petrarch collections of printed books and manuscripts. These articles cover nearly fifty columns of the German journal, and present the first exhaustive bibliographical and literary description of this rare library ever published. The Rhæto-Romanic and Dante collections of Prof. Fiske, now in the library of Cornell University, are only incidentally mentioned in a footnote. We may state, by the way, that the *Beilage*, which appears six times a week and is devoted to literature, science, and art, may now be subscribed for separately, and is also published in a weekly edition, which costs seven marks a quarter for all countries in the Postal Union, and is certainly the most convenient form for foreign subscribers and libraries.

—No part of President Eliot's Chautauqua address on "Five American Contributions to Civilization," now printed in the October *Atlantic*, is more important than that which points out the advance this country has made towards the substitution of discussion and arbitration for war and the avoidance of armaments. There is a raking fore and aft here of the arguments of those persons of misdirected sensibility who have worked themselves into a belief that a war is needed now and then to develop the heroic virtues, such as courage, loyalty, and self-sacrifice. The crop of financial and political evils developed by war will flourish in the future as freely as ever; but with modern appliances for wholesale slaughter the brunt of battles will fall on warchests and treasuries, and heroes will have perforce to find their opportunities in the walks of peace. Some of the peaceful occupations which President Eliot instances as always calling for skill, fidelity, and resolution, and at times for heroic self-sacrifice, are those of the locomotive engineer, the electrical lineman, the policeman, the city fireman, and the trained nurse. The craving for war as an incentive to extraordinary exertions is met by the suggestion that there is no department of national life in which we could not advantageously put forth more force than we now expend. The post-office, national sanitation, and education are several of the fields in which there is still room for the largest appetite for abnormal activity to satisfy itself.

—An article in *Scribner's*, "From Light to Light," by Kirk Munroe, calls attention to still another of the avocations of peace in which constant vigilance and occasional displays of heroism are called for. The lonely light-houses scattered along the coast, from Maine to Texas, shelter lives which escape the notice of the world at large, and to most readers this account of the supply-ship *Armeria*, which once in the year carries oil and provisions to each, will give some novel and interesting impressions. But something more than a curious interest attaches to an article on "The Government of the Greater New York," by Francis V. Greene. Reduced to its last terms, the problem of good government appears here as the getting of good men. The position of the Mayor of the consolidated city will, it is argued, be second in responsibility and importance only to that of the President of the United States, and should be surrounded by every possible dignity. Fame and honor will, in fact, be the only rewards that will suffice to tempt the ablest and best men to the arduous task of administering the affairs of such a community as the Greater New York. In the formation of its charter, aid from three sources is suggested—from the Federal and State political systems, the government of great cities abroad, and the management of large business corporations, although the experience of these varied sources combined is not sufficient to cover the complicated and unprecedented problems presented by this great corporation, with its public income of $50,000,000 a year, and its population "nearly equal to that of the original thirteen States at the time the Constitution was adopted." A prime factor in the difficulties to be overcome by the Charter Commission is, of course, the mixed nature of the population, of which but twenty per cent. is American by birth and parentage. Now that more than one-third of the entire population of the United States is living in cities, and these among the worst governed in the world, this article of Mr. Greene's, with its careful consideration of civic problems from various points of view, recommends itself to all serious students of municipal government.

—In the current number of the *Century*, a study of mental epidemics by Boris Sidis furnishes a psychological key to some of the social and political spectacles of the day. Man, in common with other gregarious animals, is susceptible to the movements of his companions, and this "suggestibility," as it is called in connection with the human animal, increased to an extraordinary degree, results in nothing more nor less than "a stampede, a mob, an epidemic." The behavior of bodies of men in a state of abnormal susceptibility to suggestion, or the hypnotic state, is illustrated by the crusade, the flagellant, the dancing and other manias of the middle ages, and by the camp-meeting revivals not yet obsolete. Political conventions and crazes naturally add themselves to this list in the mind of the reader, and an excellent editorial article on "Government by Hysteria," under the head of "Topics of the Time," carries out the train of thought started by the idea of epidemic insanities to its practical issue for the voter. In this number of the magazine Prof. Sloane brings to a conclusion his lengthy history of the Napoleonic wars, and Mrs. Humphry Ward drops the curtain on the dramatis personæ of her novel "Sir George Tressady." Mme. Blanc (Th. Bentzon), assisted by the numerous illustrations of Maurice Boutet de Monvel, and drawing on her recent travels in this country for comparisons which give animation without invidiousness to the treatment of her subject, contributes an entertaining account of French children. The undercurrent of pardonable partiality that may easily be detected for the grace and suavity of the little girls of her own race, interferes in no way with the openness of mind and freedom of judgment with which Mme. Blanc views the juvenile world; while the lively designs of boys and girls are full of the artistic

chic to be expected from French work in general and from M. Boutet de Monvel in particular.

—*Harper's Magazine* gives its first pages this month to one of Frederic Remington's illustrated sporting articles, "The Blue Quail of the Cactus"—a game too small, apparently, to call out the best energies of a pencil accustomed to cope successfully with a four-footed quarry or with the bucking broncho. "A Recovered Chapter in American History," by Walter Clark, goes back to the war of 1740 between England and Spain, and claims a tardy recognition for the bravery of our fellow-countrymen who responded to the King's call to the colonies for men and means to aid in the ill-fated expedition against Cartagena. Samuel H. Scudder writes interestingly about "Some American Crickets," and an article in the "Great American Industries Series" treats of electricity. But fiction preponderates in the number, and ranges through all degrees of good, bad, and indifferent. Ruth McEnery Stuart proves as successful in the pathetic story of "The Unlived Life of Little Mary Ellen" as she frequently has done in the humorous vein. Prof. Brander Matthews's "Vigil of McDowell Sutro" shows the value to the writer of fiction of observant intercourse with all sorts and conditions of men, and is an excellent example of what can be accomplished by persistent practice and the application of sound methods in the way of making a readable story. The first part of Mr. Du Maurier's new novel, "The Martian," proves, on the other hand, how inimitable is the charm of the story-teller who is born, not made—of a story-teller who, alas! will charm us no more.

—It was only twenty-five years ago that European scholars echoed old Kaempfer's assertion that, since the time of Jimmu Tennō (the first mythical Mikado, whose very name was not invented until one thousand years after his supposed reign, 660-585 B. C.), the Japanese have been "accurate and faithful in writing the history of their country and the lives and reigns of their monarchs." The English scholars Aston, Satow, Chamberlain, and Bramsen, by elaborate investigations into the very first written records of Japan, demolished the whole edifice of mediæval and modern superstition which had been raised originally for political enginery. Then followed the work of natives, Prof. Kumi and Mr. Naka, who showed the thorough inaccuracy, untrustworthiness, and even falsifications of the writers of the two most ancient books, the 'Kojiki' and the 'Nihongi,' composed early in the eighth century. Both native and foreign scholars, however, agree in the unique value of both these works in their middle and latter parts as mirrors of history, custom, ritual, and geography. We are happy to say that now both books exist in an English translation. The 'Kojiki,' literally translated with elaborate introduction and abundant notes, both marked by great learning and critical power, by Prof. Basil Hall Chamberlain, forms a supplement to Vol. x., Transactions of the Asiatic Society of Japan (price $4.00 in silver, $2.00 in American gold; to be had by addressing the Librarian, Prof. Ernest W. Clement, Tsukiji, Tokyo, Japan).

—The 'Nihongi,' or Chronicle of Japan, has been put into English, with concise introduction, preface, illustrations, and notes by Mr. W. G. Aston, who has been for thirty-two years a student of remarkable ability in the languages of China, Korea, and Japan, in which countries he has resided. He crowns his life-work in sending forth volume i. of his two-volume translation of the 'Nihongi,' which is published for the Japan Society of London by Kegan Paul, Trench, Trübner & Co. Mr. Aston discusses the question of early writing in Japan, the date and authorship of the 'Nihongi,' the materials from which it is constructed, its character and contents, its chronology, text, and editions, and makes comparisons with the 'Kojiki.' Of the two books, the earlier one, the 'Kojiki,' or Notices of Things Ancient, is written in Japanese by means of Chinese characters used phonetically, though sometimes these are used as ideographs. The book has no chronology, and its narrative comes to an end at the close of the fifth century. The 'Nihongi' is written in Chinese, in Chinese literary style, and is overloaded with Chinese philosophical notions, historic and literary references, and even borrowed passages. These latter we can hardly call quotations, but rather transfers. Furthermore, the 'Nihongi' is double the size of its predecessor, and continues the narrative as far as the end of the seventh century. The importance of the work is therefore manifest. Dr. Florenz of Tokyo, a scholar of unusual literary penetration and grace, has also translated the 'Nihongi' into German. Mr. Aston's thorough knowledge of Chinese history enables him to locate in the Chinese books the chief ideas and phrases which make the staple of the speeches put into the mouths of early Japanese heroes by the author or authors of the 'Nihongi.' The value of the work is rather enhanced than detracted from by the author's modesty in declining to try to make sense of some of the obscure verses which are found in the course of the prose narrative. Though in general the whole story is clear and readable, we think that of the two narratives the more unsophisticated form of the 'Kojiki' is by far the most fascinating.

DICEY'S CONFLICT OF LAWS.

A Digest of the Laws of England with reference to the Conflict of Laws. By A. V. Dicey. With Notes of American Cases, by John Bassett Moore. London: Stevens & Sons; Boston: The Boston Book Co. 1896.

Mr. Dicey's name is well known to all American lawyers as the author of valuable works on Domicile and Parties; his 'Conflict of Laws' embodies a second and carefully corrected edition of his book on Domicile, which he has thus incorporated in what he modestly calls a Digest. It is in reality an elaborate treatise as well, covering the whole ground explored by Story, and dealing with it in a new way. The first sixty pages give the General Principles (compressed into a page) and the Digest, consisting of less than two hundred rules. This is followed by an Introduction explaining the nature of the subject, the method of treatment, and the general principles. Then each rule is given in order, with illustrations, consisting of cases stated in the present tense, accompanied by comment wherever exposition is necessary, and by Prof. Moore's valuable notes and American cases, of which there seem to be a greater number than of English decisions, so that the book promises to be no less instructive and useful to the American than to the English lawyer. In this way the subjects of Status, Domicile, Marriage and Divorce, Contracts, Real Property, and all the other topics which produce a question as to which of two or more territorial laws shall be applied to their solution, are discussed; yet the method of arrangement and discussion is wholly new. Research, accuracy, and condensation have been the guiding principles of the work.

The novelty of Mr. Dicey's method consists in the fact that he has adopted as the basis of his work a distinction which, when once stated, is clear enough, but which has been hitherto generally, if not universally, overlooked, namely, that the question of the judicial assumption of *jurisdiction to determine* a case presenting a question of the conflict of laws is wholly different from the question (assuming the first question to be answered in the affirmative) *by what law* it shall be decided. A brief explanation, in which we follow his Introduction, will make the distinction and its results intelligible.

Every modern State (and in this respect every American State is an independent sovereignty) administers a body of law intended to apply to all citizens, property and contracts within its borders. In almost all cases the questions which arise for determination by its courts are wholly domestic; the rights, claims, or demands set up on one side or the other being of local origin. A, living in Albany, sues B, living in New York, on a contract made in Brooklyn. B maintains that the suit is barred by lapse of time. The decision of the case depends wholly on the rule laid down by the New York Legislature as to the time within which suits in New York must be brought. But in some cases the matter is not wholly domestic. The contract, for instance, may have been made in France. In this case, is the New York rule as to the limitation of actions to govern, or the French? Or, B may admit the contract, yet produce a French discharge in bankruptcy. Shall this discharge be recognized in New York? What principle is to govern when rights of foreign origin are asserted in the domestic forum?

The question has usually been answered as if it were single. In Mr. Dicey's analysis it is twofold: first, is the case one which the domestic court will undertake to determine at all? second, to what body of law must we look to decide upon the rights of the parties? The first question is one of jurisdiction, the second one of selection between two or more competing bodies of law. The Conflict of Laws, or Private International Law, then, is that part of the law of any given State which lays down rules for the decision of these questions. Although the principles governing it are very much alike throughout the civilized world, the enforcement of them depends wholly on the view locally taken of the subject, and this view differs in some respects in different countries; for instance, the English courts determine the question of the legitimacy of a foreigner by the law of his domicile at birth, while in Italy the question is determined by his nationality. Hence, instead of pursuing, as most of the writers before Story did, a theoretic method of inquiry into a supposed system of private international law existing in all countries, the rational method is to confine the investigation to each country separately. Mr. Dicey accordingly inquires simply what are the rules recognized by English courts. In this country the English rules are generally followed (though of course we have statutes of our own which are non-existent in England, and vice-versa), and separate books on the conflict of laws in the State of New York, the State of Massachusetts, and the State of Nevada would be absurdities. But law is a practical matter, and Mr. Dicey's Digest must be

considered as a treatise embodying principles of English law, and not as part of the imaginary world-wide *corpus juris* invented by Continental writers.

Mr. Dicey's fundamental question divides the subject into two fields. He calls the first that of jurisdiction, the other that of choice of law. The rules governing domicile and nationality precede these two divisions. Throughout, he has followed what he calls the "positive" as distinguished from the "theoretic" method, and he considers that the adoption of the former debars him from the examination of the historical problems connected with the growth of private international law. With this view of the matter we cannot altogether sympathize. By cutting himself off on one side as far as possible from theory, and on the other from historical interpretation, he has left to himself nothing but pure positive law, and this his Digest is intended to be. But for purposes of complete exposition we need, as he would not deny, both the historical explanation of the growth of the rules so far as it can be ascertained, and the theoretic discussion of the philosophical grounds on which the general principles can be rested. The author is in reality a master of exposition and explanation, yet he seems in this book to have subjected himself to a self-denying ordinance under which he declines to explain any positive rules of law except in terms of law itself. The result is, that his "general principles" are condensed statements of the matters which form the substance of the book, put in a highly abstract form; and such statements, in our opinion, sometimes defeat their own ends, owing not to inaccuracy, but to their pushing a particular method to a point at which it becomes ineffectual. In other words, it seems to us that while much of private international law is capable of being stated in the form of rules, portions of it cannot be thrown into this form effectively, and that here the theoretic and the historical method must be pursued.

For instance, contrast such a rule as the following on Domicile: "The domicile of a married woman is during coverture the same as, and changes with, the domicile of her husband," with the following on the essential validity of contracts: "The essential validity of a contract is (subject to the exceptions hereinafter mentioned) governed indirectly by the proper law of the contract." The former is perfectly lucid, and states a rule as a judge would give it to a jury; the latter represents an attempt to extract a *ratio decidendi* from a great number of English judgments, holding that the question whether a contract will be held valid by an English court or not depends on the law of the country with which it has most substantial connection, *i. e.*, a French contract must be tested by French law, an Italian by Italian law, etc.

"But when we ask what is the circumstance which in the main determines what is the country to which a contract belongs, we find that it is the intention of the parties, or, in other words, we are brought round again to the conclusion that the essential validity of a contract is in the main determined *by the proper law* thereof. We can now see what is the real meaning of English judges where they decline, as they often most rightly do, to be bound by any hard-and-fast rule as to the law governing the construction or validity of a contract. They do not intend to question the principle that a contract is governed by the law or laws to which the parties intended to submit themselves, but do intend to express the perfectly sound doctrine that, in ascertaining what this intended law is, a Court ought to take into account every circumstance of the case, and ought not to be tied down to any rigid presumption that the parties must have intended to be bound by a particular law, whether it be the *lex loci celebrationis* or the *lex loci solutionis*" (p. 766).

This is a most lucid explanation of a most difficult point; but an examination of the rule does not, to our mind, advance us at all. And the author himself gives us the reason. It is because the judges themselves say that they will not be bound by a hard-and-fast rule at all. The rule as given, with the qualifications, explanations, and exceptions and correlated rules, brings us back to the point that there is no rule.

The reader will perceive that this criticism is founded upon a view of which Mr. Dicey himself would perhaps not admit the validity —that the whole *corpus juris* is not capable of being stated in the form of rules resembling statutes; that there is a large body of law as to which the judges are not bound by rules capable of precise formulation. Any such digest as he has prepared is in reality a code, and necessarily raises the old question whether and how far codification is possible. Here we have a case where the judges themselves have refused to be bound by any rule, and a rule prepared by one of the acutest and clearest legal writers of our day to supply the deficiency. Is it supplied? Will the judges accept it? We think not. We think they will continue to say, "On the whole, this is a New York contract," or "On the whole, this is a French contract," and decline to be bound by any rule at all. Of course it will be said that law which is not a rule is not law at all, and the question is one which involves the nature of jurisprudence itself. What we have said does not impugn the excellence of Mr. Dicey's work. It merely raises the point whether in certain portions of it the formulation of rules is not a task beyond human powers.

For practical purposes (and the Conflict of Laws is a highly practical subject) Mr. Dicey's method, in both conception and execution, has every merit. If, here and there, it shows signs of inadequacy, the author's explanations, paraphrases, and instances always make the conclusion of the matter so clear that, in the end, the process by which it has been reached has become in great measure unimportant. The effort to construct a rule, even if not wholly successful, is, to the student or practising lawyer, often as illuminating as the most complete triumph of juridico-legislative statement could be. In these respects the book is essentially different from Story's; it is eminently a book out of which to advise a client. Its publication may be said to mark an epoch in the study of the subject, to whose importance it is now some sixty years since Story called attention by the publication of his well-known treatise. "There exists no treatise upon it," he said, "in the English language." The materials for its study were "loose and scattered," and to the student of the common law "absolutely repulsive." These repulsive materials consisted of the opinions and reasonings of Continental jurists, of which Story was forced, by the fact that common-law courts had not then devoted much attention to the subject, to make much of his treatise bodily consist. All such discussion is by Mr. Dicey wholly eliminated, and, while we still get the fruits of the speculations of Rodenburg, Boullenois, Bouhier, Froland, and even the learned Strykius, we get them in the form of English and American judgments, and the author's own clear and practical analysis. Story's book has become a classic, but it is little read, partly because, although he was the first to apply to the subject the positive method of the common law, he could not apply it thoroughly. Since his time many common lawyers have explored the field, but we believe it has been left to Mr. Dicey to crown the work. What he has undertaken to do we can hardly imagine any one doing better, and his book must, of necessity, become the leading authority on the Conflict of Laws for England and the United States.

MORRIS'S IRELAND.

Ireland, 1494-1868. With two introductory chapters. By W. O'Connor Morris, County Court Judge, etc. Macmillan. 1896.

We have here another volume of the admirable Cambridge Historical Series, whose aim is "to sketch the history of modern Europe, with that of its chief colonies and conquests, from about the end of the fifteenth century down to the present time." This book does not claim to be a history, and yet it is a history in the best sense. The ordinary reader will gain from its perusal a clearer view of the course and bearing of the story of Ireland than from most other books in which events and persons are more clearly defined. The title is somewhat misleading. The words "with two introductory chapters" had better have been omitted. The history of the island from 1494 to 1868 is the main burthen; but this period is naturally led up to and followed without break by a narrative which constitutes the whole a complete history from the earliest times to the present day. The writer does not keep his personality in the background; and his erudition, his grasp of the subject, his breadth of view, make his personality the most interesting portion of the work. It is the best general history of Ireland that has yet appeared, and subsequent writers will have some difficulty in surpassing it. Once taken up by one at all interested in the subject, it will scarcely be consigned to a permanent place in a library until read through.

The preface says truly:

"The annals of few countries so clearly illustrate the evident sequence of cause and effect in the evolution of the life and fortunes of a misruled, backward, and most ill-fated community. . . . Irish history places in the fullest light the evils of wrong done in the name of religion; of a system of government planned on the principle of the ascendancy of a mere sect; of society formed in all its parts on the domination of a small caste, and on the denial of right to a conquered people; of the divisions of race and faith rending a community in twain and forbidding the fusion of classes kept apart; and of commercial restrictions of extreme harshness; and it teaches a whole series of economic lessons, throughout its long course, of the greatest value."

Judge Morris expatiates upon the immense power of circumstances in shaping the course of affairs in Ireland. Most readers will supplement his "instances" with the thought of the might-have-been in our day if Mr. Parnell had not met his Delilah.

The myths concerning the origin of the Round Towers die hard. One would suppose that Petrie had for ever laid them. We are not aware of a single scholar of Celtic literature since his day that has not agreed with him regarding their Christian origin. It would be difficult indeed to visit Ravenna without recognizing the ecclesiastical towers there as their prototypes. Our author still considers Petrie's "supposition open to doubt."

He entertains a high estimate of Henry VIII.'s Irish policy:

"He had formed views on Ireland and Irish

government remarkable for their enlightened wisdom—the best, perhaps, considering the circumstances of the time, that were ever conceived by an English statesman. He turned a deaf ear to the argument of force, and refused to listen to plans for conquering Ireland with the sword, and for 'planting' the whole country with English colonies. He wished, indeed, to be a real king in Ireland, and to make his kingship a good influence."

Judge Morris's virile exposition of past wrongs and misgovernment is strengthened by the fact, patent in his latter chapters, of his being a Unionist. We have, as the result of the latest and fullest historical inquiry, the fateful bogey of the "Massacre of 1641" fully laid:

"This is a myth devised by passion and self-interest. Unquestionably much that was atrocious was done, as has always happened in crises of the kind; there were cruel scenes of revenge and blood; but the deaths of the settlers caused by violence seem not to have been more than a few thousand, though doubtless numbers perished from other causes—cold, exposure, and the hardships of winter. . . . The colonists, stricken down at first, had ere long stood savagely at bay; and, after the fashion of a dominant race, they were guilty of barbarities of all kinds, probably worse than any inflicted on them."

Our author does not appear to us altogether fair to the Irish Parliament. He is too much inclined to compare its faults of omission and commission, not with other parliaments of the same time, but with those of to-day; and, unconsciously, we believe, he does not bring out with sufficient clearness the degree to which it would have followed a liberal and wise policy in relation to the Catholics had it not been baffled and thwarted by the British Ministry. On the other hand, he is right in his estimate of the want of wise statesmanship shown by Grattan and his compatriots in believing that the arrangement of 1782 was one that was likely to stand without modification. Had they recognized the necessity for union in essentials, Ireland might have retained her liberty in local affairs.

In describing the Repeal agitation we perceive one of the few blots into which partisanship regarding present politics has betrayed Judge Morris. He speaks of home rule as the "same thing" as repeal. No statement could be more misleading. The arrangement of 1782 was thinly veiled independence, with rights and duties, in so far as union was concerned, ill defined. "Repeal" meant a reversion to such a state of things. No one could read either of Mr. Gladstone's home-rule bills, or the debates and discussions relating to them, without recognizing that home rule as now understood implies the continuance of a union more rigid than that between our States, and the supremacy of the Imperial Parliament. The report of the Financial Relations Committee had not appeared when Judge Morris wrote, or he would scarcely speak so tentatively concerning the fiscal policy pursued towards Ireland since 1800. We are curious to know what grounds there are for the statement, on page 306, that Grattan, "in his later years, . . . seems to have approved of the Union he had so fiercely denounced."

According to our author (page 335), Irish landlords have "been grossly wronged" by recent legislation. That an Irish county court judge, often exercising functions in regard to land cases, can so write, furnishes us with a key to the extent to which legislation passed for the benefit of the Irish masses has, in its administration, been invariably stretched as far as possible against them. All recent statistics tend to prove that the English landlords, by the quiet force of surrounding public opinion, have, in the land depression affecting the whole world, had to give way more than their Irish brethren, free from surrounding public opinion, through the force of law. We might cite numerous passages in which Judge Morris admits the incapacity shown by England to legislate satisfactorily for the internal affairs of Ireland. He suggests no remedy. He knows little of the character and intentions of most of the Irish leaders of his day, or he would not have written so severely concerning them. Ireland has passed through a fiery ordeal within the past sixty years. She has lost nearly half her population. It is but ten years since a degrading Coercion Act was permanently riveted upon her. Yet he can speak of the present as "a most glorious reign." How little has he, under a union that has subsisted for ninety six years, been brought into sympathy with the mass of his fellow-countrymen!

These are, however, but slight blemishes in what is, upon the whole, a valuable book, and one which all classes of Irishmen might read with profit. We cannot conclude without a word of praise as to the preparation of this series of books. They are pleasant to handle, pleasant to read; condensed, yet clear. We trust that in a second edition the provincial divisions on the otherwise excellent map of Ireland will be made clearer.

A PROFESSOR'S SHEAF.

Harvard Studies in Classical Philology. Vol. VII. Boston: Ginn & Co. 1896.

THE latest volume of the Harvard Studies is dedicated to Prof. Lane, and is made up almost exclusively of articles by his former pupils. It was presented last commencement, under circumstances of ideal fitness and propriety, to the professor whose long and useful services it commemorates. It was the fiftieth anniversary of his A.B. degree; and, at the noon meeting of the class of '46, Mr. Greenough, in a Latin speech, presented him a specially bound copy of the dedicatory volume. The affair was a great surprise and pleasure to the Emeritus Professor, who expressed his thanks also in Latin, in the presence of a dozen classmates. No one of Prof. Lane's pupils can forget the grace, the neatness, the succinctness with which he wore his ample learning; no one of his older pupils can forget that he was above all a teacher, with inspiring manners and methods, and perfectly definite aims, at a time when the old-fashioned Harvard College possessed in its faculty many scholars—some geniuses, in fact—but very few genuine teachers. A genius is well worth catching and displaying in the environment of a university, even though he appear to be an expensive extravagance, like a magnificent orchid; a genuine teacher deserves equally to be coddled and cultivated, though he may expend his energy exclusively on kindling other minds instead of writing and publishing.

This is what Prof. Lane preferred to do, and, for the good of his pupils, was permitted to do. The complimentary preface expresses a wish that he had not been so sparing of ink and paper; but really in this very matter he has set an example of self-restraint and self-denial to the younger generation of scholars which they will find it hard to imitate. Make haste—write—publish—edit—advertise your names, and you will receive promotion—this is what the universities practically say to the young men whom they invite and urge to publish their hasty views of some Liliputian horizon. The invitation sets a premium on immaturity and inaccuracy, and multiplies raw work and fragmentary publications. Mr. Lane preferred to ripen his pearls at leisure, and let them be worn by others; or, rather, he chose to play the Socratic midwife and assist at the birth of scholars. What we gain by such a rôle is exemplified in this dedicatory volume.

The Studies offer an embarrassment of riches from which it is hard to restrict one's self in choosing nuggets. Prof. Goodwin's subtle distinctions, Prof. Herbert Weir Smyth's elaborate discussion of Æschylus's use of anapæsts, and some other valuable papers must, we regret to say, remain "caviare to the general." Prof. Greenough, in remarking on the "construction contrary to fact" in cases where no condition is expressed, represents ingeniously by diagrams the difference of voice inflections with which we say "I *meant* to go to town" according as we did or did not go; he reminds us that the Greeks and the Latins must have used similar varieties of tone to intimate the double meaning in this class of sentences. Dr. Everett contributes some clever emendations and sound criticism apropos of Brieger's useful but vulnerable, and sometimes glaringly careless, edition of Lucretius. Most scholars will agree with Prof. Morgan's sensible conclusion and proofs that Persius was not obliged to resort to his *Gradus* in writing hexameters, and that he knew his quantities, and followed satisfactory usage when he wrote *rūdere* (cf. *Bĭthyni*, Juv. 7, 15), and probably even *rŏgās*. The expression *numeros scribere* is just as natural as the English *to write metre*. Dr. Morgan is right in regarding *sitiat* (i. 60) as a true potential—that very rare usage in Latin; but his illustrations from Horace and Juvenal are not strictly pertinent, as the subjunctive in these cases is influenced by an implication of purpose or result. In iii. 29 we would read "Censorem vetulum vel quod trabeate salutas." *Vetulum*, the "good old" Censor, seems to us tolerably *Persian*, while the vocative *trabeate* is a mannerism.

Prof. Hale makes out a very strong case in controverting the ordinary Latin rule for syllabification which requires the syllable to end with a vowel and begin with a consonant or any pronounceable combination of consonants. He maintains that this rule applied mainly to the written, not to the spoken, word; and he shows that the same is the case with the Romance languages, which have been cited in support of the supposed ancient Roman practice. He finds that in daily speech the Romans and the Florentines actually say *bas-ta*, *capis-co*, *tec-nico*, not *ba-sta*, etc., as the phonetists assert. The testimony of our own ear agrees with this conclusion; and, indeed, some carefully printed Italian books and dictionaries do not follow strictly this rule of division.

Prof. F. D. Allen's excursus on Plautus's "Os Columnatum," illustrated by the modern pillory and the African slave-stick, throws new light in many points on the subject of ancient appliances for punishment, and on the dark and savage side of slave life among the Greeks and the Romans. The excellent facsimile of Coronelli's rare map of Athens, preserved in the German Institute, and dating about 1690, is here presented and discussed by Prof. J. R. Wheeler, and is an interesting token of the spread of Greek studies at that period, as well as of the Venetian conquests which culminated in the bombardment and ruin of the Parthenon. It has next to no topo-

graphical value, the orientation being in some portions 90 degrees out of the way.

The austere scientific and philological tone of these studies is relieved by the literary interest of Prof. Dyer's paper on the "Plot of the Agamemnon." It touches the same difficulty as to the sequence of events which was raised by Dr. Verrall some years ago and received from him a somewhat mechanical solution. He doubted the possibility of the beacon-message from Troy; but the late Prof. Merriam, in his paper on "Telegraphing among the Ancients," has proved the ideal plausibility of such a message. There is, besides, another apparent difficulty. The action of the greater part of the play belongs evidently to the day of Agamemnon's reaching home; but the action begins on the night of the capture and sack of Troy, of which Clytemnestra gives us an imaginative vision. It is continued by the arrival of Agamemnon's herald in the morning of the same day, his announcement of victory, and his circumstantial narrative of the shipwreck of the Greeks. Now, as a matter of prosaic fact, the herald and Agamemnon ought to have required at least a week to sail home to Argos; and one who measures time by the watch might criticise the poet, as a certain scholiast did, for "making the Greeks arrive on the same day." The general answer to this objection is that the earlier action of the play is managed with such dramatic power and imagination that the anachronism does not occur at all to the reader or spectator who has yielded to the poet's spell. But in particular Mr. Dyer points out how skilfully the dramatist has bridged the gap between Clytemnestra's vision of the sacked city and the herald's entrance, by the foreboding of the chorus and their lamentations for their lost countrymen—a lyric strain which must have swept away the hearts of his Athenian audience as they recalled many similar bereavements that had just befallen them at the time when the "Agamemnon" was first produced.

Histoire de la Langue et de la Littérature Française, des Origines à 1900. Publiée sous la direction de L. Petit de Julleville. Tome I.: Moyen Âge; Première Partie. Paris: Armand Colin & Cie. 1896.

To judge from this initial volume, the result of the task undertaken by M. Petit de Julleville and his fellow-workers will be an invaluable addition to the history of the French language and literature. The work, to be completed in eight volumes, of which the last will appear only some years hence, while it purposes to treat the subject comprehensively and minutely from the Strassburg Oaths in 842 to the end of the nineteenth century, is not intended for strictly special or for merely popular use, but is addressed to the general class of educated readers in all countries. If the volumes yet to come fulfil the promises of this first issue, we shall at last possess, in not too bulky a shape, the best conclusions of contemporary learning and judgment in France on the vast subject with which the work professes to deal. Accuracy of scholarship was, indeed, to be expected from the list of distinguished names prefixed to the table of contents; the expectation is fully justified by the character of the treatment, as well as by the admirably selective bibliography at the end of each chapter; but it is more than gratifying to find that incongruities of method and style, usually thought to be inseparable from work done in collaboration, have thus far been successfully avoided, save in one instance, to which particular attention will presently be drawn.

Two striking features of the general conception of the work call for special notice. For the first time in a complete history of French literature on a grand scale, the productions of the Middle Ages are to receive the ample space they deserve, instead of being, as in most treatises, summarily disposed of in one or two half-contemptuous, often perfunctory chapters. Further, literature and philology work here side by side, each great literary epoch being preceded by a broad yet thorough exposition of the development of the language during that time. The present volume shows the application of the plan to the period included between 842 and the time when strictly mediæval influences began to wane. From this are omitted all works written in Latin, whether scholastic or other, "as not properly belonging to the national literature, but to the general literary history of Latin Christianity."

It is not possible to speak otherwise than with unstinted praise of M. Ferdinand Brunot's masterly introduction on the origin of the French language, perhaps the ablest, and certainly to us the most interesting, chapter in the book. Though the subject bristles with controverted points, the writer has done justice to every hypothesis, all the while maintaining his own positions firmly and without a lapse into the unnecessary vivacities of expression which philological discussion seems to have an unfortunate tendency to provoke. This introduction is far too detailed to be called a sketch, and would deserve separate publication. Among other excellences it contains a comparative table of the different stages through which the French language has passed, illustrated in renderings of part of the Strassburg Oaths from the original form to that of the present day.

The literary part of the work is divided into five chapters, each of which has been assigned to a separate writer. Their subjects are as follows: religious narrative poems, national epics, epics based on ancient classical stories, epics (so called) of courtesy, and songs. In spite of the relative dulness and meagre literary importance of much of the matter here examined, not one of the writers has failed to make his share attractive; two of them, MM. Clédat and Jeanroy, who have respectively treated the subjects of the last two chapters, handle their material with rather more grace than their collaborators, probably because of the greater intrinsic interest it contains, for no competent critic can feel hampered in having to speak of Tristan and Iseut, of the lays of Marie of France, of the work of Chrétien de Troyes, or of mediæval song. The less inviting topics of religious narrative and pseudo-classical epic allotted to MM. Petit de Julleville and Constans, have been examined with scholarship and criticised with laudable sobriety of taste.

We wish that we could say the same thing of M. Léon Gautier's work on the Chansons de Geste, by far the bulkiest chapter in the volume, filling one hundred and twenty-two pages of the text. Of the erudition here displayed we cannot speak but in praise. Few passages in the book are better worked out or more interesting than his exposition of the rise and development of the epical romances that hold so important a place in the literary history of France during the Middle Ages, and in their time did so much towards keeping alive the spirit of chivalry through their presentation of heroic and national ideals. But less commendable is the enthusiastic fervor which M. Gautier thinks fit to show in upholding the *present* æsthetic merit of the 'Chanson de Roland,' of Aliscans, and all the rest—with only trifling reservations. We note, by the way, that he quotes very sparingly indeed. Not much good comes to any cause from the studious cultivation, in its defence, of an almost uniformly hyperbolical, and at times ejaculatory, style. To do this is, as has been said, to run the risk of forcibly displacing the centre of interest of a great literature. On the point in question, it is possible, even permissible, to hold a diametrically opposite opinion to that expressed by M. Gautier, for many a student of these romances timidly admits, in private, that much reading of them is a deadly weariness to the spirit. No one to-day contests their historical and linguistic importance. As M. Gautier has contented himself with merely alluding to differences of view, we venture to refer readers who may care to examine a vigorous polemic on the other side to M. Brunetière's article entitled "L'Érudition contemporaine et la littérature française au moyen âge," in the *Revue des Deux Mondes* for June 1st, 1879. The fact that this paper now stands first in the recently collected "Études Critiques" constitutes a fair presumption that the author's opinion remains unchanged.

But, notwithstanding the discrepancy, to which sufficient reference has now been made, the literary part of the work is unusually excellent; its writers have collected and classified a mass of material most of which is hardly known, even by name, to the general reader, and only imperfectly understood by many who profess familiarity with the literature of France. New conclusions were scarcely to be expected from men whose special work and ways of thinking have long been known to the world of letters, and yet each one of them has found something to add to his subject in the matter of information or of commentary. From one point of view, M. Gaston Paris's admirable preface to the first two volumes stands higher than any other division of this treatise. The sweeping generalizations, dear to the French critic, with which it abounds are not of a character to arouse hostility; they rank among the most generally accepted of critical "formulas," whether in France or out of it. What especially recommends his portion of the work to our notice is the uniform correctness and eloquent precision of his style. There is no doubt less difficulty in selecting expression for somewhat familiar propositions than in finding new ideas, the search for which is apt to interfere with what some of M. Paris's collaborators scornfully term "rhetoric"; but we may well wish that the latter had been alive to the demands of the situation in this respect, on all occasions. Surely, without cavil, it is not too much to ask that a work dealing with matters literary should be free from such cacophony as "mélange étrange" (Introd. p. lxxx.); from such a barbarous hybrid as "monoassonancé" (p. 116), which is not atoned for by its inverted commas; and from such inelegant constructions as the following: "Chacun dans *leur* langue" (Introd. p. lxxvii), "Héroïsme ou folie, l'un et l'autre *est* loin de nous" (p. 13), and "*est* une satire *et* qui n'épargne personne." The last of these clumsy constructions is repeated several times.

The book itself is a superb specimen of the best that French publishers can produce in regard to paper and type. It contains several illustrations, consisting of facsimiles of manu-

scripts and exquisite reproductions of antique illumination, rivalling the originals in delicacy and purity of color. Those, however, serve rather to embellish the volume than to elucidate matters contained in the text. It is not too much to say, in the words of the preface, that those who have aided in the preparation of this great work "have deserved well of learning and of their country," and earned the thanks of all who take pleasure in the union of sound learning with literary discrimination and skill.

State Railroad Control, with a History of its Development in Iowa. By Frank H. Dixon. With an introduction by Henry C. Adams. New York: Thomas Y. Crowell & Co.

Prof. Adams's introduction to Mr. Dixon's historical résumé divides the history of inland transportation in the United States into four periods—first, that which came to a close in 1830, marked chiefly by schemes of internal improvement at federal expense; second, the period from 1830 to 1850 (internal improvements carried on by States); third, 1850 to 1870 (railroad development by private corporations); fourth, 1870 to the present time (the period of commissions—State and interstate). Of commissions there are two sorts, weak and strong, the chief difference being that the first confines itself to investigating and making reports, while the second has authority of some kind over rates. The Massachusetts commission is the best known example of the first kind; in Iowa both sorts of commission have been tried. For the future the choice, Mr. Adams thinks, is between commissions having considerable power of control and Government ownership and management. He is opposed to Government ownership, not because it would be bad for the railroads, but because it would be bad for the Government. It would make the national administration so powerful that the legislature and judiciary would be swamped.

Prof. Adams is followed by Mr. Dixon, who gives a detailed history of the commission system in Iowa, shows how the Granger movement originated in "the feeling"—not in the fact—that "rates were too high" ("a careful study of the rate question will disclose a rapid fall in rates from the close of the war down to the end of 1870"); that the first Granger law was repealed after four years' trial, in 1878, the only intelligible reason given being that the Grangers had overshot the mark and made their law so oppressive that it could not be continued in force; that this was followed by an advisory commission, and this in 1888 by a commission with power to establish reasonable maximum rates. Meanwhile it has been made clear that the most important part of the railroad business of the country is not that subject to the States, but interstate. The supervision of this has been relegated by Congress to an Interstate Commission, so that we now have a double system, that of State commissions as to local business, and a federal commission as to through business. The history of this last system of Government supervision remains to be written.

The book, though valuable for its collection of facts, is inconclusive. It discusses a problem, as serious and comprehensive as any that can engage the attention of man, which has been approached as if it could be settled by the application of a few general principles. Rates should not be exorbitant; let us have hem all fixed by a commission. It is unfair that one shipper should pay ten dollars for a shipment from New York to Chicago, and another fifteen for a similar shipment from New York to Cleveland; prohibit it by a law against discrimination. Pooling through business tends to prevent competition; prohibit pooling. To put the whole matter in a very few words, the business of the railroads might be managed better than it is; call a Government commission into existence to manage it. The question which now needs discussion first above all, especially after twenty-five years' experience of commissions, is what they have actually accomplished.

That they have not reduced rates except here and there, and temporarily (these having been steadily forced down by general causes connected with the business itself), seems to be admitted by the author; that they have introduced any new principle for determining what is a "reasonable" rate is nowhere apparent; that they have abolished the test of "what the traffic will bear" does not seem to be asserted; that they have enabled every one to get his goods shipped for a rate determined by the mere cost of transportation is clearly not the fact. What have they done? So far as appears from this volume, they have accomplished little except to give publicity to all facts connected with what is called the "railroad problem," and to have produced a good deal of important litigation which has thrown into bolder and bolder relief the one underlying fact of all, that railroad charges are regulated in the end by economic causes over which legislatures and commissions have no control. If we were to say that thus far railroad commissions had had very much the same effect on the railroad problem that labor commissions have had on the labor problem, we should not be far out of the way. Curiously enough, there is some evidence now that the commissions are being utilized for an object exactly the opposite of that for which they were introduced—not to lower rates in the interest of shippers, but to make rates more stable in the interest of the railroad owners. To the latter for twenty-five years these commissions have been a standing socialistic menace.

The author, though he refers to the decisions of the Supreme Court (p. 28), does not seem to be aware that they decide anything more than that the States have the power to establish limitations of the right of railroad companies to fix rates. The Supreme Court has laid it down in repeated decisions that this is not an arbitrary power to confiscate and destroy, and that it cannot be used to strike at the root of property and contract. In other words, the power must be reasonably used, and of this reasonableness the courts are to judge. In the case of Reagan vs. Farmers' Loan and Trust Company (154 U. S., 362) it was held that a State Commission could be enjoined by a court of equity from enforcing rates shown to be unreasonable; in the more recent case of St. Louis and San Francisco Railway Company vs. Gill (156 U. S., 649) it was decided that if a legislature itself chose to establish unreasonable rates, the defence of unreasonableness might be set up in an action for the collection of penalties.

In conclusion, we may say that if we were to sum up the impression produced by the history of the relation between Government and transportation in this country, it would be that Prof. Adams's first period was one of schemes, and nothing else; that the second was one of State construction ending in bankruptcy; that the third was one which showed that private corporate construction and management produced great prosperity, accompanied by a declining cost to the public; and that the fourth—that of commissions and State supervision—had thus far been, among those who had actually built the railroads, one of great suffering and of constant struggle for the right to enjoy the profits guaranteed them by their charters, aggravated by wild attempts to escape the effects of depression by unnecessary construction of unproductive lines. Certainly no argument in favor of public control of rates or Government purchase can be extracted from such facts as these.

Introduction to Sociology. By Arthur Fairbanks. Charles Scribner's Sons. 1896.

The aim of Mr. Fairbanks's volume is, he tells us, rather practical than theoretic; by this he means, apparently, that it is designed as a groundwork for the study of the subject. It certainly contains a good deal of information about the development of human society, derived from the author's reading of Spencer, Darwin, Bagehot, Comte, Giddings, Malthus, Bluntschli, Montesquieu, and other writers; but when we ask what he adds to what they tell us, or what he maintains that sociology teaches, we are somewhat at a loss for an answer. The reason is that he has no very clear conception of what he means by sociology. The great discovery of Spencer was that progress is produced by the development of the heterogeneous out of the homogeneous, and the law of natural selection shows, in one field, how this takes place. Maine has explained that *status* precedes contract, and it is generally believed that all over the world common ownership of land preceded individual ownership, and the clan, the State. All this is sociological knowledge; but what is sociology? If it is merely the sum of all the sciences of man, it is no new science. If it is something different from this, what is it? Does it exhibit any law or laws not economical, not anthropological, not political, governing the development of society?

The author seems to think that it differs from political economy because it studies groups, while economics deal with man as an individual. But these groups are mere aggregations of individuals, and the author himself explains very clearly that treating the group as an organism is a mere figure of speech. The family, clan, state, or church is merely a collection of persons acting together for a common purpose. The common purpose is what determines the behavior of the group, and this common purpose is founded upon the desires, wants, aims, and beliefs of individuals. A group of great importance in our day is the corporation. Does Mr. Fairbanks really suppose that we can discover a law of the evolution of corporations without considering the purpose and aim of the half-dozen human beings who obtain the charter? Probably not. Probably he has, at bottom, a hope of discovering some law by which, at a given stage of civilization, corporations become important and common. But he can only get at it in one of two ways—either by showing that in the past corporations have always made their appearance in connection with certain surrounding phenomena, which warrants the inference of a connection between them, or that they answer some want, desire, or necessity of man as we know him. What light will sociology throw on these matters, *quâ* sociology? The *subject* of sociology is as old as man. What the science professes to teach is a

new method of studying society, but what is it?

Sociology, as it appears in Mr. Fairbanks's book, has for its content the *omne scibile* about Man as he appears in groups. We are to believe that, after the study of the individual, the study of persons grouped into "organisms," such as the family, tribe, and state, will come to crown the work. But this is a mere prediction. So we might predict a science of cosmology; but we should not feel warranted in calling the forecast practical in its aim.

Republican National Convention, St. Louis, June 16th to 18th, 1896. Illustrated. With a History of the Republican Party, and a Survey of National Politics since the Party's Foundation, etc., etc. By Charles M. Harvey. St. Louis: I. Haas Publishing and Engraving Co. 1896.

MR. HARVEY is associate editor, as his title-page announces, of the St. Louis *Globe-Democrat*, and his book is a campaign history and text-book "for permanent reference." There is a quantity of the usual campaign information, and a skeleton history of the Republican party, all of which, as far as it goes, seems to be accurately compiled, while the volume is enriched with numerous portraits of eminent contemporary Republican statesmen. These include men of such distinction as to forbid the idea, so often suggested by books of this sort, that they have been induced to become promoters of the volume by the hope of making the public familiar with their features. Possibly in some cases the portrait may slightly over-accentuate the trait which has endeared the person represented to the public, but this is no doubt owing to its having been selected by friendly, not critical hands. If straightforward frankness, rugged honesty, virile candor, and boyish *bonhomie* typify the prevailing party expressions, where should we look to find them emphasized if not in a campaign handbook? The illustrations are, for the most part, nearly equal in size and in artistic merit, and except in the few cases in which we are unfortunate enough never to have looked upon the original, we can vouch for them as unmistakable likenesses. Of those of the committee which "secured the convention for St. Louis," so much cannot fairly be said. With the exception of Mayor Walbridge, the committeemen are not treated as handsomely as the Senators and other party leaders, though this cannot have been the author's intention.

The history possesses comparatively little general value, as there is no proper examination of the merits of the questions passed in review. Reciprocity is mentioned, for instance, but we can find no explanation of what reciprocity is. The independent Republican movement of 1872 is alluded to, as is also the "Mugwump" bolt of 1884, but the author does not seem to be aware of any historical connection between the two. The Liberty party's relation to the Republican party, if only as chronologically antecedent, is not so much as hinted at.

The Hastings Chess Tournament. Edited by Horace F. Cheshire. G. P. Putnam's Sons. 1896.

The Principles of Chess. By James Mason. London: Horace Cox. 1896.

THE story of the Hastings chess tournament is very completely told in Mr. Cheshire's volume. The score of every game is given in full, and in nearly every instance the turning-point of the game is illustrated by a diagram. The annotations, instead of being by one hand, are the work of a dozen of the leading players, the idea being that no player should annotate his own games. The result of this arrangement is a mass of valuable and sometimes rather amusing criticism. Chess-players familiar with the predilections of the different masters who took part in this tournament will note, here and there, a personal flavor in their annotations which makes them more entertaining than such commentaries usually are. Mr. Cheshire has also provided likenesses and brief biographies of all the players, and has done his editorial work so carefully that, after a thorough examination, we have failed to detect a single misprint in the scores of the games.

The Hastings tournament was one of the most successful meetings of its kind. With one or two exceptions, the twenty-two players who competed were in the front rank of living players, and the games played were of excellent quality—superior, in the opinion of good judges, to those played during this summer at Nuremberg. Few finer games have ever been recorded than those played at Hastings by Steinitz against Bardeleben, by Tarrasch against Walbrodt, and by Pillsbury against Janowski; and in these particular cases the annotations of Tarrasch and Pillsbury are quite worthy of the text. One of the best innovations tried in this tournament was the giving of consolation prizes for games *won* rather than *drawn*, in order to encourage the players to finish out their games; yet, in spite of this inducement, Schlechter, who has been dubbed the "Viennese drawing-master," managed to play twelve drawn games out of his twenty-one! Another striking result of the influence of the Vienna school on the players of the day is to be found in the fact that the queen's gambit, the Ruy Lopez, and the French defence were the openings adopted in 142 games out of a total of 230. It is certainly to be regretted that the tendency of the modern game is in the direction of safety rather than of brilliancy.

Mr. James Mason, who began life as a New York newsboy, has been for twenty years one of the best-known expositors of the game, and in his little book on the 'Principles of Chess' he puts into convenient shape much information about position play and the openings which the beginner will find useful. But, after all, chess is like other games, and the best way to learn it is to practise with stronger players.

BOOKS OF THE WEEK.

Abbott, Rev. Lyman. Christianity and Social Problems. Boston: Houghton, Mifflin & Co. $1.25.
Amicis, Edmondo de. Constantinople. Putnams. $2.25.
Andrews, Prof. C. M. The Historical Development of Modern Europe. Vol. I. 1815–1850 Putnams $2.50.

THE ENGLISH DIALECT DICTIONARY.

Being the Complete Vocabulary of all Dialect Words still in use or known to have been in use during the last Two Hundred Years; founded mainly on the Publications of the English Dialect Society and a large amount of material never before printed. Edited by JOSEPH WRIGHT, M.A., Ph.D., Deputy Professor of Comparative Philology in the University of Oxford (Hon. Secretary and Literary Director of the English Dialect Society). To be completed in 16 Parts. Large quarto. Part I *now ready*. Price to subscribers, per Part, $3.75.

"This is a work of no little magnitude and importance . . . and there is ground for congratulation on the part of the scholarly public that its publication has at length been entered upon. The extraordinary energy shown in the undertaking by Professor Wright gives assurance that the work will be satisfactorily completed at no very distant date. . . . No one who can at all appreciate the difficulties to be encountered will regard what Professor Wright has so far accomplished as anything short of a brilliant success. . . . The English Dialect Dictionary will assuredly deserve a place among the very best productions of English philological scholarship."—*London Athenæum.*

G. P. PUTNAM'S SONS

NEW YORK AND LONDON.

A NEW NOVEL BY THE AUTHOR OF "THE PRINCESS SONIA."

The Violet.

A NOVEL.

By JULIA MAGRUDER. With 11 Illustrations by Charles Dana Gibson. Crown 8vo, cloth, ornamental, gilt top, $1.25.

"It contains no objectionable woman-with-a-past. It is an old-fashioned story, and all the people in it give you a satisfying sense that you are in good society. The heroine, poor, beautiful, accomplished, makes a very satisfactory subject for romance. C. D. Gibson's numerous illustrations are in his best manner, and add greatly to the attractiveness of the book."—*The Bookbuyer.*

Important New Books

PUBLISHED TO-DAY BY

LITTLE, BROWN & CO.

"QUO VADIS." A New Historical Romance by the Author of "With Fire and Sword."

"QUO VADIS" A Narrative of Rome in the Time of Nero. By HENRYK SIENKIEWICZ, Author of "With Fire and Sword," "The Deluge," etc. Translated from the Polish by JEREMIAH CURTIN. Crown 8vo. Cloth. $2.00.

This remarkable romance, dealing with history and religion, with the customs of Rome in the days of Nero, and the martyrdom of the early Christians, although a strong contrast to the famous "With Fire and Sword" series and the author's novels of modern Poland, is likely to take a place as the greatest of his works.

The End of the Beginning.

A New England Romance. 16mo. Buckram, gilt top. $1.25.

The problematic title of a new story that may claim for itself a place somewhat aside from the thousand and one novels of the day.

Salamon's Memoirs During the Revolution.

MGR. DE SALAMON. UNPUBLISHED MEMOIRS OF THE INTERNUNCIO AT PARIS DURING THE REVOLUTION, 1790-1801. With Preface, Introduction, Notes, and Documents by the Abbé Bridier, of the Clergy of Paris. Portrait. Crown 8vo. Cloth, gilt top, $2.00.

A narrative of some of the most remarkable events in the French Revolution, from the pen of an eye-witness, one who was brought into close contact with the social life of the time.

Nuttall's Handbook of Birds.

A new edition, with important additions, and a series of more than one hundred colored illustrations.

A POPULAR HANDBOOK OF THE ORNITHOLOGY OF EASTERN NORTH AMERICA. By THOMAS NUTTALL. Revised and annotated by Montague Chamberlain. Vol. I., *Land Birds.* Vol. II., *Game and Water Birds.* Second edition, with corrections and additions. Illustrated with one hundred and seventy-two beautifully engraved figures and a series of twenty exquisitely colored plates, containing one hundred and ten full-length figures of the most important land and water birds. 2 vols. Crown 8vo, Cloth, extra, gilt top, $7.50 *net.*

The Nation.

NEW YORK, THURSDAY, OCTOBER 22, 1896.

The Week.

THE statement of this country's total foreign trade during September, issued on Thursday by the Bureau of Statistics, makes without question the most remarkable showing, for the autumn season, in the history of American commerce. It was in September, 1891, that the failure of the European and Asiatic wheat crops started the huge export movement of American grain to Europe. Our export record of that year has long been proverbial in the records of United States commerce. Yet, though our total export trade of September, 1891, reached the large figure of $82,954,085, the exports of last month rise materially above it, reaching the quite unprecedented total of $85,098,594. To appreciate the bearing of such a movement on the present situation, comparison with more recent years is necessary. This September export trade of 1896 rises $26,558,531 above that of September, 1895, and $26,059.731 above 1894. When the almost equally remarkable shrinkage in merchandise import trade last month, as compared with previous years, is taken into reckoning, the contrast becomes even more impressive. Our exports last month exceeded imports by $34,272,889, whereas in the same month of 1895 there was an actual excess of imports reaching $6,765,257. There is little cause for astonishment in the favorable movement of the foreign exchanges when such a radical alteration in our trade situation has occurred.

It is sufficiently well known that a large part of this enormous export trade has been caused, in 1896, as in 1891, by a shortage of certain European grain crops, against a very generous harvest in this country. But it would be a great mistake to ascribe entirely to the grain movement the present heavy export trade. The record of September's grain exports, by quantity and by volume, is issued by the Bureau simultaneously with its general trade report, and throws great light on the details of the movement. Comparison of these figures with those of the corresponding month in 1891 shows very plainly that other commodities have combined with breadstuffs in raising this year's export average to its heavy total. It is true, the breadstuffs export movement of September shows an increase of fully 51 per cent. over last year; but as yet it makes no such comparison with 1891. Although our total exports of all kinds exceed the record of that year, the breadstuffs trade of 1896 falls materially lower. Last month, for instance, the country's total wheat exports were 9,649,253 bushels; in September, 1891, they were 19,496,165. The corn exports, to be sure, were this year nearly double those of 1891, and flour exports are slightly larger; but rye falls very far below the record of five years ago. In brief, the value of all breadstuffs exports in September, 1896, was $17,054,222; in September, 1891, it was $31,462,021. But in 1891 the breadstuffs exports made up nearly 38 per cent. of the total September exports; this year their percentage of the total is barely 20. From this the necessary conclusion is, that our export trade this season, in all branches of general products and of manufactures, has not only vastly exceeded that of a year ago, but has passed far beyond the record of 1891. In other words, the country's manufacturing export trade, after two years of the Wilson tariff act, has reached a volume quite without precedent in our history.

We have received from a puzzled correspondent a copy of a campaign document of the Bryan kind entitled "Sound Labor Questions," some particular parts of which we are desired to answer. The first part which calls for attention is this:

> "Can one business man who gets 68½ cents for wheat, for instance, compete with a business man getting $1.37 for the same quality and quantity of wheat? Of course not, you say; but 68½ cents in money is what the American farmer gets when his competitor, the Hindu farmer, gets $1.37 in money for identically the same quantity of wheat."

This brilliant argument was scarcely dry from the press when the American farmer who could not possibly compete with the Hindu farmer in raising wheat, began to export wheat from San Francisco to India in large quantities, showing that he could easily compete, not only in the Liverpool market, but in the Bombay market also. This, it may be urged, is an exceptional condition, due to a short crop in India, but does it not suggest that the price at any particular time is due to the law of supply and demand, and not to the kind of money in use?

The writer of "Sound Labor Questions" goes on to say that

> "if an ounce of silver can be bought in London for 68½ cents, that is all they will pay for an ounce of coined money—silver rupees; but the money value, in India, of an ounce of rupees is $1.37, or double the price of silver metal uncoined. As you can buy nearly double the number of rupees to-day with gold that you could twenty years ago, so you can buy in India two bushels of wheat or double the quantity of cotton that you could twenty years ago with the same amount of gold, because the market value of the silver in the rupee has nothing to do with its money value in India."

This is puzzling because nobody can understand it. It implies that anybody can buy silver in the London market at 68½ cents per ounce and have that silver converted into rupees, which he can use in wheat-buying at the rate of $1.37 per ounce. This is not true. The mints of India were closed to the coinage of rupees more than three years ago. Nobody can buy silver in London for conversion into rupees at any rate whatever. Therefore the whole argument falls to the ground. But the argument was unsound even before the Indian mints were closed. The commission who examined the question reported that the export trade of India was more active and prosperous when the rupee was steady in value than when it was declining. They reported also that any advantage gained by the exporter of wheat in India by the fall in the value of silver was at the expense of labor, and that the depreciation of the currency had been a great hardship to the wage-earning class. So it would be here.

It is evident from Bryan's speech to the women, as well as from several other speeches, that he has in his mind two silver dollars, one of high purchasing power and hard to get hold of. This is for the use of the people who have something to sell. The other is to be of low purchasing power, and easy to get, for the use of people who have debts to pay It is, of course, very hard to recommend both these dollars to the same people, but he seems to act on the same principle as the man who aimed his gun so as to miss if it was a cow and kill if it was a deer. The new Bryanite dollar is to have the quality of becoming very valuable and high-priced in the hands of a man who has wheat to sell, but in the hands of a debtor it is to become quite cheap and plentiful. We can hardly think of a better arrangement than this. The only fault we find with it is that it does not go far enough. We think that there ought to be dollars for each class in the community, just like clothing and food—a dollar for men, a dollar for women, a dollar for the workingman, and a dollar for the idle rich man. There will never be true happiness till every man has his and every woman has her own dollar, suited to his or her circumstances in life. There would then be no complaints. And we would have it an American dollar, of good American silver and coined in the best manner. Only, of course, all dollars would not have the same value. Why should the poor washerwoman have the same dollar as the Fifth Avenue lady, any more than the same gown or boots? Bryan has not yet hit on the real thing, but he is marching in the right direction, and he will "get there." This compulsion of the poor to use the same dollar as the rich is the worst feature of the régime which is shaking under his blows. A

dollar suited to each man's individual needs is what the times call for.

Chairman Jones of the Popocratic national committee has aroused the country with another call to arms against perils which it does not suspect. He says that the "great corporations, with scarcely an exception, and many of the large employees of labor are engaged in a concerted effort to coerce their employees into voting at the approaching election against their own convictions," and declares his solemn belief that if the conspiracy prospers, "government by corporations will have succeeded government by the people." Jones says he shall do all he can to prevent it by having "every scoundrel, whether public officer or private citizen, who is detected in any violation of the law, vigorously prosecuted and sent to the penitentiary if possible." There will be no trouble about doing this. The election, in all except a few Southern States, will be held under the Australian ballot system. No voter can be coerced unless the coercer forces his way into the booth with him and bulldozes him there in the marking of his ballot. Jones can catch any "conspirator" who tries to do this and can land him in the penitentiary without difficulty. He need not make public disturbance now about this, for the public is with him everywhere. Nobody has ever tried to violate the booth law since its adoption, except some of Jones's Tammany Hall friends in this city a few years ago, and it should calm Jones to reflect upon the fact that they *were* all sent to the penitentiary without the aid of a "call to the people."

Election bets are not safe criteria of the state of public opinion, but if they could be considered in this light, the bets made every day in Wall Street would settle the matter against Mr. Bryan decisively. Here, for example, is a firm of substantial resources offering to sell "calls" for gold, good until November 6, at 1⅛ premium, or until December 15 at 1¾ premium. All calls sold will be guaranteed by the American Surety Company. It is not necessary that the buyer of these calls should deposit anything except the 1⅛ per cent. If he wants to insure himself to the extent of $10,000, he can put up $112.50, and then the firm will give him $10,000 in gold after the election in exchange for $10,000 in United States currency. The latter may be all silver certificates if he chooses, or it may be a certified bank check. There is no limit to the amount of business that can be transacted on this basis. Sums smaller than $10,000 are not offered, because the amount of the premium is not large enough to warrant the expense of getting the contracts guaranteed by the surety company for sums less than that amount. For any larger sum the door is open during business hours. Now if Mr. Bryan were to be elected, the premium on gold immediately after that event would be much greater than 1⅛ per cent. It would be much greater on the 15th of December than 1¾ per cent. Therefore these offers to sell gold for future delivery, while purely business transactions, are virtually bets that Mr. Bryan will not be elected. Of course the firm which makes these bets takes no risk. All that it needs to do is to buy sterling exchange at the same time that it sells the call. It can buy sixty-day bills at a rate which will save the interest meanwhile. This means that the whole commercial world takes the same view of Bryan's chances of election that this particular firm does.

The exceptionally large registration throughout this State, especially in all the cities, affords the usual amount of satisfaction to the "arithmetic men" of both parties, but the claims of encouragement which the Bryanites put forth come chiefly from the mouth of Johnny Sheehan and have a very empty sound. Nobody knows better than Sheehan that there is no encouragement for him in the registration figures, or in any other aspect of the campaign in this city and State. For the first time in the city's history, money is wagered on the size of the Republican majority here. It is generally believed that McKinley will carry the city—an assumption that is not at all unreasonable in view of the fact that there was a majority cast against Hill for Governor here in the election of 1894. Hill's vote was 127,000, and the combined vote of Morton and Wheeler was 133,000, or 6,000 greater. Nobody expects that Bryan will poll as many votes as Hill did, for Tammany was united and enthusiastic for Hill, while it is completely demoralized over Bryan. The registration in this city is in some respects a disappointment, but there is no doubt that the chief reason why a larger increase was not made is to be found in Democratic dissatisfaction. Believing that the State is certain to go for McKinley by an overwhelming majority, many Democrats decided not to register. Whatever gains there are here and in other cities may be set down safely, therefore, as in favor of the Republicans.

The decision of the Court of Appeals in favor of allowing the ticket of the National Democrats to be printed upon the ballots in this State is a verdict of great value. Being unanimous, it cannot be disputed as sound law, and as sound common sense it is above question. The first object of the secret-ballot system, with all ballots printed and distributed at the public expense, is to give all candidates a just and equal standing before the voters at the polls. The object of the efforts that the Popocratic managers in this and other States have been making to keep Palmer and Buckner electors off the ballots, has been to prevent the people from having this free chance to express their will. They were afraid that if the National Democratic ticket was before them, many voters might prefer that to the Bryan ticket. There was no other purpose in their opposition. They have been defeated in nearly every case, we believe, and the judicial verdict in this State is so emphatic that it will stand as a precedent and will discourage the repetition of such efforts in the future.

Gov. Altgeld's speech at Cooper Union on Saturday was principally a defence of what is called the "free-riot clause" of the Chicago platform. His allusions to the silver question were few, and of a kind to show that he understands free coinage to be something very obnoxious to rich people, and therefore presumably right. He attacked President Cleveland for not waiting till he (Altgeld) was ready to suppress the Debs riots—if there really were any such riots, of which there is grave doubt in his mind. He says that he had suppressed some coal riots in Illinois before, and he thinks that that fact ought to have convinced the President that he intended to suppress the Debs disturbances, admitting, for the sake of argument, that there were any. If there were any riots in Chicago, Altgeld holds that they were not of a kind to warrant interference by the President. The mails had not been stopped, interstate commerce had not been blocked, nothing had occurred which could be called a breach of federal law. In laying down these premises, Gov. Altgeld differs from the judges who passed upon these questions afterwards, including the judges of the Supreme Court. But his speech was so largely directed against judges that this point of disagreement is trifling in comparison with others.

Mr. Lucius B. Swift of Indianapolis has for eight years edited in that city the *Civil-Service Chronicle*, a monthly journal devoted to the cause of civil-service reform. He announces that with the defeat of Bryan, which he confidently expects, he shall suspend its issue. The Indianapolis *News* makes this announcement the text for a well-deserved tribute to Mr. Swift. The conduct of the *Chronicle* has been an admirable illustration of the effective work in the interest of good government which can be done by a public-spirited citizen. For eight years Mr. Swift has made this little journal a scourge for the spoilsman wherever he found him, attacking Republican and Democratic offenders with equal vigor. There was no State in the Union where the doctrine of reform in the civil service more needed to be preached than Indiana when he began his work, and no place in the nation that offered a better field for such a

publication than a city in the heart of the interior region of the country, which was slower than the Atlantic seaboard to recognize the significance of the movement. At first ridiculed and then abused, Mr. Swift has at last come to see the importance of his work recognized even by the spoilsmen, and its value to the community confessed by all friends of good government.

An appeal reaches us from a "Distressed *Tribune* Reader" for help against the impending "Serio-Comic Supplement of sixteen pages" with which the editor of that journal threatens him in future. He calls attention to the fact that if the *Tribune* adopts it, there will be no Sunday paper left in the city which a respectable, intelligent man can see come into his house without groans of anguish, and asks if something cannot be done to "bring the editors of our great dailies to their senses." He adds: "The *Tribune's* conduct strikes me like that of an eminently respectable lady who, having reached advanced age in an entirely decorous manner, suddenly dons bloomers and takes to the bicycle." We are sorry to say that we are powerless in this matter. The journalistic view which impels the *Tribune* to put on the cast-off clothing of a deceased journalistic mountebank, who died of starvation through public neglect, is something beyond our powers of comprehension. We should very much like to have Horace Greeley restored to us in full vigor for a few minutes in order to hear his opinion of it. What he would say to a "Serio-Comic Supplement of sixteen pages, some of the pages in colors, devoted to wit, humor, and satire, and containing a profusion of political cartoons, half-tone pictures, pen drawings, etc.," issued from the *Tribune* office, any of his old acquaintances can imagine. Were he to reappear, we fancy that his successor would do what the gentleman did who was overtaken by the irate father whose daughter he was eloping with—put a broad table between them "lest acts might be committed which both of them would regret for ever afterwards."

Under the treaty of Berlin, the Porte promised to provide satisfactorily for the protection of the Christians, and Great Britain was to insist on fulfilment in return for its protection of the Porte against Russia. At Edinburgh, Lord Rosebery took up this separate agreement, and said England was not bound in honor to intervene in consequence of it. He declared that he always understood that, "the Sultan not having fulfilled, or tried to fulfil, any one of his pledges under that convention, England had been equally released from hers," and "that the convention had been a dead letter ever since it was signed." So that "the peace with honor" treaty was pure humbug, and bound the Sultan to nothing, while it was used to persuade the British public that its fleets and armies had accomplished a great work for humanity. From this fact, the deadness of the treaty for eighteen years, Lord Rosebery deduces the conclusion that the present Government is no more bound to interfere than those which have preceded it since 1878, in spite of the fact that this year the evils against which the Cyprus convention was intended to guard, and which England then, to all outward appearance, pledged herself to prevent, have assumed an acute form, and have caused the death, it is estimated, of 100,000 human beings. In no year since the convention was made has this, or anything like this, happened. What it proves is, not that the treaty should now be treated as null and void, but that it was a shameful thing not to have enforced it from the beginning, because, had it been enforced, these horrors could not have taken place. Lord Rosebery's argument, if sound, means that as long as England keeps Cyprus the Sultan may do what he pleases to the Christians. This is a nice little argument, but it is hardly one for the chief of the Liberal party to make.

Lord Rosebery's account of the treaty throws an interesting light on the "concessions" Mr. Terrell has secured from the Porte, and on the treaty the Porte is going to negotiate with us. It appears that the Porte has agreed to let the wives and children of Armenians naturalized and living in America join their husbands and fathers in this country. Just think of this. See what comes of patient negotiation, and how the old man loves America and Mr. Terrell. The Porte has agreed also to negotiate a new treaty affirming and explaining the treaty of 1830, giving our consuls complete exterritorial jurisdiction over our citizens in Turkey, native as well as naturalized. As the Porte has broken this treaty constantly with regard to naturalized citizens, the importance of getting it to make another cannot be overestimated. It must be said for the Porte that it has hardly ever refused to make a promise or a treaty, and we trust Minister Terrell will get a good lot of them out of it.

At the close of Sir William Harcourt's address on the Armenian difficulty on the 5th, he took up the old question why England is not liked. That she is not liked he admitted, and said that the tone of the Continental press seemed to indicate that the Powers were much more likely to combine to menace England than to aid Armenia. Sir William frankly declared that one cause was bad manners and lack of cordiality on the part of those responsible for English diplomacy. Then he added that England, while resolute to advance her own empire in every way, had shown unreasonable jealousy of the successes of other countries. It had not been perceived that the advantage of another nation might also be the advantage of England. Hence had come the succession of panics in England over the alarming growth of some foreign power. In the sixties it was France that was going to invade England, and after 1870 no true-hearted Englishman could sleep without dreaming of the Battle of Dorking. Later on, Russia became the great national bugbear, and had remained such till the present time. All this was as absurd as it was undignified, argued Sir William, and it was high time that England, after having tried overbearing manners and international suspicion all these years, should see what a conciliatory tone and a true *entente cordiale* would do.

Statues to public men have been the theme of much artistic and moralizing discussion in the French papers of late, and a good deal of speculation has been indulged in respecting the reasons why some men are favored at the expense of others. Merit, or even popularity, does not always seem to determine why one popular subscription for a statue to a poet or philosopher should be successful and another fail. Why, for example, should a monument be erected to Mürger, while Chénier and De Vigny still go uncommemorated? It cannot be that the admirers of the former outnumber those of either of the latter, or that they are richer or more enthusiastic. M. Ed. Rod seems to have hit upon the solution of the puzzle, and to have developed, at the same time, a fruitful principle governing in such matters. It is not that Mürger is so much worshipped, but that he is a convenient club with which to whack unpleasant people over the head. His statue is not erected *to* him, but *against* others. His works are pure mediocrity, and no one knows that better than the subscribers to his monument; but he was most annoying and offensive to people whom they heartily dislike, and what could be more delicious than to carve his figure and put it in a public place in order perpetually to remind them of their enemy? The principle is obviously capable of wide expansion. You might not be willing to give a sou for the purpose of placing a bust of Montesquieu in a library, but if you were shown one of Diderot across the room, and were appealed to as against him, you might put your name down for three figures. In other words, a public statue as an expression of hate or revenge has a great future before it. Only get it into people's heads that monuments may be erected to spite somebody, and the offers to fill up Central Park with specimens of the lapidary art would fairly rain upon the Board of Aldermen: a statue to Whitman in order to exasperate his detractors; one to Platt in order to see the *Tribune* writhe; one to Dana for the sake of making Tammany yell, and so on.

WHEAT ADVANCES, SILVER DECLINES.

THE rapid advance in the price of wheat and the persistent decline in the price of silver have arrested public attention more than any other fact in the course of the present campaign. This is very natural when we reflect that the main argument of the Popocrats at the beginning of the campaign, and indeed for several years past, has been that the gold standard has depressed the price of wheat and everything else. To prove this, they have paraded figures to show that the downward price of silver has kept pace with the downward price of wheat, that the two have run in parallel courses, and that such a phenomenon could be due only to the "grip of gold." 'Coin's Financial School' is full of this, and Mr. Bryan echoed the same argument repeatedly during the earlier months of the campaign. When wheat began to advance a few weeks ago, he said that the rise was due to the prospect of his election. There was no way to disprove this, although it was evident to all persons acquainted with the conditions of the market that the rise was due to the cessation of wheat exports from India, and the bad crop conditions in other countries which are usually our competitors in the production of that cereal.

A new element has since forced itself upon Mr. Bryan's notice, although he has not yet told how he explains it. Silver has fallen more than 4 cents per ounce, while wheat has advanced more than 22 cents per bushel. If there is any article of commerce which ought to advance on the prospect of Mr. Bryan's election, it is silver. He says that free coinage will cause it to rise to $1.29 per ounce, and that his election means free coinage; it ought, on his own theory, to show a considerable advance now, instead of which it has fallen to the lowest price known in the past two years. Mr. Bryan will probably explain that the bankers and syndicates have conspired to put up the price of wheat and to put down the price of silver for political effect, and very likely he will make many of his followers believe it—especially those who believe that bankers and syndicates are in the habit of cornering gold in order to oppress the debtor class.

The causes of the present advance in wheat and decline of silver are to be found, as heretofore, in the law of supply and demand. Not only has India ceased to export wheat, in consequence of the drought, but she has begun to import it from Australia and even from California, according to recent reports. The Russian supply is also short. Foreign purchases in our market to make good these deficiencies have put up the price. There is nothing simpler, nothing more easily understood. On the other hand, the demand for silver in China and Japan has fallen off. The following explanation of the decline in demand is given by the *London and China Express* of September 25:

"The speculation which had held silver above the parity of rates of exchange in the East has died out, while only disturbing elements remain. We refer to the uncertainty attending matters in the United States, to which have to be added the almost total absence of shipments of silk from Japan, and the very small purchases of this commodity made in China. The position in the Far East, which, being the ultimate consumer of most of the white metal produced, has a considerable say in fixing its value, is that bills are all going one way, and that, consequently, little support is accorded. Shipments of Straits produce also continue on a small scale, and therefore lend no assistance."

In other words, the price of silver has been governed by the law of supply and demand, just like the price of wheat. If India is unable to export wheat, she is less able to buy silver. If the Straits Settlements are not exporting so much of their produce as formerly, they are under the same disability. If China and Japan for any reason are not sending as much silk abroad as usual, they too are disabled from buying silver in the customary amounts. The two phenomena, which have come to pass just at a time when they were most needed to confound the silverites, are explainable in the simplest possible way, and they show conclusively that the other movements in the price of wheat and silver, which played so great a part in 'Coin's Financial School,' were due to like causes, and that the "grip of gold" had nothing to do with them one way or the other.

There is now every prospect that Mr. Bryan will be beaten overwhelmingly. If the business world did not think so, both East and West, not only would silver advance, but gold would be going out of the country, instead of coming in, and business would be growing worse instead of better in every quarter of the Union. When he is beaten, and all elements of uncertainty as to the standard of value are eliminated, there is every reason to expect a season of prosperity akin to that which followed the resumption of specie payments in 1879. Every tradesman knows that his customers are holding back their orders for goods till after the election. They are buying the very smallest quantities that they can get on with. If a man thinks of furnishing or refurnishing his house, or buying anything beyond what he must eat and wear from day to day, he puts it off till after the election. He wants to know what he can expect after that momentous event, and although he may feel very sure that the Popocrats will be defeated, he wants to have absolute certainty before he risks his money in anything. This state of mind is reflected in the hoarding of gold which is going on in all parts of the country. These hoardings are in small amounts to each individual hoarder, but are large in the aggregate and have caused a small premium for the yellow metal over paper currency. When the silver craze is smashed, these hoards will be unlocked, and the long-withheld orders for merchandise of every kind will come forward, and we shall have once more a period of active trade, confident enterprise, and large demand for labor—conditions that can never come so long as a doubt remains whether the dollar is to be worth one hundred cents or only fifty.

THE OFFICES, AND INTEREST IN POLITICS.

ONE of the extraordinary features of this extraordinary campaign has been strangely overlooked by some of our ablest thinkers and publicists. We refer to the fact that the offices to be striven for were never so few, while political interest was almost never so great. This surprising state of affairs certainly calls for explanation. Our gravest and most experienced instructors in the principles of public life, under a democracy, have assured us for years that what we are now seeing we never should see. As the offices were made competitive, interest in politics would gradually decline, until, if the civil-service reformers had their way and got all the offices under the rules, no one would go to the polls except a few dyspeptic professors and valetudinarians. To the men who have been solemnly telling us this all the while, the spectacle the campaign now affords must excite special wonder.

As to the facts there can be no question. President Cleveland's order of last May, together with the subsequent regulations made, removed practically the whole federal civil service from its time-honored place in the quadrennial pig-trough. Something like 90,000 "places" are now under the rules, their occupants protected from intimidation, assessment, or partisan displacement. And, what is more, McKinley approves of this work and promises to sustain and continue it. He is thoroughly pledged to "extend the civil-service laws wherever practicable," to "take no backward step," and to "improve, but never degrade, the public service." Now, according to the leading authorities on American politics, this should have been fatal to the McKinley canvass. No offices, no interest; no "places," no organization, no votes. Especially might this have been expected to be the result in view of Bryan's attitude. In this respect he is up to the level of old-fashioned American patriotism. No "life tenure" for him. No "aristocracy of office-holders" under his administration. As it was the President's order that removed the offices from the scramblers, another Presidential order can restore them, and such an order Bryan tacitly promises to issue. His opponent has no offices to hold out as bait; *he* holds them all out. On the theory in which we have been carefully educated, this should have meant at once a dispirited and flagging campaign for McKinley, an enthusiastic and cumulative rising of the masses of free-

men for Bryan. But the plaguey thing has not worked that way, and we think our old political philosophers are bound to tell us why.

We shall not let them off with the excuse that the issue this year is one of absorbing interest and transcendent importance. It is precisely that kind of an issue which required and justified the spoils system. Confound it, with your country in peril, were you going to haggle about giving the bosses a few offices? Didn't you see that, while your theories might be all very well, you really could not, you know, in practical politics overlook the actual forces that decided elections, and you should say now, as an honest man and a patriot, whether you would prefer to have the rebel debt assumed, with slavery very likely reëstablished, all the mills closed, and business ruined, instead of waiting a few years until the public mind was ripe for your civil-service views? Of course, we should not get angels in *all* the offices—no reasonable man would expect that—but just consider the tremendous importance of carrying this election, and do be practical for this once.

Everybody knows, in fact, with what enthusiasm the spoils politicians would have welcomed the critical issues of this campaign as just the strongest arguments against reform. "*This* year of all untimely years," they would have said. "Think of the millions of wage-earners in terror at the threat to cut their pay in two, and then tell us if you have the heart to take the offices away from us and so break down the gold standard. Oh, those widows and orphans, whose little all is endangered while you cold theorists are calmly discussing utopian plans, without seeing that this is the time for urgent action by strong men, using every available means, ready to pledge every office five times over in order to avert the distress of innocent and helpless women and children."

All such humbug has been given the lie in this campaign in a way that ought to serve for all time. We have seen unequalled enthusiasm for the candidate who promises no offices, while his opponent, who does not conceal his aim to loot the public service to reward his followers, has thereby made his canvass but so much the more hopeless. The keenest and most general political interest that we have witnessed for a generation has been, in short, aroused without a particle of what was so long alleged to be the necessary stimulus. Some of the most enthusiastic workers in the campaign—the gold Democrats—have, by their action, positively cut themselves off from every hope of getting office. The spoilsmen were all along the real theorists. Moreover, as is now clear, they were wretched slanderers of the American people in asserting that there could be no interest in politics without the motive of personal profit and greed; and one of the great achievements of this campaign will be the final disposing of that slander for the brainless and degrading thing it is.

INTERNATIONAL MISUNDERSTANDING.

THE difficulty nations have in understanding each other was never better illustrated than by the explanations and predictions in regard to the present crisis in America which reach us from the other side of the water. In the first place, there are currents of thought and feeling in every country which escape the observation of a stranger, and can become known to him only by long residence and by daily contact with a large number of natives. He finds out in this way, little by little, by an infinite variety of small incidents, why certain things which cannot and will not be in any given country, seem quite possible and likely to a foreigner reasoning on the matter à priori. A Frenchman's account of an English girl, or of the relations of the sexes in England or America, is an example of this. It may be logically deducible from a considerable number of undeniable facts, and yet the Englishman or American knows it to be absurd. In the same way it would have been (and has been, we may say) impossible during the last twenty years to explain to an American silver man or bimetallist why there was no likelihood that England would adopt the double standard. He would go to England, see a certain number of ardent bimetallists (bimetallism is a kind of religion), one or two of them ex-Governors of the Bank of England, hear that Mr. Balfour, the great English statesman, was a bimetallist, and come back with the conclusion that the old pound sterling was doomed. But the average English business man would feel in his bones that it was all nonsense, and that the pound sterling was as safe as the pyramids. He would tell you that it was to her dislike of such "fads" that England's commercial greatness was due, that Mr. Balfour was not a financial authority, and that his opinions on finance made no impression on that portion of the English public which knows and feels, through daily use and wont, the importance and value of the gold standard.

In the second place, foreigners naturally find it impossible to estimate the weight and importance of men who profess to speak for their own country abroad, explain its motives, and record the drift of its popular opinion. It is not unnatural that a man's official position, such as Mr. Balfour's, or Senator Lodge's, or Senator Morgan's, should seem to arm him with authority on all subjects whatever; and yet only a native could tell accurately on what subjects he was to be listened to, and on what laughed at, and how much importance should really be attached to his official position. This difficulty is increased in England with regard to America by the English practice, due mainly to the absence of well-defined social classes in this country, of lumping all Americans together as essentially the same thing. This is carried so far that often there are assumptions in England that any American would be glad over there to meet any other American; that any editor would fly to the arms of James Gordon Bennett, Joseph Pulitzer, or Mrs. Frank Leslie; that Mr. J. C. Carter would be delighted to come across Howe & Hummell in London, or President Eliot to hobnob with Edward Lauterbach. Why not, they would say; is he not an American? Consequently, anybody who can put "U. S. A." to his name, finds ready access to a prominent place in the London papers, whether he comes from Montana or New York, and whether he has kept a gambling-house or preached the Gospel; and is listened to with equal deference. Not the slightest trouble is taken to gauge him, or weigh him, or ascertain by what right he speaks for one of the largest and most heterogeneous countries in the world.

It is to this curious state of mind that we owe the attention given to Mr. Thomas G. Shearman recently in the London *Times*. He wrote one or two long letters explaining the Bryan trouble and the condition of the West. As facts, they were a mass of blunders and exaggerations, as was shown conclusively a day or two later by Mr. Parker, our consul at Birmingham. As opinions, we shall only say that, produced at Mr. Shearman's habitat, Brooklyn, they would not have attracted the smallest attention, and we can say all this without denying that Mr. Shearman is a man of ability. Nevertheless, the *Times* had two editorials on the letters as a revelation. The *Spectator* had another, and thanked him for letting light in on the Bryan question. This same method of weighing authorities has led some of the London journals to discredit the Eastern papers, as not knowing what they were talking about when they predicted Bryan's defeat, in that they were under the influence of the "money power" and paid attention only to what was passing in their immediate vicinity, for had not William C. Pink of Arkansas, U. S. A., or Moses J. Cheever of Oklahoma Territory, U. S. A., explained fully why Bryan would carry every State in the Union except New York, Pennsylvania, and Massachusetts?

We do not know that there is any remedy for this state of things but inquiry. In these days, when every man who wishes can find an organ, if the mere wish to write on any subject is taken as competence to write, confusion must always reign. There could hardly be a more potent cause of blunders about America than the habit of taking for granted that any American who, happening to be in London, chooses to lift up his voice for the "U. S. A.," is to be

listened to with attention and respect. Before keeping silence in the presence of a fluent talker or writer about American affairs, it would be always well to ask, What attention is paid to him at home? Do people listen to him there with respect? Whom does he persuade? What proof has he given of honesty and perspicacity? Have his predictions ever come true? What was he doing in Arkansas or Oklahoma before he took up the business of enlightening Englishmen about affairs in his native land?

THE ISOLATION OF AMERICAN HISTORY.

THE past ten or fifteen years have seen a remarkable awakening of interest in the academic study of American history. Formerly the subject was one to which colleges paid not much attention; a single brief course, usually neither thorough nor interesting, being all that most institutions offered. But with the development of universities and the increase of facilities for advanced work, courses of instruction in American history have come to occupy a place of especial prominence in the historical curriculum, while significant fruit of the new enthusiasm appears in a long list of monographs, annotated reprints of historical documents, and "topical outlines" for the use of students, all testifying to earnestness and industry, and often fairly bristling with an array of "critical apparatus." No field of historical inquiry in the United States now calls out such widespread interest or enlists so many workers as does American history, and in scarce any department has zeal for publication run such lengths.

Something of this quite exceptional popularity is doubtless attributable to patriotic impulse, and the natural attractiveness of an accessible and not much wrought vein. Something, also, is certainly due to the fact that American history, in comparison with many other departments of historical investigation, seems to offer an "easy" field. A considerable amount of valuable work can be done in it by a student unacquainted with any foreign language, ancient or modern, and quite ignorant of the science of diplomatics; and a university man who fancied that he could have the form of historical learning without the substance might think that here was his opportunity. It can hardly be said that the universities, notwithstanding all their efforts, have been quite successful in combating this idea. Few of them as yet require any very extended special preparation on the part of intending students of the subject; an elementary course or two, or even a small amount of "general reading," being usually enough to satisfy all demands. An examination of catalogues and other official publications is pretty certain to leave the impression that American history is still too often looked upon as in some way a distinct and separable branch of historical study, capable of a large measure of isolation, and for whose profitable pursuit any tolerably well informed young person who has passed the sophomore year is, presumably, fitted. More than one institution calling itself a university, and justifying its name by the high character of its work in some other lines, will this year admit to "original research" in an American history "seminary" some students, both graduates and undergraduates, who would have difficulty in framing a creditable account of the main events in any Presidential administration, and whose knowledge of the "sources" is hardly sufficient to enable them to trace a bill through the pages of the *Congressional Record*, or interpret a reference to the Statutes at Large.

This tendency to isolation is undoubtedly a serious danger to the future of historical work in the United States. While the comparative method of modern science has been appropriated by nearly all departments of learning, its application to the treatment of our national development has thus far been infrequent. No one, for example, doubts that the student of Germanic philology must know Greek and Latin, and the student of medicine learn something of chemistry and physics, but it is still possible, in some quarters, for the student of American history possessing a very meagre knowledge of the history of any country except his own to be lifted into the company of scholars. It is this, doubtless, that makes some college presidents hesitate to call to permanent professorships young men whose advanced degrees have been obtained by a course of study in American history alone; not that the importance and the educational value of the subject are in any way undervalued, or that there is any lack of eminent scholars filling chairs of American history in this country, but because the training, where the subject is isolated, is very likely to be insufficient and unsatisfactory.

The logical consequences of this inadeqate preparation are manifest also in the innumerable publications which illustrate its methods and embody some of its results. Here and there, in the apparently endless series of "studies" and "contributions" which one university after another now feels called upon to issue, one comes upon work of real distinction, creditable alike to its authors and to American scholarship; work, for instance, like Miss Follett's recent study of the Speakership, a notable example of learning and industry wisely directed. Of such work there can never be too much. The trouble is that anything comparable to it in excellence is as yet the exception rather than the rule. One is impressed, in examining many of these serial contributions to American history, by their rather indiscriminate character. There is no end of industry and learning, only the industry is a bit desultory and the learning ill-digested. To accumulate a great mass of information, from all sorts of sources, upon some topic which has not yet happened to be sufficiently "investigated," to help out the text with liberal quotations and weight it heavily with foot-notes, to append a so-called "bibliography" and extracts from more or less relevant "documents," and then to get the whole published as part of a "series," may serve to advertise the author and help him to a "call," but it rarely produces a work that illustrates either the method of science or the spirit of sound learning. The intentions of the writers may be excellent enough, and the fruit of their labors often contains much of interest and importance, but its value is distinctly out of proportion to its bulk.

What is needed is a more rational adjustment of the relations between American history and other departments of learning than most of our universities have yet secured. We have no lack of earnest laborers and patient investigators, but there is often occasion for regret that they could not have been better equipped before setting about their ambitious tasks. What the details of that equipment shall be is too broad a question for discussion here; plainly, however, they ought to include a wider study of history, government, and law than is now usually insisted upon. As to the prevailing eagerness for publication, there is a certain manifest reasonableness in asking that a person, whatever his field, shall have something to say before rushing into print, and that he shall give us results rather than processes and "notes." For success in the writing of history does not depend upon the possession of vast learning or a picturesque style, but upon easy mastery of facts, sound judgment, sure sense of proportion, and power of simple and accurate statement. Of these qualities the writing of American history is still much in need.

A PICTURE OF NEWFOUNDLAND.

ST. JOHN'S, September, 1896.

A JOURNEY from New York to Newfoundland in summer is delightful, not only because it transports one to a cooler climate, but as bringing one into contact with modes of life and novel surroundings which are unique on this hemisphere. The island still justifies the name given it four centuries ago, for every traveller has to rediscover it for himself. He can obtain only the haziest information about any spot beyond that on which he stands. A number of steamers sail to St. John's from American, Canadian, and English ports, but, when they have any schedule, departure from it is the rule, not the exception. There is probably not a steamboat agent in a foreign port who can give any information as to the route of the railroads built or building, or supply a time-table. Nor are they to blame. Although there exist three systems of railroads, almost encircling the island, no time-table is published in a railway guide, in a public newspaper, or on a separate sheet. The traveller must therefore constitute himself an explorer, and investigate Newfoundland for himself.

It has been for four centuries a stage for drying codfish, and little else. The fisherman is loath to become a farmer; yet he loves his little garden, and therefore, wherever enough square feet of soil has accumulated in the hollows of the rocky coast, there he, in the intervals of fishing, and the women, who remain at home to wash and cure the fish, grow a few of the dear old-fashioned flowers—phloxes, pinks, and sweet-williams—on narrow beds planted on each side of one central walk, and flank them with hardy vegetables, which thrive in that moderate moist climate. The decennial census, which fills two thick octavo volumes, and which pries minutely into the doings of the 197,000 souls and bodies with which it is concerned, tells us that, though there are only 1,545 farmers on the island, there are 36,301 fishermen and others who cultivate the land, or nearly every head of a family of five.

These same census volumes explain many other anomalies of life in this strange isl and. The next column of the recapitulation to that which expresses so vividly the love of these weather-beaten fishermen for their tiny garden plot, tells us that 608 members of the farming community are supported exclusively by the Government. In other words, 39 per cent. as many depend on state salaries as derive a living from tilling the soil. There must be, under any system of government, a staff of officials to govern a community, be it large or small; but the number is out of all proportion large when the population is so small and scattered. Newfoundland gathers her revenues in chief part from customs du-

ties, and must defend her shores from smugglers. This is the more difficult as the French islands of St. Pierre and Miquelon are almost within a stone's throw of the south coast of the larger island, and are suspected of thriving on their contraband trade. It is at least suspicious that this group of small French islands, with some 6,000 inhabitants, imports not less than ten million francs of merchandise annually. The capacity of consumption of their population is certainly surprisingly great.

The Post-Office Department of Newfoundland also employs an extraordinary number, for the largest accumulation of population in one locality is by all odds in St. John's, with its 29,000 souls, while the next largest town is Harbor Grace, which can muster only 6,400 inhabitants. The total population of this large island of 40 000 square miles would not fill a second-rate city, and yet it is scattered around a rocky shore so deeply indented by great bays, which again are fringed by so many long promontories, concealing deep coves, that its coast line probably exceeds 5,000 miles in actual length. To supply such an attenuated population with regular mails, and with the judicial machinery for settling their quarrels, involves unavoidably a great waste of force and money. But departments seem to be unduly multiplied. The Government owns and operates the domestic telegraph lines, not, however, through the post-office, but under a separate head.

The most glaring and, to the ordinary secular observer, the most unwarrantable dissipation of energy is in the denominational school system. It seems good to this little body of independent thinkers that religion be taught in their schools, and by religion they mean that peculiar system of theology which each prefers. The population is distributed theologically as follows :

Church of England (Episcopalian)	68,075
Church of England (Reformed)	467
Church of Rome	72,342
Methodist	52 672
Presbyterian	1,447
Congregational	782
Salvation Army	2,352
Baptists and others	37

These stanch sectarians are satisfied by the ministration of only 180 pastors, but, recognizing the importance of instilling pure theology into the infant mind, they pay, in great measure out of the public chest, 601 school-teachers. Looking down the list, we find, for instance, that Cat Harbor, with 30 inhabited houses, has 2 schools; Twillingate, with 587 inhabited houses, has no less than 8 schools, Little Burin, with only 60 inhabited houses, has 3 schools, and other as striking examples might be added to the list. Yet, despite this multiplication of schools, it would seem that 29,400 children under 15 years of age attend them against 37,559 absentees, though there are so few isolated inhabitants on the island that only 8,356 children live at more than one and a half miles from the nearest schoolhouses. If anywhere in the world, here sectarian education is reduced to an absurdity. In some of the smaller hamlets, the Presbyterians and Methodists combine their state contributions, and are able to pay a common teacher somewhat more than a starvation salary. But the Episcopalians and Romanists stand invariably and rigidly aloof from others and from one another. Three of the more numerous denominations even maintain separate institutions for the communication of higher learning and the inculcation of true doctrine.

But the school system is not the only anomaly in this charmingly anomalous island. It is hoped that the interior will be settled, if access to it be given by railroads. As it is, there are no long continuous thoroughfares or highways beyond a radius of sixty miles from St. John's. You may take the railroad car at the head of St. George's Bay on the west coast (now the end of the track, which will next summer be at Port au Basque, its terminus) and travel northwestward until you get a glimpse of the Gulf of St. Lawrence through the beautiful Bay of Islands; then across the island by the picturesque valleys of the Humber and Exploits, and over the weird wilderness of swamp and scrub known as the Great Barrens to the head of Morris Inlet, one of the arms of Notre Dame Bay; then southward through a scanty spruce forest, looking occasionally out on to the Atlantic between the rocky capes which, like magnificent buttresses, support the island, and prevent it from being engulfed by the angry Atlantic, until you reach St. John's. The railroad journey covers more than 500 miles, yet until you are within a few miles of the capital you do not see a graded or macadamized road. The surprise and wonder with which you at length greet one of the excellent highways which radiate from St. John's, if you have been some little time in the interior, must be akin to what a countryman feels when he comes unexpectedly and for the first time upon the iron tracks. This absence of roads had to be supplied, if the island was ever to be peopled. And as nowadays it is as cheap to build a poor railroad as a good highway, it was with reason that Sir William Whiteway, in 1878, proposed that the Legislature should subsidize a cross-country railroad in furtherance of a scheme conceived by Sandford Fleming of a combined rail and steamboat short route to Europe. Whatever force there may have been in the arguments of the promoters of this route, which would have involved at least five transfers before Liverpool could be reached, across Cape Breton, Newfoundland, and Ireland, from the American mainland, has been so weakened by the increased speed attained by the "ocean greyhounds" that now hardly any one can be found to reiterate them. However that may be, this impracticable proposal gave the first excuse for the successful impetus to railroad-building on the island. Since then it has progressed with varying rapidity under two different systems.

First, a contract was given to an American syndicate for the building of a medium-gauge road of three feet six inches (another anomaly), the consideration being an annual subsidy of $180,000 for thirty-eight years, and 5,000 acres of land per mile. The company failed after building so much of the road as entitled it to a subsidy of $45,000 a year. A receiver now runs this—the "Newfoundland Railroad." That plan failing, the Government tried its own hand at building, and constructed twenty-seven miles of road through the Peninsula of Avalon to the old French capital of Placentia. (The euphonious name, it may be remarked in passing, of this, the southeastern pendant of the island, is the only survival of the fantastic nomenclature adopted by Lord Baltimore.) But, after building twenty-seven miles, the Government reverted to the contract system, and advertised for tenders to build a road to almost encircle the island. The contract fell to Mr. R. G. Reid, who has nearly completed it, and has received the stipulated price of $15,600 per mile built. But the building of the road was a less serious embarrassment to the Government than the prospect of having to operate it when built. To relieve itself of this, the Government agreed with Mr. Reid that he should run two trains a week over the Placentia branch and his own road for ten years, for a consideration of 2,500,000 acres of land. The term of the contract has not yet half expired, but so appalling is the prospect of having to take over the railroad, even at that distant date, that it is rumored that the Government already contemplates a renewal of the contract—a suggestive warning to those who advocate state control of railroads without having to face the responsibilities of their management.

Such hesitation on the part of the Administration is not groundless, for Newfoundland railroads, to a degree without parallel even in our own progressive country, where so many a road has been built in advance of its traffic, are developers, which it is hoped and believed will successfully evoke from the blank surface of the island the latent image of prosperity. The interior is uninhabited, though enough good land to support a fairly large population has been rendered accessible by the road, which has already led to the opening of magnificent granite quarries. Moreover, it cuts through an extensive coal field, and passes over the same rocks in which valuable copper and iron ore deposits have been already developed, where Nature has exposed them on the face of the bare sea cliffs. It is therefore not without good warranty that the colony is creating a three and a-half per cent. interest-bearing debt of some $10,000,000 in favor of railway construction.

Farming will never be prosperous in this northern clime unless to supply a large local mining or lumbering population. But it has been suggested that the island might be, considering its geographical position, advantageously turned into a great grazing ground for fattening cattle en route from the Northwest to Europe. It lies midway on the watery highway, and so near the shores of the consumer that lean cattle shipped on the Lakes might be landed on its shores in the spring; fattened on its nutritious, succulent grasses during the summer months; reshipped at no great increase of transportation cost, and transferred so speedily to the European market that the loss of weight would be trifling. Both Newfoundland and Cape Breton might thus perform, as the fattening pasture-ground for European shipments, the same service that Kansas and other of our prairie States do for the lean carcasses transferred to them from our Rocky Mountain cattle-rearing ranches.

These, or some such, stimuli must be given to maintain even the past industrial status of the island, in view of the waning prosperity of the fishing trade. That it is waning should excite no surprise. Four centuries of fishermen drew on the teeming shoals of cod without endeavoring to replace the drain. As long as hook and line were the instruments of capture, their natural prolificness maintained the supply, but since seines and traps have been introduced, a notable decline in the number and size of the fish has been remarked, and the fishing industry has correspondingly languished. To arrest the decay of this staple of the island's wealth, the Government has established hatcheries. Though the period within which the experiment has been under trial has been too short to determine the extent to which artificial propagation will not only supply the demand, but replace the deficiency, it is generally conceded that the number of small fish inshore has increased. Aside from artificial propagation, there are, it is true, stringent laws against the destruc-

tion of fish below a certain size, which, if stringently enforced, would check the evil; but it is especially difficult, for political reasons, to enforce obnoxious laws in a small community under representative institutions. Politicians cannot be expected to appraise codfish at a higher value than votes. For instance, an officer of the Fisheries Department instructed a magistrate in one of the bays on the east coast to institute proceedings against all who were using seines with a smaller mesh than the law prescribed. Without difficulty or delay, evidence was secured for some forty actions, involving some one hundred voters. But the effect of so many suits, incriminating a large proportion of the voting population of the district, would have had so serious an influence on the prospects of the party in power at the next election that the magistrate, like a prudent politician, before proceeding to extremities, referred the question to headquarters, and was advised to drop all the suits. One benefit of the French concurrent rights along the French shore is, that the French cruisers take a particular pleasure in summarily interfering with any infraction of the international agreement as to fishing methods and fishing rights.

The presence of these French cruisers watching English fishermen is only another of the many anomalies which make a trip to Newfoundland so novel and delightful. Still others are that outside of St. John's you never get a fresh fish to eat, though the island subsists upon their catch, and you never see a Newfoundland dog. As a counterbalance, though we visited the west coast, the east coast, and the interior, the landscape was never once concealed by fog. J. Douglas.

WILLIAM MORRIS.

London, October 6, 1896.

It certainly seems, as Mr. Gosse wrote in the *St. James's Gazette* immediately after the death of William Morris, "as though the dying century were bent on sweeping its stage clear of all its greatest figures before it makes way for its successor." Perhaps one realizes this the more acutely now since there are few of its famous men it could so ill afford to spare as Morris. Of all the group of artists and poets with whom he must ever be identified, his is by far the most picturesque and striking personality, his the strongest influence. If Rossetti's name has come to be a symbol of picturesqueness, it is only for the elect. If Swinburne's long seclusion in this age of noisy advertisement has its element of romance, future generations will appreciate it more keenly than the present. But William Morris was a man ever before the public, known familiarly to the many as to the few; he was to be found always in the thick of the fight, commercial or political, literary or artistic. And once seen, once known, he was not easily forgotten. His personality impressed itself upon you whether, unbelieving, you listened to him preaching the poetry of socialism in the little, bare, whitewashed hall at Hammersmith, whether you watched him—a short, sturdy figure in blue—leading the socialist procession through the streets of London, or whether you sat under him, still unbelieving, in the lecture-room of the Arts and Crafts Society. You might disagree, you might disapprove; you could never remain unimpressed, unmoved. And there is as little question of the influence he exercised; if any vital Pre-Raphaelitism has survived, it is due to him rather than to the original Pre-Raphaelites themselves.

The strength of his personality exerted itself from the very beginning. He was somewhat younger than Rossetti—he was sixty two when he died—belonging, rather, to the generation of Burne-Jones, his friend and fellow-undergraduate at Oxford. But he had not left the university before he had become one of the most gallant and active champions of the special cause advocated by the Pre-Raphaelite Brotherhood. It was he—for he first studied to be a painter—who, with Rossetti and others, decorated the Union, thus proclaiming the new gospel in the very stronghold of learning; an easy matter, however, where every new thing (in art, at least) good or bad, is accepted with equally rapturous applause. It was he who not only contributed to the *Oxford and Cambridge Magazine*, which aspired to be a second *Germ*, but financed it for a while, its chief prop and support. It is just here, I think, that one great reason of his strength and power is found. Morris was a rich man, the son of a prosperous merchant, really one of the class he despised. It was within his means to put to a practical test, to give definite form to many of the doctrines which Rossetti, Ford Madox Brown, and Burne-Jones could never have carried beyond the stage of theory. His capital, as well as their designs, was essential to the establishment of the house of Morris, Marshall, Faulkner & Co., which helped more to spread Pre-Raphaelite ideas than any work done single-handed in the studio. But for Morris, despite Faulkner, who also had some money, the chances are the firm would never have come into existence, and all the Victorian horrors of horse-hair and antimacassars and wax-flowers under glass cases might have lingered on to the very end of the century.

But do not let me be misunderstood. Money alone could have accomplished nothing; money, backed by good design, could have been productive of but little more. But Morris brought to the enterprise the still more splendid, the still more useful gifts of energy and enthusiasm and daring, tempered by honest commercial ability and sense, inherited from his merchant father. In a word, his was the talent for success, the genius for making things go, that rarely deserted him through life—never, one might say, except when the spirit of adventure and poetry led him to play the socialist.

As an artist I think it is likely that Morris will be remembered less for his own personal accomplishment than for the enormous influence which his position enabled him to extend from his immediate friends to the general public: first, through his shop, and, later, through the Arts and Crafts Society and his printing-press. He made, it is true, designs for wall-papers and carpets and embroideries. He was the fine colorist who converted Burne-Jones's weak black-and-white cartoons into gorgeous pieces of tapestry and glowing, jewel-like stained-glass windows. But the list of his designs might be longer than it is, and it would still be true that it was not so much in these that he displayed his originality (indeed, they were but so many examples of his sham mediævalism) as in the great revolution he worked in the decorative arts of England. If this meant merely that the few who could afford it adorned their houses with "Morris papers" and "Morris hangings" and "Morris chairs" (which, as a rule, were not "Morris chairs" at all), the gain would have been too small to prove worth recording; but he did much more than this. He set people thinking on the subject of decoration, he awakened them to the hideousness of the standards then accepted, he stimulated them to fresh efforts and new departures. His large and often wholesome influence reveals itself not exclusively in designs and furniture that bear the Morris stamp, but in decoration which he probably would have been the first to condemn, for no man was narrower in his artistic creed, and, though he might be responsible for an artist's escape from the yoke of the ugly, he was not therefore ready to accept that artist's idea of the beautiful. If the exhibitions of the Arts and Crafts Society hitherto have contained all to which he was willing to lend his approval, they have by no means exhausted the work that is as truly the outcome of his influence.

With the Kelmscott Press at Hammersmith it is the same as with the shop in Oxford Street. Attention has been called here too recently to the merits and faults of the books he printed for these to be criticised anew. They might be an improvement upon the old printers' work; it is not so certain that they could compete with the modern printer's accomplishment. And yet Morris, even before he had established the Kelmscott Press, from the time Reeves & Turner published his 'House of the Wolfings' (1889), roused printers and publishers and artists to a realization of the possible beauty of type and margins and spacing and title-pages, even as he had forced the public to prize beauty in furniture and all utensils in daily use.

It is too curious a fact to be ignored in any estimate or appreciation of William Morris as an artist, that, while he initiated so healthy a general reaction, his immediate influence was often unfortunately bad. Decorators who have based their style essentially upon his have been as apt to tumble into the pitfall of affected commonplace as the painters who have slavishly copied Rossetti. But it is, above all, in the decoration of books—for he was impatient of the term illustration—that his teaching and example have been most fatal. Surely, he could have no worse crime to answer for than the creation of the Birmingham School! The trouble was that he was for long one of the Examiners at South Kensington; and students, and, more important, masters paid by results, knew well that nothing had so good a chance, if any chance at all, as the drawing made with the Kelmscott book as a model. The result was that the younger generation of designers have all devoted themselves to the manufacture of the Morris border, the Morris initial, the Morris woodcut, not because their sympathies have lain in that direction, not because they have found therein the most natural method of expression, but simply because their object was to win prizes in the schools, and, afterwards, at the publisher's and bookseller's, to cater to a passing fad. A worse master, really, than Morris could not well be imagined, since in his books he was always the imitator, never the original man. And, moreover, no one could have been narrower and more prejudiced in the old standard thus revived. Good printing, good decoration, for him, ended with Albert Dürer, who was as dangerous a red rag to him as any modern illustrator. However, there is no doubt that Birmingham will pass away—it is passing now—and that the good effect of his propaganda will endure. Even as I write I hear that the Kelmscott Press will be stopped for ever: a monument, as it were, to the distinguished man who founded it. This is fortu-

nate. His books, interesting as the intelligent, if mistaken, experiment of an artist, will survive. The foolish phase to which they gave the initiative will come to an end, as Morris, of all men, would have had it cease. He reserved his approbation for work done in accordance with his teaching, but he also withheld it when that work was too successful a tribute. Before he died, had the law allowed it, he would have sought legal redress, it is said, against some of the too flagrant imitations in Boston and Chicago.

If I have spoken, so far, wholly of Morris as an artist, it is because I believe that it is as an artist his greatest work was done. Already, in the few days since his death, his English critics have not been slow to point out that his later achievement in verse never fulfilled the promise of 'The Defence of Guenevere.' Mr. Gosse, the most lavish in his praise, has likened the 'Earthly Paradise' to Spenser's 'Faerie Queene'; the chief point of resemblance is, I fancy, that few people have read either poem to the end. William Morris was too fluent, too facile. It may be wonderful that, writing so much, he wrote so well; but the pity is that, writing so well, his fluency gave him no chance to write still better. He has often been found fault with for his Wardour-Street English, and the reproach is not unwarranted. It is a question whether even the next generation will preserve a taste for such long-winded, consciously archaic stories as 'The Roots of the Mountains' and the 'House of the Wolfings.' But here again, were there but space, it would be interesting to trace his influence for good even when wrought by that work which contributes least to his own reputation.

On the other hand, as a Socialist, I think he will be more admired in the days to come than at the present moment. Now, one sees only the weakness and evils of the cause into which he threw himself heart and soul, only the conceit and silliness and self-advertisement of too many of his "comrades." And never by argument or eloquence could he make good his claim, for he was quite the most illogical and fanatical of speakers. But posterity will remember only the romance of his crusade, will see his political career only in the poetic light through which he himself saw it always. For, perhaps, he was never more the poet, never more the artist, than when he strode through the streets at the head of his weak-kneed, timid followers, when he thundered from his platform at the Hyde Park or Trafalgar Square demonstrations, when he argued with the rabble of Tower Hill or Edgeware Road. It was of art he was ever thinking in his long campaign against capital and commercialism. Change the social conditions, and art would flourish as it had never flourished before—that was his great doctrine. And so it was always in the cause of art he labored, even on that famous Sunday when he descended with the mob upon Westminster Abbey, and all London held its breath, fearing to see renewed in its midst the worst vandalism of the Paris Commune. It is natural that men who feared the follies and worse to which his fanaticism might lead could have no sympathy with his heroism. But in the history of the nineteenth century, yet to be written, he will figure as a very Savonarola among artists.

N. N.

RENÉE DE FRANCE.—II.

PARIS, October 7, 1896.

THE name of Olympia Morata figures among those which surround the memory of the Duchess of Ferrara. She had been admitted at the Duchess's court as a friend and a teacher of her young children. Olympia was born in Ferrara in 1526; she was an infant prodigy, and wrote with elegance in Latin and in Greek at the age of fifteen. She became at the age of thirteen the companion of Anne, the eldest daughter of the Duchess. Olympia espoused with great enthusiasm the ideas of the Reformation; she was allowed, nevertheless, to be a teacher and a companion of Lucretia and Eleonora, the younger daughters of the Duchess. The list of the books which were read in common by them, and which we find in the account-books of Ferrara, would astonish and perhaps frighten many advanced ladies of our time. Olympia was obliged to leave the Court to take care of her sick father in the country. Her absence was long; when she returned, Anne, her pupil, had left Italy to be married to Francis (son of Claude de Lorraine, Duke de Guise), the future conqueror of Calais, who was assassinated by Poltrot de Méré. Olympia, for reasons which have remained unknown, fell into disgrace, and was exiled from the court. It was probably because the Duchess had a new almoner, named Bolsec, who, once a monk, had turned Calvinist, then again Catholic (he returned later to the Calvinistic faith). Olympia had married a German named Grunthler; she left with him for Schweinfurt. The town was besieged and taken by assault; she fled with her husband, and arrived at Heidelberg, where she died at the age of twenty-nine.

The struggle had fairly begun in Ferrara between the partisans and the enemies of the Reformation. The new ideas were making rapid progress at the Court. Renée was more or less openly the centre of resistance to Rome; she was in correspondence with Calvin. The Duke was in constant perplexities, between his wife and the Pope, who urged him to persecute the heretics. The Duchess herself was often uncertain; she had not yet detached herself openly from the Roman religion. "So many excellent Catholics," says with truth M. Rodocanachi, "had fulminated against the Apostolic See, from Saint Bernard to Catherine of Siena, and had with acerbity demanded reform, that it probably still seemed to her that by helping those who were trying to correct the abuses she did not become a heretic. . . . The immediate or remote consequences of the movement in which she coöperated certainly escaped her mind. And who, even among the most enlightened apostles of the Reformation, could at the beginning foresee the importance of the changes which the Reformation was going to make in the world?" The chasm which divided the Duke and the Duchess was, however, widening every day. The Duke had become the instrument of the Holy See; Renée no longer heard mass, even on Christmas day, and spoke of the Catholic religion as an idolatry. In 1554 the Duke made a decree banishing from his states all persons suspected of favoring the Reformation. Several of the servants of the Duchess had to leave, and she confined herself to her retreat at Consandolo. Hercules did not allow his two unmarried daughters to remain with her; she became a prisoner in her palace.

An inquisitor was sent to Ferrara, and the Duchess had to appear before the tribunal of the Inquisition. She was condemned, it was said at the time, to perpetual imprisonment and the confiscation of her property, and taken, in secret, to an old castle which was to be her prison. For a week, Renée refused to go to mass and to receive the sacrament; on the 13th of September a change took place. It was said, though she was still shut up, that she had recovered her reason, that she was penitent, and there was no longer any talk of a trial or a condemnation. It is certain that on the 21st of September, after having seen the Duke, her husband, she saw a confessor and took the Communion. She was set at liberty and returned to Court. The Jesuits had conducted the whole affair, and Calvin, alarmed, wrote to his friend Farel: "I receive sad news from the Duchess of Ferrara: Vanquished by threats and by the fear of opprobrium, she has fallen. Constancy is rare among the princes of the world." And Olympia Morata wrote to a friend: "I have always told you that she was a light head." The forced conversion of Renée was not sincere, as the rest of her life showed; and her husband, contenting himself with appearances, knew this better than anybody. It was not long before the Duchess renewed her relations with Calvin and his followers. Calvin himself wrote to her "to arrange matters in her household so that the mouths of all the evil talkers should be shut." The persecution of the Protestants became very severe in Italy after the accession of Paul IV. The Inquisition, well organized, had been introduced into all the cities; under the hand of Caraffa, the Church, armed by the Council of Trent with a stronger law and a more rigid organization, became very militant. If there were fewer victims of the persecution in Italy than in Spain, it was merely because the apostles of the Reformation in Italy almost all chose exile rather than martyrdom.

Duke Hercules died in October, 1558, after a short illness. Renée assumed the Regency, as her son was at the time at the Court of France; on his return she resolved to go back to her native country and to establish herself in her château of Montargis. She found herself, on revisiting France, in a very delicate situation. All her sympathies were on the Protestant side; her daughter Anne was the wife of the Duke de Guise, the head of the Catholic party. Her house at Montargis, situated on the high-road which unites the valley of the Loire with the valley of the Seine, was in a strategic position which was of great importance in the civil wars. The castle, placed on an eminence which dominates the great plain of the Gâtinais, the forest of Montargis, and the River Loire, passed for impregnable (the Revolution destroyed the old fortress, of which there are hardly any vestiges left). Renée's first care was to repair the fortifications; her subjects were ardent and very intolerant Catholics, always ready to rebel. She begged Calvin to send her a minister, which he did; but though the Duchess asked this minister, Morel, "to make short sermons, without speaking of the Pope, of the images, or even of any other abuse," he quarrelled almost immediately with the inhabitants of Montargis.

Fortunately for the Duchess, the cause of the Huguenots was apparently in the ascendant; the Court seemed won over to the new ideas. Renée was invited to go to Saint-Germain, and to wait there for the result of the theological negotiation which bears in history the name of the "Colloquy of Poissy." Unfortunately the "massacre" of Vassy forced all swords out of their scabbards. Fifteen days after this massacre, the Duke de Guise, who was the head of the Catholic party, made an almost royal entry into Paris; a civil war began all over the kingdom, and Renée retired to Montargis, where she received many

Protestant refugees from Nemours, Blois, Tours, even Paris. D'Aubigné tells in his Memoirs how, having left Paris with his tutor (he was then a mere child), he was made prisoner by the Catholics, but, succeeding in escaping with his tutor, took refuge with the Duchess of Ferrara. "She made me sit down by her on a cushion," says he, "over three hours, to hear my infant speeches on contempt of death (I was then twelve years old), and then, having kept me for three days, she had me sent to Gien with all the company."

The castle at one time held as many as six hundred refugees. Renée's retreat was a kind of oasis in the troubled times of the wars of religion, which continued so long with short interruptions. The treaties of peace signed from time to time between the two parties were mere truces. At the beginning of the wars, the Duke de Guise, who had command of the royal troops, wished to take possession of Montargis. He sent his wife Anne to her mother, and threatened, in the name of the King, to have her shut up in a convent if she did not dismiss the Protestant refugees Anne, the Duchess of Guise, had no aversion to the Protestants; she was suspected of a certain leniency toward those who looked upon her mother as a Providence. The Duchess stood by her rights, but she could not as easily defend herself against her Catholic subjects as against her own daughter. The little town of Montargis and the castle, filled with the retainers of the Duchess, were violently hostile to each other. So it was in many places in France: the battles fought by the Catholic and Huguenot armies were fought again, on a smaller scale, in a number of provinces and cities. The feelings of the Duchess in those troubled times can easily be imagined. When her son-in-law was assassinated on the 18th of January, 1563, before the walls of Orléans, which he was besieging, there was a great feeling of relief among the Protestants: Orléans was saved and their greatest enemy had fallen; but, as Morel wrote to Calvin: "The Duchess is full of affection for our brethren and of sympathy for their sufferings, but she cannot help wishing well to her son-in-law, on account of her daughter." And in another letter: "It is, for her, a painful trial, as zeal for the religion of Christ is at war with the affections of the flesh."

The Edict of Amboise, which was signed at the end of the first civil war, was favorable to the nobility; they were allowed to celebrate Protestant services in their castles. Renée tried, after the peace, to effect a reconciliation between the Guises and the Châtillons, but she could not obtain much from the Guises, who accused Coligny of complicity in the murder of the late Duke.

"Antoinette de Bourbon," says De Thou, "the mother of the defunct, a woman respectable for her conduct and her modesty, marched at the head of the family, and, near her, Anne of Este, the widow of the Duke, both in long black gowns; they were followed by the children of the Duke and by their ladies, who filled the air with their moanings. The relatives, the connections, the friends in mourning dresses, ended the lugubrious procession. Arriving before the King, they all fell on their knees. The King bade them rise and promised to look after the affair, but postponed judgment till a more favorable time."

The vengeance of the Guises really took place on the fatal night of St Bartholomew, when the unjustly accused Coligny was assassinated in his bed by the orders of the new Duke de Guise. The Duchess of Ferrara had been invited to go to Paris for the wedding of the King of Navarre and of Marguerite, the King's sister. She arrived there on the 12th of August, in company with the King of Navarre and a number of Protestant noblemen. She could not stop at her daughter's house, but received the hospitality of an old friend who lived in the neighborhood of Notre Dame. She could not, thanks to the distance from the Louvre, witness the horrible scenes which occurred on the night of the 24th of August in the palace of the King and in its neighborhood. As soon as the gates of Paris were reopened, she left the capital, which had become a scene of carnage. She had to accept an escort from her grandson, the Duke de Guise, the assassin of Coligny. She went as rapidly as she could to Montargis. She had succeeded in taking with her among her servants a few Protestants, who owed their lives to her. Her terror was such that for a time she ceased to try to evangelize the town of Montargis, as she had done before. She was ardently urged by her daughter and by Queen Catherine to make a public profession of Catholicism, but she resisted these entreaties. None of her children had followed her way: her son Alphonse was an ardent and intolerant Catholic; her son Luigi was a cardinal of the Roman Church; Anne, her eldest daughter, was bound to the Guise interest; her two other daughters had become almost strangers to her.

She died, after a short illness, at Montargis, on the 15th of June, 1575. She had, it may be said, a double funeral—one according to her own instructions, a second which was celebrated according to the instructions of the Duke of Ferrara a few days later. Her will, which is very detailed, is given in M. Rodocanachi's work. He gives also, *in extenso*, a spiritual will which she wrote at Montargis, and which shows exactly what her spiritual views were. This document leaves no doubt of her fervent attachment to the doctrines in which she had been bred, which had been expounded to her by Calvin, Beza, and others, and to which she had been faithful amid so many trials.

Correspondence.

"REDEMPTION" MONEY BEFORE AND AFTER "THE CRIME OF '73."

To the Editor of The Nation:

Sir: The advocates of the free and unlimited coinage of silver at the ratio of 16 to 1 complain that there is a great scarcity of "redemption" money in the United States. They say that the suspension of the coinage of silver dollars in 1873 (called demonetization) "struck down" one-half of the redemption money of this people, and that all our financial ills are attributable to that fact.

The reports of the Director of the United States Mint contain some interesting information about "redemption" money which the silver party will find it worth while to think about.

In 1873 our stock of gold was estimated at	$128,389,864
Silver dollars coined up to 1873	8,031,238
Fractional silver coined up to 1853	76,734,964
Total "redemption" money in 1873	$213,156,066

Prior to 1853, fractional silver was of full weight and unrestricted legal tender. It was therefore just as good "redemption" money as the silver dollar. In that year fractional silver coins were reduced in weight and their legal-tender quality was restricted to sums of $5 (now $10), and they thus became subsidiary coins, but this legislation did not affect fractional silver coined prior to 1853. As a matter of fact, none of the fractional silver coins were in circulation in 1853, but let us give the silver party the benefit of the doubt, and assume that they were and constituted a part of our stock of "redemption" money and were "struck down" when the dollars were.

From 1873 to 1896 gold "redemption" money was coined to the amount of	$997,076,991
Stock of gold and silver "redemption" money in 1873	213,156,066
Increase (about 368 per cent.)	$783,920,925

All of the gold coined since 1873 was not, however, in circulation in 1896.

On July 1, 1896, the Director of the Mint estimated our gold stock at	$600,100,000
Stock of gold and silver in 1873	213,156,066
Increase (about 181 per cent.)	$386,943,934
Population in 1896	71,390,000
Population in 1873	41,677,000
Increase (about 71 per cent.)	29,713,000
"Redemption" money per capita in 1896	$8 40
"Redemption" money per capita in 1873	5 10

An increase since 1873 of 181 per cent. in our stock of "redemption" money, as compared with an increase of 71 per cent. in population, does not appear to indicate that our people are suffering from the scarcity of "redemption" money to any appreciable extent.

Respectfully yours,

Clayton Harrington.

Dallas, Texas, October 12, 1896.

THE BLAND BILL AND THE FALL IN SILVER.

To the Editor of The Nation:

Sir: In the many articles and speeches on the silver question, there is one phase which it seems to me has not had the consideration it deserves. I refer to the immense stimulus given to the production of silver in this and other countries by the silver-purchasing clauses of the Bland-Allison and the Sherman acts, which stimulus must have operated to attract an immense amount of capital to the industry of silver-mining and smelting, and by the laws of competition greatly reduced the cost of production. What an immense encouragement the acts referred to must have proved, can best be imagined by stopping to consider the effect on the production of any other metal or manufactured article should the Government be compelled by law to purchase at market prices each month stated quantities of such products, amounting to from 21 to 28 per cent. of the entire world's production. Of course, the first effect of such legislation would be to advance prices, then to attract much new capital, which, with the added business energy and inventive genius it would bring to bear, would soon greatly lower the cost of production, and finally the price, unless the demand increased proportionately or the price was artificially maintained.

Has not this been just the history of the fall in the cost of production of silver in the last twenty years, and does not this account for the fact that the cost of the production of silver has fallen more rapidly than that of any other metal or commodity? I venture to say that no Government ever attempted by "bounty" or "protective tariff" to give such a "bonus" to the production of anything as was given by our Government to the producers of silver, and it seems to me these immense purchases of silver did far more to increase the production of silver and reduce its cost and value than if the principle of the unlimited coinage of silver on a 16-to-1 ratio had been

adopted in 1878, when the Bland-Allison Act was passed. FREDERIC A. DELANO.

CHICAGO, 1933 INDIANA AVENUE, October 11, 1896.

THE SILVER NUISANCE IN CANADA.

TO THE EDITOR OF THE NATION:

SIR: The experience of Canada with our silver during the civil war affords an illustration of the Gresham law which, at the present time, it is worth noting and remembering.

During and after the war, silver always stood on the American exchanges at a discount below gold which varied from day to day, sometimes reaching 5 per cent and over. Prior to the war, American silver had circulated freely in Canada as change, and was on a par with gold and Canadian banknotes. When, however, it could be bought at a discount, it became the exclusive currency of Canada, driving out gold and banknotes as effectually as the greenbacks had driven it out of this country. All the current transactions of life were effected in silver. The shopkeepers stuck up notices that silver would not be accepted except at a discount, yet never refused it at par. Wages were invariably settled in it. Every one who had money to pay went to the broker, gave his gold check, pocketed the discount, and paid his bill with silver at its face value. The banks kept with their customers a silver account and a gold account. It was aptly called "the silver nuisance," and was worse than a nuisance, for every merchant's stock in trade varied in value from day to day. As it was, the small traders were the heaviest sufferers, but, had the nuisance continued long, they would have covered themselves by raising the price of their goods, and the real sufferers would then have been the wage-earners.

Effort after effort was made to buy up the silver and export it, but it flowed back as quickly as it was shovelled out. The evil was at last remedied by a curious manœuvre of Sir John McDonald's Finance Minister, Sir Francis Hincks. He issued a proclamation that, after a certain date, the American quarter was to be received for only twenty cents, and the half-dollar for only forty cents, or far below their intrinsic value. Of course every one laughed at the proclamation and at Sir Francis's presumption in supposing that his fiat would alter the actual value of anything, still less of money. But, on the Sunday before the proclamation came into force, it was read from the pulpit of every Roman Catholic parish church in the Province of Quebec, and therefore, when the day came round, there was not a market woman or a small French trader who would take a quarter or a half-dollar except at the value named. When a large section of the people refused to accept the silver, save at its real value, it disappeared from circulation as spontaneously as it had entered. JAMES DOUGLAS.

FREE SILVER A MEANS, NOT AN END.

TO THE EDITOR OF THE NATION:

SIR: Doubtless many people have felt the need of a laboratory method for the investigation of the motives at the basis of the free-silver agitation. As the nearest practicable approach to this method, I have been conversing quite freely with a large number of advocates of that cause, and have sought to find from each individual just what his reasons were for espousing it. One of the most radical of these men, after having spent a number of hours in my study, acknowledged that he could not see that free silver was going to do any good; but he insisted that "The People" were in this contest against the "Moneyed Classes," and he wanted to see "The People" score a victory even if it did cost them something. Others made similar statements, and all seemed to be prompted by similar motives, except one who had a mortgage on his farm, and who said boldly that he wanted cheap dollars with which to pay it off.

The result of these observations has been to confirm me in the opinion that, with the exception of those interested in the silver market and a very few dishonest debtors, the advocates of free silver do not care a fig for it in and of itself. Class antagonism, hostility to the wealthy classes, is the basis of the agitation, and the silver question is hit upon simply as a convenient issue. In certain colleges one may sometimes see two bodies of students struggling violently over a harmless cane. To an observer who was not initiated into the mysteries of student sentiment, it might appear that the cane was an object of tremendous importance; but, as a matter of fact, the students care nothing for it on its own account. Class rivalry is the cause of the "scrap," and, for certain traditional reasons, a cane is a convenient thing to "scrap" over. It furnishes an issue just as the silver question does in the present campaign.

Any one who will take the trouble to acquaint himself with the feelings and sentiments of the less enlightened classes, whether rural or urban, will find that there is a vast deal of hostility toward the wealthy classes. The question is not whether this feeling is justified or not—no one will defend it—but the question is, what are the wealthy classes going to do about it? There may be no serious danger in ignoring it, but it is at least an element of unsafety. So long as it remains it will be a potential factor for evil. When the silver craze dies out, some other and equally dangerous movement will set in to take its place, to disturb industry, and unsettle society. The interests of the wealthy are endangered by the existence of this sentiment, and, what is more to the point, this sentiment will be removed only by the action of those against whom it is directed. T. N. CARVER.

OBERLIN, O., October 16, 1896.

HUMBUG FROM CANTON.

TO THE EDITOR OF THE NATION:

SIR: I have seen it stated that the present tariff (miscalled the Wilson bill) is, on the average, only 4 per cent. lower than the McKinley tariff; is this statement correct? If it be true, what are we to think of the following words of Mr. McKinley, addressed to a delegation from West Virginia, reported in the New York *Tribune* of October 12?

"Is it not true that partial free trade has injured us one and all? Is it not true that partial free trade has injured every interest and every industry in West Virginia? Have not the people and the Government grown steadily poorer under its destructive operations? Have not both producer and consumer been injured? The Southern, in common with all the other States, steadily advanced under the protective system."

Can any sensible and honest man call a tariff higher than any the Republicans ever cared to demand, or dared to demand before the advent of Mr. McKinley, "partial free trade"? And what are we to think of the narrow partisanship, the mental and moral capacity, of the man capable of such an utterance? Is it not a bugle call to all real advocates of freer trade to vote for Palmer and Buckner, following the sound advice of Thomas F. Bayard, who means to die a Democrat (like his illustrious namesake) "*sans peur et sans reproche*"?

W. ALLEN JOHNSON.

MIDDLETOWN, CONN., October 18, 1896.

CHAUCER AND ITALY.

TO THE EDITOR OF THE NATION:

SIR: The argument for fixing the beginning of Chaucer's Italian period at the time of his first journey to Italy is based on his own statement, in the Prologue to the 'Clerk's Tale,' that he

> "Lerned [the tale of Griselda] at Padowe of a worthy clerk,
> . . . .
> Fraunceys Petrark,"

together with the confirmatory evidence that Chaucer was in Italy on the King's business for some months during the year 1372-3. This business was with the Duke and certain merchants of Genoa, but we know that Chaucer visited Florence also on this occasion, whence he might easily have gone on to Padua, where Petrarch was then living, in the suburb of Arquà. It is a most natural inference that the young English poet visited the old Italian one when he came into his neighborhood. They were both courtiers, both diplomatists, both stylists in literature; Chaucer had just entered upon the stupendous task, which he performed so well and with such apparent ease, of creating a style in English where none had before existed, while Petrarch was the greatest living stylist, the most distinguished man of letters in Europe. I am disposed to lay stress on Petrarch's attraction for Chaucer on the score of style, because it seems to me additional proof, if any is needed, of the actual meeting of the two poets. Chaucer goes right on here in his Prologue to say,

> "the laureate poete,
> Hight this clerk, whos rethoryke sweete
> Enlumined al Itaille of poetrye."

Further, Petrarch's letter to Boccaccio, which serves as the preface to his version of the tale of Griselda, "De obedientia et fide uxoria mythologia," is dated June 8, 1373. At the time of the supposed visit, therefore, Petrarch must either have been about completing his version, or just through with it. With the tale fresh in mind, he must have told it to his visitor, especially since he has given us his word that, even before the idea of turning the story into Latin occurred to him, he was so pleased with it that he committed it to memory for the express purpose of repeating it to his friends. We learn also from Petrarch that, although he had only recently read the 'Decameron,' in 1373, he had heard this particular tale "many years" (*multos annos*) before. Petit de Julleville thinks that Petrarch must have known it from some early French *fabliau*. It is a well-known fact that the tale of Patient Grisel ('Decameron,' x. 10) was far and away the most popular Decameron story in mediæval literature. Legrand d'Aussy mentions upwards of twenty translations of it that he had seen in the French prose of the fourteenth century, in such collections as the 'Miroir des Dames' or the 'Exemples de Bonnes et Mauvaises Femmes.' So popular was the story that a secular mystery play, *Le Mystère de Griselidis*, unique of its kind, was represented

in Paris towards the end of the fourteenth century.

It is not at all improbable that Chaucer was also familiar with the story in some crude French form. He had served in the French wars, he was widely read in French literature, and he was a lover of good stories, on the alert for good ones. Suppose Chaucer did know the story, suppose he had been attracted by it as a promising subject, and then had heard it from the lips of Petrarch. Fancy what an impression it would have made on him!! He would of course have wanted Petrarch's literary version, and Petrarch would of course have given it to him at parting. That Chaucer had Petrarch's Latin version before him as he wrote and translated is evident from the MSS., and it is difficult to see how he came by it, except from Petrarch or through Petrarch. Prof. Skeat's conclusion is, that the closeness of the translation and the test of metre both argue that the 'Clerk's Tale' was written soon after the first Italian journey, either in 1373 or early in 1374, as indeed would be the natural order of things. Line 29 of the Prologue to the 'Clerk's Tale,'

"He is *now* deed and nayled in his cheste,"

suggests that Petrarch was still living when Chaucer first wrote the tale. (Petrarch died at Arquà, July 18, 1374.)

Finally, Skeat ('The Works of Geoffrey Chaucer,' vol. i., pp. xxiv, xxv) cites the account from Dec. 1, 1372, to May 23, 1373, that Prof. Mather quotes, but he does not infer from it that Chaucer returned to England on the last date mentioned in the Foreign Accounts roll. Nor does he say that the additional moneys were paid "on his return to England." He says they were paid Feb. 4, 1374, two and a half months after Chaucer is known to have been in England from the fact that on Nov. 22, 1373, he drew his pension in person.

MARY AUGUSTA SCOTT.

BALTIMORE, October 13, 1896.

Notes.

DODD, MEAD & CO. will publish a 'Comprehensive Index to Universal Prose Fiction,' by Zella Allen Dixson, A.M., Librarian of the University of Chicago. It is described as "an arrangement into an alphabetical list of all works of fiction, in all languages, which are founded upon facts—historical, physical, psychological, or moral"—in other words, "novels with a purpose," and no others. It will embrace more than 10,000 entries. They also announce 'The Cure of Souls,' by Ian Maclaren (Rev. John Watson), being his Lyman Beecher lectures on Preaching recently delivered at Yale University.

Harper & Bros. have nearly ready 'Impressions and Experiences,' by W. D. Howells.

"The Sportsman's Library" projected by Edward Arnold, under the editorship of Sir Herbert Maxwell, will be issued at the rate of two or three volumes a year, and will consist of the best works of past writers on sport, with facsimile and other illustrations.

The Macmillan Co. will shortly issue 'The Castles of England, their Story and Structure,' by Sir James Mackenzie, Bart.; and in connection with Bohn's publishers will begin a new edition of Swift's prose works, with a biographical and critical introduction by Mr. Lecky, and a complete bibliography of Swift's writings by Temple Scott.

Longmans, Green & Co. are to undertake "a series of books on the practical workings of the functions of the state and society, with especial reference to American conditions and experience," and hence entitled the "American Citizen Series." It will be under the editorial direction of Dr. Albert Bushnell Hart of Harvard University. The volumes already in preparation are 'Financial History of the United States,' by Prof. Francis R. Dewey of the Massachusetts Institute of Technology; 'American Foreign Policy: Diplomacy and International Law,' by Prof. John B. Moore of Columbia; 'History of Political Parties in the United States,' by Prof. Anson D. Morse of Amherst; 'Elements of Political Economy,' by Prof. E. R. A. Seligman of Columbia; 'Outline of Practical Sociology,' by Carroll D. Wright; 'Actual Government, as applied under American Conditions,' by Dr. Hart. The same firm will begin their "Harvard Historical Studies" with 'The Suppression of the African Slave Trade to the United States of America, 1638–1870,' by William E. Burghardt Du Bois, a colored graduate of Harvard, a student also at the University of Berlin, Professor of Latin at Wilberforce University, Ohio, etc. Mr. Du Bois is a native of Massachusetts.

'The Story of Canada,' by the Hon. J. G. Bourinot, and 'The Story of the Balkan States,' by W. Miller, will be the two next volumes in the "Story of the Nations Series" of the Messrs. Putnam.

'Kallirrhoe,' a dramatic poem by Philip Becker Goetz, is in the press of the Peter Paul Book Co., Buffalo.

Ginn & Co., Boston, announce for the present month a 'Laboratory Manual of Inorganic Chemistry,' by R. P. Williams.

The first part of a 'List of Private Libraries,' compiled by G. Hedeler, Leipzig, is to be ready in December, and will include more than 500 important collections in the United States and Canada. The accounts of the number of volumes and special features for the most part proceed from the owners themselves, and are conveniently condensed in an alphabetical arrangement. A subject-index will satisfy curiosity as to the whereabouts of special collections. The second part of this useful series will deal with the private libraries of Great Britain.

The epithets "superb," "marvellous," and "stupendous" bestowed on a series of 253 designs by Bartolomeo Pinelli, which were executed in Rome some seventy years ago, would not occur to us in connection with them, but their admirers in Italy, on their being brought to light three years ago, formed a committee of publication and intrusted Count Angelo de Gubernatis with the descriptive text. The result was an *édition de luxe* entitled 'Illustrated Mythology,' the letter-press in five languages, viz., Italian, German, French, Spanish, and English (Rome: G. Maussier & F. O. Maruca). But as the Greek myths appeal to a much wider audience than could afford to purchase such a work, the publishers have proposed a wider circulation for these sepia drawings, and are now soliciting subscriptions for any one of the five sets. The designs are at least interesting and scholarly.

The Dutch publishing-house of Loman & Funk, at The Hague, is publishing an authorized version, by Dr. D. C. Nijhoff, of Miss Ruth Putnam's 'Life of William of Orange.' Miss Putnam has just been admitted to membership in the Society of Netherlands Literature at Leyden, which dates from 1778, and is the first foreigner of her sex thus to be honored.

The student of the history of modern Italy cannot afford to ignore the voluminous 'Storia Critica del Risorgimento Italiano,' by Carlo Tivaroni (Turin: Roux, Frassati & Co.), the first six volumes of which bring the story down to 1849. The most recent volume, the first of a new series devoted to "L'Italia degli Italiani," covers the period from 1849 to 1859. Sig. Tivaroni is as dry and charmless as a legal document; but, like the latter, he sets forth plain facts, and by giving, in addition, references to material newly uncovered, he is, in a certain degree, indispensable. Works like his, which have their counterparts in all languages, especially in the German, suggest that the time may come when the distinction between historians and historical hodmen will at last be frankly recognized, and that the latter, instead of dumping together pieces of historical material with comments of their own, will collect and print *verbatim* all the material bearing on any event, and leave the writing of history to historians—men, that is, endowed with the faculty of selection, of arrangement, of proportion, and with corresponding literary skill. The current notion that any one who heaps up a sufficiently ponderous mass of citations from "original sources" is a historian, degrades a calling which has been, next to that of the poet, the highest in literature.

A translation, with illustrations, by Emily J. Harding, of 'Fairy Tales of the Slav Peasants and Herdsmen,' from the French of Alex. Chodsko, comes to us from Dodd, Mead & Co. (London: Geo. Allen). One very interesting feature about this collection is the classification of the tales, so far as possible, into groups which present several versions of the same story. In no case are the versions sufficiently similar to be wearisome, while the variations are instructive to the students of such lore. Under the caption "The Abode of the Gods," for example, we find three stories: The Two Brothers; Time and the Kings of the Elements; and the Twelve Months. There is a family resemblance between many of those which are unclassified, and between the entire collection and the numerous tales from Slavic sources which have appeared in divers previous volumes, published during the past few years. As a rule such tales are better when translated directly from the originals. In this case, however, very little, if anything, seems to have been lost by filtration through the French, and the rendering is unusually lively and elegant. The illustrations are a delightful addition. As for the contents, since the children of the present day (not to mention their elders) are not much given to taking their reading-lessons very seriously, the glorification of the customary trinity, Luck, Love, Laziness, may not be productive of any detrimental results.

Miss Marie A. Molineux, Ph.D., has followed an excellent plan in compiling 'A Phrase-Book from the Poetic and Dramatic Works of Robert Browning' (Boston: Houghton, Mifflin & Co.). Unlike the editors of some other phrase-books we have seen, she has succeeded in selecting and arranging her material in such a way that the student, if he remembers any significant word in a quotation, can readily find it in her volume. Besides nearly 300 pages of phrases, she adds an index of more than 200 double-column pages of the significant words not elsewhere noted. Thus the book will be invaluable, not merely for any one who wishes to find or verify a phrase, but also to the critic and the philological student of Browning. One need read only a few pages of the first part at random to discover, better perhaps than by reading many of the poems consecutively, the

quality of Browning's thoughts, and his skill in shaping them. These are the very bricks with which he builds his structures; how do they stand the test of comparison with similar detached thoughts and phrases of Shakspere and Milton, of Pope, Byron, Wordsworth, and Tennyson, the English poets who occupy the chief place in Bartlett's 'Familiar Quotations'? Likewise, a study of the Index of Words reveals the range of Browning's vocabulary. Here we recognize his habit of coining new words or of reviving old ones; his power of suffusing commonplace expressions with a glow of imagination; his fondness for the harsh, the outlandish, the bizarre. We cannot enter into details further than to point out his predilection for compound words, which, as Coleridge long ago remarked, run counter to the genius of our language. "Pig-of-lead-like," "pity-worth," "safe-return-price," "sister turned mother," "skull-and-cross-bones-banner," are specimens of what we mean. The volume is well planned to form a companion to the Riverside Browning.

The Historical Sketches of Staff and Line of the Army, which appeared originally in the *Journal of the Military Service Institution*, have been collected and republished under the general title of 'The Army of the United States,' edited by Brig.-Gen. Rodenbough and Major Haskin (New York: Maynard, Merrill & Co.). The history of each staff department, of the Corps of Engineers, the Signal Corps, and of each regiment has been broadly sketched by a chosen historian from its own numbers. These historical sketches are now brought together by the editors in a closely printed octavo of 740 pages, illustrated by portraits of the generals-in-chief from Washington downward. The work is, of course, confined to the organizations of the regular army, and will be a valuable book of permanent use for reference to the history of the units of staff and line which compose the army.

The officers at the Fort Leavenworth Army School have added two useful books to the list which has already been brought out by them. In the International Military Series edited by Capt. Wagner, Lieut. Reichmann (Ninth United States Infantry) gives a good translation of Von Trotha's 'Tactical Studies on the Battles around Plevna' in the Russian-Turkish war; a work recognized as an authority in Europe, and one which criticises the handling of the troops on both sides with judicial frankness. Lieut. Dickman (Third United States Cavalry) has published in smaller form Baron von der Goltz's 'Conduct of War' in a pleasing idiomatic rendering into English. The original has the merit which has given a just reputation to the author—a perfectly clear and simple presentation of matters commonly thought to be complicated and abstruse. No treatise so small as this is more successful in giving the principles of military conduct in an intelligible form. It can be understood by any one of ordinary education, and is entirely trustworthy as being an accepted exposition of the subject according to the most recent lights. The translator deserves credit for the good quality of his work. Both volumes are published by the Hudson-Kimberly Publishing Company, Kansas City, Mo.

Another book dealing with military incident, if not with military science, is Archibald Forbes's 'Camps, Quarters, and Casual Places' (Macmillan). Mr. Forbes has brought together about a score of papers contributed by him to reviews and magazines, and nearly all of them gain permanent value from the way in which his large experience and observation of warlike events and of leading officers and statesmen tell upon his judgment of historical events. To have known the actors in a great campaign closely enough to judge of their personal quality, is so great an advantage for one who is a keen observer of human character that, when he has also the author's literary power, his papers have an authentic trustworthiness and interest quite beyond the common. In this way Mr. Forbes's "Version of Balaclava," "The Cawnpore of To-day," "Bismarck before and during the Franco-German War," etc., become something more than casual contributions to current literature, attractive as they would be in that view alone. They are lasting contributions to historical criticism.

The 'Student's Lyell,' a manual of elementary geology, edited by Prof. J. W. Judd of the Royal College of Science (London), although published in the Student's Series by Harper & Brothers, New York, is so essentially a British text-book that it hardly needs a review for schools or colleges in this country. If English readers of the *Nation* desire our opinion of it, we must regret not to be able to accord it high praise. The backward arrangement of the stratified series from the newest to the oldest rocks is as awkward in geology as it would be in any other essentially historical study. The chapters on the successive formations are so largely given over to palæontology that they are of little service to the average student of geology. Even for the British Isles, which are treated in much detail, it is impossible to gather a clear idea of geological progress. The great unconformity of the New Red on the Palæozoic rocks, so vastly important in England, is passed over as lightly as the minor unconformity of the Cretaceous on the earlier Mesozoic. As a whole, the treatment is too serious and technical for the general reader or the ordinary student; and for the advanced student the work is not so well elaborated as Geikie's admirable text-book. Here, as in other examples that might be named, it does not seem useful to furbish up a famous old text-book in the belief that it will make a good new one.

In a brief paper on "The Growth of the French Canadian Race in America," lately published by the American Academy of Political and Social Science, Mr. John Davidson of the University of New Brunswick presents some interesting statistics tending to confirm Malthus's well-known theory of the law of increase of population. The practical isolation of the French in Canada, the reliable data obtainable for a period of some two hundred and fifty years, and the prevalence of conditions of life "at least as favorable as in any other land," not only make it possible to ascertain with great accuracy the rate of natural increase, but also, in Mr. Davidson's opinion, render that rate especially fit to be taken as a standard by which to test Malthus's theory. The sum of his inquiry is that from 1765 to 1890–'91 the French Canadian population doubled every twenty-seven years, or in but two years more than the period taken by Malthus as his "standard." As for the general opinion that the French Canadians are multiplying much more rapidly than the rest of the population, statistics show that only in the census year 1891 does the average size of families in the Province of Quebec exceed the average for all Canada, and even this is offset by a decline in the Canadian average from 5.3 in 1881 to 5.2 in 1891. The extremely high birth-rate is counterbalanced by extraordinary infant mortality, so that "after the first year the proportion living at any given age varies little from the proportion among other Canadians." The application of Malthus's "checks" in this connection would be an interesting topic for further investigation.

The American Economic Association has recently added to its publications a series of economic "Studies," which are addressed to the general reader quite as much as to the special student of political economy. We notice among the last two numbers a compact history of the "Populist Movement," by Dr. F. L. McVey, and a translation, at the hands of Dr. John Cummings, of an address on the "Present Position of Bimetallism," by Prof. Lexis of Göttingen. Prof. Lexis is as competent an authority on monetary questions as can be found among the Germans, and his review of the present position of bimetallism in the world at large is an admirable example of lucid and impartial statement. Among its more elaborate publications the Association has recently issued Mr. Hoffman's "Race Traits and Tendencies of the American Negro," and we may also mention Prof. Irving Fisher's monograph on "Appreciation and Interest," in which that writer undertakes to show that a decline in prices brings with it a fall in the rate of interest, tending to offset any loss to the debtor from lowered prices. We are glad to take note of the activity of the Association, which is established solely to promote the advance of economic knowledge. Its secretary, Prof. J. W. Jenks, Ithaca, N. Y., will be glad to receive applications for membership.

A correspondent of the London *Times* calls attention to the progress made by the Madras Government in the arrangement and publication of its early records. Among recent finds is a file of old Dutch papers which throw further light on the struggle between the Dutch and the English for the control of India. The printing of the Consultation Books, or official diaries of the Government, for the seventeenth century, several volumes of which have already appeared, is to be continued. Another important discovery is the complete manuscript, in seventeen volumes, of the journal of Runga Pillay, the confidential agent of Dupleix while the latter was at the head of French affairs in India. Pillay has been called the Indian Pepys, and his journal, first made known in 1846, forms a minute record of the struggle between the French and the English, from 1742 to 1754, for the possession of the Carnatic. The original is in Tamil, but an English translation is nearly completed, and will be edited, with an historical introduction, by Mr. Forrest, the Director of Records to the Government of India. The Madras Government is also likely to aid the publication of a new edition of the Abbé Dubois's 'Customs, Institutions, and Ceremonies of the Hindus,' for nearly a century one of the great authorities on the condition of southern India just before the British ascendency. An English version appeared in 1817, and the original French in 1825. Dubois, however, thoroughly revised and largely rewrote his work, and the complete manuscript, of which there is a copy in the India Office, has lately been found among the records of the Madras Secretariat.

We note the conclusion, in the September-October number of the *Revue Historique*, of Mr. C. H. Firth's descriptive bibliography, begun in the previous issue, of publications between 1885 and 1895 relating to the history of England in the seventeenth century. The two articles form a valuable supplement to

existing bibliographies, and should prove especially useful to teachers.

At the moment when a report, however incredible, is in circulation of the disappearance of Robinson Crusoe's island, Mr. Henry F. Waters lays his hand on the original will of Alexander Selkirk, and publishes it in the current (October) issue of the *New England Genealogical and Historical Journal*. It is dated December 12, 1720, and was proved by his remarried wife December 5, 1723. The will was not unknown to John Howell, Selkirk's biographer, in 1829. Mr. Waters's regular "Genealogical Gleanings" are remarkable for the number of connections established between this and the other side of the Atlantic, as Allyn and Allen, Cade, Meriam, Shotton, Cole, Needham, Fuller, Barney, and Hardy. Mr. Worthington C. Ford continues his Jefferson and Callender correspondence, getting Callender into Richmond jail for sedition, at the time of Gabriel's rising—one of the most famous of the slave insurrections. Callender tells of the trial and the hanging in batches of the conspirators, and cites the acquittal of one Baptist preacher, George, "the property of a Billy Burton," as evidence of the working of "a very humane law," by which no negro could be condemned in Virginia to capital punishment unless the judges were unanimous. The real motive of the law was to prevent any reckless destruction of "property," as appears from Callender's reporting that George's master swore to an alibi for George at the trial, but "soon after the tryal was over began to recollect himself, and acknowledged that his *alibi* was founded upon a mistake."

The first number of the fourth volume of President Stanley Hall's *Pedagogical Seminary* (Worcester, Mass.: J. H. Orpha) possesses unusual interest for all who concern themselves with the new "child study," which derives its chief impulse from Clark University. A Fellow of this university, E. W. Bohannon, presents types of peculiar and exceptional children drawn from a very extensive collection of condensed biographies. The array is on the whole somewhat saddening, but the relator's "interpretation of data" is to the effect that "advantageous traits are inherited more than twice as frequently as disadvantageous ones," and that the larger proportion of the worst abnormalities are of non-American (racial) origin. There is a curious "Test of Memory in School Children," by John C. Shaw, and a "Study of Children's Drawings in the Early Years," by Herman T. Lukens, with facsimile illustrations; one series showing a given child's evolution in drawing. The young artist of four years who commented on his own cat, "Only one ear—can't see the other," had never heard of his predecessor with the three-legged cat in Viollet-le-Duc's 'Learning to Draw.' Finally, Miss Sara E. Wiltse contributes a striking preliminary sketch of the extent and nature of child study on scientific lines in this country during the year ending September, 1896.

The "International Congress of Women," which held its sessions in Berlin during the last week in September, was attended by nearly 1,300 delegates from various parts of the world, and among them one young lady from Armenia, Margaret Melik-Beglaryanz, M.D., who gave a most interesting account of the condition of women in her native land and the efforts to promote their higher education. There were representatives from nearly every nation of Europe and from the United States, who read reports on the progress of the movement in their respective countries. The speeches were limited to fifteen minutes, and among those who took part in the debates were several lawyers, a still larger number of doctors of medicine, and one eloquent divine. The discussions embraced a wide range of topics and were admirably conducted. The new civil code of the German Empire was sharply and justly criticised, especially for the degrading position in which it places married women, and the applause with which these strictures were received indicated a general concurrence of public opinion with these views. Altogether it was one of the most attractive and successful of the many "congresses" that have met in Europe during the past summer. The spacious Festsaal of the Rathhaus was constantly crowded, and hundreds sought admission in vain. After the first two days no more tickets were issued, except in rare cases to foreigners who had come from a distance on purpose to attend the meetings.

The fiftieth anniversary of the discovery (first sight) of the planet Neptune by the German astronomer J. G. Galle was celebrated on September 23, on which occasion he received the congratulations of the "International Astronomical Society" then in session at Bamberg, and of the "Association of German Naturalists and Physicians" assembled in Frankfort. The Director of the Berlin Observatory, Prof. Encke, having made the most complete map of the stars then in existence, it was to him that Leverrier wrote requesting him to turn his telescope to a certain point in the heavens determined by his calculations on the disturbance of Uranus. The letter arrived in Berlin on September 23, 1846, and on the same evening Encke's first assistant, Dr. Galle, pointed the telescope in the prescribed direction. One of the first stars that entered the field of vision was the unknown planet. The observation was repeated on the following night, and the planetary character of the new star fully ascertained. Dr. Galle, now in the eighty fifth year of his age, has been Professor of Astronomy and Director of the Observatory in Breslau since 1851.

—The Smithsonian Institution has just issued Special Bulletin No. 3, which continues Capt. Charles Bendire's 'Life Histories of North American Birds.' The handsome quarto bears date of 1895, having been delayed more than a year in passing through the Government Printing-Office; but wrong dates of official publications are unfortunately too common to excite surprise. The former volume of this work, which appeared in 1892, treated of the raptorial, gallinaceous, and columbine birds; the present one contains the psittacine and picarian groups, the non oscine *Passeres*, and the corvine and icterine families of *Passeres*. The work may be regarded as resuming the oölogical investigations which were conducted by the Smithsonian in former years, but which broke down after the appearance in 1857 of vol. i. of a 'North American Oölogy,' by the late Dr. T. M. Brewer. Meanwhile the collection has been enormously increased, and it is now by far the best one in existence, whether we regard its extent or the exceptionally excellent manner in which the specimens are preserved. The colored lithographic plates which illustrate both of Capt. Bendire's volumes, drawn by Mr. John L. Ridgway and engraved by the Ketterlinus Company of Philadelphia, are the best of the kind ever produced in this country, and compare favorably with the finest results attained in England in the representation of this notoriously difficult class of objects. The text, as far as it goes, is the outcome of nearly lifelong studies on the part of the author, both in the field and in the cabinet, supplemented by the results of correspondence with many other investigators. It is elaborately descriptive of the breeding habits, as well as of the nests and eggs themselves; and further notable for the precision with which geographical distribution in general, and the breeding range in particular, have been worked out. But as data in such cases have usually been published as soon as secured, in the *Auk* or elsewhere, the present somewhat belated work represents rather the diffusion of knowledge in conveniently accessible form than its actual increase; and the ease with which the author stands first among American oölogists is offset to some extent by the evident laboriousness of his application to literary pursuits. We also regret to note a number of typographical infelicities.

—A report on the recent explorations made at Copan, Honduras, was made public last month and will no doubt attract the attention of archæologists as well as of scientists in general. Though most of these remarkable ruins are under ground, the earliest description which we have of them (by the *oïdor* D. de Palacio, 1576) has ever since maintained the interest in them; systematic explorations were made by Stephens and Catherwood, and recently by Alfred P. Maudsley of England (1885). The Peabody Museum of American Archæology and Ethnology at Harvard University sent its first expedition to the ruins in October, 1891, having intrusted it to the charge of M. H. Saville and John G. Owens, then assistants of the curator, Prof. F. W. Putnam. Three further expeditions had to be sent to the spot, for the work of surveying and digging was much more considerable than could have been foreseen. Mr. Owens, who directed the second expedition, succumbed to a malarial attack in February, 1893; Mr. Maudsley was placed in charge of the third, and Mr. Gordon of the fourth expedition. Explorations were possible only during the winter months, from December to June. The ruins lie at an altitude of about 2,000 feet above sea level, twelve miles south of the Guatemala boundary, in a dry, hilly section along Copan River. They all belong to a prehistoric period, and the carelessness of the natives has contributed largely to their destruction. They are grouped with great regularity around squares or central *plazas*, and appear as pyramidal and oblong mounds, as temples with stairways leading up to them, as pyramids, tombs, underground walls, vaults, and other structures of the most varied description. Walls are built up of square-cut blocks of rock, and ornamented with sculptures somewhat ruder than those discovered on the north coast of Yucatan. Plaster coatings in different colors were intended for embellishment. The monoliths, or four-sided stelas, show sculptures of human or divine beings, and in front of each is a disk shaped "altar," standing on four supports resembling the feet of a quadruped. Many of the structures are connected by carefully laid pavements; the vaults and doorways prove that the native architects were still far remote from the invention of the round or keystone arch, for the blocks are left square at their edges. The images intended to represent animals and men all exhibit the same grotesque appearance as they do in other remains of the Maya coun-

tries. The statue of the "singing girl" on Plate ix. is expressive of character in her features, and critics may even find in it an attempt at portraiture from life. The photographs accompanying this report represent the objects taken from their most instructive side in a manner that makes us wish for more. In fact, the field explored is but a small part of what will be found and described in future years, for the ruins extend further for nine miles up along the shores of Copan River. The present report, though full of information, purports to be "preliminary" only; it forms vol. i, No. 1 of "Memoirs of the Peabody Museum," the special title being: "Prehistoric Ruins of Copan, Honduras."

—One of the most important and least known of the great collections of books in Europe is the Imperial Public Library of St. Petersburg, which, according to a recently published report, contains more than a million printed volumes, over 30,000 manuscripts, several hundred cases (*thecæ*) of autographs, and some 80,000 drawings and engravings. The nucleus of the library was the famous collection of books and manuscripts made by the Polish ecclesiastic and bibliographer Count Zaluski, who generously placed these treasures, numbering in all 293,000 titles, in a separate building at Warsaw for the public use, and on his death as Bishop of Kiev, in 1774, left them as a "bequest to the Polish people." After the defeat of Kosciuszko and the third partition of Poland in 1795, they were seized and confiscated by Russia as heir to the property of the Polish Republic (lately deceased), and brought to St. Petersburg. Owing to carelessness or official corruption, 30,000 works, many of them of rare value, disappeared during the transfer. Early in the present century the library was greatly enriched by the addition of the collection made by Dubrowski in Paris during the French Revolution, and containing historical documents acquired at the destruction of the Bastille and manuscripts of inestimable worth from the abbeys of St. Germain-des-Près, St. Maur, and other cloisters plundered by the sans-culottes. Then came the spoils of new confiscations in Poland after the suppression of the revolt of 1830, among which were the library of a scientific society in Warsaw, with more than 2,000 manuscripts belonging originally to old Polish churches and cloisters, and the library of the Jesuit College in Polotzk. The latter, instead of being put in its proper place, was stowed away in a building connected with the Ministry of the Interior, where it was entirely destroyed by fire in 1862. In 1817, Froloff's collection, rich in Russian incunabula, was purchased; this was followed in 1830 by T. Tolstoi's collection of Slavic manuscripts from the 11th century, in 1848 by Kasterin's collection of Slavic printed works, and in 1852 by Pogodin's collection of some 2,000 manuscripts relating to the history of jurisprudence in the 13th century. Other acquisitions have proceeded from successive suppressions of Russian churches and cloisters suspected of sympathy with the See of Rome. The unique character of the Oriental department is due, in a large measure, to Asiatic conquests, and especially to the subjugation of Turkestan by Gen. Kaufmann. Among the incunabula are several that are to be found only here, as, *e. g.*, a missal printed in 1483 by Scheffer in Mainz. We may add that there are more than 5,000 Aldine and Elzevir editions. Unfortunately the arrangement and administration of the library have not kept pace with modern progress in bibliographical and bibliothecal science, and seriously impair its usefulness. On September 13 the corner-stone of a new reading-room was laid. The building is to be three stories high, fireproof, and provided with electric lights and the latest improvements in ventilation and sanitation. It is to be hoped that this edifice will be the starting point for a thorough reformation of the present management of the library.

—The Norwegian lexicographer and poet Ivar Aasen, who died on September 23, at the age of eighty three years, was a son of poor peasants. He had not the means nor the time to get a university education, yet though, at the age of eighteen years, he commenced life as an itinerant village teacher, by persevering study, combined with eminent philological talent, he acquired a learning and scientific method which render his works, chief among them his 'Grammar' and 'Dictionary of the Norwegian Popular Language' (1848–1850), called in the second edition of 1864–1873 'Norwegian Grammar' and 'Norwegian Dictionary,' models of philological authorship. By these works he opened up an entirely new territory to the student of the Germanic languages, and showed that the Norwegian language, which in the Middle Ages had been the richest and most cultivated of the Scandinavian languages, was not dead, but still existed, if not as a literary language, on the lips of the people. Aasen's scientific work has gained the unanimous praise of the nation and of every student of Germanic philology. But he was something more than a scientist; he was a reformer. He thought the Norwegian language, the language that he had found living among the people in the valleys and on the hillsides, was good enough to obtain official recognition, and ought in due time to replace the Danish language that had come to be considered the linguistic medium of culture and refinement. So he constructed a kind of normal speech, a general denominator of the different popular dialects, which he wanted to raise to the dignity of a literary language. He himself wrote several dramatic pieces in this language, and some poems which rank among the best modern Norwegian lyrics, and some of which have come to be national songs, hardly second in popularity to Björnson's magnificent poems, sung with feeling and enthusiasm even by those who detest the language in which they are written. Although Aasen, by his advocacy of this linguistic reform, became a sign to be spoken against, he was nevertheless one of the chief factors in the modern Norwegian national development, and the national importance of his work received public acknowledgment by his being granted for the last forty-five years a stipend from the State.

—Very significant is it, to criticlings on the other side of the Atlantic, that so many Americans are found to write *worshiped*, *traveler*, and *hocusing*, for instance. To them, in default of philological inquiry, spellings like these are simply tokens of conceited ignorance. For the enlightenment of such persons, Mr. Alfred Erlebach contributes to the issue of the *Leisure Hour* for October an exhaustive monograph. Taking his stand on analogy, he there formulates, with respect to vocables not compound, the following rule: "A word of two syllables ending in a single consonant preceded by a single vowel, before the addition of such suffixes as *-ed*, *-er*, *-ing*, *-y*, doubles the final consonant only when the accent is on the last syllable of the word, *not otherwise*." That, in the case of certain words of recent introduction, Englishmen manifest an inclination to conform to this general rule is shown by quotations from authors of repute, for *caucusing*, *faceted*, and *focusing*. *Gallopped* and *gossipped*, oddly enough, never had existence; and *biased* is no longer looked upon as peculiar. To pass to longer words than those above referred to, we have always had *paralleled* and *unparalleled*, analogous to which are Dr. Webster's *unequaled* and *imperiled*. It is farther made out, with much besides, that one does well in electing *bayoneted*, *carbureted*, *coroneted*, and *diagramed*, as orthographical. *Handicapped*, *kidnapped*, etc., their bases being composite, are, however, recommended for continued approval. In passing, as to *kidnapped*, *-ing*, *-er*, though Dr. Webster so spelled, his editors strangely strike out their second *p*. Why, then, should they have hesitated at *horsewhiped*? Mr. Erlebach, it is observable, following the advice which has recently emanated from a high quarter, practically favors *disyllable*, in place of the unetymological *dissyllable*, which seems to have been imitated from the French *dissyllabe*.

PALMER MEMORIALS.—I.

Memorials. Part I. Family and Personal. 1766–1865. By Roundell Palmer, Earl of Selborne. Macmillan. 1896.

FEW casual observers of Roundell Palmer's career would have suspected him of an intention to write his own life. If one were to select a man of autobiographical propensity from among the chancellors of the present century, he would choose Lord Brougham or Lord Westbury. Fancy delights to portray them engaged in the task of telling posterity their deeds, their opinions, and their enmities. Either of them had enough assurance for anything. The Earl of Selborne differed in character and instinct from these his eminent predecessors on the woolsack. Combativeness and the spirit of self-glorification were remote from his disposition. He had interests outside of and above the strife of the law courts. Even parliamentary distinction was less than what he prized most. He did his work and won his honors under the promptings of ambition, but always under the restraints of a natural, unaffected piety. Besides being thrice Lord Chancellor, he was a Sunday-school teacher and the editor of the 'Book of Praise.'

The motives which led the Earl of Selborne to describe at length the events of his life are intelligible and sufficient. He belonged to an unusual family, he had reached unusual eminence, and he had a strong historic sense of the value of family records. He wrote primarily for his children. "In the evenings of the summer of 1885," says one of his daughters in the preface, "my father and I were much alone, my mother having died in April of that year; and he then told me more than I had before known of his own father and his early life; and when we went to Siena the following August, I asked him to write these recollections that we might possess them." Fortunately for this suggestion, Lord Selborne had long been accumulating family documents. "I have never kept journals or diaries or any other record of my private thoughts and meditations, but I have a very vivid memory of the earlier part of my life, and it has been my habit to preserve such letters and papers as I thought of permanent interest, whether relating to family or to public

affairs." While the narrative thus originated was intended first for family eyes, it was also intended for publication as a posthumous work, and every manner of change or deletion has been avoided in conformity with the author's express wish. A passage of the preface vouches for the integrity of the text. "There is much of so intimate and personal a nature that it would not have been given to the world but for loyalty to his known intent and desire in regard to these memorials." The two volumes now published are but an instalment of the whole work. They constitute the first part and are presumably to be followed by at least two more volumes, which will bring down the history of the Palmers and of Lord Selborne to a point some twenty-five years later than 1865, the terminal date of Part I.

Lord Selborne was almost a Hebrew in the strength of his family affection, and these memorials owe their marked unity to his feeling of reverence towards his ancestors and of love towards the members of his own home circle. We state this fact at the outset because an appearance of complexity might seem to be inevitable where so many biographical sketches are given. These digressions do not leave upon the mind the idea of a mixed performance, but serve, rather, to emphasize the continuity and sacredness of the family stem throughout successive generations. Of domestic annals between the reign of Queen Elizabeth, when his paternal ancestry first becomes known, and the marriage of his grandfather, William Palmer, with Mary Horsley in 1766, Lord Selborne has little to say. William Palmer was a prosperous merchant of the City of London. His wife was a sister of Samuel Horsley, Bishop of Rochester, an editor of Newton's works, and secretary of the Royal Society. Five of their six sons went to Charterhouse. There were also three daughters. Lord Selborne's father, William Jocelyn Palmer, went to Oxford, entered the Church, and became rector of adjoining parishes in the diocese of Rochester: Finmere and Mixbury. Two of the sons entered the service of the East India Company, one entered the navy, one entered his father's business, and the sixth became a barrister. The names of Lord Selborne's uncles and aunts and of their children are often on his tongue. Thomas Palmer of the Indian service and Edward Palmer of the navy receive notice in separate chapters. We cannot pause even to mention Lord Selborne's more distant relatives, bound though he was to them by ties of attachment and intimacy. They are too numerous and the main theme of the autobiography is too full of matter. But his father and his eldest brother refuse to be put lightly aside. Standing in the foreground of the canvas, they demand some notice before we pass to the author himself.

William Jocelyn Palmer must have been as near an approach to the poor parson of Chaucer's Prologue as can be reached by a modern clergyman of the Church of England who marries and has a large family:

"I have heard some people speak as if the care of a few hundred souls were insufficient employment for the zeal and energy of a clergyman of mark. My father did not think so. There was no position in the church which he could not (in my belief) have worthily filled, which he might not have ennobled and adorned. But what God had charged him with was the care of those five or six hundred poor people at Mixbury and Finmere, for whom there was no one else to care, among whom there was no praise to be won, no ambition to be gratified. He was content with this and sought for nothing more."

This passage is an epitome of Lord Selborne's character-sketch of his father; and many quotations from long, considerate, inspiring letters show that his children were but the dearest members of his flock. His pride at their academic and professional success was great but not immoderate. He knew how to give good counsel without becoming officious. He remained while he lived the patriarchal centre of his family, and when, thirty-five years after his father's death, Lord Selborne dedicated these sketches to his children, he could say: "Of all the characters and influences here commemorated, that which it has been most a labor of love to me to delineate is your grandfather's; and if, in what you learn concerning him, you find the main interest of this work, I shall be rewarded."

Mention of Lord Selborne'e eldest brother, William, brings us to one of the most striking features of the present work, its theological aspect. The Palmers were not only religious, they were theological. William Palmer, a man of strong personality and conscientiousness, left the Anglican Church and went over to Rome. He had been in sympathy with Newman for many years before his conversion, but the final step was delayed till 1855. Here he is presented in his domestic relations and with much fulness in his relations with the Greek Church. A self-constituted envoy of the Church of England, with no further credentials than a letter from Dr. Routh, President of Magdalen College, Oxford, he set out to determine whether he could be admitted to the Greek communion without formally abjuring the Church of England. He was resident in Russia for considerable periods, and a record of his first visit remains in 'Notes of a Visit to the Russian Church in the Years 1840–1841,' which was published by Cardinal Newman in 1882. William Palmer, though he failed in his object and became involved in a singular controversy, had good opportunities of examining the Eastern Church and of meeting its chief dignitaries. Lord Selborne, by drawing copiously upon his correspondence, leaves a distinct impression of character, and throws some side light upon Tractarian aspiration in the early forties.

Reared by such a father, influenced by such a brother, and surrounded on every side by a religious atmosphere, Roundell Palmer was compelled to take a stand either for or against Christianity in its Anglican form. We exclude indifference, because he was of a temperament too serious and scrupulous to admit that alternative. We are following the whole drift of this autobiography when we place religious matters first in Lord Selborne's heart and mind. Indeed, he fixes upon a certain religious experience as the crisis of his life:

"About this time I was approaching a crisis of mental suffering such as I had not before experienced and I have happily never since known. I needed disappointment and mortification to complete the discipline necessary for my soul's health, and on St. Matthew's Day, 1845, it came. I knelt alone on that day in a corner of a country church remote from my home, and offered prayers, which it pleased God, though not without a passage as through fire, to accept and prosper. Then it was that the want, in my particular case, of that medicine which our Church has provided for those overburdened souls who cannot quiet their own consciences, was brought home to me. The priest to whom I had recourse was a friend, whose opinion of me had always been better than I deserved, and to whom it was therefore a special humiliation to go. He administered to me, very lovingly, the consolation and counsel which his office entitled him to give; and I went away feeling like Christian in the 'Pilgrim's Progress' when the intolerable burden had fallen from his back, relieved from my spiritual trouble, and in some degree strengthened to bear the temporal cross which I had still to endure."

When writing in the above strain, Lord Selborne undoubtedly refers to a final act of self-conquest, for his letters conclusively show that in every year of his life, from boyhood on, he recognized the call of religious duty. 1845 was the year of Newman's secession and a time of heart-searching among all Oxford men of Palmer's generation.

ARETINO.

L'Italie du XVI. Siècle: L'Arétin. Par Pierre Gauthiez. Paris: Hachette et Cie. 8vo, pp. 438.

In April, 1492, the birth of a little girl, the descendant of kings, was welcomed in the French castle of Angoulême; in the same month of the same year a little Italian boy saw the light in a small two-story house in a narrow street of Arezzo. The little princess became a Queen, Queen Margaret of Navarre, and the little Aretine became *the* Aretine, Pietro Aretino. Conspicuous figures in their own day, they personify opposite sides of their times, and this not the less because of the strong individuality of their respective characters. Queen Margaret represents the high aspirations and generosities of the Renaissance, Aretino its audacities and degrading triumphs; and in the Queen's mysticism and the parvenu's insolence may be found a reflex action of the passions, the powerful wills and the mean motives that on every side were battling confusedly for the right and for the wrong. But the conditions in France and in Italy during the sixteenth century were so unlike that the Renaissance resembled a great orange tree bearing flowers and fruit at the same moment. Italy was ripe, almost beginning to decay, while France was still blossoming; and Aretino seems as if he had lived a generation later, or many generations later, than Queen Margaret. In some respects he is the contemporary of Voltaire, of Beaumarchais.

The critic Ginguené said, a hundred years ago, "Aretino is often spoken of, he is much despised, he is little known"; this is still true. An adequate Life of him has never been written. It would seem an easy and interesting piece of work to accomplish, for no man ever had more open or more picturesque relations with other men, and some mention of every person of importance in his day might be included in his story. But it has not been done. M. Gauthiez has not done it, but has written a volume about him which, though injured by a lack of familiarity with the Italian language, has enough ability and enough scholarship to dishearten any one else from taking up the subject for some time to come. But M. Gauthiez is confessedly an adorer of the "primitives"; his last page is a sigh of relief at escaping from Aretino's company and returning to that of Dante and St. Francis, and he is not to be blamed if his aversion to the personage he is portraying is felt in every page. Rather he is to be praised that it does not induce positive injustice, and his justice is marked in his treatment of one point, the gross licentiousness for which Aretino's name is almost a synonym. Aretino has been made one of the world's scapegoats for this sin. He was scarcely more guilty than such contemporaries as Firenzuolo, and Alessandro Picco-

lomini, professor of moral philosophy at Padua, who died an archbishop; and revolting and entirely unreadable at the present day as some of his writings are, their indecencies are the reflection of the manners, at that time, of the papal court. M. Gauthiez points out that there were not lacking, among "the great," voluntary and pleased recipients of his worst offences in print against morals. Two hundred years later the French academician La Monnoye thought it well to translate them into Latin distichs. Within a few weeks M. Brunetière has remarked that "the Elzevirs printed no obscene books, with the exception of the Ragionamenti of Aretino in 1660, and no defamatory libels." This may be regarded as some indication of the estimate Aretino's works were held in by men of that date. It is to be remembered, also, that disgraceful writings were falsely ascribed to Aretino during his life and after his death. A singular mistake made by M. Gauthiez is an illustration of how easily, without ill-will, unfortunate falsities may take shape. He refers to Aretino as "l'homme dont on parlait jusque chez le Grand Turc, mieux encore, à qui l'on envoyait . . . une Turque belle et de prix." The letter he refers to as his authority reads: "Il Caorlino . . . mandavi una turchese bella e di prezzo"—a fine *turquoise!* A similar mistranslation, as entirely erroneous as this, and suggesting a still more serious charge, may be found on p. 160, accompanied by a sentence of contemptuous comment.

If M. Gauthiez's insight and capacity were as marked as his rectitude, his book would be more valuable than it is. It is not a vigorous presentation of Aretino's character, and gives no clear interpretation of his career, no sufficient explanation of his extraordinary position. It is therefore possible that a sketch—the slightest of sketches—may suggest some things wanting in this carefully executed portrait. First, it may be observed, Aretino was a "parvenu"; he was the greatest of that class the world has ever seen. Far more truly than he was *the* Aretino, he was *the* Parvenu, the illustration of the name. Moreover, he attained this height by a path peculiar to himself, original with him. M. Gauthiez speaks of him as "a true journalist." He was more than that; his letters—critical, satirical, eulogistic, ironical, written in *lingua volgare*, sometimes "editorials," sometimes "chroniques"—circulated everywhere, and were the organ, the sole organ, of interprovincial, international public speech. He invented the most powerful of modern instruments, he wielded its power, and in so doing he created himself—an incarnation of "the Press."

He was no wiser, he attained no greater heights, no nobler depths, than the English Thunderer—the thunderers everywhere—of to-day; but he alone then thundered and lightened over all Europe. He alone was "the Scourge of Princes," as he was styled by Ariosto. He was more venal than his successors, but he did not invent venality, and it did not die with him. And his venality, even his blackmailing, was often only "business"; it might even be called legitimate business. His rightful revenues, the earnings of his industrious and vigorous pen, came not from subscribers to his letters (as in later days with Grimm, the polite correspondent), but from donations from those to whom they were of service. Titian's pictures were often paid for by gifts of jewels and offices. Aretino never asked for the emoluments of public honors, but he gladly accepted gold in every shape (Erasmus did also)—wrought in splendid chains or cups or finger-rings, or not so treated—and he more gladly accepted beautiful pictures, statues, bronzes, medals, brocades, game, and fruit and wines. If these were not sent him on time, he dunned for them as for a bad debt, and threatened the delinquent. He sincerely felt they were *due* him. But he gave as freely as he received. He was not like a robber baron descending from his fastness, with his armed followers, to snatch indiscriminate booty; he was the Robin Hood of literature, though he had no troop at his back. He took from the rich to give to the poor. He was the Scourge of Princes, but he was the protector of artists, and his protection was graced by a skilled appreciation that ennobled his praise. In the fantastic phraseology of the day, he declared "avarice to be the tomb of the virtues, and liberality the funeral-urn of the vices," and he practised what he preached. His Venetian palace was as a great bazaar, in which the only bare room was the one in which he worked; the things that made it beautiful one day were gone the next; and from his possessions he sent splendid gifts to his "patrons," a Raphael to one, a Titian to another, a Sansovino bas-relief to a third, or a drawing by Moretto, mirrors of Eastern crystal, wonderful poignards and exquisite intagli. At the portals of the palace, as at the gates of a convent, was perpetual alms-giving. To his friends he was generous of better things, and with ardor and without stint he used his time and talents for them.

But he had larger virtues than those of liberality and friendship. He possessed, he had acquired by his own strength, intellectual virtues that are noteworthy in any age. Not only did he "dare to stem tyrannic pride," not only did he cast scorn on "the unco guid," but, before Burns, he knew and he declared

> "The rank is but the guinea stamp,
> The man's the gowd for a' that."

"True nobility," he cries, "derives from the spirit; the nobility of blood is of bastard birth." "Don't quarrel, my dear son," he writes to a friend, "with those who affirm that I am of low birth. For I claim the honor of having been born of mean parentage . . . and of being able to bestow nobility, although I myself have never received it." As Montaigne in his own person found a type of humanity, so Aretino in his own person found a type of the individual; and he proclaimed the rights of the individual, and won his cause. The individual—working the press—became the master of princes, kings, emperors, popes, and simulated the huge figure of Democracy. "I am a charlatan and no philosopher," he shouts in his strident tones; "my bag is full of things of no weight or value—audacities, coaxings, lies, tricks, odds and ends," while he might well have added to himself, with a meaning headshake, "If, like the sword of Brennus, I cast my bag into the balance, *Væ victis!*"

But the impression that all men in power were his enemies, and that the tributes to him were those of fear only, is an erroneous one. In saying just now that he had no one at his back, all that we meant was that he employed no paid "spadassins"; he was supported and sustained by a large body of the most remarkable men of his age. Setting aside the group of his distinguished artist friends, voices from every quarter applauded him and encouraged him. He published two volumes of letters written to him which do him honor, and this honor is secured by the fact M. Gauthiez vouches for, that the published letters correspond accurately with those still remaining in manuscript. The many writers of these letters have few points in common save their high regard for the recipient of them. The signatures range from that of Giovanni delle Bande Nere, the great condottiere (of whose death-bed in 1526 one of Aretino's own letters is an admirable and moving description) to that of the Countess Veronica Gambara of Correggio, whose pure and pious days of courtly widowhood resembled, as did her studious girlhood, the life of her friend Vittoria Colonna. There are nine letters from her to Aretino, extending over four years, full of "the affection I feel and shall always feel for your great worth and for your virtues, unparalleled in these days." The Marchioness Pescara herself is represented in the collection by a civil postscript to a letter of her famous husband's famous kinsman Alphonso d'Avalos, Marquis del Vasto, whose own letters are numerous and all full of friendship. A letter from the great Constable of France, Anne de Montmorency, the greatest name of all, is addressed to the "Signor Aretino, he who makes known men's virtues and vices." Guicciardini, the future historian, writes of "the deserts of your virtue," and signs himself "as a brother"; and Michelangelo says, "I am much pleased at receiving your letter," and again, "I beg you to write to me," adding, "Kings and Emperors hold it as a high favor to be named by your pen."

The endless list of his friends, of those who befriended him, opens, naturally, in his youth, with the Medici, Leo X., and Cardinal Giulio (afterwards Clement VII.), and then comes the Duke of Mantua, to whom he was introduced by the delightful gentleman Baldassar Castiglione. In 1527 he went to Venice, and there, little known at first, he soon made himself so welcome to the highest personages of the city—the Doge Andrea Gritti, the great statesman, at their head—and he soon became so ardent a lover of the beautiful city itself, its waters and its skies (which he often depicts with charming enthusiasm), that for the remaining thirty years of his life it was his abiding-place. The King of France might offer him hospitality, Henry VIII. might invite him to England; but, barring a short excursion he made stirrup to stirrup with the Emperor, he would never quit Venice, save five or six months he spent in Rome in 1533, when Julius II., in full conclave, kissed him—a resounding kiss!—and a visit to Urbino in 1550, when he escorted his daughter to her husband's home, and was received by a body of cavalry eight thousand strong, sent by the Duke to meet him, and the city illuminated in his honor.

Such a man was not a mere scoundrel; his name does not deserve infamy only. His personal example may have done little or no good, public or private, but his vices were not unfamiliar to men. What was new was the power and width of his influence, and it has never been asserted that this influence was exerted in bad causes. In truth, it was not "causes" that interested Aretino; he was moved as a writer by irritation against "the upper classes," by indignation at the undeserved privileges of "the great." It was no sacred love of freedom of speech, it was the anger of an unjust man at the sight of injustice. But a ducal envoy could say: "We who spend our days in princes' service, and every courtier also, and other men too, know that if we are considered, and our deserts recognized by our masters, it is thanks to the castigations they have received from Pietro's pen." "Pietro" himself declared he deserved

some little glory "because I have thrust truths into the presence and the very ears of the great, to the shame of flattery and falsehood." And Antonio da Leyva, Charles the Fifth's great general, said that Aretino was more useful to the world than all the pulpit preachers, for they instructed the common people only, while he directed princes. Such contemporaneous judgments have been in his case too much disregarded.

One name is not to be found among his friends—that of the Queen of Navarre. She and he were not "contemporaries" in any true sense, as has been already said, and they were not leagues but worlds apart. A translation of one of his religious works (of which there are several) was dedicated to her; she paid him no compliment in return. "I have never received anything from her, and I can hope for nothing," he writes. That sentence is perhaps his true verdict.

Travel and Talk, 1885-93-95. By the Rev. H. R. Haweis, M.A., author of 'Music and Morals,' etc., etc. 2 vols. London: Chatto & Windus; New York: Dodd, Mead & Co. 1896.

Mr. Haweis's contribution to the literature of international appreciation is not the least remarkable of many such. It is a monument to the good-nature of the American public and to its impartial generosity in its treatment of the gentlemen and scholars, on the one hand, and the adventurers and confidence men, on the other, who come over here to do a little lecturing. It affords fresh evidence of the absurdity of international comparisons based on individual peculiarities. "Broadly speaking," as Mr. Haweis himself remarks, "cultivated people are much the same everywhere." Even people who have had the best advantages differ more among themselves than the well-mannered of England and America differ from each other. It is greatly to be hoped that no American abroad has abused the privileges of hospitality more liberally than Mr. Haweis has done. What will the Bishop of Tasmania think and say when he sees in print the astonishing letter which he wrote to Mr. Haweis only last year? It wasn't a nice letter for a bishop to write, but that Mr. Haweis should publish it is passing strange—or would be if, before reaching vol. ii., p. 169, we had not ceased to be surprised at anything that Mr. Haweis might say or do. See vol. i., pp. 97-102, where he describes at length the peculiarities of a lady whose husband's name he prints in small capitals as one of three great Americans and his distinguished friend. See vol. i., pp. 103-6, where the wife of a New York college president is ridiculed for her too assiduous hospitality to a clergyman whom she had mistaken for a gentleman. Both of these ladies are dead, and Mr. Haweis is entitled to such excuse as there is in that; but should not the survivors have been considered, and his own prospects of future hospitality? He complains that on one of his later arrivals in this country no one met him at the wharf. If his book should be generally read, he might at his next coming find a crowd upon the wharf to meet him and wish him a speedy return.

He admits that his impressions of travel are "snap-shotty." How could they be otherwise, covering, as he did, 100,000 miles in his three journeys, and seldom stopping anywhere longer than was necessary to get off his lecture? This met with various fortune. In Australia he does not seem to have had a good time at all. The clergy of his own church fought shy of him—he thinks because they had not free admissions, but it is possible to imagine other and better reasons. In the rougher parts, his lecture being two hours long or longer, he had a recess in the middle for the men to go out and "liquor up." Mr. Haweis was never anything but scrappy, even in 'Music and Morals,' the book which gave him a deserved reputation, and here the touch-and-go of his itinerary makes him scrappier than ever. His notes were evidently not sufficient for his two volumes, for he has padded the first with some fifty pages of Mormon history, and the second with nearly 150 pages on the missions to the South Sea Islands. These, if their information could not be found in better shape elsewhere, would be the most valuable portion of his book. The fact that his grandfather, Rev. Thomas Haweis of Aldwinckle, Northamptonshire, was the founder of the Missionary Society, and Lady Huntingdon's chaplain, is his excuse for introducing so much matter foreign to the original purpose of his book. There are other things which could be better spared—notes from distinguished people accepting or declining his polite invitations, and such unconsidered trifles. Even when the hook was baited with several Cabinet ministers, bishops, and well known writers, Phillips Brooks did not rise to it.

Mr. Haweis is frequently amusing, but oftener when he does not mean to be than when he does. He has some apt descriptions and tells some good stories, but they are generally old and he does not always tell them straight. He misapplies Phillips Brooks's "dear old moth-eaten angel," which did not, we think, originate with him; and he spoils the beautiful words of Emerson at Longfellow's funeral. His humor tends to coarseness, as do the manners of the book; "the railway nigger" being his designation for the porter on the Pullman car. He had a tragic time at Vassar, where he tried in vain to get a glass of sherry and had to put up with a cup of tea—"a sort of green decoction that tasted like verdigris." One of his Sundays was a web of mingled yarn. He went to the Church of the Holy Spirit in the morning, preached at Grace Church in the afternoon, went to hear Beecher in the evening "with Courtlandt Palmer the Agnostic and the charming Miss Ingersoll, daughter of the famous Anythingarian lecturer Colonel Ingersoll," and ended with a supper at Delmonico's with Andrew Carnegie. He complains that the canvas back duck was not cooked. "The little mud-turtles in the soup" were more to his taste. He learned something at that dinner about the fondness of the canvas-back duck for wild celery, but in general the acquisition of exact information was not in his line. Joseph Jefferson is not nearer eighty than seventy; he is only sixty-seven. Bryant was not one of the Boston set of literary men. Beecher and Mrs. Stowe were not the two principal agents in the destruction of slavery, and the Mormon contribution to that event was not conspicuous. There is no "Stanford and Leland University" in California. "Emerson and Longfellow would none of Whitman" is unfortunately not true, Emerson's praise of Whitman long serving "the good gray poet" for his best advertisement. We have no "Nonconformists" in this country. Mr. Haweis could not preach for Beecher without the consent of Bishop Potter, and there are various indications that he imagines our Episcopal Church to be a State church and a branch of the Established Church of England. Naming our literary men, Bryant, Emerson, Longfellow, Whittier, Lowell, Hawthorne, Holmes, he says that they were "all abolitionists," but Holmes and Hawthorne he should have known were nothing of the sort. Long Island is not exactly "the New York Isle of Wight." And so on indefinitely.

The climax of Mr. Haweis's inaccuracies is his chapter xx., vol. i., "Charles Sumner." Only a few choice extracts can be given:

"It has been my privilege to know [besides President Cleveland] three other high-class politicians, Senator Abram Hewitt, the Hon. John Bigelow, and Senator Charles Sumner." "Charles Sumner has always been a fighter of monopolies and jobs, and monopolists and jobbers have revenged themselves upon him by shuting him out of office whenever they could. But somehow there is a vitality about integrity and pluck, and only last year [1895] Sumner went to Washington and defeated a pretty little Southern Pacific job at the instance and to some extent under the ægis of my good friend Mayor Sutro of Francisco. Sumner's name will for ever be associated in the politics of the nineteenth century with the noble fight he made against the postal and telegraphic monopoly scandals." "Sumner was in England in 1883." "I still remember Sumner's warm grip and moist eye as he shook me by the hand in 1893, after my last sermon in Francisco."

As Sumner died in 1874 it would appear that Mr. Haweis has confounded him with some one else, but he has "his characteristic card," signed "Charles Sumner," and written in 1883, when, having tried in vain to effect an entrance into Mr. Haweis's church in London, he "retired in good order." Evidently there is something here which requires clearing up.

Federation and Empire: A Study in Politics. By Thomas Alfred Spalding, LL.B. London: H. Henry & Co. 1896.

The title of Mr. Spalding's book would lead us to expect another contribution to the literature of Imperial Federation, but it bears upon that subject only indirectly. It is rather a most interesting and effective argument for the federation of the three home kingdoms—powerful both from the vigor and directness of the style and from the thoroughness of the investigation of the facts of the case.

The argument is like this. Every one admits that the British Parliament is able to get through but a small portion of the business which seems imperatively demanded of every session. This paralysis of Parliament, as Mr. Spalding delights to call it, is not due to a rapid increase of imperial business, as one would naturally suppose at first thought, but solely to the pressure of local legislation. The fact primarily responsible is that each of the three kingdoms differs so widely from the others in its legal system and administration that separate legislation on a great variety of topics is needed for each. Theoretically this should make no difference, for, in the language of Prof. Dicey, whose defence of the present system Mr. Spalding makes the target of repeated attack, members of Parliament "have not been the delegates of special localities, they have not been English members, or Scotch members, or Irish members, they have been simply members of Parliament; their acknowledged duty has been to consult for the interest of the whole nation." That this theory is the exact opposite of the practice, Mr. Spalding most clearly demonstrates. In order to force through the legislation needed by their states—even though it might be vitally necessary legislation—the

Scotch and Irish members have been forced to subordinate everything else to this purpose, and to take their position upon English and general questions not according to the merits of the case, since their own constituents held them to no direct responsibility in such matters, but according to the effect their stand upon these questions would be likely to have upon their own measures. Obstructive tactics have been resorted to for the same purpose. These facts can be most distinctly seen in the action of the Scotch and Irish members, but the evidence is conclusive that in certain ways the demands of separate legislation for England are even more responsible for the present paralysis of Parliament. The result has been two-fold—first declining attention to imperial (that is, foreign and colonial) business, just at the time when the rapid development of the empire has been constantly creating new demands, and, second, an abandonment of the principle that all laws shall be assented to by a majority of the representatives of those who are to obey them, and, with the loss of this, naturally a loss on the part of the representative of the sense of his responsibility to his constituents. These results tend to prove that the present situation is full of danger, not merely to the empire at large, but to popular government as well.

The force of the argument cannot be made to appear in an analysis like this. It is founded upon a most laborious and apparently thorough classification of all legislation since the union with Ireland in 1801, and of debates which failed to result in legislation, made clear in tables and graphic diagrams, and suggesting many most interesting conclusions besides those bearing upon the main argument. This classification exhibits both the increasing inability of Parliament to do business, and the lines of its action which are most affected by this paralysis, and it reveals the cause—the pressure of local business, mainly that of England, under such conditions that it is able to force imperial business out of the field.

Mr. Spalding argues that by these symptoms the federal system is indicated, as the physicians say, as the natural remedy. The Union has never been a real union. Each of the attached kingdoms retained in entire independence all its local peculiarities of law and administration. It gave up its parliament and received the privilege of sending a few representatives to the Parliament of the United Kingdom, which remained, however, in spite of these additions, in every essential particular the Parliament of England. It follows that the Parliament exercises in turn the functions of a State Legislature for each of the three states, and attempts to do federal and imperial business as well. What could be more simple than to relegate the separate state business to a separate state legislature, actually composed of the representatives of those concerned and responsible to them, and confine the federal Parliament to federal and imperial business?

To this point one follows Mr. Spalding's argument with ready agreement. But he goes further than to demonstrate his case. He believes, very correctly, that the English people can never be led to adopt a federal form of government merely by convincing them that it is a natural remedy for certain of their difficulties. They are afraid of it. The majority of English voters believe that it means dissolution, and apparently they cannot be convinced of the contrary by an appeal to American experience. They can be convinced only by constructing a form of federal government so modified that it is clear at a glance, even to the English mind, that it does not destroy but preserves the Union. Such a modified federal system Mr. Spalding attempts to construct, and this is not the least interesting part of his book.

He calls the Home-Rule bills "amorphous and illogical federation," but the terms apply with almost equal force to his own plan. Mr. Spalding seems conscious of this and seeks its justification, where indeed it is to be found, in the impossibility of going further, and in the necessity of going so far very slowly. He supposes that a first step could be taken by committing local state business in the present House of Commons to the representatives of each state, who, after the manner of a committee, should put the desired legislation into its final form, to be adopted then by the whole Parliament. Gradually it would become evident that they could be trusted to do this business in Dublin or Edinburgh, and that it might not be necessary for every state representative to be also a member of the federal Parliament. This method of growth and this result avoid two great difficulties, as the English regard them: there is no "inflexible" written constitution, and the judiciary has no power to declare an act of the Legislature void. Each state legislature, of one house, remains in theory an offshoot of the House of Commons. Its bills, therefore, go up to the House of Lords, which Mr. Spalding hints may be a House of Lords reformed according to a plan which he published some little time ago. It falls to the House of Lords to determine whether in any bill the local legislature has exceeded its powers. If it has, the bill is referred to the federal House of Commons. If not, it follows the regular course of all bills through the House. Local taxation, determined upon by the local legislature, is sent to the federal House of Commons and becomes a part of the imperial budget as now. It follows that every local act is constitutionally an act of the imperial Parliament, though put into form by a House of Commons composed only of representatives of the state concerned. As more fully developed by the author, this is a most interesting scheme.

The fear of the possible action of Ireland, if granted any degree of local independence, is at the bottom of the English fear of federation. If the relations between the Irish and the English were like those which now exist between the Scotch and the English, the task of explaining federation to the English voter and of leading him to adopt it would be far easier than it is. This fear of Ireland is the penalty which England is now paying for the misgovernment of Ireland.

Pioneers of Science in America: Sketches of their Lives and Scientific Work. Reprinted, with additions, from the *Popular Science Monthly*. Edited and revised by William Jay Youmans, M.D. With Portraits. D. Appleton & Co. 1896. 8vo, pp. viii, 508, 50 plates.

THESE biographical sketches are fifty in number, and the principle upon which the selection of them as representative of pioneering in American science is made is no doubt determined by the materials the editor had on hand from the *Popular Science Monthly*. At the same time there is a certain method and congruity in the collection, the subjects being men who were born from about the time of Benjamin Franklin down to about 1810, and while it is of course not pretended that these fifty comprise all the names that are entitled to like distinction, they are a very notable group, typical or illustrative of the men who may be said to have made science what it is in this country, on both the biological and physical sides of the same shield. The various personages are arranged in the order of their birth, from Franklin to David Dale Owen, 1706 to 1807; the dates of death run nearly to the present day, as that of Ericsson in 1889. With one exception, each biography is accompanied by a portrait, and these are, as Dr. Youmans informs us, "in every instance well authenticated." "In collecting materials for the *Monthly*," the editor adds, "no effort was spared to reach the most trustworthy sources of information. . . . The accuracy thus secured in the first instance has been made more perfect by a thorough revision of the matter for this volume."

It is certainly a useful and convenient volume, and reliable too, if we judge correctly of the degree of accuracy of the whole by critical examination of those cases in which our own knowledge enables us to form an opinion—for no reviewer could pretend to be personally informed in all these premises. One thing that the sketches bring out clearly is that, while fame and merit often go hand in hand, as in the instances of Franklin and Morse, solid scientific acquirements have not always won commensurate recognition from the world at large. Thus it happens that men whose wide renown is that of an Audubon or an Agassiz, here appear in line with others whose reputation, if not less enduring, is mainly in "mouths of wisest censure," like that of a Sullivant or a Lesquereux, scarcely known except in bryology and palæobotany. The most picturesque figure in the volume is that of C. S. Rafinesque, who seems likely to exercise the patience of naturalists for all time. We are tempted to particularize many other cases, but in so doing should be led far beyond reasonable limits. In general it seems to us that the handy volume is specially to be commended for setting in just historical perspective many of the earlier scientists who are neither very generally nor very well known, such as the two Bartrams, S. L. Mitchill, B. S. Barton, and C. A. Lesueur, who thus take their proper places in a line of worthies which reaches to our own times, and are clearly seen to have occupied in their day the same place in science that is now held by its recognized leaders. In this particular Dr. Youmans's plan works admirably, and the net result is so good that we hope the succeeding volume, at which the editor's preface hints, may soon see the light.

La Société Americaine. Par Prof. M. Dugard. Paris: Hachette & Cie.; New York: Lemcke & Buechner. 1896.

M. DUGARD came to the United States in 1893, and in four months saw something of New York, Boston, Philadelphia, Washington, Salt Lake City, San Francisco, and the intervening West, including Chicago. He is a thoughtful observer, and his report, though here and there exaggerated and inaccurate, is marked by that true French urbanity which always knows how to spare the vanity of those criticised, without missing its point. M. Dugard found many things to interest him, and some of those which struck him are worth our attention also. The quality which he declares to be the national trait most visible to a stranger is ebullient youthfulness, and in his chapter "Through the West" he makes very plain

what he means. For instance, the American's ambition is as youthful as if the teachings of experience on the subject were quite worthless. "To live quietly, to content himself with little, to avoid devoting himself to the pursuit of wealth—all these precepts of ancient wisdom are unintelligible to him; the golden mean dear to the Latin poet would seem to him cheap and contemptible." Another indication of youthfulness is an "incredible facility" of changing one's occupation and place of abode; in older societies a fixed domicile is one of the great objects of life. In America not only is one's furniture light and movable, but one thinks nothing of moving his house. The author met one of these "habitations ambulantes" one day in San Francisco; mounted on *poutres de glissement*, "it moved rapidly and lightly through the streets, the exact symbol of a society in which everything is in motion." The American is restless, also, with a feverish restlessness. All these traits hardly go with the bourgeois qualities of prudence and economy; "time is the only thing which the American knows how to economize," and as for prudence! In Arizona the author had the good luck to be carried across an abyss in a railroad train by an engineer who "chanced" it apparently out of love of excitement, and then to hear an employee say to a friend, "I'll bet you a dollar another train doesn't get over," and the man laughed, "amused by recklessness which might have cost a hundred lives." As he is reckless, so the American is wasteful. Having fallen heir to immense riches of a new continent, he squanders them like a young spendthrift. These traits are not very wonderful, either, for America is a country of young people. The West has been built up by men under forty.

All this is true, and has been said by others; it must be added, however, that M. Dugard seems to have acquired while here a touch of the same youthful spirit which, as he says, leads, among other things, to exaggeration. "No precaution against accidents" is hardly fair as applied to the whole railway system of the United States, nor is it true that American purchasers are, as a rule, in too great a hurry to wait for small change. Exaggerations and mistakes such as these disfigure a book with an inaccuracy from which a little of the prudence which should mark the old when criticising the young would have saved it. Were it not useless to make the suggestion, we should also complain of the proof-reading. Foreign, and especially English, terms in French books always suffer strange transformations, which cannot but reflect on the author's familiarity with the language of the people he criticises. "To work among the poors," "boghey" (for buggy), a policeman's "cub," are all unnecessary blunders. The surprising thing is, however, that, notwithstanding exaggeration and mistakes of fact, the book as a whole gives an impression of the country which shows in the author a rather unusual critical capacity.

BOOKS OF THE WEEK.

Aldrich, T. B. Judith and Holofernes: A Poem. Boston: Houghton, Mifflin & Co. $1.25.
Ambroslus, Johanna. Poems. Translated by Mary J. Safford. Boston: Roberts Bros. $1.50.

The Nation.

NEW YORK, THURSDAY, OCTOBER 29, 1896.

The Week.

It is a common remark in Wall Street that never was an event, regarded as so certain as McKinley's election is, so little discounted in advance. One cannot find a banker or business man who will admit a doubt of Bryan's defeat, yet on all hands there is the suspense, the holding of the breath till November 4, which would seem to imply a fear that free silver might, after all, win. But this, we believe, is a result not so much of doubt about the victory of honest money as of uncertainty about the nature and proportions of that victory. That Bryan will be beaten the business world is convinced. But will he and his cause be crushed? Will the majority be so overwhelming that free-silverism will go to join greenbackism? What sort of a Congress are we going to get? Will the vote for McKinley be so non-partisan and enormous that he will see in it a call to continue his profitable studies in finance, and to urge Congress to clinch the victory by reforming the vicious currency system which threatens us with a renewal of the peril in the future? These are the really critical questions, and they cannot be answered until the returns are in. Till then business and industry will continue to live as in a state of siege, and meanwhile it is the duty of every voter to make sure that he casts his ballot in the way to count most in giving merchants and manufacturers that confidence in the distant future of which they are waiting to get an assurance.

The Populistic campaign for the Presidency is ending appropriately in a series of insults and outrages upon those who stand for sound money and the maintenance of the national honor. The "boy orator's" speeches weeks ago degenerated into an attempt to incite a war of classes such as has never been known in the country. Nothing could have been better calculated to provoke the silverite mob to personal violence upon advocates of the gold standard than Bryan's incendiary appeals. The men who threw eggs at the Secretary of the Treasury when Mr. Carlisle spoke at Covington last week, only carried out the spirit that their candidate for President embodies, and there was another exhibition of the same spirit at Springfield, Mo., on Saturday night, when men in a Bryan procession set fire to a sound-money banner under which they marched. Repeated attempts to break up sound-money meetings in Chicago illustrate this tendency in the city where Altgeld has done so much to encourage anarchy ever since he pardoned its representatives from prison.

These incidents are symptomatic. They are precisely the sort of thing which any student of history might have predicted would happen during the closing days of the canvass after such a campaign as Bryan has made. When a candidate for President rushes through the country telling the poor that every man who advocates the gold standard is their enemy, he is arousing a feeling among the ignorant and depraved which leads inevitably to such outrages as those we have just enumerated. There are two compensating features. One is the fact that it is only a comparatively small element of the voters whom Bryan can delude into either committing such outrages or sympathizing with them. The other is, that this revelation of the logical end of the Bryan canvass increases the determination of good citizens to make the defeat of his cause perfectly overwhelming. Those who began by considering him a sincere patriot see at last that he is an unscrupulous demagogue, ready to go any length in his desperate efforts to gratify his ambition, and realize the necessity of rendering his overthrow so complete that he shall always serve as a "horrible example" in American history—a perpetual warning to our youth of the contempt that is heaped upon a man who would stir up a war of classes in a republic.

One of many signs showing the desperate character of the Popocratic campaign is the circular put out by their committee at Chicago intended to provoke strikes and riots on the eve of the election. This incendiary document begins by saying that it is "generally admitted by Chicago manufacturers that the election of McKinley will be followed by a reduction in wages." This is a lie of the first magnitude. The fact is that the manufacturers, not merely of Chicago, but of the whole Union, expect a remarkable revival of business in case of McKinley's election. They have thousands of orders for goods on their books now, conditioned on that very event—orders to be executed in case Mr. Bryan is defeated, and not otherwise. This is not the usual condition of a reduction in wages. Every workingman knows that a reduction is impossible when demand exceeds supply. "It is a significant fact," continues the circular, "that not an employer of labor in the United States, so far as can be learned, has publicly or privately offered to raise wages if McKinley be elected." It is not customary for employers to make corrupt proposals of that kind. If an employer should make such an offer, he would be liable to prosecution for bribery, and he would be held up to infinite scorn by this Bryanite committee. The purpose of the circular is shown by the paragraph which immediately follows, viz.:

> "If the workmen of any great factory or of any great industry are in doubt as to the absolute accuracy of this assertion, they can easily prove or disprove it. Let them appoint a committee and authorize it to confer with the employees or employers. Let this committee ask for an agreement in writing either that wages shall be raised in the event of the election of Mr. McKinley, or that the present rate of wages shall be maintained, or finally demand an absolute guarantee that no cut in wages shall follow the triumph of the single gold standard."

The circular concludes by suggesting that the wage-earners put their employers to the test by asking them to sign a paper agreeing not to reduce wages for two years in case McKinley is elected. This, it says, "will cost nothing, and may settle a disputed point."

Probably the most awkward thing in the canvass for Altgeld to meet is his backing up the Chicago and other rioters in July, 1894, and inserting a defence of them in the platform. One of his supporters is Senator Daniel of Virginia, who presided at the Chicago convention, made no objection to "the free-riot plank," and has since in his addresses, notably in a recent one at Richmond, defended the platform without mentioning this plank. Moreover, he was the very Senator who introduced in the Senate in 1894 the resolutions approving of the President's course in using the troops. This is shameless enough, but Col. Mosby, the ex-guerilla, now resident in San Francisco, makes it more shameless by publishing his own telegrams sent to Senators Daniel and Hunton from San Francisco in 1894. The first says they are "in a state of siege, and the mob in possession of the railroad." The second says, "The mob reigns in California, the State Government paralyzed, and the militia worthless," and begs for federal troops. Senator Daniel replies: "We have endorsed your telegram, and sent it to the President, and hope for speedy action." This man is now standing on and defending a platform which justifies the rioters and rebukes the President for putting them down. For the honor of human nature, be it said, such cases of self-abasement are rare, though they are more numerous among the silverites this year than we ever remember before. Altgeld has also tried to make it appear that the mails were not much delayed by the riots at Chicago. Mr. Hesing, the Postmaster there, shows that "for ten days practically no mails left Chicago," and that "never in the history of the country was mail service so seriously interfered with or so long delayed as during the strike of 1894."

Secretary Carlisle's speech at Covington on Thursday evening was equal to his reputation as an earnest, logical, cool, and temperate debater of public affairs. Mr. Carlisle has the rare faculty of elucidating any subject that he touches, of divesting it of mystery, sophistry, and fog, and presenting it so that the common mind can easily grasp it. This is the true test of a good public speaker. Thus, in dealing with the magpie utterances of Mr. Bryan that foreign nations are dictating our financial policy, he said:

"Notwithstanding all that has been said or may hereafter be said to the contrary, we have now a distinct monetary system of our own, freely adopted by our own legislation, without dictation from or consultation with any other nation in the world, and we have the right and the power to change it or abolish it altogether whenever we choose. The excited orators who are traversing the land in every direction, vexing the ears of the people with a reiteration of the statement that there is some party or some body of men in this country denying the right or authority of the United States to change its monetary system without the consent of some other nation, are simply evading the real questions at issue, and misrepresenting the position of their opponents for the purpose of making unworthy appeals to the passions and prejudices of their audiences. It is not a question of power, it is not a question of national independence, but it is a question of national prosperity and national honor."

It would be impossible to answer Mr. Bryan's everlasting clatter about foreign dictation in our financial affairs in fewer words or in a more effective manner. It is humiliating that any answer should be necessary, but, since it is, Mr. Carlisle has discharged the need of any further reply to it.

Equally clear and cogent was Mr. Carlisle's answer to the question what remedy he would propose for the present stagnation in business, viz.:

"The first and most important step is for the people of the United States to make such a record at the polls on the 3d of next month as will for ever put an end to the selfish and mischievous agitation of the currency question, which has done more than any other one thing to paralyze industry, destroy credit, and depress our trade at home and abroad. The next step is to take the Government of the United States entirely out of the banking business by retiring and cancelling every one of the notes issued by it, thus for ever stopping the demand upon the Treasury for their redemption in gold or silver, and placing the burden of furnishing gold, when gold is demanded for the redemption of notes, upon the banks, where it properly belongs, and where it always rested until the Government most unwisely inaugurated the policy of issuing its own obligations to circulate as money."

Here is the whole gospel of sound finance, as applied to the present situation, in one paragraph. It is not a new thing just brought to light. On the contrary, it has been reiterated many times, and will probably need to be repeated many times more. But such common truths gain much by being uttered at the right time by some man of high powers, holding a great place and addressing a "doubtful State." All these conditions were united when Mr. Carlisle made his speech at Covington; and the unmannerly behavior of the Bryanite mob that threw eggs at him and tried to howl him down has served only to draw greater attention to his words.

We observe that the death of ex-Speaker Crisp is regarded by some newspapers, the Boston *Herald* among them, as involving "a serious loss to the Democratic party." We are unable to share this view. The *Herald* appears to base the conclusion upon its belief that "Mr. Crisp was a living force on the Democratic side in the House of Representatives; and in the Congressional contests which lie before his party it will sadly miss his great parliamentary skill and the dauntless courage with which he fought a lost battle to the bitter end." Mr. Crisp never did a thing to commend the Democratic party to the favorable consideration of that independent element in the country which it must win in order to secure a majority. On the contrary, it was in spite of Mr. Crisp, rather than because of him, that independents supported his party, just as it was in spite of Gen. Butler's being a Republican thirty years ago, rather than because of it, that the same class of men supported that party then. His determined opposition to Mr. Cleveland is notorious. It has been for years, and still remains, the great misfortune of the South, that so many of its leaders in public life have been men of the Crisp type, who were ready to accept any popular error in order to win or keep office, instead of doing their duty by exposing and combating it. Georgia, "the Empire State of the South," as it likes to be called, has for years shown no genuine leadership in public affairs; nor has Alabama, with her Morgan and Pugh; nor Mississippi, with her George and Walthall; nor Tennessee, with her Harris and Bate; nor Arkansas, with her Jones and Berry; nor Missouri, with her Vest and Cockrell and Bland. The man of convictions, with the courage to express them, seems to have disappeared from the older generation when Mr. Lamar died, and there are as yet only a few representatives of a younger generation animated by his ideas of duty, like Secretary Carlisle, Postmaster-General Wilson, and Senator Caffery of Louisiana.

A bill was introduced in the last Congress providing that in any trial by jury the judge's charge shall be wholly confined to the law of the case. The object of the bill is, like that making contempt of court triable by jury, to emasculate the courts. There is a large class of the community to whom courts and judges are every year becoming more and more repulsive objects. The idea that any one man should have so much power and authority as to be able to punish another for refusing to obey him, is repugnant to their feelings; yet it is a fact that this power lies at the root of our judicial system as it exists. Orders and judgments of court, like other commands for the dispatch of business, have to be executed at once, to be of any value. If a jury had to be resorted to to determine whether a judicial order should be made efficient or not, judicial trials would very likely soon come to an end. Most witnesses, for instance, dislike subpœnas extremely, and as soon as they found out that the only result of their refusing to testify would be a jury trial to determine whether they should be made to testify, they would, whenever it was for their interest to do so, remain silent, so that one of the first results of the new system would be that proof would fail, and without proof there can be no administration of justice at all. At the very best, trials, instead of being speedy, would become more and more dilatory, and in the end would revert to the stage of six hundred years ago, when "the forbearance of the law" was so great that the plaintiff was lucky if he got a trial at all.

We venture to say that if Altgeld and Debs and Coxey and Bryan and their numerous supporters would express their opinion, it would be found to be just as strongly against judges charging the jury "on the facts" as in favor of jury trial for contempts. To charge the jury on the facts seems to suggest that a judge not only knows more law than the jury—which has not yet been disputed—but more in general. How can "any one man" know more than twelve men about the force and weight to be given to testimony which they have listened to? If he is allowed to charge them about facts, he may bias them improperly in favor of one side or the other. So he may, but if he does, his charge will be upset on appeal; while if he is not allowed to charge on the facts, the jury are deprived of the only guide they have. The idea that they will come to a more sensible and impartial conclusion by their unaided wits, than after having their attention directed to the salient points of the case by an expert trained in testing and weighing proof, is absurd. The only result of shutting the judge's mouth as to the facts would be to substitute the bias of the jury for that of the judge, and the one is just as much greater than the other as the ignorance and inexperience of jurymen are greater than those of judges. The federal courts are now a main judicial reliance against anarchy, and these bills ought to be killed. One of them is, naturally enough, fathered by D. B. Hill.

The Supreme Court of Massachusetts has, we are glad to say, decided on appeal that it is not lawful to walk up and down in front of a man's premises for the purpose of preventing persons from entering his employ by intimidation or threats. The extraordinary doctrine that this was lawful because the persons doing it were trying to better their con-

dition, got into the heads about a year ago of Judges Holmes and Field, but the majority have happily overruled them. This doctrine is a legitimate part of the crazy communistic creed that if you employ a man once, it gives him a right to remain for an indefinite period in your service on his own terms, so that, if you lower his wages, or if he thinks you ought to raise his wages, and refuses to work for you on your terms, and you dismiss him, you do him a wrong, and he has a right to annoy you and do what he can to prevent others from filling his place till you take him back. A more astounding doctrine probably never got into a court of justice. The Massachusetts court has nipped it in the bud by following the decision of the United States Supreme Court in the Debs case and of the English courts in the McGregor case. It denies that acts intended to injure or annoy others are justifiable if performed with intent to better your own condition, and goes on to say:

"This motive or purpose does not justify maintaining a patrol in front of the plaintiff's premises as a means of carrying out their conspiracy. A combination among persons merely to regulate their own conduct is within allowable competition, and is lawful, although others may be indirectly affected thereby, but a combination to do injurious acts expressly directed to another, by way of intimidation or constraint, either of himself or of persons employed or seeking to be employed by him, is outside of allowable competition, and is unlawful."

It must be remembered, now that the Venezuela matter is near settlement, by those who feel disposed to think that Mr. Cleveland's and Mr. Olney's way of approaching the subject was the right one (if it should appear that it has accomplished the desired result), that Mr. Olney's dispatch was the first application to arbitrate made to Great Britain on our own account. To conclude, therefore, that his way of beginning the negotiation was the right way is to conclude that all politeness of form, not only in diplomatic usage but in human intercourse, is unnecessary. Down to Mr. Olney's day the only mention of the Venezuela trouble made in our dispatches to England was recommendations to arbitrate for the sake of Venezuela, a small and angry state. Even Blaine expressly disclaimed the idea that the dispute was in any sense our affair, although the contention of the Venezuelans all along was that it was our affair. No such view was taken by any of Mr. Olney's predecessors. The first intimation Great Britain had that arbitration was due to us, and that refusal to arbitrate, or determination to draw boundaries without arbitrating, was a violation of the Monroe Doctrine, came from him accompanied by a threat of war, which threw the business of the country into confusion and greatly alarmed the British. If this were the right way to begin, all civility in diplomatic intercourse would be a mistake, and it is not an unfair deduction from it that civility in private disputes would also be a mistake. If you differ with a gentleman about the interpretation of a contract or the items of an account, and the right thing to do is to go to his house with a big stick or a bowie-knife, and tell him that if he does not settle this matter on your view you will break every bone in his body or rip him open, there is hardly doubt that any quiet gentleman who had no courts or police to appeal to, would settle promptly, if the amount involved were not too large, in order to get rid of a ruffian. But if the ruffian continued to call himself a gentleman and to say that the result showed that this was the way to decide controversies, the judicious would both smile and grieve. There was no reason in the world for not telling Lord Salisbury politely that the Administration took a more serious view of the matter than its predecessors, and considered the matter as our concern, and would feel obliged by a prompt settlement. When this failed, it would be time enough to let loose the dogs of war. It would reflect discredit on our civilization if we looked back with satisfaction on the way this controversy was begun, however well pleased we may be with its termination.

Our old friend the Indian rupee is at work again. The great advance in wheat has made it necessary for it to take the field. It has always been the strong resource of silver logicians in sore straits. You think you have them cornered, their facts demolished, their arguments riddled, but then comes that dreamy, far-away look in their eyes, and they escape triumphantly by way of the Indian rupee. On that Mr. Wharton Barker now rides away from the dilemma of advancing wheat and declining silver. It is a good deal of an Asian mystery as he explains it, but he stoutly affirms that if you will look narrowly into the extraordinary behavior of the Indian rupee, all will be clear and the necessity of free coinage irrefragably established. What is still more alarming, he intimates that there are other foreign coins in reserve if the rupee fails him. There is the Argentine peso, as to which he darkly hints that he could tell many things about its effect on the price of wheat in the Dakotas. All this shows how feeble the gold-standard logic always must be. It can never make an end of the silver reasoners. Drive them off the rupee, and they take their stand on the peso; make them bolt out of that hole, and they are prepared to seek refuge with the sucre or the bolivar, the ruble or the kopek, the tael or the yen, or, if worst comes to worst, with wampum and beads. They turn and pass and come again with the facility of Emerson's elusive spirit, and always have a fresh obscurity with which to account for the most obvious facts.

It is probably too soon to assert that the new Spanish loan of $200,000,000 has absolutely failed. London will have nothing to do with it, and Paris and Brussels have not yet taken it up, but their hesitation may simply be a bid for better terms. French investors are already so heavily loaded up with Spanish securities that they may feel compelled to loan more money in order to protect what they have before loaned. This is, to state it baldly, the last hope of the Spanish Treasury. It practically says to the Paris Bourse, "Find us $200,000,000 additional, or we may default on the interest of what you have already advanced." The first answer is a rush to sell Spanish securities and a serious fall in their price. But this may be only a prelude to a successful floating of the loan on terms a little more onerous for the Spanish Treasury. In any case the negotiation is almost a matter of life and death. The interest on the existing Spanish debt absorbs two-fifths of the entire national revenue. In addition, as Cánovas informed the Cortes, it will shortly be necessary for Spain to make good its guarantee of the Cuban debt. Prostrate Cuba cannot pay the interest on that, which will require several millions. Then there are the extraordinary war expenses of $10,000,000 a month. Spain simply has not the money to meet all these liabilities. She cannot raise it by increased taxation. She must borrow it, on any terms, or else there is nothing for it but a general smash-up. The fate of the Cuban insurrection will be decided rather on the Paris Bourse than in Pinar del Rio or along the *trocha*.

The almost forgotten doctrine of economy in public expenditures through close attention to minor details is preached with vigor by Paul Leroy-Beaulieu, apropos of a successful application of it in the French Department of the Jura. What has filled the minds of finance ministers and councillors for many years past has been the idea of some grand, sweeping stroke by which, through a glorious "conversion" or the exploiting of some new monopoly, the state would save millions or add them to its revenue. Mere petty economies have been beneath their lofty minds. To waste their precious time in stamping on a 1,000-franc job here and cutting off a useless expense of 1,500 francs there, could hardly be expected of such brilliant and important personages. But that is the only way to do the business. While other councils-general were dreaming of spectacular operations, that of the Jura buckled down to details, and, by saving 177 francs in the commune of Pannessières, 144 at Nance, 75 at Largillay, etc., succeeded quietly in effecting a distinct reduction in taxation. That this merciless application of the knife to particular items is the only practical way of economizing in public expenditure, our Congress will do well to remember next winter.

MOB VIOLENCE.

THE accounts which reach us from various parts of the country, of mob violence, egg-throwing, disturbance at meetings, and insults to speakers by the Bryanites, are not absolutely new in American politics. They were common enough in the days of the anti-slavery agitation, and, beginning early, they indicated clearly the determination of the pro-slavery partisans to decide the controversy, if necessary, by force. Moreover, this spirit was encouraged and promoted by all the leading pro-slavery men. Not only were all attempts at persuasion prohibited on Southern soil, but the mob in Northern cities were taught by speeches and articles that the use of violence against anti-slavery men was legitimate whenever they attempted any public proclamation of their opinions.

This example is being followed to-day. Bryan and Altgeld and their congeners do not, it is true, say: "Your opponents ought to be stoned, or egged, or interrupted, or hanged"; but they accuse their opponents of opinions, of a course of life, and of designs which, to an ignorant or excitable poor man, make mobbing seem too good for them. More than this. The offences of the Anarchists in Chicago were worse as a menace to social order than anything which has happened since the Commune in Paris. These men assembled in the street, against the police prohibition, to make incendiary speeches directed against the laws and against other classes of society, armed with bombs to be used in murdering anybody who interfered with them. They accordingly murdered some policemen. Several were hanged and others were sentenced to imprisonment. Gov. Altgeld has pardoned these, and set them at liberty, avowedly through sympathy with them, and officially abused and vilified the court and jury that convicted them. Ever since, he has been a leading member of the Democratic party, and had a leading share in drawing the Chicago platform. He does not disavow or repent anything he has ever done. The platform rebukes the President for suppressing very formidable riots when Gov. Altgeld, the local sheriff, and militia had proved unable or unwilling to do so, thus making out that it was more important that the local authorities should not be interfered with against their will than that the great lines of communication should be kept open and life and property protected. This doctrine fully carried out would mean that any State could remain in a condition bordering on anarchy as long as the Governor and Legislature did not choose to call for assistance, and that the poor might bomb the rich without being interfered with.

Considering these things, and many others for which we have no space, the wonder is not that there have been so many Bryanite outrages, but that there have been so few. In the early days of the republic, when newspapers were few and communication difficult, and the population homogeneous and equally well instructed, it did not make so much difference what any one said. Everybody wanted law and order, and sought the same results by different means. Nowadays we have among us a large body of persons of varied degrees of education, of different kinds of training, many of them knowing little or nothing about government except what they hear from their leaders. That is to say, they are especially liable to *influence* rather than open to persuasion. They are themselves completely unable to devise a political framework or to criticise it. They know little or nothing about currency except that it is a good thing to have plenty of it. Of the merits or defects of our Constitution they know nothing but what they hear from the men whom they follow. They care little or nothing for the things which Americans used to value and to which they used to point with pride. They care nothing about judicial integrity, or public credit, or any of the constituent elements of a great state. They would fain, in short, illustrate all the evils which reactionary writers ascribe to pure democracy. Their idea of government is an omnipotent club, like that of the Jacobins, doing whatever the leaders said was good for the people, rejecting the wisdom of the past as superstition, and looking on the saving classes as public enemies. They are filled, too, with an immense sense of power.

Now, when such people as these see a man of their own, like Altgeld—sharing all their opinions—put in the Governorship of a great State; when they see their peculiar views embodied in the platform of one of the great parties of the country, and see their chosen candidate for the Presidency preaching them from a hundred stumps all over the country, is it any wonder they grow impatient enough to throw stones, or eggs, or anything that comes in their way, at their opponents? The theory of conspiracy alone is enough to incite ignorant men to violence. That theory maintains that the gold standard is the result of a combination among dishonest men for their own benefit, and causes immense misery to the poor, for which, however, the conspirators care nothing. It also holds that judges and legislators who maintain it, and orators and writers who advocate it, are hired by the conspirators, and are not speaking their honest sentiments, but are seeking their own advantage; and that poverty may be abolished by some sort of legislation. The present situation, in fact, shows strikingly that we shall have hereafter to consider far more carefully than ever before, not only the construction which may be put on our words by intelligent Americans, but the way in which they may be construed by, and the suggestions they may contain for, hundreds of thousands of Americans who are not intelligent and have caught the virus of European communism. If we said that the Chicago platform and Altgeld himself were the direct product of both the Democratic and the Republican teaching of the last twenty years, we should not be far wrong.

THE FARMER AS A BUSINESS MAN.

PROF. LAUGHLIN has an article on the condition of the farmers in the current *Atlantic Monthly*, in which he calls attention to the fact, at this moment brought home to everybody's consciousness, that all our products, and especially our farm products, have to compete with those of all other countries in the markets of Europe. The happy Greeley days, when the factory was to spring up beside the farm, and the operatives were to eat all it produced, are gone. We produce, owing to improvements in transportation and machinery, a great surplus of everything, which has to be sold abroad, because our own people are stuffed full already of wheat, corn, cattle, and hogs. The operatives declare they can eat no more, so that, as we see by the advance in grain, the prices in the European markets are of the last importance to the farmer. It depends largely on them whether his year shall be prosperous or not. It depends on them, too, what crop he had better raise, and whether he should hold his product or sell it. Prof. Laughlin points out that farming has become in some sort a commercial business, and that, great as the competition is, the man who conducts it as a commercial business prospers.

Now, our competitors in the markets of Europe are India, Russia, Australia, Rumania, Argentina. Probably Africa will have to be added to the list before long. It is of the greatest concern to us, as the events of to-day show, what these countries are producing, what prices they are getting, what are their modes of cultivation, and what are their means of transportation. Therefore, we need to study them just as a tea or coffee merchant studies the tea or coffee crop, or as a sugar merchant studies the sugar crop, or a spice merchant studies the spice crop, and so on. He does this by closely watching all the countries from which his merchandise comes. He reads the market reports in the various daily papers. He takes a trade paper and reads it closely. He talks with his brother merchants on 'change. He gets hold of every bit of intelligence he can find relating to the internal condition of the countries in which he is interested.

But what does the Populist farmer do? He reads a blathering local paper, which is full of misinformation put in to "help the party," and he collogues with other farmers as ignorant as himself at the corner grocery. Of the world outside he knows and cares nothing. "America is good enough for him." England and the

East generally are full of dudes, and "gold-bugs," and speculators. The result is that, having a good deal of time on his hands, he sits idly waiting for the demagogue and the crazemonger, and they come along at regular intervals. Had the Western farmers been watching the markets with intelligence during the last ten years, the idea of tampering with the currency would no more have entered their heads than it would have entered the heads of the members of the New York Produce Exchange. If they had been conducting their farms as business men, and had a realizing sense of the conditions which fix the price of their merchandise, they would have had no time this summer to nominate Bryan and "whoop him up." They would have foreseen and have been waiting eagerly for the present rise in wheat, and would have known why it was to rise. We believe some farmers were warned of it by Mr. Hill of the Great Northern, and have profited thereby, but they ought to have known as much about it as Mr. Hill.

At present they are as ignorant and credulous and suspicious as European peasants. Instead of understanding economical phenomena, they think these are the result of a conspiracy. Every one which they do not like is the work of secret enemies. The rise in wheat is an electioneering dodge. All falls in stocks, caused by political folly, are "put-up jobs," the work of anti-American speculators. The result is that it is at present very difficult to teach them political economy and finance, because they do not believe in the reality of the phenomena through which economy and finance are taught. A man who thinks stocks go up and down under foreign manipulation, or that the price of grain is regulated, not by supply and demand, but by intrigue, is very difficult to enlighten or convert about economical conditions. We laugh over the tendency in the Middle Ages to put the blame of scarcity on the Jews, and the blame of epidemics on the doctors; but are we much better off?

Another unfortunate tendency of the Bryanite farmer is towards suspiciousness. He suspects nearly everybody who does not live in his State. All bankers and rich men are conspirators, and so are nearly all foreign business men. Worse still, these conspirators are generally laboring to destroy property in America, to impoverish the farmers, impede business, "corner" gold, wreck railroads, and produce a general condition of distress and decay. That is, they are trying with all their might to ruin their own best customers. Why they should do this is never explained. The farmers never ask what impels business men to seek to destroy the purchasing power of the people to whom they sell and lend, and on whose prosperity their own prosperity depends. In fact, the whole Bryan campaign is filled with this theory of unprecedented, unnatural, and inexplicable human baseness, and it does not excite wonder among his followers. Nothing of the kind has ever happened in the history of mankind. Turks and Tartars and mercenary troops have often ruined wide tracts of country, but they have had personally the fun of burning the houses and destroying the property. No large body of men has ever labored for the destruction of another large body secretly, when nothing was apparently to be gained by the operation. It is unpleasant to remember that this suspiciousness, too, as alienists know, is one of the earliest symptoms of insanity. The sense of being followed or surrounded by enemies is too often the forerunner of hopeless brain disease.

ARCHBISHOPS AND ORTHODOXY.

In choosing Dr. Temple, Bishop of London, as the successor of the late Archbishop Benson, Lord Salisbury has done one of those rash and radical things which only a Conservative Government can venture upon in safety. When Mr. Gladstone named the same man in 1869 as Bishop of Exeter, there was a wild outcry from startled Churchmen, and a resolute effort made to prevent his confirmation. Probably the real grounds of objection to him were that he had openly and vigorously supported Mr. Gladstone and Irish Disestablishment, but the formal charges laid before the Vicar-General alleged that he was not sound in the faith—the chief document in the case being his contribution to that *scandalum magnum* of the '60s, the 'Essays and Reviews.' But Dr. Temple was confirmed nevertheless, and in 1883 gave fresh offence with his volume of Bampton Lectures which were open to the suspicion, to say the least, of being the product of a rationalizing mind. Yet he was promoted to the See of London two years later, and now becomes Primate. Like Tait, he reaches the position via Rugby and the bishopric of London, but who could have picked out the daring Essayist and Reviewer of thirty years ago as the man to receive the highest dignity of a Conservative church at the hands of a Conservative Prime Minister and ostentatious Churchman?

The solution of the mystery is, we suppose, very simple. Theological views scarcely count any longer in these matters. The work of a bishop is largely executive—the Archbishop of Canterbury, in particular, must have a vast genius for detail and dispatch of business. Given a man of ability (and Dr. Temple's is unquestioned and preëminent), who will be fitted to grace the office in all its public aspects, who has a record of organizing and administrative success behind him, and who is willing to work like a horse, and his particular stripe of theology is hardly worth considering any more. Yes, there is one part of his theological attitude which is most important: How does he stand on the question of High and Low Church? What does he think of chasubles and thurifers? Extremes here will never do. An Archbishop of Canterbury must not be too High nor yet too Low, must not indulge in Romish practices himself, but must not be too hard on those who do. Bishop Temple, like both his immediate predecessors, is thought to be well qualified in these particulars. There will be a decent ecclesiastical peace in his day, and that, Lord Salisbury no doubt concluded, is the main thing.

Yet the Bishop of London's elevation to Canterbury is, after all, a striking sign of the times. Like many other such signs, it shows how theology does get on in spite of everything. Macaulay's famous and rather futile assertion that theology could not be a progressive science—for all you had to do, whether you were in Patagonia or in Oxford, was to sit down with your creed and your Bible, and there was an end of it—has had of late some striking commentaries in England. One of them was the address of the Bishop of Lichfield at the opening of the Church Congress. The congress met at Shrewsbury, Darwin's birthplace, and this fact was noticed by the Bishop, who said that "all members of the church of Christ owed a great debt of gratitude to Charles Darwin. He had simplified and interpreted, as a true man of science would be anxious to do, the methods which have been pursued by the Great Almighty Creator in His works, and in so doing he had added to the dignity of the conception which they were able to form of Him who made us and all the world." Think of all this being said, and no one having a fit, within thirty years or so of that other bishop's ferocious attack on Darwin, and on Huxley as Darwin's friend and champion!

All this, of course, is but one chapter out of a history where all chapters tell the same story. Theology is never more in a state of flux than at the very occasions which it chooses for the purpose of asseverating that its metes and bounds are fixed for ever. As a living science, in a living, breathing world, it must be so. The folly is not in changing, but in denying that one has changed. Canon Gore read a paper at Shrewsbury in which he frankly admitted that "evolution had taken hold of theology; it had modified our way of thinking about it. It would not be dislodged." This is undeniable, and the only wonder is why theology has been so long about it, why it is thirty years behind the rest of the educated world in submitting to, if not welcoming, the most fertilizing intellectual principle of the century. The explanation doubtless lies in the tenacious conservatism of the Church, which has its great advantages, all must concede, as well as its unfortunate drawbacks.

Two dangers confront the Church in its changed attitude towards science. One is that it will potter away, and make a vain show of being liberal and progres-

sive, over an obsolete science. It fights Hugh Miller for a generation, and then turns round with much comforting talk about the way "the old red sandstone" confirms the Mosaic account of creation, after Miller, in the scientific world, has become only an historical curiosity. It is a melancholy truth that theology, as a general rule, falls a-fighting only thirty years after that battle is all over and a fresh one started elsewhere. The other danger is that there will be an ignorant and undignified scurrying after all kinds of undeveloped or pseudo-science, in order to press it instantly into the service of theology. We read at this moment of a leading clergyman of Cleveland preaching on "The Being of God Illustrated by the X-Rays," "The Soul and a Future State, Illustrated by Psychical Facts," with much other weariness to the flesh. To all such rushers-in, and to that kind of theology in general which is so anxious to show that it is not only up to date but quite ahead of the calendar, we may commend that beautiful saying of the Psalmist's—fit epitaph for either the devout theologian or the humble agnostic—"My heart is not haughty, nor mine eyes lofty; neither do I exercise myself in great matters, or in things too wonderful for me."

NOVELS AND NEWSPAPERS AT THE CHURCH CONGRESS.

"Reading and the invention of printing are the greatest blessing ever given to mankind, or else the greatest curse, I forget which." This uncertainty, to which a witty maker of books confesses, seems to have possessed the minds also of the gentlemen who addressed the recent Church Congress in England on the subject of "Current Literature, Society Papers, Novels, etc." In fact, they distinctly held a brief for the curse. Unlike Disraeli on a famous occasion, they did not side with the angels. If Macaulay's New Zealander, in the intervals of his melancholy reflections over the ruins of London, should unearth a copy of the proceedings of this Church Congress as his sole means of information respecting the condition of English literature at the close of the nineteenth century, he would conclude that it was in a state of lamentable decay and corruption. This was an inevitable result of classifying literature among the deadly sins of the day against which the Church must bear her testimony. When you assign an afternoon to "Tendencies in Modern Society which need to be considered in the Light of Christian Teaching," any one at all versed in such matters instinctively feels that the said tendencies are sure to be bad. Grouped, at any rate, at this particular congress, literature was with social extravagance, questionable amusements, unwholesome recreations, and the other snares which the enemy of souls spreads for the feet of the unwary.

Of course, a Church-Congressman, like all other mortals of this evil time, when he says literature means novels. Fiction *is* literature nowadays. As the presumption used to be that all poets were atheists, so the fair inference now is that every writer is a novelist. Historians, essayists, poets are all very well in their humble way, but the serious and strenuous workers in literature, the men who go about bent and haggard under the burden of their solemn calling, are those curious descendants of light-hearted troubadour and jongleur—the modern novelists. Thus no one should have been surprised who went to the Congress hall to hear the Dean of Rochester read a paper on current literature, at finding that it was all about novels. A thing equally agreed was it that it should be all about objectionable novels. The *Spectator* had, it is true, intimated in advance that the clergy would be attacking books and papers about which they knew nothing. But Canon Ainger repelled this with suitable warmth. Since when was it necessary to know all about what you were assailing? As the gay Mr. Jacobs lately said, when brought to book for some wild work of his in Arabic literature, "Of course, this is all conjecture. Else where should I come in?" Moreover, as Canon Ainger truly said, it was possible to pick up more than enough knowledge of current literature without devoting much time to it, and there was, besides, the solemn duty of the clergy to pay some attention to morbid as well as healthy literature. In this disinterested spirit, and with smelling salts and handkerchief ready, many a clergyman has gone a-slumming in literature, taken copious notes, printed them, even preached them.

There was more or less of such professional mannerism about the papers read, but it must be said that they were in essence sound, and contain truth to which we should all do well to give heed. The Dean of Rochester was naturally the lighter of touch, and his cry for a deliverer from the "impossible" novel was more original and needful than his condemnation of the other two classes of the objectionable novel—the "lascivious" and the "profane." Open defenders of the latter, once admitting the definition, it would be hard to meet. But the impossible novel has become thick as the leaves in Vallombrosa, and its producers and consumers afflict the land. The great objection to it, said the Dean, is that it gradually saps the power of credulity, as well as the capacity of being thrilled and wearing beads of agony on the bewildered brow, and that it is filling the world with a lot of infinitely weary readers. They are perfectly certain in time to lose all gratification at hearing the distant bay of the ferocious bloodhounds, and are already more and more feebly putting spurs to their gallant chargers flecked with foam and blood. They cannot much longer have zest in dangling over the sea on ropes by which they have escaped from prison, and which they observe to be gradually fraying in two against the sharp edge of the rock. As for the joy of being struck down by a blow from behind, just as you are polishing off the last of the five ruffians who had beset you, losing consciousness, and then all a blank until you awake in a cottage which is small but scrupulously clean, with the object of your affections gazing fondly upon you with finger on her lips—as for all this, the Dean of Rochester truly said that there are growing multitudes who sadly say they find no pleasure in that kind of amusing literature.

Fully as much to the point, if uttered in graver tone, was what Canon Ainger said about the terribly unbracing effect on the mind of a steady reading of the futile gossip and silly scandal that make up the typical "society paper." If the Canon had known the sort of thing in that line we produce in this country, what with the "serio-comic" ventures and the crime-loving and crime-breeding exploits of our daily press, he would have given his censure a keener edge. As it was, he said the least that could be said about the evil when he affirmed that its direct and main effect was "further to enfeeble already feeble minds." The only remedy he thought to be at all hopeful was the gradual leavening of society with true mental and moral culture. We think he might have gone further, as far as our own plight is concerned at any rate, and called upon church and clergy not only to denounce but to cease to patronize an immoral and debasing press. One of the appalling things about our newspaper evil (for its existence ought to be recognized just as clearly as that of the social evil) is the utter lack of intellectual and moral discrimination which leads good men to make themselves *participes criminis* with the deadliest journalistic instruments of Satan by reading, patronizing, and even praising them.

THE MARRIAGE OF THE CROWN PRINCE OF ITALY.

Italy, October 7, 1896.

The betrothal of Prince Vittorio Emanuele III., or, as the republican papers call him, "Prince Gennaro" (he bearing also the name of Gennaro, the patron saint of Naples), to Helen Petrovitch, daughter of Nicholas, Prince of Montenegro, differing as it does from the ordinary routine of royal marriages, has aroused more sentiment throughout the country than anything connected with royalty has done for many a long year. The young heir apparent has never been much before the public. As a lad he was kept tied to his mother's apron strings, allowed to have pretty much his own way, provided he attended mass regularly and duly performed his religious duties, while his early education was more literary and artistic than that bestowed on any former scion of the house of Savoy, from which on both sides he descends. Physically he betrays the Hapsburg blood, es-

pecially in the protruding under lip and haughty bearing derived neither from his father nor his grandfather (bluff soldiers both), but from his grandmother and great-aunt, Austrians in heart and feature. At eighteen King Humbert decided on making a soldier of this only son and heir, and until lately kept him entirely aloof from politics. On one point only the young man proved indocile to parental authority: he declined to marry, partly, it is said, on account of his delicate health, partly, perhaps, because none of the royal brides proposed suited his taste. Hence the announcement of his betrothal to the beautiful Helen of Montenegro, with whom he is said to have fallen in love at Venice, when the Princess, with her mother and two sisters, were there on a visit, comes as a surprise. Their acquaintance was renewed at St. Petersburg, and on his return the dutiful son asked permission of his parents to formally demand her hand in person—a permission readily granted, as the royal couple were only too glad to consent to what seemed the only chance of the crown descending in the direct line of Carignano. Said and done. The young Princess, whom rumor first assigned to the present Czar before his marriage with the daughter of Queen Victoria's "Alice the well beloved," was gladly accorded by the head of the Petrovitches to the heir apparent of the Italian throne, no difficulties being raised to the proviso that she must abjure the faith of her forefathers and become a pervert to the Roman Catholic Church. So the wedding is fixed for the 24th of October, and is to be a simple family affair, the King insisting from the first that this year of disasters, when thousands of families are mourning their dead and vainly awaiting the return of their imprisoned sons, is no time for public festivals or for the interchange of gorgeous costly international courtesies.

The Jingo party, who still clamor for "war to the death" against the Emperor of Abyssinia, aver that this is no time for any royal marriage, and do not conceal their contempt for the penniless daughter of a mere "brigand chief," as they style the warrior head of the Petrovitches. Nor is their animosity diminished by the successful termination by the Rudini-Visconti Venosta Cabinet of the Tunis treaty, which puts an end to the useless, fruitless, baneful friction between France and Italy. Grievous certainly to Italy is this final irrevocable recognition of France as paramount in Tunis—Tunis, which, but for Italy's unskilful diplomacy at Berlin in 1878, might now be a flourishing Italian colony. Nothing remained for the Italians save to make the best possible terms with the republican masters of Tunis, and this from a commercial and political point of view the present ministry has succeeded in doing. The Jingoes will not admit this very evident fact, but the country is satisfied and looks forward to a general renewal of commercial relations between the two countries. There is not the slightest foundation for the report set afloat by the Jingoes that the King is hurrying on the wedding because he has decided never himself to sign a peace with the Emperor of Abyssinia, resolving rather to abdicate and leave that task to the young King Victor Emanuel III. The rumor probably originated in the fact that the heir apparent did, at the moment of the crisis, when Italy was on the verge of revolution, leave his regiment at Florence, and, going to Rome, ventured to remonstrate with the King on the folly of plunging the nation into civil war for the sake of an impossible revindication of territory unjustly acquired, and useless as an acquisition. Possibly his remonstrance may have decided the King to accept the resignation of the late ministry and to accord his sanction, however reluctant, to the proposals of their successors for the settlement of the African muddle.

Parties and partisans aside, the marriage is popular throughout the country, for whereas a mere matrimonial alliance with any of the European dynasties would have excited no interest (that of the Duke of Aosta with the Orleans "right-divine" family was held in aversion), this wooing of Helen of the Black Mountain appeals to the sentimental side of the people. Mazzini's predilection, too, and Garibaldi's enthusiasm for the sturdy patriots who, after centuries of struggle, cast the Turkish yoke from their necks, and, unlike their neighbors, sturdily and successfully refused to exchange it for that of Russia or Austria, harmonize with the present rapprochement.

In 1877 Russia had vanquished Turkey and was disposed to repay those who had assisted her in so doing. Foremost of these was Montenegro, and the Czar had, in the Treaty of San Stefano, both strengthened and enlarged the gallant little state. But here Austria intervened, and the Treaty of Berlin reduced considerably the benefits of San Stefano. The reunion of Antivari and the adjoining territory to Montenegro was fettered with the conditions that the region south of and up to the River Bojana should be restored to Turkey; the commune of Spizza incorporated with Dalmatia; Montenegro permitted free navigation on the Bojana, but prohibited from owning ships of war or a naval flag of war; foreign war-ships not allowed to enter the port of Antivari; the existing fortifications razed and no others constructed; maritime and sanitary police placed under the control of Austria in Antivari and all along the coast of Montenegro, which must adopt the maritime legislation of Dalmatia. Austria was pledged to accord her consular protection to the commercial flag of Montenegro, and with Austria must be concerted the right of constructing and maintaining roads and railroads in the newly acquired territory. This pettifogging arrangement was irksome indeed to the Montenegrins, whose hatred of Austria breaks out from time to time with scarcely less vigor than that displayed in former times against the Turk; but, say they, "The end of the Turk is not far off, and that will be the beginning of the end of Austria." Russia stands stanchly by the Montenegrins, and, should the unfortunate young King of Servia come to an untimely end, as he has no direct heirs and the Servians are close allies of the Montenegrins, there are more improbable things on the cards than a union of the peoples of Servia and Montenegro under one government. At the time of Prince Victor's betrothal it was rumored that Prince Nicholas would bestow the hand of his younger daughter Anna on King Alexander of Servia, and there was no doubt that the young King was anxious to take her for his helpmate, or that the Servians would have welcomed her right heartily. But the prudent head of the house of Petrovitch did not see his way clear to ally his fortunes with the disorderly house of Obrenovitch. Possibly the Czar, whom he has hitherto called his "one friend in Europe," dissuaded him from the step; probably his new friends and relations of the house of Savoy will be of the same opinion.

The marriage contract is being signed today, two ministers of the Prince of Montenegro arriving yesterday. The Italian ministers chosen are Costa, Minister of Justice and Pardon, Visconti Venosta, of Foreign Affairs. This contract remains secret. As soon as Parliament is reopened, the question of the young heir's appointments will be discussed. Hitherto his father has supplied him from his own civil list, supplemented by his pay as colonel. The religious ceremony will take place in the Church of Santa Maria degli Angeli; the royal couple will pass their honeymoon in Florence, the Prince returning to his regimental duties. Many of the newspapers have stated that Carducci is writing an ode for the occasion—some have even given the subject, others have gone so far as to quote lines from the poem. There is not the slightest ground for the rumor. "I have no talent for royal epithalamia," is a phrase of his own, and you may be sure that, during the wedding festivals, Rome will not see her poet's face. He has just completed and published the second volume of the 'Italian Resurrection,' of which I shall send you early extracts. Now he is finishing his preface to the 'Political Writings of Alberto Mario.' After that, he says, "I shall devote myself to philology."

J. W. M.

THE LONDON ARTS AND CRAFTS EXHIBITION.

LONDON, October 2, 1896.

IT is three years since the Arts and Crafts Society gave its last exhibition in London. In the meanwhile, it has been discovered by the foreigner. The Frenchman has come to it for his new sensation, and the least successful brasses of Bond Street and the always beautiful glass of Whitefriars make a triumphant display in Paris, at M. Byng's "Salon de l'Art Nouveau," which, as the name explains, prizes novelty above all else. The fever has spread to Germany, with, so far, the ponderous quarterly *Pan* as chief outcome. In Belgium, that centre of eager but often unintelligent imitators, wall-papers in which Mr. Morris's designs have gone quite mad, and furniture in which everything is sacrificed to affectation, are the tribute offered. It is needless to point out how frequently the American book reveals the English influence. In fact, of late years, it is to England that many people interested in the decorative arts have looked for inspiration; and with a certain amount of reason.

It is because of this effect which the Society has been having abroad that greater interest than usual is attached to its new show. So much has been heard of the copy that one is the more curious to look again at the original—in this case, to tell the truth, often enough a copy itself. Moreover, one feels that artists and craftsmen who have the sense not to follow the fashion of giving a yearly exhibition just for the sake of giving it, must, when they do open their gallery, have something worth showing. But it must be confessed that the collection now in the New Gallery presents much the same features and characteristics as the other collections which the Society has got together in the past. The mistake the members have made from the start has been to set up for themselves far too narrow a standard. They have never been able to see beauty in anything but in the "Neo-Gothic," of which Mr. Morris, by far the strongest personality among them,

is the master. Now, it is not necessary, at this late date, to insist upon the excellent work that Mr. Morris has often accomplished, or upon the change for the better that began with the founding of the famous house of Morris, Marshall, Faulkner & Co. But that which may be strength in the leader is apt to become feebleness in the follower; and yet the Arts and Crafts Committee would rather accept the weakest work done after the approved models, than any genuinely original and distinguished performance of the man who holds another and opposing artistic creed. The result is, as it has been from the beginning, a pervading amateurishness, which often interferes with one's enjoyment of the really great and good things included.

Again, the shortcomings of previous years are as obvious as ever. For example, there is but little furniture shown, and that little is mostly commonplace. I could find no exception to the rule unless it was a fine mantelpiece in wood, which really should be ranked as architectural decoration rather than furniture. This was designed by Mr. Harrison Townsend; it has for ornament carving by Mr. George Frampton, and is a graceful, imposing structure, free from sham mediævalism, that will be seen to still better advantage in the hall for which it is intended. Ranking with this is a most impressive lectern, the work of Mr. W. Bainbridge Reynolds. Carpets, as well as furniture, are sadly neglected, though I know of nothing to which arts and craftsmen could so well turn their attention. If more thought has been bestowed upon wall-papers, it is simply to prove that well-known designers continue to be without rivals; here the men legitimately conspicuous are once more Mr. Lewis F. Day and Mr. Walter Crane, the latter in a new and striking arrangement of his favorite peacock motive. It is the same with the textiles, which also give the palm to Mr. Day. It is the same with the glass, where Powell & Co. are supreme, and, indeed, the world over I know of no glass to compete with that which comes from Whitefriars. Perhaps, in fairness, I ought to add that there are three or four wonderful pieces of enamelled glass by Miss Casella, which could hold their own if placed side by side with the old Dutch and Venetian models. But, after all, if I were to mention every individual exhibit of merit, I could make quite a long and pleasing catalogue.

My object, however, is to consider the main tendencies of the exhibition as a whole, the sole consideration of importance to those who cannot visit the gallery. I might describe at length Mr. Morris's new tapestries, for the largest of which he has taken Botticelli's "Spring" as subject, and executed it with extraordinary fidelity, when one remembers the difficulty of his medium, but with, to me, a somewhat unpleasant crudity and gaudiness of color. I might, too, enter into a minute explanation of Sir Edward Burne-Jones's designs of "Ministering" and "Praising Angels" for the other two tapestries, and of "Love" for a most splendid panel in needlework, since these are among the masterpieces of the collection. But I think, especially at the present moment, it is more interesting to note that the Society, after its three silent working years, shows very little improvement, very little progress, very little sign of that vitality without which schools of art are never founded or movements carried on. Of the younger men, but two or three stand out with any special distinction: Mr. Christopher Whall, who has been making a delightful series of decorations for Douglas Castle chapel, though in his designs Sir Edward Burne-Jones is too evidently the inspiration; Mr. Nelson Dawson, of whose silver caskets and enamel decoration I have already had occasion to speak in my notices of the Academy; Mr. C. R. Ashbee, who in his jewelry and metal work reveals more originality than any other exhibitor. Mr. Ashbee's silver and gold chalices and tankards are always exquisite in form and delicate in workmanship, while his jewels are set with a gayety and extravagance of fancy which is refreshing even when the result is not altogether satisfactory. But, save for these exceptions, it seems almost as if with the older members there must perish, not only the doctrines which they have preached with so much eloquence, but all trace of their influence. Their achievement has been great; their disciples have inherited but their weakness.

I am forced to the same conclusion when I turn to the books and illustrations. There is a case of the Kelmscott series; almost all the other volumes are but so many slavish imitations. That the Kelmscott Press should have led to Birmingham is to me one of the saddest spectacles of the day. Even when one has not agreed with Mr. Morris, one has had but respect for his mistakes. For the futile pretences of his imitators, however, there is no feeling but impatience. And, indeed, nothing could be more tedious than a collection of books, like the present, based upon the Kelmscott model. Even Mr. Hugh Thomson's edition of 'Pride and Prejudice' comes as a relief, though one wonders if it would have found its way into the exhibition had it not been issued by the Allens, Mr. Ruskin's publishers. Mr. Ricketts and Mr. Shannon and Mr. Lucien Pissarro are sufficiently tainted themselves not to suffer from being seen in such company, though their work is immensely better than the childish productions of Birmingham. But it is curious to note that even in this sort of bookmaking the chief triumph has been left to America. Mr. Berkeley Updike of the Merrymount Press, Boston, shows 'The Altar Book,' with illustrations by Mr. R. Anning Bell and borders and initials by Mr. Bertram G. Goodhue; and there is not a volume from the Kelmscott Press that can compare with it in clean, clear, sharp black printing. It has some of the Kelmscott faults—the page is sadly overloaded with ornament—in fact, it is but a reëcho of Kelmscott; but, as a specimen of printing, it is admirable. The original illustrations are as monotonous, almost all being done after the same pattern. Mr. Anning Bell's are the exception. He is decidedly a man who has something to say for himself, and who endeavors to say it in his own fashion, though it may be within conventional limits. Perhaps he has done nothing more amusing this year than a set of designs for playing-cards, a charming improvement upon the average pack in vogue. Another experiment to be noted is Mr. J. D. Batten's water-color print of "The Harpies," which is the most successful color print of the kind he has yet done.

It seems almost as if the members of the Arts and Crafts Society had hesitated to rely entirely upon their own work to attract the public, for they have set apart a room for an exhibition of designs and cartoons and pictures by Ford Madox Brown, who has waited long to receive the honor which is his due. It is he without doubt—and few will now deny it—who was the true founder of Pre-Raphaelitism. It is impossible to read the letters of Rossetti without realizing how much he owed to the older painter, and it is as impossible to read the history of Pre-Raphaelitism without knowing that it would never have been, or at least never have been just what it was, but for Rossetti. It has not been easy hitherto to form an estimate of Ford Madox Brown's actual work, for so complete an exhibition of it has never before been held in London. Of course even this one does not include the most important examples—the decorations for the Manchester Town Hall, for instance, or the "Christ Washing the Feet of Peter" in the National Gallery. But few pictures are hung. However, in these few, and in the long series of designs, something of his career can be learned. That he himself passed through many phases is evident. There are early pencil sketches, especially one or two exquisite, tender studies of a mother and child, that suggest Ingres. An early picture of "Mary Queen of Scots" points to a period when Devéria and Delacroix must have been his masters. There is even a water-color of "Sterne and Mario" that recalls Rowlandson. But gradually he developed a method and style of his own; gradually his close and deferential study of nature led him to that minute attention to detail which the ardent young Pre-Raphaelites borrowed from him. One wishes that he had held nature in a little less respect, for too often it bewildered and misled him. Problems of light and atmosphere interested him long before they had begun to preoccupy the modern artist; his strange picture with the foolish name, "The Pretty Baa Lambs," is, in its background, a marvellous study of summer heat brooding over a wide green landscape. And not only this, there was no one who was happier, when he chose, in giving his impression of a scene, or a portion of it: in the "Cromwell at St. Ives" a cattle market is indicated with a masterly breadth that few painters could rival. But in both these pictures—and they are typical—excess of detail mars their effect as a whole; they are curious rather than beautiful. Madox Brown was, too, a great colorist; Rossetti never surpassed the rich splendor of his water-color of "The Younger Foscari," or the dainty harmony of his tiny "King René's Honeymoon." And he was a genuine humorist in paint, scarce a canvas or drawing failing to reveal some touch of comedy or fun—now in a poodle watching the grim tragedy of the "Death of Tristram," or again, perhaps, the fatuous expression on a lover's face, as in the "King René"; and yet the humor is never allowed to obtrude itself or to strike a false note. For a time forgotten, because of the greater noise made by the more self-conscious and younger reformers, the world has at last begun to recognize his true position. It is to the credit of the Arts and Crafts Society, of which he was a member from its foundation until his death, that it is now helping to make him still better known by so characteristic an exhibition of his work. N. N.

Correspondence.

SOUND MONEY, AND THEN HANDS OFF!

To the Editor of The Nation:

Sir: The following extract from the second foot-note to the introduction to Kant's 'Streit der Facultäten' is just now of gravest significance to the American people. Its adaptability to our political needs justifies an applica-

tion far different from that for which Kant so pertinently employed it:

"Ein französischer Minister berief einige der angesehensten Kaufleute zu sich, und verlangte von ihnen Vorschläge wie dem Handel auf zuhelfen sei, gleich als ob er darunter die beste zu wählen verstände. Nach dem Einer dies, der Andere das, in Vorschlag gebracht hatte, sagte ein alter Kaufmann der so lange geschwiegen hatte: 'Schafft gute Wege, schlagt gut Gelt, gebt ein promptes Wechselrecht, u. dgl.; übrigens aber lasst uns machen.'"

GEORGE M. FORTUNE.

PARIS, TEXAS, October 20, 1896.

ANOTHER CAMPAIGN FORGERY.

TO THE EDITOR OF THE NATION:

SIR: I have received a quarto pamphlet of forty pages by Horace F. Bartine, a member of the Fifty-first Congress from Nevada, "issued by the California Silver Campaign Committee, Baldwin Hotel, San Francisco, September, 1896," on the first page of which, as a sort of dedication, is printed in large type:

"WORDS OF DANIEL WEBSTER.

"Daniel Webster, in the 24th Congress, December 21, 1836, said: 'Gold and Silver is the money of the Constitution. The constitutional standard of value is established and cannot be overturned. TO OVERTURN IT WOULD SHAKE THE WHOLE SYSTEM. Gold and Silver at rates fixed by Congress constitutes the legal standard of value in this country, and neither Congress nor any State has authority to establish any other standard or dispose OF THIS.'"

On the day named, Mr. Webster made his speech in the Senate on the Specie Circular. Mr. Bartine probably relied on a general ignorance or forgetfulness of the well-known fact that neither this speech nor any ever delivered by Mr. Webster touched upon any branch of the present financial issue. The silver variety of monetary madness had not then developed in any form.

The Treasury order of July 11, 1836, known as the "Specie Circular," had directed that only gold, silver, and Virginia land-scrip should be received in payment for public lands, and Mr. Webster spoke in favor of a resolution to rescind this order. The first sentence of the alleged quotation is entirely spurious. That statement was not made by Mr. Webster, nor was the language of the remainder of the alleged quotation used by him as is pretended. In discussing what is legal-tender money under the Constitution, Mr. Webster said, in that part of his speech which was so forcibly quoted thirty-five years later in the legal-tender cases:

"The States are expressly prohibited from making anything but gold and silver a tender in payment of debts; and although no such express prohibition is applied to Congress, yet, as Congress has no power granted to it, in this respect, but to coin money and to regulate the value of foreign coins, it clearly has no power to substitute paper, or anything else, for coin, as a tender in payment of debts and in discharge of contracts. Congress has exercised this power, fully, in both its branches. It has coined money and still coins it; it has regulated the value of foreign coins, and still regulates their value. The legal tender, therefore, *the constitutional standard of value, is established and cannot be* overthrown. *To* overthrow *it would shake the whole system.*" (Webster's Works, vol. iv, p. 271.)

"I am certainly of opinion, then, that *gold and silver, at rates fixed by Congress*, constitute *the legal standard of value in this country; and* that *neither Congress nor any State has authority to establish any other standard, or* to displace *this.*" (Webster's Works, vol. iv, p. 280.)

The words of Mr. Webster which are used in this pretended quotation are italicized, showing the character of the falsification.

CHAS. B. WILBY.

CINCINNATI, October 19, 1896.

ENGLISH AT COLLEGE.

TO THE EDITOR OF THE NATION:

SIR: "The growing illiteracy of American boys" is becoming so familiar a phrase that, while scientifically investigating the fact, we are in danger of accepting the condition as inevitable; but could not the colleges as well as the preparatory school do more to remedy the evil? At present the requirements for admission to the best colleges are such that something must be slighted, or else the average age of entrance must be raised. Sufficient pressure is put upon the lower schools to force them to send up their boys fairly well equipped in the classics and in mathematics, but the English departments have not yet compelled the schools to give a thorough training in their study.

It seems to me that the fault lies as much with the colleges as with the schools, for whenever the lower teachers have a chance to prepare a course of study irrespective of college requirements, they invariably supply fuller and better work in English. In other words, they tacitly acknowledge that they would give better instruction in English if they were not so crowded in other branches that they must neglect the most important one.

If, as is sometimes said, time is wasted in the lower schools, it might be possible to put more English training into that available time. Otherwise, rather than raise the age of entrance to college, would it not be better to lower the requirements in some other studies in order to give opportunity for English?

I should like to suggest, also, that considerable blame attaches to the committees who hire teachers in the preparatory schools. If the teacher of Latin or mathematics or physics does not himself speak grammatically, or does not appreciate the more obvious distinctions between the right and the wrong words in conversation, how can the pupil be expected to describe an experiment or translate a foreign language with any accuracy? If the influence of the school were uniformly good for five or six hours a day, it might go far to counteract the illiterate tendency of much home training. E. M. BUCKINGHAM.

ADELPHI COLLEGE, BROOKLYN, N. Y., October 21, 1896.

TO THE EDITOR OF THE NATION:

SIR: The discussion in the *Nation* of October 15 of English teaching in the preparatory schools, although I agree with some of its conclusions, seems to ignore, as many similar discussions have ignored, a very essential difference between the work of the teacher of English composition and the work of teachers of other branches. The teacher of physics or Latin, for example, when he takes his new pupils in hand, finds them utterly ignorant of the subject, and perfectly conscious of their ignorance. They are to learn all they are to know of these subjects through the teacher, and nothing that they see or hear elsewhere in any way interferes with or counteracts the work of the laboratory or the class-room. Under competent teaching there may be something like the same accumulation of knowledge and power by every individual in the class. If this accumulation is not steady, symmetrical, well ordered, the difficulty lies, if not altogether with the teacher, at least between the teacher and pupil. There is no third party who can be blamed.

The situation of the composition teacher differs from this in every particular. He takes students at fifteen or sixteen years of age, who have been studying the art of English composition under various circumstances from their infancy, without any vacation, and for a good many hours a day. They suppose themselves to be entirely competent, their habits of expression are fixed, and no two of them are alike. The time they spent in the study of grammar or composition during their earlier schooling, even if well spent, has counted little in comparison with influences elsewhere. The home, the very cheap newspaper, the street, have furnished them with their common speech; and although the first of these may sometimes be all that can be desired, very often the balance of power belongs to the others.

When the student begins the study of composition in school, these agencies by no means cease to operate. Year by year they grow stronger. This is what is meant, I take it, by the reference, in the protest of the principals, to "the growing illiteracy of American boys" which you took as the title of your article. Under favorable circumstances the teacher of composition is allowed forty-five minutes a day for three years in which, besides teaching something of the history of literature, he is to counteract influences that have fifteen years the start of him, and fifteen times as great present opportunity. The only remarkable thing is that, under such circumstances, he accomplishes anything at all. Certainly, to put upon him the entire responsibility for the productions of his pupils is gross injustice. As a matter of fact, I believe he can have very little power. The whole problem, as the protest of the principals implies, lies further back than the secondary schools or any schools.

As an illustration of where the responsibility belongs, take the advertisements that glare upon us from every possible point of display. Perhaps no other one perversion of talent has done so much to vulgarize our speech, and yet we seem powerless to defend ourselves. Would it not be more profitable to organize a crusade against this acknowledged evil than to prepare with trumpet and drum for another onslaught on the defenceless teachers in the preparatory schools, who are already doing the best they can? WILLIAM F. BREWER.

BOZEMAN, MONTANA, October 19, 1896.

NOT SENATOR SUMNER.

TO THE EDITOR OF THE NATION:

SIR: As your reviewer of Haweis's 'Travel and Talk' quotes two apparently distinct passages alluding to "Charles Sumner," I cannot be sure whether Mr. Haweis himself confounds Senator Charles Sumner with the Hon. Charles A. Sumner, sometime a member of the national House of Representatives, and a well-known attorney in San Francisco. Probably he does so. The Hon. Charles A. Sumner is a son of Judge Increase Sumner, a well-known citizen of Massachusetts, who resided for many years in Great Barrington, where he died a good many years ago. This Charles A. Sumner is he who met Mr. Haweis in England in 1883, in "Francisco" in 1893, of whom it may be truly said he is a man of "integrity and pluck," and also that he has "always been a fighter of monopolies and

jobs." When in Congress he introduced a bill for a postal telegraph, a subject to which he has given great attention. If, as seems altogether probable, Mr. Haweis has confounded these two men, he certainly stands discredited as an observer of men. H.

[In the first passage we quoted from Mr. Haweis, the person in question is designated "Senator Charles Sumner."—Ed. Nation.]

Notes.

Ginn & Co. have nearly ready 'The Forms of Discourse,' with an introductory chapter on Style, by William B. Cairns of the University of Wisconsin.

D. C. Heath & Co. will shortly publish 'First Italian Readings,' by Prof. B. L. Bowen, of the Ohio State University.

Copeland & Day announce 'An Outland Journey,' by Walter Leon Sawyer, with fifty illustrations by R. F. Bunner; and 'Songs of Exile,' by Herbert Bates.

The forthcoming volume of Frederick Warne & Co.'s "Public Men of To-day" will be 'Grover Cleveland,' by James Lowry Whittle, with two portraits. They will issue directly the sixth and concluding volume of 'The Royal Natural History.'

'Sketches of Printers and Printing in Colonial New York,' a popular account, by Charles R. Hildeburn, will appear in a limited edition of 375 copies from the press of Dodd, Mead & Co.

Fresh announcements by G. P. Putnam's Sons are 'The Last Days of Knickerbocker Life in New York,' by the late Abram C. Dayton; 'A Romantic Voyage to Venezuela and the West Indies,' by Ira Nelson Morris; 'International Law,' a simple statement of principles, by Henry Wolcott Bowen; and 'The God-Idea of the Ancients; or, Sex in Religion,' by Eliza Burt Gamble.

Brentano's, No. 31 Union Square, New York, have been appointed sole agents of the publications of the American Jewish Historical Society.

Besides Mr. Dole's edition of FitzGerald's 'Rubáiyát of Omar Khayyám,' we have received a pretty paper-covered copy from the Dodge Book and Stationery Company, San Francisco, including the translator's sketch of Omar's life and his notes, the text being of the last edition. The proof-reading is too defective to be depended upon, but the small type, in which the lines are unbroken, pleases us better than that, more open, of T. Y. Crowell & Co.'s edition, which has, however, the merit of appending the text of the first edition and all the variant readings, together with FitzGerald's "Salámán and Absál," after Jámí, Tennyson's tribute to "my Fitz," and the portrait of the latter for frontispiece.

Messrs. Crowell also offset Mr. Lang's new Life of Lockhart with a reprint of Lockhart's Life of Scott in two volumes; but it is Lockhart's own abridgment of 1848 that is here in question, though the work had the benefit of revision in accordance with the latest information about the author of 'Waverley.' We can hardly call these volumes handsomely made except as regards the binding. The type is large and readable in itself, but the page is pretty condensed. A like judgment we should pass on the same publishers' two-volume edition of Browning's Poems: mechanically it is something less than attractive. The editors of *Poet Lore*, Charlotte Porter and Helen A. Clarke, contribute the introductory biography and appreciation; and there are several portraits of the poet. Finally, this firm presents anew Ormsby's translation of 'Don Quixote' in two volumes, with illustrations.

The classic just mentioned, in its present garb, may well be compared, with respect to taste, with the 'Gil Blas' (in Van Laun's version) just reproduced in four 16mo volumes by Gibbings & Co., London, and J. B. Lippincott Co., Philadelphia. We except at once the binding, which the Spanish colors do not adorn, but the letterpress is delightful, and the little books are readily held in the hand. The same English and American houses put their imprint on a six-volume edition of Lane's translation of the 'Arabian Nights,' and with equal success. A brief introduction by Joseph Jacobs and illustrations by Frank Brangwyn give a special stamp to this beautiful edition. Their 'Robert Burns: Poems and Songs Complete,' in four volumes, Messrs. Lippincott publish in connection with James Thin, Edinburgh, and again we have a handsome product of the press. It purports to be a popular edition in behalf of an "instructive and deeply interesting biographical study"; to which end the poems are "presented unabridged and untampered with, and arranged in chronological order, the date of each composition being recorded." The fourth volume consists of the late Prof. John Nichol's estimate of Burns.

Burns is very much in evidence this centennial year. Mr. Andrew J. George has conscientiously prepared for D. C. Heath & Co., Boston, a volume of Select Poems, with copious notes, a glossary, index, and bibliographical references, and it will be useful for reading in school or privately. Noticeable is the complete edition of Burns's Poetical Works, edited by J. Logie Robertson for the Clarendon Press (New York: Henry Frowde). The thin papers available in that establishment make possible the feat of filling 635 pages with large letter, and yet making a really slender book. The leaf is not so thin as to be annoyingly transparent. A chronological index supersedes a corresponding arrangement of the pieces, and there is the inevitable glossary with a sufficiency of notes. Of the same style and order of manufacture is the Oxford edition of Wordsworth's Poetical Works, with a compression of nearly 1,000 pages into a perfectly light and handy volume. The editorial work is from the competent hand of Thomas Hutchinson, who vouches for the inclusion of every piece of original verse known to have been published by the poet himself or authorized for posthumous publication, and who has taken the greatest pains with the capitals and the pointing. In the case of the minor poems he follows the arrangement of 1849–50, Wordsworth's own to the last. A chronological life-table is prefixed.

Well-conceived and tastefully executed are the initial volumes, of uniform appearance, of Kingsley's and Thackeray's novels, published by G. P. Putnam's Sons in connection with Service & Paton, London—'Hypatia' and 'Henry Esmond' respectively. They are printed in a bold type on laid paper, and bound in crimson cloth effectively gilt. The illustrations are pen-work, and are passable. The same combination gives us a still more elegant output in Carlyle's 'Sartor Resartus.' This, too, is the beginning of a series. Whistler's well-known portrait of the author faces the title.

Houghton, Mifflin & Co. continue their uniform reimpression of Mrs. Stowe's works with 'Household Papers and Stories' and 'Uncle Tom's Cabin and Key.' The latter combination ought never to be abandoned. 'Uncle Tom's Cabin' will to the end of time remain an historical novel, and its verisimilitude will be questioned in one-half of this country for at least half a century to come. The documents, therefore—the 'Key'—do well to accompany it, refuting its assailants, and deepening the moral impression of the story. The 'Key' is by no means unreadable; it here fills half the second volume, but is comprehended only by extensive abridgment, involving whole chapters, some of which were in the nature of a general discussion of slavery from a Biblical point of view, and were not needful for a defence of the truthfulness of 'Uncle Tom.' This story, the foundation of the author's fame, properly leads in the Riverside Edition, and is accompanied by a biographical sketch of Mrs. Stowe, Charles Dudley Warner's "story of the story," and a bibliographical account of one of the greatest successes in literature. From the same firm comes 'A Year in the Fields,' a charming volume compiled from the writings of John Burroughs, and photographically illustrated by Clifton Johnson in a very intimate and personal way; the fine views showing this agreeable writer in his favorite environment, of wood and brook and Hudson River hillside, as well as about and in his own home.

A new and revised edition of President Jordan's 'Science Sketches' (Chicago: McClurg) has now appeared. In its present form the bibliography of scientific papers at the end of the book has been dispensed with, and, for the chapters on American bird nomenclature, "Darwin," "The Story of a Stone," and "The Evolution of a College Curriculum," have been substituted others on "Agassiz at Penikese," "The Fate of Iciodorum," "The Story of a Strange Land," and "How the Trout Came to California." As at present constituted, the book comprises nearly 300 pages of pleasantly written popular science, in which the science has the advantage of being the real article, written by one who knows, and not the far too common rehash of doubtful trivialities and obsolete sensations which often masquerades as science in books for the general reader.

The fifth volume of Dr. Hans Blum's 'Fürst Bismarck und seine Zeit' (Munich: Beck), was originally intended to be the final one; but as it covers a period of only eight years, ending with 1879, it was deemed advisable to add a sixth volume of 521 pages, bringing the work down to the celebration of Bismarck's eightieth birthday, on April 1, 1895. We shall not attempt to epitomize the author's interesting history of political events in Germany during the quarter of a century following the Franco-German war, but simply wish to call the reader's attention to the discussion of the Chancellor's internal policy. Shrewd and successful as Bismarck proved himself to be in diplomacy, he was a bungler in financial and economical affairs. His "Invaliditäts- und Altersversicherungsgesetz," which was designed to win the favor, by alleviating the lot, of the working classes, is, after nearly ten years' trial, generally acknowledged to be a failure, and is most severely denounced by those for whose benefit it was enacted. In financial matters Bismarck entertains a predilection for bimetallism without having any clear conception of what it means. It is a part and parcel of his agrarian programme, like the advocacy of a high tariff on American

agricultural products for the profit of the Prussian landowner, regardless of its effect in increasing the cost of living for the poor. While in office he was wont to air this monetary whimsey in private over a glass of wine, but never seriously attempted to embody it in legislation. In 1886, when he was disposed to favor an agrarian movement for the formation of an "International Double-Standard League," the Prussian Minister of Finance, Von Scholz, pricked this Utopian bubble by putting a few pertinent questions to its promoters, and then effectually squelched the project by declaring that "no one who loves his country, and does not wish to betray his country, can advise the Government to join such a league."

Arsène Houssaye's 'Souvenirs de Jeunesse, 1830–1850' (Paris: Flammarion; New York: Brentano's) is light reading, and, considering the array of literary celebrities with which these reminiscences of an interesting period are interwoven, contains little of importance. Still, the book adds slightly to our knowledge of the men and women of the time. To learn that the poet of the 'Méditations' was in the habit of exclaiming, on the least provocation, "mille tonnerres de nom d'un diable" will be a surprise to many; to hear V. Hugo speak of Racine as a "maître d'études" is perhaps less unexpected. The author has not allowed himself to be troubled by promptings of discretion.

M. Henri Lavedan has gathered into a volume 'Les Petites Visites' (Paris: Calmann Lévy; New York: Brentano's), about a score of imaginary scenes from French social and family life, each of which involves a short visit. Most of the conversations are not particularly edifying, but there is a certain fascination about them all, due perhaps as much to the serious undertone as to the charm of language and vivacity of dialogue.

The heroine of Flagy's 'Cœur d'Or' (Paris: Calmann Lévy; New York: Brentano's) represents a type of the woman with one passion only, viz., ambition; but her individual character, as well, is strongly marked and well brought out in the course of her extraordinary career. The bright, fair, and strong-willed daughter of a retired officer, she rises from her modest and lonely existence first to the position of a lady of rank and wealth, and subsequently, by a second marriage, to that of a sovereign princess, without recourse to seductive arts, neither feeling nor wishing to inspire love. Her moral conduct, in the narrower sense, is irreproachable from beginning to end; ambition has engrossed her heart to the exclusion of all other passions, good or evil. The story is decidedly out of the common order. It may not be generally known that "Flagy" is the nom de plume of the aged widow of the Comte de Mirabeau, the daughter of Colonel de Gonneville.

The *Geographical Journal* for October opens with an account of a journey in the valley of the upper Euphrates, made two years ago for the purpose of discovering traces of the Roman system of defences of this eastern frontier of the Empire. A peculiar interest appertains to it from the fact that the region visited has been the scene of the most recent Armenian massacres. In Egin, a town of about 15,000 inhabitants, there was in 1894 some complaint on the part of the Armenians of Turkish oppression, but there was no excited religious feeling, and outwardly "perfect toleration was exercised by Moslem to Christian, and vice versa." A day's journey to the north was Pingan, a village of about two hundred Armenian families, where there was "an excellent school, served by two French-speaking teachers, and a reading-room furnished with journals and reviews in the Armenian language." Mr. J. Theodore Bent describes a visit to the northern Sudan coast of the Red Sea. Traces of ancient gold mines were abundant. In one place the ruins of at least seven or eight hundred huts can still be seen, and scattered about are hundreds of crushing-stones. There are also numerous structures very similar to the ancient buildings in Mashonaland in South Africa. Dr. Sven Hedin's account of his passage of a desert in Chinese Turkistan contains a terribly graphic picture of suffering from thirst, hardly to be equalled in literature.

The principal article in the *Scottish Geographical Magazine* is Major L. Darwin's address before the geographical section of the British Association. It was chiefly upon developing the resources of tropical Africa through the construction of railways. Laying down the principle that none should be built in a region with a population of less than eight per square mile, he described the different routes into the interior, those projected as well as those in course of construction.

The opening of the port of Hangchow to foreign commerce on September 26, in accordance with the Japanese treaty, gives a timely interest to Mr. John Fowler's account of this place in the Consular Reports for September. The capital of a province with a population of thirty-five millions, the terminus of the Grand Canal (the great waterway of eastern China), and "the centre of the most extensive silk and tea districts in the world," it is the richest city in the empire. Its opening to foreign commerce promises not only to revolutionize the tea trade, but also to develop other industries, especially the cultivation of cotton and the establishment of silk and cotton mills. In anticipation of a great demand for machinery and other foreign goods, "English, French, German, and Japanese are all on the *qui vive*, making every preparation, flooding the country with catalogues, sending agents to Hangchow, and even trying to obtain choice sites for mercantile purposes"; but, so far as our consul knows, "not an American has made a move in the matter." This was written a year ago and, possibly, may not hold good now, the reason of this inactivity being, in Mr. Fowler's judgment, the fact that American interests in the East are almost wholly represented by British subjects. Tables of the exports and imports of the neighboring port of Ningpo are given, as well as a useful list of articles most in demand by the people. There is also an interesting account of an extensive journey in the Congo Free State by our commercial agent, together with statistical and other information. The figures are for 1894, and the outlook then was far from promising. The expenses of administration were a million and a half dollars, while the revenue, apart from subsidies, was six hundred thousand. The total value of the exports was $1,690,836.48.

The Report of the Commissioner of Education for 1893–94 follows closely upon that for the preceding year. Though the importance of the statistical matter which necessarily takes up a considerable portion of the two volumes is not to be underrated, educators, we presume, will prize especially the various contributions by competent writers on educational history, science, and methods, as bearing directly upon their work. Such are, among others, the article on "Educational Values," from Commissioner Harris's own pen, those on "The Psychological Revival," on "Sanitary Legislation affecting the Schools," on "Public Instruction in Italy," on "Education in Central Europe"—this last with an appended "German Bibliography of the History and Methods of Arithmetic," which, however, in spite of its two hundred and thirty-one titles, is neither new nor adequate, as specialists will easily discover.

The splendid hospitality of the École Pratique des Hautes Études is shown by the *liste des élèves*, published in the *Annuaire* of 1897 for the Historical and Philological Section. Here we find no exclusion either of sex or nationality. Armenians, Turks, Jews, Germans, Englishmen, and Americans are alike admitted as workers in this industrious hive of learning, directed by the highest intelligence of the Republic. Its catholicity in another direction is proved by such suggestive entries as the following: "Tchernitsky, Antoinette de, née a Swiridowka (Russe), and Witkowsky, Esther, née a Chicago, fellow de l'Univ. de Chicago." The indefatigable character of these scientific labors is hinted at in the report of one student of Old French, who was sent to Oxford to search for rare old words in the MSS. of certain Jewish commentators on the Talmud. He reports a collection of thirty-nine words discovered by reading through 1,292 pages of manuscript. The names of the directors and lecturers embrace such masters as MM. Monod, Maspero, Gaston Boissier, Michel Bréal, Oppert, and Lebègue. An instructive and sympathetic memoir of Joseph Derenbourg, late Professor of Rabbinical and Talmudic Hebrew, is contributed by M. Carrière. We shall have occasion hereafter to revert to the luminous essay, by M. Maspero, entitled "Comment Alexandre devint Dieu en Égypte."

A prize of £50, to be called the Welby Prize, is offered for the best treatise upon the following subject: "The causes of the present obscurity and confusion in psychological and philosophical terminology, and the directions in which we may hope for efficient practical remedy." Competition is open to those who, previously to Oct. 1, 1896, have passed the examinations qualifying for a degree at some European or American university. The committee of award (whose names will be published early in 1897) will consider the practical utility of the work submitted to them as of primary importance. The essays may be written in English, French, or German, must be typewritten and extend to at least 25,000 words. They should be headed by a motto, and accompanied by a sealed envelope containing the name of the writer. Manuscript from America should be sent to Prof. E. B. Titchener, Cornell University, Ithaca, N. Y., and must reach its address not later than Oct. 1, 1897. The right of publication of the successful treatise is reserved.

We some time ago announced that a prize was offered, for general competition, for an essay in the history of religious liberty in America, for which the money ($200) had been placed in the hands of the president of Brown University. We now learn that the prize was obtained by Miss M. Louise Greene of New Haven, Conn., whose essay was on the history of the movement towards disestablishment and complete religious liberty in Connecticut. The donor, anonymous hitherto, is announced to be the Hon. Oscar S. Straus.

By a natural, yet not wholly excusable, error in our last issue, the sex of Prof. Dugard, author of 'La Société Américaine,' was mis-

represented. Miss Dugard is professor in the Paris Lycée Molière.

—Complementary to Bulletin No. 6 of the Bureau of Rolls and Library of the Department of State, a calendar of letters from Jefferson, is the newly issued No. 8, letters to him (in the main). All his fellow-Presidents, from Washington to William H. Harrison, inclusive, except Van Buren, are more or less copiously represented, along with Sam Adams, Callender, Duane, Gallatin, Genet, Gerry, Granger, Meriwether Lewis, Thomas Paine, Lafayette, and many other eminent personages. The political current of the time is more or less discernible in the abstracts of letters from such correspondents, which show what a centre their recipient was; but quite as striking evidence of Jefferson's multifarious interests and intellectual attachments comes from other sources. In 1803 John Brightthought writes to him from Baltimore respecting a machine for printing calico; in 1805 John Chamberlin wants his encouragement for a proposed work on government; in 1787 Benjamin Hawkins will gratify his request for plants and seeds and a Cherokee and Choctaw vocabulary; in 1784, Francis Hopkins confers with him about air-balloons and a harpischord; in 1800, Robert R. Livingston passes judgment on his invention of a mold-board, etc., etc. Then there are innumerable demands for personal advice or assistance, with occasional offers of gifts—a saddle from Stephen Burrowes, his own bust from Joseph Ceracchi — which he accepts on being allowed to pay for them. Most amusing of all is the long series of letters from Mrs. Lucy Paradise, a Virginian whose domestic affairs were anything but paradisaical, her husband being given to liquor and in pecuniary straits; she hears that he gets drunk after receiving her letters, but in the end she reports his condition as "not drunk, but nervous," and the family peace seems restored—thanks, evidently, to Jefferson's good offices. Altogether this calendar is an impressive reminder of qualities which make Jefferson the most interesting of all the Fathers.

—That the world forgets very soon is evidently the opinion of Mr. John Ashton, for he now turns his antiquarian attention to the reign of William IV., in 'When William IV. was King' (D. Appleton & Co.). We shrink from questioning the justice of any view he may form on the subject. A publisher's list at the end of this volume shows that he is already responsible for twenty-eight works, mostly antiquarian. In some cases, indeed, their titles are printed in old English spelling. Thus qualified, he ought to know what the public needs to be told about the past and also what it will buy. The 350-odd pages now offered consist of clippings from the *Times*, the *Annual Register*, Greville's 'Memoirs,' and a few more equally recondite sources. We cannot guess what other people may think of Mr. Ashton's productions, but for ourselves we prefer going straight to 'Chambers's Book of Days' whenever we have an hour to browse in the succulent pasture of scraps and gossip. They are about equally systematic, and Chambers is more comprehensive. It ought, however, to be stated for the benefit of those who are addicted to Mr. Ashton, that 'When William IV. was King' maintains his usual standard of text and exceeds his usual standard of illustration. The chief trouble with it is that we all feel familiar enough with the period to find his jottings and excerpts either tame or inadequate. Had the general social atmosphere changed a good deal more than it has done, they might be more interesting. We are less hard to please when Mr. Ashton plunges back to 'Humor, Wit, and Satire of the Seventeenth Century,' or even to 'Social Life in the Reign of Queen Anne.' But so near home he is a trifle dull. Perhaps an exception should be made in favor of his notes on children in factories, Dotheboys Hall, and the Hon. S. Wortley's election bill of 1830. Even Mr. Lodge, after reading the latter document, will be constrained to admit that the English, though still far from electoral perfection, have made some progress towards it in the last sixty-five years.

—The interest which French scholars have again begun to take in the study of German literature is a gratifying evidence of the healing power of time. It has been frankly admitted by the French themselves that they were too much given over to self-admiration; the rest of the world was disregarded. "Who among the subjects of Louis XIV.," exclaims M. Mézières, "except the exiled St.-Evremond, had any suspicion of the genius of Milton?" And Boileau, although he wrote of epic poetry and the drama, knew nothing of 'Paradise Lost' or of the plays of Shakspere. In the eighteenth century, men like Voltaire, Rousseau, Diderot, and others opened the eyes of their countrymen to the intellectual life of the neighboring peoples. It was England to which attention was first directed and which exercised the greatest influence, but from Mme. de Staël to Edmond Scherer the interest of the French in German letters steadily grew until the war of 1870 broke off all relations. Although France, during the last quarter of a century, has occupied herself with the literatures of the world more perhaps than ever before, patriotism has turned the French mind away from the study of German thought. The gradual resumption of relations was primarily the work of the Wagnerites like Lamoureux and Jullien. German music has won, and now there is evidence of a renewed interest in German literature. Prof. Grucker of Nancy, after his exhaustive studies in the pigtail age of Gottsched, published the Life of Lessing which was reviewed in these columns last March. Inspired perhaps by this work, M. Mézières of the French Academy has written for the September number of *Cosmopolis* the most luminous bit of appreciative criticism that France has yet contributed to the study of Lessing. To the unprejudiced reader it is a pleasure to see, in the cordiality and fairness of M. Mézières's tone, the promise that German literature is once more to receive its due at the hands of French scholars.

—Lessing's frank recognition of the debt he owed to Diderot constitutes a strong claim upon French sympathies. In attacking the formalism of the classic French drama he was doing only what Diderot had done before him, and M. Mézières implies that Lessing deserves well of France for having put into her hand a different mirror from that in which she had so long been admiring herself. Moreover, Lessing's criticism had no touch of Chauvinistic acrimony; it was no part of his purpose to make English taste the sole arbiter. If the 'Dramaturgie' exalted Shakspere and the Greeks, 'Laokoon' was directed against one phase of the English influence which was threatening Germany, namely, the false word-painting of Thomson's 'Seasons,' while in France Lessing would have recognized in Mérimée and Maupassant the products of his own teachings. He established, as M. Mézières puts it, the school of faithful and idiomatic translation which produced Schlegel and the elder Voss, and which has made the knowledge of the German language a key to the literatures of the world. The creative character of Lessing's criticism revived Germanic traditions, so long interrupted, and handed them over as a national heritage to the poets who had already arisen. "Productive" was the adjective which Friedrich von Schlegel applied to this kind of criticism, himself one of its greatest exponents. "Le critique a charge d'âmes," says M. Mézières, and for such men as Diderot and Lessing, though they left no great works of art behind them, he claims a place "parmi les premiers après les plus grands."

—Considering the indebtedness of modern culture to Italy, our histories of education do but scant justice to the contributions of Italian writers to the science of pedagogy. A recent volume by Prof. G. B. Gerini, 'Gli Scrittori Pedagogici Italiani del Secolo Decimoquinto' (Turin: G. B. Paravia), calls to mind in a forcible manner the almost total neglect of the earlier Italian humanists by authors of text-books on educational history. One has to turn to general works on the Renaissance rather, like G. Voigt's and Ludwig Geiger's, for information concerning their work and influence. Compayré, in his deservedly popular 'History of Pedagogy,' devotes a short paragraph each to Vittorino da Feltre and Aeneas Silvius Piccolomini; but of several other important educators of the fifteenth century that helped to adapt the ideas of the ancients to the requirements of a Christian education, he mentions not even the names. While drawing their inspiration and ideas almost exclusively from Plato and Aristotle, from Cicero, Quintilian, and Plutarch, some of these writers and teachers, like Vergerio, Vegio, and others, anticipated in more than one essential point the teachings of Locke, Fénelon, Basedow, Pestalozzi, Fröbel, etc. Their lack of philosophical insight, their inadequate conception of female education, and their failure to sympathize with anything like our modern ideas of popular instruction, have not prevented them from exerting an influence which often, as in the case of Vittorino, Piccolomini, and Guarino, extended beyond the boundaries of their native land. Prof. Gerini's book fills a gap in the history of educational thought, and will be the most highly appreciated by those who conceive of the history of pedagogy as an account of the continuous development of ideas rather than a record of special theories and practices attaching to a few famous names.

—The collected opinions of more than one hundred leading professors in twenty German universities, on a question involving radical changes in the whole fabric of modern society, form, it may be imagined, a weighty document. Its very title is imposing: 'Die Akademische Frau: Gutachten hervorragender Universitätsprofessoren, Frauenlehrer und Schriftsteller über die Befähigung der Frau zum wissenschaftlichen Studium und Berufe,' edited by Arthur Kirchhof (Berlin: H. Steinitz). The fulness of the title relieves us from quoting verbatim the questions which these men, most of them the highest authorities in their respective fields, were requested to answer. Their replies are arranged by faculties and departments, and range in length from a few lines to several pages. Some of the writers are reserved and undecided, a few positively averse to the higher education of women, but the great majority are surprisingly progressive for a set of men whom we naturally count

among the conservative social forces. Among the former are some theologians and jurists. An almost pathetic instance in the second class is the categorical declaration of the philologian Wüstenfeld, of Göttingen, now almost a nonagenarian, "dass ich der Zulassung von weiblichen Personen zu akademischen Studien . . . *entschieden entgegenstimme.*" The members of the faculties of psychology and philosophy, twelve in number, are remarkably unanimous in their support of the new idea. Eduard von Hartmann, however, holding, as he does, that a liberal and general intellectual culture is obtainable only from reading, that the Gymnasia are nothing but "schablonenhafte Drillanstalten für den geistigen Mittelschlag," and the universities no longer institutions for the study of the *humaniora*, does not anticipate, from the admission of women to academic studies, happiness for them or for society, but he would not deny them that doubtful privilege. Interesting statements are contributed by Prof. Felix Klein, the well-known Göttingen mathematician (recently the guest of Princeton), and Prof. Dr. med. Franz von Winckel of Munich, who has nothing but words of praise for the female assistants, more than forty in number, who have been his co-workers in his medical and professorial career, and all but one of whom are at present earning their living as practitioners. A dozen or more eminent authors are hearty supporters of higher education for women, while the opinions of the few teachers in higher schools for girls which have been given room in the volume are divided.

FRANCKE'S SOCIAL FORCES IN GERMAN LITERATURE.

Social Forces in German Literature: A Study in the History of Civilization. By Kuno Francke, Ph.D., Assistant Professor of German Literature in Harvard University. Henry Holt & Co. 1896. Pp. 577.

Prof. Francke's work more than fulfils the promise of its title. It not only describes the social forces that have been operative in German literature, but also, and especially during the last one hundred and fifty years, it treats that literature as itself one of the most potent of these forces in shaping new social conditions. The range of vision is comprehensive, but the details are not obscured. The splendid panorama of German literature is spread out before us from the first outburst of heroic song in the dim days of the migrations, down to the latest disquieting productions of the Berlin School. If on so extensive a canvas there is here and there a faulty bit of perspective, a point of too vivid color, an occasional incongruity in the grouping, we none the less owe a debt of gratitude to the author who has led us to a commanding height, and pointed out to us the kingdoms of the spirit which the genius of Germany has conquered.

Prof. Francke's purpose is to show that there has been reflected in German literature "a continual struggle between individualistic and collectivistic tendencies — a struggle which may be said to be the prime motive power of all human progress." But the struggle is not that one tendency shall triumph over the other; the aim is that neither shall triumph, and the equipoise be maintained. In the book itself Prof. Francke does not always make it clear that this is his conception of the matter, but in the preface he expressly states that "those ages and those men in whom the individualistic and collectivistic tendencies are evenly balanced, produce the works of literature which are truly great." This is sound doctrine, and yet we cannot avoid the suspicion that Prof. Francke is something of a socialist; and if, as he seems to indicate, we are approaching a socialistic era, it shall cause us no mental wrench to carry his thesis to its logical conclusion, and assert that we are in that case approaching a period of disaster from which we can only hope that, out of the upheaval which the conflict of socialism with the irrepressible individual must occasion, there may evolve itself a new status in which the two forces shall again be balanced.

In each of the great epochs of German literature a culmination is reached in which the essential characteristics of the age are summed up in its highest representatives. It is a great merit of the author's method of presentation that in each period he discovers the elements out of which the next period is to be developed. By these subtle transitions the real continuity of growth is clearly brought out. The age of the migrations was doubtless individualistic, but its characteristic virtue was *Treue*, faithfulness—not "faith," as on p. 30, for the word is seldom free from an irrelevant subsidiary meaning. It was this strong national trait that, during the incursions upon the tottering empire of Rome, supplied by force of custom the authority which pertains to law; and this was the force, too, which in the course of centuries developed the feudal system and established the imperial power of the Hohenstaufen. The twelfth and thirteenth centuries were the most brilliant epochs in the history of German literature before Goethe. Surely here the two social forces may be said to have been "evenly balanced," but Prof. Francke calls the age of Frederick II., Walther von der Vogelweide, and Wolfram von Eschenbach exclusively collectivistic. It was an age, indeed, of lofty idealism, which the author associates with the collectivistic tendency, and it suits his purpose well to find at the very climax of this epoch the beginnings of an individualistic reaction in the direction of realism. In other words, the collectivistic tendency, beginning to get the upper hand, precipitated this reaction, which culminated in the reassertion of individualism through the Reformation. With this we have no quarrel, but we think Prof. Francke has failed to give due weight to the individualistic forces of the Hohenstaufen age.

"Wonderful and incomprehensible" are the adjectives which the author appropriately applies to the sixteenth century. Other great movements have accomplished their purposes, and out of the fulness of their achievements we can judge them. The Reformation was a great movement that failed, and we lack the final criteria for the complete understanding of that pregnant but futile time. Luther was unable to control the era of individualism which he had inaugurated, and Germany descended into the chaos of the Thirty Years' War. But if through individualism the nation had fallen, through individualism also she worked out her own salvation in the slow and painful process of two hundred years. In an individualistic spirit the great men of the classic age began their work, and it issued in the adoption of collectivistic ideals. Herder, says Prof. Francke, "conceived of all history as a conscious or unconscious striving after a harmonious blending of individual and collective forces." Kant discovered the same ideal in the intellectual and moral nature of man. Goethe, while regarding the highest culture of the individual as the crown of all, nevertheless taught in 'Wilhelm Meister' and "Faust" the gospel of human solidarity. The two opposing forces regained their equipoise. This, in brief, is the course of events as interpreted by Prof. Francke.

Before passing to the specifically literary aspects of the work, we have some doubts to express as to the validity of the contention that the individualistic tendency necessarily takes literary form in realism, and the collectivistic in idealism. These doubts arise at many points; but when we come to romanticism, which, as Prof. Francke says, was "individualism run mad," by what stretch of that elastic word can this be called realistic? We incline to the belief that the occasional correspondence between the social forces and the literary modes is accidental, and that realism and idealism in their alternation are governed by other laws than those which regulate the progress of society.

The author's characterization of the different literary epochs is lucid, and, except that his main thesis as to the balancing of the social forces at the culmination of an epoch is not always sufficiently emphasized, his exposition is admirable. Particularly interesting is the comparison he draws between the rude heroism of the migration and the courtly civilization of the Middle High German age. The heroic figures which arose in those days of wandering and war have accompanied the people in their progress through the centuries, taking new forms in altered times, until they received their latest, but probably not their last, embodiment in the music dramas of Wagner. These old sagas assumed the form in which we know them about the twelfth century. Some coarse realistic touches of the elder time still cling to them, but in the main they reflect the ideals of a cultured age. There is a psychological study of character and a fine appreciation of the spiritual life of which the brawny singers of the migration had no conception. The complex character of Gudrun, the poetic grace of Siegfried and the younger Kriemhild, and the moral elevation of Ruediger, whom Prof. Francke, with one of his illuminating comparisons, calls the Max Piccolomini of the 'Nibelungenlied,' all mark the advance which German culture had made since the grim days of the Waltharilied and the Hildebrand fragment. Poetry had passed into the hands of the knightly order when chivalric culture had reached its height, and it attained its highest perfection in the wonderful age of the Hohenstaufen.

In the "realistic frankness," or rather outrageous coarseness, of the fourteenth and fifteenth centuries, Prof. Francke sees a protest against the conventions of chivalry. These conventions had been carried to a ridiculous extreme, and the common sense of mankind revolted; the undercurrent of coarseness, never absent in any age, came to the surface uncontrolled by conventions of any sort. The beginnings of this realistic reaction are to be found in the "Neidharte" of the thirteenth century and were deeply deplored by Walther von der Vogelweide. It was then, as we have said, that the individualistic era began which lasted under the most varied forms down to the middle of the eighteenth century. In the dreary literary annals of this long period the sixteenth century alone possesses universal interest.

The Humanists receive somewhat cool treatment at Prof. Francke's hands. He regards them as destroyers only, and their literary work as sarcastic rather than appreciative. We regret that one of the most brilliant and

effective satires of the world's literature should have been passed over with a mere mention, the famous 'Epistolæ Obscurorum Virorum.' David Strauss has aptly compared this work to 'Don Quixote.' Each treats of an outgrown and therefore ridiculous mode of thought contrasted with the spirit of a new age, and by the touch of genius both works are raised out of the realm of mere timely satire into that of genuine humor. It accords with Prof. Francke's point of view to see in the later years of Luther the beginning of the literary decline, and to class Sachs and Fischart as exceptions. To us it appears rather that it was not until the last part of the century that the descent began; then, indeed, life had ceased to present worthy themes, and literature became the making of bricks without straw. But amid the confusing data of an age of high promise unfulfilled, perhaps the cleanliest shift is to take refuge in the author's "incomprehensible" sixteenth century. Its true history is yet to be written, but we venture to prophesy that, when it is, the Humanist movement, though only an episode in the great Reformation, will be seen to have been the force which reappeared later in the splendid pages of Winckelmann, of Herder, and of Lessing.

The petty and pedantic literature of the seventeenth century is treated with a kindly forbearance, born of the wonder that among a people so crushed and disorganized there should have been even these traces of intellectual energy. But we wonder that such cordial praise should be given to a few wretched examples of " the Protestant drama" which were based on the traditions of Terence. These are singled out as the beginnings of a national dramatic literature, instead of the equally wretched but more workmanlike and Germanic plays which grew out of the influence of the English comedians. We cannot understand in what sense the former were more democratic than the latter. To be sure, it makes little difference which seed would have sprouted since all were killed, but to us the line of development seems to have been from Hans Sachs through Ayrer and Duke Julius to Gryphius. Prof. Francke greatly underestimates Gryphius. Scherer, with clearer appreciation, speaks of him as the one who stood "for all that the Thirty Years' War had left of a German Shakspere." He had in him the stuff of a great tragic poet, and to rank him, as most historians do, with the inane representatives of the First Silesian School is to do an injustice to the greatest German dramatist before Schiller. After him the further we advance towards the middle of the eighteenth century, the deeper the literary degradation. The disastrous war had far-reaching effects: the human mind lay fallow. But if we regard this time as a period of recuperative sleep, we may agree with our author in considering it less as an age of decay than of necessary preparation for the development of a new society.

With the advent of Lessing the fresh, bracing air of modern thought disperses the mists of seventeenth-century sentimentality. We are warned not to lay too much stress upon the English influence as opposed to French in the pages of Lessing, for many of his weapons had come "from the critical forge of Diderot." But Diderot himself, to carry out the figure, procured his bellows in England. Throughout this work the English influences are neglected, from the time of the English comedians down to the great Shaksperian revival a century ago. In a book written from a purely literary standpoint this would be a serious defect. To the classic age of German letters Prof. Francke devotes more than half his volume. The rehabilitation which he denies to Gryphius he accords with liberality to Klopstock and Wieland, and with warmth to Herder and Kleist. That the two former had a message for their time cannot be doubted. The period of enlightenment, exemplified in politics by Frederick the Great, found its literary representation in the exalted idealism of Klopstock and the wide culture of Wieland. The injudicious praise of Klopstock as the German Milton elicited from Coleridge the caustic comment, "Very *German*," but Prof. Francke forestalls this kind of criticism by taking the "Messias" out of the class of epics and calling it an oratorio, to be ranked with the works of Bach and Handel. These two names are several times curiously coupled in these pages as *par nobile fratrum*. The omission of Bach would render the comparison with Klopstock more apt, but the author goes so far in his apologia as to admire and quote "Die beiden Musen," in which the Muses of Britain and Germany run a foot-race, kicking up clouds of dust, perspiring and breathing heavily. We have still less sympathy with the laudatory superlatives with which Prof. Francke attempts to rescue the works of Wieland from their dusty repose. What though 'Agathon' was the best novel between 'Simplicissimus' and 'Meister,' and, as Lessing said, "the first and only novel for a thinking man of classic tastes"? We live in other times, and to-day the book is practically unreadable. It is our conviction that Wieland and Klopstock must rest content with the lofty place they deserved and won in the *history* of their national literature.

But with the splendid works of Schiller, the exalted conceptions of Herder, and the brilliant creations of Kleist, the case is different, and these glowing tributes will find a grateful echo in the hearts of all who love the rich literature of Germany. The plea for Schiller's "Jungfrau von Orleans," and especially for the superb "Braut von Messina," is bold and admirable; for "Tell" the pleader is obliged to make too many concessions. In the treatment of the writings on "Æsthetics," we miss any reference to the excellent lectures of the late Heinrich von Stein, 'Zur Aesthetik der deutschen Klassiker,' which are by far the best contribution of recent times to the discussion of this fascinating theme. Herder's importance is set forth in a convincing manner. To him, in some ways, as much as to Lessing, belongs the glory of having inaugurated the new era. He conceived of poetry, says Goethe, as "a gift to the world and to all peoples, and not the private heritage of a few refined and cultured men." He restored the Volkslied to German literature. He was the father of the modern evolutionary view of history. As to Kleist, those who do not know him will think Prof. Francke's words exaggerated, but they are true: his creations are invested with "a halo of immortal poetry." Of the 'Prinz von Homburg' it is written that "the history of literature knows of no other poetic production which . . . in a more emphatic manner manifested [*sic*] in itself the concentrated thought of a whole epoch than does this wonderful poem." Kleist was potentially the greatest dramatist Germany has produced, and his 'Michael Kohlhaas' is the best short story in the language. When he said, referring to Goethe: "Ich werde ihm den Kranz von der Stirne reissen," it was more than an idle boast; but the indifference of his countrymen drove him to suicide at the age of thirty-five.

In the treatment of "Faust," Prof. Francke's general plan compels him to take the two parts separately as products of two different periods, but it is entirely beside the mark to speak of an "original" and of a "later" conception. As well might one call Dante's "Inferno" the original conception of his 'Commedia,' and "Paradiso" a later one. "Faust" is an organic whole. We think that this is also Prof. Francke's view, for he cites among the most recent commentaries those of Baumgart and Valentin, who are both advocates of the unity of the poem. It was conceived as a whole from the beginning, and there is some evidence that the essential idea of the Second Part was in Goethe's mind before the Gretchen incident had taken shape.

We have left little space for the interesting chapter on Romanticism. The author regards this movement as a retrogression; the classic age turning back upon itself to the extravagance of the *Sturm und Drang*. This will serve as a broad generalization—both movements were "individualism run mad"; but the earlier movement was the rousing of the national genius in conscious though unchastened strength, the later one was the disappointed spirit of Germany taking refuge from the gloom of the present in the glories of the past—a mediæval renaissance. The *Sturm und Drang* sought for a land of freedom until Goethe cut the Gordian knot with "America is here or nowhere!" Romanticism went in quest of the mysterious "blue flower," and lost its footing in reality altogether. The work of men like the Grimms and Uhland is all that remains as a permanent acquisition of the human race.

The few errors in the book are insignificant. One of them Prof. Francke has corrected in these columns. The attention of the student should be called to the fact that, although Willmann's edition of Walther von der Vogelweide is the one named, the poems are all cited according to the numeration of Lachmann's. The frequent departures from the orthodox estimates are the result of the new view-point. They are often a distinct addition to our knowledge; much that has long been pigeonholed in our memory is brought forth to receive new meaning and importance, and we are stimulated by the new groupings of the literary phenomena. If we have ventured to disagree with the author in matters of detail, it is with the consciousness that he has excellent arguments for his own position. To the study of German literature in its organic relation to society this book is the best contribution in English that has yet been published.

PALMER MEMORIALS.—II.

Memorials. Part I. Family and Personal. 1766–1865. By Roundell Palmer, Earl of Selborne. Macmillan. 1896.

WHILE we find the keynote of these memorials in the author's religious experiences and theological interests, we must not altogether pass by his academic, legal, and parliamentary life. Roundell Palmer received his first intellectual training in a class taught by his father. The other members of the class were his brothers William and Tom. Rising early, they read the Psalms of the day and then proceeded with their classics. They began Latin at five years old and Greek at six. By the time they were nine they had made a good start in Virgil and Horace, in prose and

verse translation, and had begun the Greek Testament. *Pari passu* they did Shakspere, Milton, and other English classics. They had the run of a good library, and their faculty of observation was strengthened by outdoor lessons in the habits of birds and animals. The plates of Harris's 'British Lepidoptera' lured them on to the study of entomology. It was at Rugby, where he was sent in 1823, that Roundell Palmer came into competition with other boys and began to prove his mettle. Two years later, at the age of thirteen, he became a commoner at Winchester, then under the headmastership of David Williams. As a Wykehamist his contemporaries were Lowe, Cardwell, and W. G. Ward. With Ward he was on good terms, with Cardwell he formed a life-long intimacy, but his most valuable discipline came from rivalry with Lowe.

"To Robert Lowe (afterwards Lord Sherbrooke) I was under great intellectual obligations. Both from our place in the school—next to each other—and from other circumstances, we were very much thrown together. . . . A successful rivalry with him was not possible without effort, and the effort was constantly made. We did not always agree, for he was capable then, as since, of saying pungent things; and certain physical disadvantages under which he labored, and which he bravely overcame, sometimes tasked his high spirit and his naturally generous temper. But our friendship did not suffer upon the whole because we sharpened each other's wits."

Five years of Winchester brought Palmer youthful laurels. They also brought him care and responsibility in the form of præfect's duties, under which he groaned. In 1830 he was released and entered Oxford with an open scholarship at Trinity.

Lord Selborne's recollections of Oxford are for the most part personal and do not attempt a general survey of academic conditions. This is to be regretted, for the Oxford of 1830–33 was a centre of note, and Palmer's immediate set—Claughton, Thomas, Charles Wordsworth, Wickens, and Frederic Faber—while very good men, hardly deserve to monopolize his sole attention. An editor's note contains the remarkable list of his prizes, ended by a first-class, the Eldon scholarship, and a fellowship at Magdalen. Wordsworth's poetry was then a vital force at both universities. Palmer made it his guiding star.

"I know no other reading (except the Bible) of which the influence upon myself has been so profound and lasting. From Wordsworth I learnt, in Frederic Faber's company, large human sympathies. Wordsworth interpreted to me the language of nature as speaking to the heart of man; the beauty of everything real and true, the Divine voice everywhere, the worthlessness of whatever is artificial and conventional, in comparison with the common bond and heritage of mankind. . . . Neither in those Oxford days, nor since, have I felt the presence of any discord in his works. A few of them, taken apart from the rest, may be thought trivial; but I think there are none which have not moved my feelings and helped to strengthen my heart."

Gladstone was at his zenith in the "Union" when Palmer began to speak there. After Gladstone graduated, the Conservatives were represented by Ward, Rickards, and Palmer, while the Liberal leaders were Cardwell, Lowe, and Tait. Each of these in turn became president of the society. In the spring of 1834 Palmer took his degree, and, before entering at Lincoln's Inn, acted for above a year as tutor to Lord Maidstone, the only son of Lord Winchelsea.

The reader will find little in these memorials to remind him of the barrister in active practice. Private cases, however important, are passed over for the weightier matters of public law, public affairs, and theological discussion. Palmer entered Lincoln's Inn resolved to follow Sir John Richardson's advice—law first, society afterwards. He prepared for the Chancery bar by a year of conveyancing and a year under an equity draftsman. "The descent from the flowers of history, poetry, and philosophy to those dry bones of technical systems, and especially to the dull copying-clerk's work and mechanical processes of conveyancing, was dispiriting enough." Even towards the end of his life Lord Selborne seemed to feel the *ennui* of this apprenticeship, for he passes over it rapidly. During the intervals of routine, religious and academic interests occupied his thoughts. The controversy over Dr. Hampden's Bampton Lectures, the status of the Canadian Church in 1837–38 involving the Clergy Reserves question, the affairs of the Christian Knowledge Society, the Jerusalem bishopric, and the contest between Williams and Garbett for the Oxford chair of poetry, take precedence, during 1836–44, of the "dusty purlieus of the law." One must not suppose that because Lord Selborne says little of his private practice he went without briefs. He won his spurs in the case of Knight vs. Marjoribanks, 1839. Following two senior counsel, he made such an impression that James Freshfield, solicitor to the Bank of England, wrote to Horsley Palmer: "From all I can learn, I offer my confident opinion that your nephew's fortune is in his own power, and that his exertions will not be more beneficial to himself than to his clients." That year Palmer passed the "Rubicon of £100." In the midst of engrossing work he never forgot his friends, and several portraits in chiaroscuro illuminate the narrative of his first London years.

While the steps by which Lord Selborne made his way to the head of the junior bar are but vaguely indicated, the course of his political life is fully set forth. At the general elections of 1847 he was solicited to stand for Plymouth in the Peelite interest, and, having carried the seat, his connection with that constituency continued ten years. In 1857 he was replaced by Mr. James White, whose sonorous cheer in the House of Commons earned for him the name of the "Plymouth Sound." Shortly after he entered Parliament, Palmer married Lady Laura Waldegrave, a lady of the same religious temperament with himself. They lived together for thirty-seven years "a life of uninterrupted love and happiness."

Election to Parliament gave Palmer a double hold on success, and throughout the decade 1850–60 he steadily improved his position. Becoming Solicitor-General under Palmerston in 1861, he had to deal with many of the important international questions which arose from our civil war. Along with the Attorney-General, Sir William Atherton, he advised the British Government on points of law arising from the cases of the *Florida*, the *Alabama*, the *Alexandra*, and the steam rams. He makes a strong *prima-facie* plea for his own action in the *Alabama* affair, and no future historian of the incident can afford to overlook his statements with regard to both fact and policy. His capacity for work was enormous. Busy as he was at this time with public duties, he managed to provide an anthology of hymns for the Golden Treasury series. Once Goldwin Smith, when calling at his chambers, was told by the confidential clerk that he had better not go in, "as Sir Roundell had not been in bed that week." The record of his later and more famous services will doubtless be given before long. With the Colenso episode, the fall of Bethell, and the death of Lord Palmerston the published part of this important memoir closes.

We have occupied so much space in the futile attempt to compress the contents of Lord Selborne's pages, that we shall conclude by offering two, and only two, considerations of a general nature. The first relates to the author's style; the second, to the essential qualities of his character. In 1837 he was much interested in the Upper Canada Clergy Society.

"Only one thing of importance to me arose out of my connection with this society. I had composed, in a much too florid and ambitious style, the draft of a letter intended to be sent by the committee to the Society's principal missionary. This Mr. Gladstone saw, and he spoke of it to me in terms of kindly expressed criticism. 'Too good,' were the words which he used, emphasizing them, so as to make it plain to me that the composition was not to his taste. I date from that criticism, of which I felt the justice, a dislike to an ambitious and rhetorical manner of writing, which has since grown upon me and has become a confirmed habit of my mind."

The text of the present work shows the result of fifty years' discipline in the use of compact and lucid English. Plain and straightforward, it seldom sinks into dryness.

Lord Selborne's judgments of contemporaries and rivals show him to have been a generous, kindly man. He writes without hard words or innuendoes, and is able to appreciate the integrity of an opponent's position. He is as modest as an ex-chancellor when speaking about himself can be. His memory is remarkable for a man of years, and his great strength of mind is revealed in many long arguments and disquisitions. Above all, true goodness is blazoned on his forehead. One is reminded here of a curious story which Renan tells about the observance of St. Yves's day in Britanny. St. Yves is the only canonized lawyer, and even his own people cannot get over the sense of anomaly. The burden of the song sung by the Bretons on his day is *advocatus et non latro, res miranda populo*. The legal profession has comprised many bad men. With all respect to St. Yves, it has contained no better man than Roundell Palmer.

Famous American Actors of To-day. Edited by Frederic Edward McKay and Charles E. L. Wingate. Thomas Y. Crowell & Co.

THE primary, if not the avowed, object of all books of this description, collections of stage biographies written by miscellaneous authors connected professionally with the theatre, is to secure a sale by gratifying the vanity of the actors selected as subjects for discussion, and provoking the jealousy or curiosity of those omitted from the list. In these respects the present volume proves no exception to the general rule, but it is superior to most of its immediate predecessors in fulness and accuracy of detail, in literary workmanship, and its comparative freedom from triviality and absolute silliness. Some of the articles, indeed, contain genuine and judicious criticism, but these, it may be observed parenthetically, relate to the dead, to players of assured and acknowledged distinction, or to those whose days of activity are ended. Of the remaining essays, the great majority possess more or less interest as records, but, otherwise, are simply fluent but worthless eulogies of the kind invented by box office agents and adopted complacently by the daily press. A sufficient expla-

nation of this characteristic will be discovered by the initiated in the names of the writers.

The best work in the book is to be found in the article, by Mr. Henry A. Clapp, on Edwin Booth, which is reprinted from the *Atlantic Monthly*, and was recognized long ago as a conscientious, appreciative, and thoroughly able piece of analysis, even by readers who do not agree with all its conclusions, and in a remarkably interesting and well written, if somewhat over-enthusiastic, article by Mrs. E. G. Sutherland, upon William Warren, so long the pride of Boston. Mr. Edward King does no more than justice to the many delightful attributes of Joseph Jefferson's acting, but his paper would have been more convincing if he had taken some of Jefferson's limitations into account. The article on Mme. Janauschek, on the other hand, although highly laudatory, cannot be accepted as an adequate acknowledgment of her commanding genius. In high romantic tragedy she has had no peer in this generation except Salvini, and, considering her versatility, it is doubtful whether either Rachel or Ristori was her equal. W. J. Florence, the most versatile comedian of his day, is another actor whose most sterling qualities, if not altogether overlooked, are certainly under-estimated. The sketch of Mary Anderson is nothing but a synopsis of her autobiography, while that of Mrs. John Drew, whose fine skill could have nothing to fear from intelligent criticism, is a mere box-office puff. The only other essay worthy of particular mention is that on Ada Rehan, by Mr. E. A. Dithmar, which is a well-written and exhaustive plea in defence of a rather weak case.

Here comment on the book might stop so far as its historical, literary, or critical value is concerned, but the publication has a significance probably unsuspected by its compilers, though undeniably interesting to students and lovers of the stage. A moment's reflection will show that the very title of it is a misnomer. Not more than half-a-dozen of the actors commemorated in it can, by any stretch of courtesy, be designated as famous, and these cannot fairly be included in a list of representative players of to-day. Mr. Jefferson, to be sure, is still in harness and happily able to keep alive the memories of his earlier triumphs. But he stands alone. Janauschek, the ghost of her former self, "a noble wreck in ruinous perfection," lends occasional dignity to modern farce or melodrama, but her day is over. Modjeska has shaken the dust of New York from off her feet; Booth, Lester Wallack, John Gilbert, and William Warren have joined the illustrious majority, and Mrs. John Drew, worthy of fame even if she has not fully attained it, has retired into well-earned privacy. These are the only names in the selected list of forty-two worthy of permanent remembrance for high achievement in the artistic drama. Such conscientious and competent performers as Lawrence Barrett, W. J. Florence, and Charles Fisher, although they did good and valuable work, belonged to a lower class. They, too, are dead.

Who, then, are the famous actors of the contemporary American stage? In attempting to answer this question, Messrs. Wingate and McKay, after a survey of the existing material, propose the names (following their own order) of Fanny Davenport, Richard Mansfield, Ada Rehan, John Drew, Julia Marlowe, Agnes Booth, J. H. Stoddart, Maurice Barrymore, Rose Coghlan, W. J. Le Moyne, E. M. Holland, Georgia Cayvan, E. H. Sothern, Alexander Salvini, James O'Neil, and a few others of still less consequence, of whom some are dead and others in retirement. Of Edwin Varrey, the best "old man" in the country; of Eben Plympton, who has no equal on this side of the Atlantic as a leading man; of the veteran E. C. Couldock, of Ada Dyas, and of Joseph Wheelock, they make no mention at all. Others might be added, but the list as it stands fairly represents the best American talent. How many of these players are in the front rank? How many of them justify the hope that they may reach it in the future? Alexander Salvini has genius, but he is dying. Agnes Booth, J. H. Stoddart, and W. J. Le Moyne have done their best work. Miss Davenport is devoting herself to the vile Sardou drama, to the demoralization of her art and her audiences. Mr. Barrymore is and long has been in a condition of arrested development, and Miss Marlowe is going backwards. Mr. Mansfield has energy, ambition, ability, and artistic sense. In him, undoubtedly, there are latent possibilities, but it is a grave question whether his temperament will ever permit their realization. John Drew is one of the best light comedians to be found anywhere, but he is laboring in a restricted field, without much apparent chance of widening his artistic horizon, while Miss Ada Rehan, his old associate, an actress of peculiar ability in her own line, has impeded her own progress by venturing beyond her depth.

All this is only a rapid summary of facts long acknowledged and deplored by experienced and disinterested observers, but never, perhaps, so clearly demonstrated as in this book, which, in its search after famous American actors, upsets the very proposition which it set out to establish. "To-day," it is explained in the preface, is meant to refer to the decade just closing. Of the great actors who have adorned that period, only Mr. Jefferson is left to us. Of the competent performers of the second rank, all are past their early prime, and most of them—the subject is somewhat delicate are of an age which precludes any reasonable expectation of development. Within the ten years there has not arisen one single American actor, male or female, of any conspicuous ability in any of the higher walks of the drama. The temporary encouragement afforded by the early work of a few intelligent novices has been dashed by their later performances. Never was the outlook for the home theatre more depressing. Every season we are becoming more dependent for good acting upon the foreign supply, and there is small chance of improvement so long as the present system of management by syndicate prevails. It is not surprising that there should be no actors when there are no stock companies, the only schools of any value. But the production of a volume on famous American actors, in present circumstances, is a cruel, if unconscious, bit of irony. It also illustrates the prevailing lamentable tendency to describe all our theatrical geese as swans.

Moxon's Mechanick Exercises; or, the Doctrine of Handy-works applied to the Art of Printing. A literal reprint in two volumes of the first edition, published in the year 1683. With preface and notes by Theo. L. De Vinne. New York: The Typothetæ of the City of New York. 1896.

THE selection of this rare volume for reproduction witnesses to the sound judgment of the master printers associated as "The Typothetæ," while the perfection of its manufacture is an honor not only to the De Vinne Press but to American printing. Moxon was a Yorkshireman with a mathematical turn, and an ingenious mechanic; he had been made hydrographer to the King in 1665, and by and by embarked in type-founding and printing. The present work was part of a series bearing the general title of "Mechanick Exercises," and "has the distinction of being not only the first, but the most complete of the few early manuals of typography." It is most orderly in treatment, and exceedingly minute in its instructions, which are aided by illustrations on copper. It is a mine of technical terminology, and is reinforced by a dictionary ready to Dr. Murray's hand. Mr. De Vinne, besides supplying a brief biographical introduction, masses at the end his annotations on the several chapters, comparing the art of Moxon's time with that of to-day. The changes have been astonishingly few in some branches, but very great in others, notably in presses. Indeed, the mechanical insufficiency of that steamless age is the most striking lesson of Moxon's manual.

The original edition was produced without any particular regard to an exemplary appearance, and would have yielded but a dingy photographic facsimile. The Typothetæ therefore undertook a line-for-line and page-for-page copy, correcting merely literal errors, and using a type, derived from Caslon's punches, which bore a tolerable likeness to Moxon's. This very noble letter, composed with the most scrupulous accuracy, and admirably printed on Holland paper, gives us a sample of American typographic skill which is at once a monument to the makers and to Moxon. Being limited, however, to 450 copies, and not being in the market, this reprint will be almost as inaccessible as the remainder of the 500 first printed in 1683, of which but three are known to be on this side of the Atlantic, and but two in England. The volumes are very tastefully bound in brown leather with orange-colored sides.

One must be somewhat versed in "the art preservative" to follow Moxon's text with a lively interest or understandingly; but anybody can appreciate his workmanlike spirit and his quaint humor, while his technical vocabulary, as we have intimated, is worth studying as he thought it worth recording in his dictionary. He acknowledges the imperfections of this pre-Johnsonian glossary, and bespeaks its amendment:

"Therefore," he says, "such Words and Phrases as have escaped my Consideration, will, I hope, be discovered by some Printer, or others, that may have a Kindness for Posterity; not only in this Trade, but in all Trades and Faculties whatsoever: That so a *Dictionary* may in time be compleated, that may render so great a number of Words used in *England* by *English-men* intelligible; which now for want of a proper Repository to store them in, seem not only Aliens to our Nation, but barbarous to our Understandings."

Moxon's appendix on the customs of the Chapel is a picture of manners that have well passed away; freedom of the press, too, has abolished "the Hole," if not the pirate publisher:

"By a *Hole*, in Printers dialect, is meant and understood a place where private Printing is used, *viz.* the Printing of Unlicensed *Books*, or Printing of other mens *Copies*. Many Printers for Lucre of Gain have gone into *Holes*, and then their chief care is to get a *Hole* Private, and Workmen Trusty and Cunning to conceal the *Hole*, and themselves."

Mr. De Vinne indulges in a little pleasantry on Moxon's requirement that the proof-reader or corrector "should (besides the *English*

Tongue) be well skilled in Languages, especially in those that are used to be Printed with us," viz., Latin, Greek, Hebrew, "Syriack, Caldæ," French, Spanish, Italian, High Dutch, Saxon, Low Dutch, "Welch, etc." "Neither," adds Moxon, "ought my innumerating only these be a stint to his skill in the number of them, for many times several other Languages may happen to be Printed, of which the Author has perhaps no more skill than the bare knowledge of the Words and their Pronunciations," with resulting orthographic offences (if the corrector be equally ignorant) implied in another passage: "And how well other Forrain Languages are Corrected by the Author, we may perceive by the English that is Printed in Forrain Countries." This latter observation is not yet out of date.

History of the Court of Common Pleas of the City and County of New York. With full reports of all important proceedings. By James Wilton Brooks. New York. (Published by subscription.) 1896.

THE New York Court of Common Pleas came to an end last year, by a process which lawyers might term merger. Together with the Superior Court it was consolidated with the Supreme Court, which has thus become the one court of general jurisdiction for the whole State. Now that these two tribunals have disappeared, it is very difficult to see why they were allowed to exist side by side so long. Consolidation was long recommended by law-reformers and judges, and the main obstacle consisted of the interests of the judges of the Common Pleas and Superior Courts, some of whom were commonly supposed to be averse to being consolidated off their separate benches. However this may be, an attempt to push the reform, made in the Bar Association of this city some years ago, fell through, one of the arguments advanced against it being that it was a good plan to have three courts, as one, or even two of them, might become tainted with corruption—as had happened once—and then, without the third, the honest lawyer and client would have nowhere to go. This argument, which would of course be fatal to the consolidation of any courts, prevailed, and the project was abandoned, only to be taken up a few years later and made law.

When the end came, both courts were past their prime, but in earlier years both had been tribunals of consequence and weight. The Common Pleas, as the present generation knew it, could trace its judicial pedigree back only to 1821, when John Treat Irving, the brother of Washington Irving, was made First Judge. Previous to this, the court had been the Mayor's Court, and the Mayor's Court had in its turn, when the English got possession of New York, supplanted the Dutch court of the Schout, Burgomaster, and Schepens. Any one imbued with the true historical spirit may therefore identify the three courts as one, and say that the New York Court of Common Pleas existed for 242 years. During one-sixth of this period—forty-one years—the presiding judge was the venerable Charles P. Daly, whose Reports will always be a valuable series of judicial records and an interesting memorial of the court.

This is itself a memorial volume, and contains a brief history of the court, and various minutes of proceedings, the latter relating mostly to trials of justices, of whom the most recently notorious was the well-known Patrick Divver, tried in 1894 on a number of charges, among which was that in 1886 he had been "accustomed to divide with one Edward Parmely Jones the proceeds of a system of swindling commonly called the 'green goods game.'" It is interesting to note that while other charges were denied, this one was met by a demurrer—a species of defence described by some one as equivalent to saying, "What of it?" The judges of the Common Pleas sustained the demurrer, not on the ground that the green-goods game is an innocent diversion, but because they had no power to remove for offences committed before the defendant became a judge. During its whole history the power of this court to try and remove justices seems, when resorted to, to have been of little value.

There are also, among other things in Mr. Brooks's volume, biographical sketches of the judges, and an account of the proceedings on the closing of the court in 1895. The sketches are not altogether critical; some are rather of the order which fails to characterize or discriminate. The accounts given do not invariably produce the impression of exalted judicial capacity, and indeed make us now and then fear that, if the truth were known, some of the later judges of the Common Pleas were second-rate men, who secured their places through a knowledge rather of politics than of jurisprudence.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 5, 1896.

The Week.

We have escaped from what a large number of people supposed was an immense danger, the danger of having our currency adulterated and our form of government changed, and a band of ignoramuses and Anarchists put at the head of what remained of the great American republic. Probably no man in civil life has succeeded in inspiring so much terror, without taking life, as Bryan. Attila and Tamerlane frightened more people, but they killed or threatened to kill them; they hardly destroyed more property. Bryan succeeded in persuading hundreds of thousands that the great fabric of government which was built up by the wisdom and experience of a thousand years, and cemented by hundreds of thousands of lives, was, almost in the first century of its existence, about to be handed over by the vote of its own people to a knot of silly, half-taught adventurers and Anarchists. We were to exchange the Constitution and the Supreme Court for the decrees of Altgeld and Debs and Bryan and Teller, whose principal occupation was to be striking off "cheap money for the poor man." The whole episode has been utterly discreditable to our politics, as conducted by politicians. Could anything better reveal the character of our nominating system than the fact that the nominating convention of one of our two great parties could be taken possession of by a few adventurers, that the platform could be drawn, in the main, by a noted Anarchist, and an unknown young man nominated on it simply because the audience was pleased with one of his metaphors, and that it should drive away from it all the party's men of light and leading before going to the country?

There is nothing partisan about the overwhelming majorities for McKinley. It was not the Republican party which won; it was the cause of the nation. In Connecticut, for example, the returns show that in a total vote about the same as four years ago McKinley's plurality is about 48,000, against about 5,000 for Cleveland in 1892, because one-third of those who supported the Democratic candidate then supported the Republican candidate now. It was not that they had become Republicans, but that they had repudiated a false Democracy in the only effective way, by voting for the only man who could defeat Bryan. The Palmer vote is insignificant, not because the men who believe in the Indianapolis platform are few, but because most of them followed the virtual advice of Palmer himself to support McKinley. One of his last deliverances was this, at Warrensburg, Mo., on Saturday: "I promise you, my fellow-Democrats, I will not consider it any very great fault if you decide next Tuesday to cast your ballots for William McKinley, although you may, if you desire, vote for Palmer and Buckner."

A popular revolution such as occurred on Tuesday almost invariably involves the control of Congress, and the rule will undoubtedly hold this time. The Republicans have carried the House of Representatives by a great majority, the only question being whether they will have a full two-thirds of the body. The gains of seats in the Senate now held by Democrats or Populists in Indiana, Illinois, Wisconsin, Kansas, South Dakota, and perhaps other States will give the Republicans also nearly, if not quite, a majority in the upper branch of men who have always been advocates of sound money. Moreover, the overwhelming rejection of the free-coinage policy will unquestionably lead some of the Republican Senators from the far West who have hitherto stood by the silver cause, to abandon it now. There is no reason to doubt that, if the McKinley Administration will formulate a sound financial policy, there will be Republicans enough in each branch of Congress to sanction it. That policy was distinctly outlined in the Indianapolis platform, and will be the touchstone of Republican non-partisanship.

The fusion campaign for the Presidency closed with an exchange of abusive epithets between the Populist and the Democratic wings of the "allied forces." Many "life-long Democrats" were overflowing with indignation at the impudence of Populist upstarts, like Senator Butler of North Carolina, in declaring that "they have taken possession of the Democratic party," and that "the Democrats have, in the broad sense of the word, become Populists." On the other hand, many honest and sincere men, who had worked for years to build up the Populist party as an effective political organization, were equally outraged at what they considered the "sell-out" to the Democrats by traders of the Butler school. The result was that, during the last days of the canvass, the movement away from Bryan among adherents of the old-fashioned Democratic party was accelerated, while another movement was taking from him Populists who found that they could not stomach the dose prepared by the fusion doctors. The history of such movements has shown that fusions never really fuse. In Oregon, for example, four years ago, the Populists polled 26,965 votes for two Weaver electors, and the Democrats 14,243 for one Cleveland elector—a total of 41,208 for the two parties; but the one elector who was supported by both received only 35,813 votes. The difficulties of fusion on a Presidential ticket, with two candidates for Vice-President, were infinitely greater.

There never was a Presidential campaign in which one of the two great parties received so little support from the press of the country as was given the fusionists this year. Every independent journal in the United States was opposed to Bryan, and throughout the East all the old established and influential Democratic newspapers were outspoken against him. In the Western metropolis he got as little backing from the press as in the Eastern, not one Chicago journal of the first class advocating free coinage, and hardly any of the lower classes. The chief Democratic newspaper of Michigan was bitterly opposed to Populism, and so likewise was that of Minnesota. Even in the South the revolt of the party press against the surrender to Populism was pronounced. The Louisville *Courier-Journal* and the other most prominent Democratic newspapers in Kentucky were earnestly opposed to Bryan; the same is true of the Montgomery *Advertiser*, the chief party organ in Alabama, and of the Galveston-Dallas *News*, the most influential newspaper in Texas. Many of those papers which nominally favored Bryan rendered him an entirely perfunctory support, and condemned the campaign made in his behalf. The *Florida Citizen*, for example, remarked that "the effort to make the present political campaign one of the poor against the rich, and to cause the South and the West to combine against the East, is one that no wise man in the South can approve." The Mobile *Register* went so far as to say that it believed Bryan's policy would ruin the country, but that it did not believe he would carry out his policy if he should be elected.

We think that the world has never before witnessed the spectacle of an immense number of people drawing gold out of solvent banks and locking it up lest the value of their money should be reduced one-half by the result of an election—this, too, in a time of profound peace. As election day drew nearer, this movement became more pronounced, causing unexpected tightness in the money market. On Thursday, call money touched 100 per cent., and it loaned at that rate again on the following day. It is the estimate of good judges that $40,000,000 was thus hoarded, most of it during the past thirty days. Fortunately this came at a time when the international move-

ment of gold was in our favor; when, too, speculation was at the lowest ebb, so that holders of securities were not likely to be "squeezed out." It is fortunate also that the banking community realized the ephemeral character of the spasm, and consequently felt justified in extending aid to the mercantile community beyond the ordinary bounds of safety. The feeling in commercial circles found expression on the Montreal Stock Exchange, where certain shares were quoted "cum McKinley." Thus, sales of Commercial Cable were quoted in the Montreal *Herald* of October 29 at 146½ for present delivery, and at 151 for delivery after November 3, if McKinley should be elected. Postal Telegraph shares were quoted at 80½ regular and at 83 "cum McKinley."

Among the humorous features of the late campaign a high rank belongs to Henry George's series of letters carrying one State after another for Bryan in a long succession, beginning with those in the Mississippi valley and working East. A few days ago he reached the boundaries of New York, and began operations with the naïve announcement that he had discovered in western New York "the same indications of silver's victory as he found further West." He summed up the outlook, as viewed from the metropolis, in "the only conclusion I can come to from such information as I have been able to obtain, that Bryan and Sewall, and not McKinley and Hobart, will carry the State of New York." Bryan himself set the pace for Populistic prophets when he said a fortnight ago: "I expect to carry every State in the Union. You should have seen the crowd at Boston. It was a most remarkable demonstration."

The address signed last week by Messrs. Arthur, Sargent, and Arnold, the leaders of the locomotive engineers and firemen, declaring that "under a condition of free coinage this country would be subjected to one of the most frightful panics that any country in this world has ever seen," was a very important deliverance. It not only emphasized a great financial truth, but pointed to a line of cleavage in the ranks of labor which the events of this campaign have signalized in a striking manner—the line between the constructive and the destructive elements of the wage-working class. The latter class are represented by Debs and Sovereign, and the former by Arthur and Sargent. Debs's method of helping labor is by pulling down, Arthur's by building up. Debs naturally falls into the Bryan campaign because Bryan preaches war between classes. To him "16 to 1" has no meaning whatever; but a license to defy the laws, disobey injunctions, and discipline the courts, as promised in the Chicago platform, is full of significance. Mr. Arthur and his associates find nothing attractive in this programme. Their theory for the advancement of labor is to create, not to destroy capital. They believe that the more property there is in the world the more the wage-worker will get. And as to "16 to 1," they have learned by study and reflection that it means a depreciated dollar, which means less compensation to the men and women who work for hire. They tell us that they were induced to sign some kind of a memorial to Congress three years ago on the subject of bimetallism; that they do not remember exactly what it was. Whatever it was, they say that it was signed without reflection; that they have since studied the matter sufficiently to know that free coinage at the ratio of 16 to 1 would be "directly against the interests of labor." They do not believe that the country can endure the present misery and distress four years longer, and for that reason they are "emphatically and unequivocally against any such measure, and are for the sound-money plank promulgated by the Republican convention at St. Louis."

Speaker Reed adds his name to the list of distinguished Republicans who confess that the silver-purchase act of 1890 was the price paid for the McKinley tariff act of 1890. In his article in the current *Forum* he explains the defeat of his party in the congressional elections of 1890 by saying that the tariff bill was delayed so long by the silver Senators. "We had been sacrificed to silver," he says. This is no doubt the truth, but it comes grotesquely from one of the head sacrificers. Mr. Reed knew all about the wicked bargain at the time, and had it in his power to frustrate the whole wretched intrigue. Yet he struck hands with the men who were sacrificing the party to silver, and defended their work on the stump all over the country. More than this, he himself, with the help of the precious Lodge, brought out in 1894 his ridiculous but reckless scheme to sacrifice the party all over again to silver. But now Lodge is going about with a pious roll to his eyes asserting that the people have been "misled" on the silver question, and Speaker Reed closes his article with a high moral rebuke to the silver Senators. Faugh! as the *Tribune* used to say when confronted with a peculiarly sickening exhibition of Mugwump hypocrisy.

The utter subsidence of the Venezuelan excitement is a good instance of the way political issues burn themselves to ashes in this country and cannot be rekindled. Less than a year ago people were convulsed at the name of Schomburgk, and grew apoplectic at the very mention of the Cuyuni River. Now they have reached a degree of indifference to the whole subject like that of Archbishop Magee, on a certain occasion, when he said that a curate might safely play with him. Sir Edward Clarke has come out in a public speech and intimated that the English case is all a sham, but not a quiver of an eyelid did he excite in this country. Our Commission's experts have come back from delving in the archives at The Hague, and not a newspaper correspondent has thought it worth while to read in their faces that it is all up with Salisbury and that there will be a war next spring. Weariness of the whole question is all that can be discovered on every side. Nor is this entirely due to our having more pressing affairs on hand. We feel that we have gone through our Venezuelan heroics and explosions for good and all. Our capacities in that line are thoroughly exhausted. Ask us to be hysterical about something else, and we will do our best to accommodate you; but Venezuela—no more of that.

"An appointment not fit to be made." That historic phrase is justly applicable to the selection by Gov. Morton of Jake Worth, the Republican boss of Brooklyn, as County Clerk of Kings County, to fill the vacancy caused by the recent death of the incumbent. This appointment will hold until the beginning of 1897, when the new Governor chosen on Tuesday must make an appointment to last until the Legislature shall take action for the holding of an election. Jake Worth has long been notorious as a perfect type of the professional politician, who is "in politics for what he can make out of it," and who has a supreme contempt for "snivel-service reform" and officials of the type of Seth Low, whose nomination and election as mayor he bitterly opposed. A fellow-workman in the navy-yard with Hugh McLaughlin, the Democratic boss, when both were young men, he has often worked hand-in-glove with him in later years, and his appointment, by a mayor who was a tool of McLaughlin, as an election commissioner to represent the Republican party a few years ago was universally recognized as a gross outrage upon the spirit of the law and the proprieties of the situation. The plea is put forward that "of late years no one has had any good reason to question the loyalty of Mr. Worth's Republicanism, and his counsels have been followed to good advantage in many critical junctures," but he is still a man of the same character that he was when his "loyalty" was questioned. While Gov. Morton is primarily responsible for this appointment, announcement is officially made from Albany that it was recommended by Frank S. Black, who is expected to reappoint Worth upon his accession to the governorship on the 1st of January; by Timothy L. Woodruff, Lieutenant-Governor elect; by Judges Dickey and Goodrich of the Supreme Court; by Mayor Wurster; by Benjamin F. Tracy, Stewart L. Woodford, and other men of the highest standing in the

Governor's party. Indeed, Mr. Morton may well plead that, in making this ad-interim appointment, he has only recorded the wish of the Republican party in Brooklyn as expressed by its foremost representatives, and of the State leader selected by the Republican party of the commonwealth. Really the most disheartening aspect of the matter is the revelation that the Jake Worth sort of politician secures recognition from the next Governor even before his election. We had hoped for better things from Mr. Black.

Comptroller Fitch kept this whole city in confusion, and kept a contractor out of his money lawfully due to him, for many days, simply, he says, because he got it into his head that the contractor's men engaged in collecting pieces of paper ought to be examined under the civil-service rules. The Corporation Counsel says there is nothing in this, and thereupon Mr. Fitch declares he is satisfied, and he will pay the money. But he might just as well have started, out of his own head, the opinion that the contractor's men must be all Protestants, and have taken the Corporation Counsel's opinion on that. There is no end to the foolish notions which a man careless of the public interests might not use as an excuse for not doing his duty by them. One of the Comptroller's first duties, towering above even his duty to be honest, is not to be silly, if it causes inconvenience to other people, though at home in his own house he may be as silly as he pleases. A moment's reflection on the civil-service law by anybody above the age of ten would show him that the civil-service law was not intended for private employees; and all employees of a man who is personally responsible for the results of their work, are private employees. How we wish Mr. Fitch would grow up, and learn that the road to glory in this community now is to facilitate, not to hinder, the policing, lighting, paving, and cleaning of the city.

The Overseers of Harvard University have not adopted the full recommendation of their Committee on Composition and Rhetoric. That is, they have not made a certain proficiency in English a condition of admission. They have simply approved of the course pursued by the Faculty and recommended its continuance. Still, the resolution of the Board will be found pretty drastic by the schools. It says:

"Voted, that, in the judgment of the Board of Overseers, every candidate for admission to the undergraduate departments of the university should give evidence that he can write the English language with such degree of neatness and skill in penmanship, correctness in spelling and grammar, and with such facility of expression as will enable him to enter, without further elementary instruction, on the elective studies to which he proposes to devote himself, including the more advanced courses in English composition; voted, that the Faculty be requested to press steadily towards the attainment of the above end."

The main effect of this will be to increase the importance of English and cause more attention to be given to it. The difficulty has largely arisen out of the fact that the old oral system of instruction in English at Harvard has been abandoned under President Eliot for the written, but the schools still prepare for the oral, and we know the result.

The news that Bismarck had a secret defensive treaty with Russia from 1884 to 1890 seems to be authentic. His personal organ affirms it, and the official mouthpiece of the Government refuses either to affirm or deny it, though practically affirming it by a severe comment on the enormity of a betrayal of such high state secrets. That Bismarck should have been capable of thus cutting under the Dreibund, about which at the time he was making such a flourish, ought not to surprise those acquainted with the professed cynicism of his theory of diplomacy. The wide reverberations of the disclosure show into what a state of nervous tension the European Powers have got themselves. Each new "European concert," in fact, seems to mean fresh international suspicion and jealousy, as if the participants in the concert were so many irritable musicians playing out of tune and doing their best to smash each other's instruments. Many things account for this condition of international nervousness, not the least of them being the strain of matching army with army and fleet with fleet. If you are bound to keep yourself stronger than an unmannerly neighbor, every step he takes to strengthen himself necessarily makes you fretful and angry. Then there is, as the *Economist* remarks, the tendency to exaggerate everything that any statesman or semi-official newspaper says, through forgetting how they must say something whether they have anything to say or not. Lord Salisbury must speak at the Guildhall banquet next week, however much he might prefer to keep still. He will also be bound to maintain that England was never greater, English diplomacy never so skilful and successful, and everything never so likely to turn out as he wants it. Careful consideration of this compulsion under which he labors should always be present in interpreting his language. Then, as for the press, it is one of its old failings to be most furious when most empty.

Mr. Curzon made a long speech in Glasgow on foreign affairs on the 14th, and it was expected in some quarters that he, as Under-Secretary and Salisbury's mouthpiece in the Commons, would hint at the line the Government proposes to take in the Armenian business. But he did nothing of the kind. What he had to say only went to confirm the fling at him in which Mr. Bowles indulged in the House of Commons one day, when he reminded some baffled inquirers that Mr. Curzon was put up, not to reveal Lord Salisbury's thoughts and intentions, but to conceal, so far as possible, Lord Salisbury's lack of thoughts and intentions. In defence of the Government's inaction, Mr. Curzon could only say that the concert of Europe was a great and solemn object of worship, that England would never be justified in doing anything for the Armenians and thereby infuriating the other Powers into falling upon her tooth and nail, and that slow methods—much letter-writing, and long waiting for answers—were of the very essence of diplomacy. But let the country not despair. In Lord Salisbury the country had "a minister of unequalled experience in foreign affairs." He was, in fact, "the *doyen* of the corps of European statesmen." Could such a doyen make a mistake? People talked of renewed massacres, asked what was England's navy doing, were in a hurry for some sort of positive action. Mr. Curzon begged them not to distrust the doyen; if you cannot repose confidence in him, whom can you trust?

There is reason to believe that among the persons surprised at the choice of the Bishop of London as Archbishop of Canterbury was the Bishop himself. He issued to his clergy, soon after Dr. Benson's death, a special prayer for divine guidance in the selection of a new Primate, which certainly did not look as if he dreamed of the appointment's coming his way. Then he delivered, on October 22, an address, on church reform, which was pretty radical for one of the higher clergy. He spoke strongly against the scandal of advowsons, or the sale of livings in the church, one-third to one-half of which he said were frequently in the market to be knocked down to the highest bidder. Dr. Temple also expressed sympathy with what he asserted to be a widespread feeling, that parishioners ought to have a voice in the appointment of their ministers—at least to the extent of keeping out clergymen not fit for their work. Another grave defect in the machinery of the church, argued the (then) Bishop, was the lack of any way of removing incompetent clergymen. He was willing to draw a distinction between those who were incompetent through no fault of their own, and those whose incompetence arose from the fact that they would not work. To throw the former upon the poor-rates would be a serious scandal; the latter really ought to be sent to the workhouse, the future Archbishop intimated. The significant thing is, that Dr. Temple is not the kind of man to change his opinions through promotion, and that the English movement for church reform may therefore count upon active support from the new official head of the church.

THE EDUCATION OF THE CONSCIENCE.

MANY a time during the past few months have those whose happiness is bound up in the honor of their country longed for the sound of voices that are now silent. Strong and earnest voices we have indeed heard in numbers, voices that we could have ill spared and that have been raised in righteous indignation and soul-stirring eloquence. But it is impossible for those whose memories run backward for a generation not to miss the inspiration that came from the utterances of great men who are no longer with us. Their fame was so widespread as to carry the influence of their teachings throughout the length and breadth of the land, and their personal power gave an effect to their arguments far greater than the same arguments can have in the mouths of men less widely known.

Fortunately these voices, although silent, yet speak to us from the records of the past. We know what Webster said concerning the attempt to array the poor against the rich. We know what Curtis said when a policy of dishonor seemed likely to find favor with the multitude. We can read the fiery utterances of Lowell as he looked across the ocean at "the land of broken promises." What Beecher thought, Mr. Bryan learned to his discomfiture, when he assured his Brooklyn audience that Beecher if living would be on his side; an appeal as dismal in its results as King Saul's invocation of the spirit of the prophet Samuel. What James Freeman Clarke would have said, the following extract from what he did say nearly twenty years ago sufficiently shows. Every word of it is as apt and true as if spoken to-day. His subject was the education of the conscience, the chief diseases of which he called stupor and ignorance. The conscience, he said, might be inactive or it might be badly instructed. The sins of the time, the crimes against society, the swindling transactions, the defalcations, the betrayals of trust, the repudiation of public obligations, are not usually deliberate violations of what is seen to be right, but rather come from consciences stupefied, sophisticated, and uninstructed. Dr. Clarke continued:

"Take, for example, the proposition made a few years since to pay the national debt in silver, when silver was below par—a plan at one time very popular, and which would have inflicted so much injury on the honor and welfare of the nation, and which would have been a blow to national credit, and the source of disaster. We mistake if we suppose that the people of the West and South were deliberately doing what they knew to be wrong in supporting it. They were misled by artful demagogues. They were taught to believe that, as the letter of the law allowed payment of the early bonds in coin of either kind, there would be no injustice in paying them in a depreciated currency. They were persuaded that the demonetization of silver was a cunning trick of rich bondholders, done in order to oppress the poor, and that the people had been defrauded thus of the money which would give new activity to business and furnish employment to thousands. But when they were taught that this was all false, and that the plan was in the interest of speculators; when they saw that it would be defrauding every man who had any money due him of ten cents on a dollar; that it would be cheating the foreign creditors who lent us their money in our war when we needed it to save the nation; that it would be cheating the widows and orphans whose small means were intrusted to the honor of the country: that it would be cheating every farmer out of a tenth part of the price of his wheat, every day-laborer of the tenth part of his day's wages; and all to put more money into the pockets of the rich owners of the silver mines—then the conscience of the land refused to accept such a proposition.

"These truths were taught boldly, plainly, unequivocally, in tones which reached every log cabin beyond the mountains. The people were taught that the collapse of business was the natural result of over-trading, over-investments in costly speculations, and pushing the credit system to an extreme point. They were taught that what we needed for the revival of business was not more money, but more confidence; that there was money enough, but that those who had it would not risk it. They were made to see that confidence comes not by repudiation of debts, not by expansion of the currency, not by trying to cheat creditors, but by exactly the opposite course, and that all these measures would only increase the evils under which we suffered. They saw at last that the remedy for the state of commercial distrust was that each man should learn economy, give up extravagance, quit speculation, do a safe business, pay his debts promptly, and that the Government should lead the way by resuming specie payments; that is, by beginning to pay its honest debts in honest money. As soon as the conscience of the nation was enlightened on such points as these, such a piece of dishonesty as the Bland bill became impossible."

Nothing more appropriate for the present crisis has been uttered by any living man. There is nothing to add to it, nothing to subtract from it. It is the truth, the whole truth, and nothing but the truth. The principles of right and wrong are immutable; the sophistical pleas of demagogues change their form, but they too remain essentially the same. They consist in appeals to the baser passions of mankind. They seek to arouse hatred and envy and cupidity and revenge. They excuse dishonesty on the ground that dishonesty has existed, and propose to defraud creditors of the present day because, as they claim, debtors were defrauded in 1873. We may fairly say that during the last few months correct views of political morality have been fully presented to the people. The truth has been "taught boldly, plainly, unequivocally," and no one who could read or hear has needed to remain unenlightened. There is no excuse for the disease of ignorance or the disease of stupor. Never was an appeal made more directly to the consciences of the people, never were more votes determined to be cast by conscientious voters.

MR. MORETON FREWEN.

WE make this gentleman a subject because he is just now doing, in our opinion, a great deal of international mischief. The only reason we can think of why the London *Times* should make him the chief explainer of America to England, instead of leaving the work to its own correspondent, is that, having once lived in this country, he is supposed to know it from the English point of view, and to be ready to speak of it in a way which might not be expected from a man who lived here still. Mr. Frewen has had a ranch in the West in which he failed, has since then been in rather embarrassed circumstances, and is extremely fond of writing about America in the English papers, displaying in all his writings a large amount of inaccuracy, misinformation, credulity, and want of judgment. After saying this we need hardly add that he is an ardent bimetallist, and has a high opinion of all bimetallists, and thinks something dreadful will happen if we do not all become bimetallists. He has contracted, too, the bimetallic affection for Silver, and has measurably succeeded in personifying it, and devotes a large proportion of his waking hours and literary capacities to glorifying it. The Bryan movement, having so much silver in it, is therefore exceedingly grateful to him, as it seems to be a fulfilment of his own prophecies. One of the most striking effects of bimetallism on the mind is the prophetic spirit with which it fills its votaries. They are all sure that within, say, ten, if not five, years the whole world will be bimetallic, and that "the ratio"—some ratio—will bring peace into millions of humble homes. The sources from which these predictions occasionally come are often amazing. Men whose judgment one would no more trust about finance than that of Wilkins Micawber, are certain that within a very few years the nations will be tumbling over each other in eagerness to make a bimetallic "international agreement."

Mr. Frewen is aided in his explanations of America to the English people by two things. One is the English disposition, at crises like the present, always to believe that the worst is going to happen to us. This is not unnatural, for we often do act like drunken men until the consequences begin to stare us in the face, and then, just as our ruin seems certain, we suddenly become rational and sober-minded. This tendency to go to the brink of the precipice and then withdraw hastily was evident as early as Tocqueville's day, and is commented on by him in his book. There were several illustrations of it during the war of the rebellion, and it led to the publication in 1861 of one of the oddest of literary products, a book on America by a man named James Spence. He managed to be even more irritating and incompetent than Mr. Frewen, and it would hardly be unfair to hold him responsible for much of the ill feeling between the two countries which lasted down to the conclusion of the *Alabama* treaty. He was a Liverpool merchant who had lived here for some years and had then gone back. His style was good and his octavo was large. He showed how greatly Americans had degenerated since the foundation of the government; how frivolous, fickle, and boastful they were; how difficult it would be to subdue

the South; how probable it was the attempt would be abandoned in a few months, and how certain it was that the money borrowed for the purpose of making it would never be repaid.

The book's effect was prodigious. It furnished proofs for ideas of America to tens of thousands of good old Tories. They believed all its statements because they seemed to them to be probable. They thought Americans would behave as Spence said they were going to behave, because this was how they were likely to behave. All the newspapers had articles on the book. Citations from it were constant in everything written about America. In fact, during the greater part of 1861 any one who disputed Mr. Spence's authority was "dismissed with a smile." His influence did not begin to decline for a year. Somewhat the same state of things prevails now. It seems extremely likely, after the silver agitation of both parties since 1873, after even McKinley's state of mind during the last ten years, that we should all now, except a few bankers in New York, be furious silverites; and after the Venezuela uproar, and our attempts to go to war with various nations last winter, that we should, with our usual frivolousness, elect a rag-tag young fellow for the Presidency if he promised us all plenty of money and unlimited credit. The whole outlook, as foretold by the judicious Frewen, has fallen in with preconceived ideas.

The second thing which helps him is our press. It is true the bulk of the press, every paper which has much weight or influence, has fiercely opposed Bryanism and predicted Bryan's defeat. But ordinarily our press is boastful in the extreme about the American people and national affairs; it is delighted with the prospect of a war about anything; it is much occupied with crimes and scandals and personal gossip—things which a European thinks very childish and trivial. The consequence is that, at a crisis like this, when events have made it serious, its utterances, as expressions of national feeling, have not their due weight. Poor a reporter as Frewen may be, he seems more reliable than the *Daily Fuz-Buz* or the *Evening Ragpicker*. So Englishmen have gone on believing with the Frewens that Bryan would be elected and that Teller and Altgeld were busy telling the truth. The only thing which could remedy all this was the election. Spence has been dead many years, but he lived to see his book sold to the ragpickers by weight and himself become an object of ridicule. Mr. Frewen will now return to England a quieter, less positive, and possibly wiser man, and will dismiss those who ask him about American politics with a sad bimetallic smile. That smile has ordinarily much pity and contempt in it for the grovelling gold-bug world. Now that Bryan is defeated there will be much deprecation and appeal and resignation in it.

THE BILL TO AUTHORIZE ANARCHY.

We need make no apology for returning more at length to the subject of Senate Bill No. 2984, which is unaffected by the fortunate issue of the election just over. For how can law survive and justice be maintained if that bill passes the House and goes upon the statute-book at the next session? The public can hardly have realized what a weapon of misrule was forged by the Senate when it passed the measure on June 10 last; and the public verdict at the polls leaves untouched the task of preventing any further Congressional action in the spirit of the Chicago platform. The paternity of the bill ought alone to suffice to discredit it. Introduced, in December last, by Populist Peffer, again in another form by Populist Allen, reported from the Judiciary Committee by David B. Hill, and championed in the closing speech by Marion Butler, it was rushed through, without a roll-call, on the day before adjournment, by a quorum hastily got together, of whom one-half had not heard the debate, and the other half had made no pretence of listening. It cannot face the sober consideration of the American people, and its pernicious features need only to be pointed out to insure its condemnation.

The essence of its provisions is to substitute, in the federal courts, a jury for the judge in all cases of "indirect" contempt of court. That is, when an order has been issued by the court, and a certain person is brought before the court for not obeying the order, the question whether he has in fact disobeyed the order—in legal language, the fact of contempt—is not to be investigated and decided (as from time immemorial) by the judge, but by a jury summoned, sitting, and deciding in the usual way of litigation. It is the seeming innocence and plausibility of this proposed innovation that constitutes its vice; for underneath it lie the most far-reaching and disastrous consequences, and the layman is not likely at once to see what these are, and how nearly they touch the security of his person and his property.

What is this "indirect" contempt of court? It is, as every lawyer knows, simply the disobedience of an order of the court. Now, in the great multitude of cases, the order of the court is the ultimate support on which rests all possibility of the practical doing of justice. If, for instance, there is any practical way of evading obedience to such an order, the juryman who is summoned need never come; the man who is ordered to pay us money need never pay; the person who is ordered to transfer a house or a lot, found by a jury to belong to us, need never make the transfer; the designing oppressor who chooses to kidnap and shut another man in his strong room, need never unlock the doors; the public officer who is ordered to disgorge embezzled funds, or to refrain from a usurpation of power, may snap his fingers at the order, and the whole power of enforcing specific redress goes by the board. In short, wherever it is necessary, in order to realize a legal right, that an order of court be issued, the legal right, without the order of court to back it up, remains a mere matter of vain theory to its possessor.

Now, what is it that makes the order of court worth anything more than the paper it is written on? Simply the power of the judge to call into court the person who disobeys it, and send him to jail until he does obey. What, then, is the surest way to encourage and protect such disobedience? To let the disobeyer demand an ordinary jury trial for investigating the simple question whether he is disobeying. A jury trial means, in the first place, long delay—a delay during which the offender calmly goes on doing or refusing to do just what the order forbade or commanded, and consummating—perhaps irreparably—the very harm which the order was designed to prevent; and, in the second place, a jury trial means often—and just in those cases where it can least be afforded—a total evasion of the order in the end, either by corrupting the jury or by appealing to the popular passions which may happen to sway them. In short, an order of court, shorn of the judge's power of immediate enforcement against those who disobey, is absolutely worthless, and leads by the shortest cut to nothing less than the wreck of courts and of civil justice. It is an apparently trifling difference; but, under our system, practically all hinges on this matter of who shall enforce the judge's order. Those who propose to defy the courts know this well, and that is just why they want the change. In the bold and unscrupulous language of its champion, Marion Butler, it will "strip the courts of their power." That is what they firmly believe it will do, and that is what it undoubtedly will do. Such a monstrous proposition is unthinkable, except as a first step to anarchy.

How has it come to be advanced? Mainly because the defenders of the Chicago riots want to make it sure that there will never again be any legal obstacle for those who wish to burn and destroy property; and, incidentally, because it is the federal courts that have chiefly stood in the way of such attempts. But in the effort to secure immunity for a limited class of wrong-doers, while veiling it under the ordinary generality of legal language, they have made the terms of the bill so broad that any and every wrong-doer would, by this change, find shelter for disobedience to any and every judicial command. To wreak vengeance on a particular class—the employers of labor—they wantonly strip the courts of the power to do justice to any part of the community.

But suppose the bill were properly drawn to attain its chief and particular end; suppose it provided merely that no

federal judge should issue an injunction in any dispute between employers and employees, or in any dispute involving a strike; would the case be any better? We have had the wickedness of the injunction so dinned into our ears that we are apt to forget that it is not the injunction itself that is to be criticised, but the occasion of using it. There are occasions when honest and law-abiding persons may conceivably differ in opinion as to its propriety—as when Judge Jenkins orders certain railroad employees not to leave their work for the purpose of crippling commerce. It is at least an arguable question, both on principle and on precedent, whether a judge may order a man to go to work or to stay at work. But there are also occasions as to which honest and law-abiding persons ought not to differ—as when the federal court orders Debs and his men not to burn freight cars, or derail trains, or sandbag their fellow-workmen. Those are things which no decent citizen wants to do; and no one in his senses ought to wish to take away the power of a court to forbid him to do them. Even in the case where the propriety of the injunction is fairly arguable, there is no arbitrary order, no "tyranny," as the Populist fathers of this bill are fond of proclaiming. The person who is commanded or forbidden to act may appear in court and justify any claim he may have—whether to stay away from work, or to tear down a boundary fence, or to burn a freight-car. Debs could have had his day in court to oppose that injunction; he simply did not dare to come in, for there was nothing that he could say for himself. When Mr. Moseley, from the responsible office of Secretary of the Interstate Commerce Commission, has the effrontery (as he had in his address last June to the Railroad Commissioners) to condole with Debs for being punished "without a trial," he falsely invokes the sympathy of a good sentiment to help a bad cause. The notion, industriously propagated, that an injunction necessarily lacks the fundamental fairness of hearing both sides, is a false one; and it is never advanced except by those who have a bad cause, and dare not defend it in court.

It is the mere resistance to law and order, after all is said, that is at the bottom of all such proposals as that of Senate Bill No. 2984. These men oppose the injunction, not because it is improperly granted, not because it does not give a fair hearing, not because it interferes with an honest man's livelihood, but because it is law and because they have to obey it. They do not want to obey it; they do not want to obey anything or anybody; they want to do as they please. It is the obedience to lawful force which irritates them. But this is just the lesson which the American people must learn thoroughly, at whatever cost, that the law is to be obeyed as such, and simply because it is law. If an injunction is, in your opinion, improperly issued, appear and show cause against it, but obey it in the meantime nevertheless; for without obedience, law and order vanish utterly, and every man's hand may be raised against his neighbor. Obey first and dispute afterwards, should be the motto of the self-respecting citizen. Defy and resist first, and obey in the end only if you have to, is the motto which the innovators propose to sanction on the statute-book. Any bill which is going to make such disobedience easier attacks liberty and property in every household in the land, and is nothing less than a bill to authorize anarchy.

A FINE TYPE OF JOURNALIST.

THE recent death of Horace Rublee, for many years editor of the Milwaukee *Sentinel* and the chief journalist of Wisconsin, merits national attention for two reasons. One is that his career was so honorable, and so serviceable to the best interests alike of his State and of the country, that it ought to receive recognition. The other is that the conditions of what is now often and properly called "the newspaper business," have so radically changed during his lifetime that he is an admirable example of what has seemed to be a passing type of journalist.

Mr. Rublee's story was of the kind which has always been so familiar in this country, and which still remains as familiar, despite Bryan's lament that the gold standard does not allow boys to "enter life with an even chance." Like Horace Greeley, Horace Rublee was the son of a poor New England farmer, having been born at Berkshire, Vt., in 1829. The family removed to Wisconsin in 1840, and the boy worked at home until he was twenty, meanwhile teaching country schools several terms. He then entered the State University, which was little better than our modern academy, and got the best that it had to give, helping to support himself by working at the case as a printer. Naturally enough, he drifted into reporting the proceedings of the Legislature, and from this was promoted to editorial work on the Madison *Journal*, then a Whig and soon afterwards a Republican organ. In a few years he had become chief editor and part proprietor. In 1869 he began a period of eight years' service as Minister to Switzerland, but he remained faithful to his early profession upon his return. For fifteen years past he had been editor of the Milwaukee *Sentinel*, the leading Republican newspaper and the most influential journal in Wisconsin.

Mr. Rublee had been reared to accept Greeley's conception of the place which an editor ought to occupy, as laid down in the latter's doctrine, that a journalist was "a public teacher," that "he necessarily had convictions, and was not likely to suppress them because they were not shared by others"; "in short, that his calling was other and higher than that of a waiter at a restaurant, expected to furnish whatever was called for, so long as the pay was forthcoming." Such a man had repeated opportunities to impress his convictions upon a State which entered the Union with less than 300,000 inhabitants shortly before he became old enough to vote, and had a population fully six times as great when he died. Before the war, some special local causes contributed to make the extreme State-rights sentiment stronger in Wisconsin than in the West generally, and Mr. Rublee's first great service was in crushing out that dogma and holding his State to the cause of the Union during the civil war. He was one of those old-school journalists who combined the chairmanship of his party's State committee and the work of an editor without loss of dignity, because he made use of this partisan position to impress right ideas upon the direction of the organization rather than to dispose of patronage and build up a "machine."

Upon his return from Switzerland, Mr. Rublee was importuned to resume the old place as chairman which he had filled with success and honor for ten years before going abroad. He consented, but only upon one condition. The Granger agitation a few years before had demoralized the politics of Wisconsin, and the growing strength of Greenbackism had rendered the managing politicians of the Republican party so timid that, in 1877, they shrank from adopting a straightforward sound-money platform. Mr. Rublee announced that he must withdraw from management of the canvass unless the campaign could be made upon lines far in advance of this "wabbling" platform. He proposed that a meeting should be held in Milwaukee, at which the candidates on the ticket and other leading Republicans should go on record as absolutely repudiating fiatism and positively favoring resumption in 1879, as then provided by law, and that resolutions of like tenor should be adopted. The suggestion was adopted. The chairman followed it up with an address to the voters which left no doubt whatever as to the attitude of the party in opposition to the movement for debasement of the currency, and the campaign was conducted to a successful issue, with little regard to the compromise platform. Nearly twenty years have passed since then, and Wisconsin has always remained a sound-money State.

It is such a career as this which makes a man, in the best sense of the words, "a great journalist." But this is not the modern type of that class. Run over the "great journals" of the country, and how many of them are controlled by men who have convictions which they are not ready to suppress if unpopular; how many by men who have no other and higher conception of their calling than that of a waiter at a restaurant, ready to furnish "serio-comic supplements" or "carni-

vals of crime," if the pay is forthcoming and promises to be greater than decency and dignity would command? In his just published 'Impressions and Experiences,' Mr. Howells has an interesting chapter on "The Country Printer," as he knew him in his father's newspaper office in the Western Reserve of Ohio forty years ago. "The greatest event of our year," he says, "was the publication of the President's message," and he tells how much more interested the people then were in the great issues of Government than in the "deadly and selfish cult of business" which he finds now. He goes on to say:

"Very likely people were less bent on the pursuit of wealth in those days, because there was less chance to grow rich, but the fact remains that they *were* less bent in that direction, and that they gave their minds to other things more than they do now. I think those other things were larger things, and that our civic type was once nobler than it is. It was before the period of corruption, when it was not yet fully known that dollars can do the work of votes, when the votes as yet rather outnumbered the dollars, and more of us had the one than the other. The great statesman, not the great millionaire, was then the American ideal, and all about in the villages and on the farms the people were eager to know what the President had said to Congress. They are not eager to know now, and that seems rather a pity."

There is much truth in all this, and the causes of the transformation afford an interesting field for study.

THE TSAR IN PARIS.

PARIS, October 20, 1896.

THE visit of the Emperor of Russia to Paris has a studied significance which cannot be denied. It is symbolic of the great change which has taken place in the galaxy of the European Powers. It is the affirmation of the evidence of a *Duplice* in opposition to the *Triplice*. Viewed in that light, it is a guarantee of the continuation of peace, of such a peace as that to which we have accustomed ourselves for twenty-five years, ruinous to the nations and incentive of national hatreds which become all the more inextinguishable as they are felt to be unsatisfied and impotent.

Those who witnessed the Russian fêtes in Paris (and the number is legion, as, from the statistics of the railroads, we can ascertain that there was added during those festive days a million of visitors to the population of Paris), all agree in saying that there was felt in the presence of the Emperor of Russia more than an idle curiosity—a deep and real enthusiasm. It was felt even more on the plains of Champagne, at Châlons, where 70,000 men were reviewed by the young sovereign, who made the military salute to every French flag. Good judges tell me that they never saw their soldiers, notwithstanding their fatigue, march with more alacrity or more decision; one of them told me that his men seemed to be marching to the assault.

The Emperor created, wherever he went, a very favorable impression. Full of reserve, speaking very little, he admired sufficiently, and did not admire too much. He might have said what the Doge of Venice did to Louis XIV., who took him over his palace at Versailles. "What astonishes you most here?" asked the King. "It is to see myself here." Even a touch of sadness, which never forsakes the young Emperor, and the melancholy of his smile, contrived to add something to the emotion of the multitude. People remembered the fearful tragedy of the coronation at Moscow; they called to mind the sudden death in a railway carriage of Prince Lobanoff, whom the young sovereign had chosen for his companion and his political guide during his journey through Europe. He seemed as if he was attended by the saddest thoughts. Many people, before his departure, tried to prevent him from going in person to Paris, reminding him of the attempt of Berezewski in the Champs-Élysées, and of the recent exploits of the Anarchists in Paris. Nicholas II. was determined to walk in the footsteps marked out for him by his father and to make his tour of Europe complete.

It was perhaps all the more necessary to give a sort of personal sanction, by his presence in the capital of the French republic, to the alliance between France and Russia, because it was doubted in many places, and in Berlin denied, that there existed a binding accord between the two countries similar to the Triple Alliance. Events follow each other so rapidly, the impressions which they leave are of such a character, that we have almost to make an effort of the imagination to go back to the days of the Dreikaiserbund, when the political constellation Germany, Austria, Russia, threw its apparently permanent light on all the political horizon. When all the diplomatic documents, now shut up in the archives, come to light, we shall know how the secession of Russia gradually took place. For a long time, the form of government in France, the instability of its Cabinet and even of its Executive power, seemed an insurmountable obstacle to any serious association of France and Russia. But certain forces were at work to counterbalance those which at first separated autocratic Russia from republican and demagogic France. These forces may be said to belong to the class of elementary forces which are always at work in humanity. It had been the task of Bismarck to keep together Prussia and Russia, notwithstanding the innate antagonism—one might even say hatred—which separates the Slavs from the Germans. The time came, however, when Russia perceived that she had given much and received little or nothing in return.

We have not quite forgotten the series of articles which an eminent writer, Klaczko, wrote on the relations of Russia and Prussia after the war of 1870. He collected them afterwards under the title of 'The Two Chancellors.' Prince Gortchakoff, the Russian Chancellor, had been outwitted by the German Chancellor, Bismarck, whom he had long considered as his pupil in diplomacy. The services rendered to Prussia during such a long period had been vain, and Klaczko summarized the conduct of Russia in the phrase "Love's labor lost." Disappointed love is apt to end in bitter hatred; the estrangement between the Empire of the North and the new German Empire began as early as 1875. "Make yourself strong" was a word several times used by the Russian Emperor in his conversations with the Ambassador of France. France did make herself strong again; she reorganized her army and emerged by degrees from her isolation. She tried her increasing strength in many directions, and adopted an active colonial policy. Germany encouraged this new form of her activity, in the hope of seeing her more and more absorbed in her colonial efforts.

Meanwhile Russia's sentiments towards her powerful neighbor suffered a complete change. The great efforts and sacrifices which she made in the Turkish war ended in the Treaty of Berlin; the independence of Bulgaria was but a poor consolation for Russia, which had carried her army, after Plevna, to the very gates of Constantinople. Bulgaria was, however, for some time a sort of dependency of Russia; her army was officered by Russian officers, and Sofia was no better than a Russian town. This situation changed when Prince Ferdinand of Coburg was chosen Prince of Bulgaria. When he saw Bismarck at the time and seemed to ask for his advice, Bismarck said to him, "You may go to Sofia; it will always be a pleasant souvenir." The German Chancellor appeared to treat very lightly the enterprise of the young Prince of Coburg, and it was said at St. Petersburg that Austria was his only patron. I have heard it said that the Emperor of Russia some time afterwards received communication of a dispatch from Prince Bismarck, in which the candidature of Prince Ferdinand was treated very seriously; Prince Ferdinand was to be the obstacle to Russian aggression in the valley of the Danube, the instrument of the traditional policy represented so long by Austria. The anger of Russia became all the more intense inasmuch as Prussia had affected a complete indifference to the Eastern Question. I believe it may be affirmed that it was from that time that the alliance with France took a tangible form, and that Russia framed for herself a definite policy. She withdrew from the Dreikaiserbund and prepared herself for an understanding with the French Republic.

The time came when it seemed necessary to quit the diplomatic shadow, and to act in full light. In July, 1891, a French squadron was sent to Cronstadt; the Tsar came on board the French vessels, and was received to the sound of the Marseillaise, which he heard with uncovered head. The officers of the French squadron had a solemn reception at St. Petersburg, and were invited to visit the Exposition at Moscow. In 1892, on the 6th of June, the Grand Duke Constantine went to Nancy to make a visit to M. Carnot, President of the Republic. In October, 1893, Amiral Avelan and his staff stayed for several days in Paris, and their presence was greeted by the French population. The Tsar Alexander III. wrote a letter to M. Carnot, thanking him for the "warm and splendid reception" which his sailors had met with on French soil. He added that these proofs of sympathy "would add a new tie to those which unite the two countries." In 1895, on the 10th of June, in answer to an interpellation made by the Left, M. Ribot, the then Minister of Foreign Affairs, said: "We have knit the interests of France with those of a great power. . . . The security which we derive from this *alliance* is and will remain a guarantee for the peace of the world."

It has been remarked that during the recent visit of the Emperor there was a sort of gradation in his utterances at Cherbourg, at the Élysée, at the Camp of Châlons. In the short answer made to the compliments of the French President, the Emperor was merely polite; at the President's table at the Élysée, replying to a toast of the French President, the Emperor said: "Faithful to traditions which cannot be forgotten, I have come to France to salute in your person the chief of a nation to which we are united by such precious bonds." Then, after the great review at Châlons, where the Emperor had seen 70,000 men march before

him, he said: "France may be proud of its army. You are right in saying so, Mr. President, the two countries are bound by an unalterable friendship. There exists between our two armies a profound feeling of confraternity in arms." It is impossible not to be struck by the studied verbal gradation in these declarations.

It is very difficult to say what will be the consequences of manifestations which have apparently more of a sentimental than of a practical character. The Eastern question was in all probability discussed during the Russian Emperor's journey. It is impossible to suppose that the hearts of the young Emperor and his young wife, a granddaughter of Queen Victoria, should not have been moved by the horrors committed in Asia Minor and in Constantinople, on an unprecedented scale and with systematic ferocity. Thus far the action of diplomacy has been a mere mockery: the Sultan takes advantage of the jealousies and divisions of the great Powers. Time will show if at Vienna, at Breslau, at Balmoral, at Paris, some way has been found or even prepared for putting an end to atrocities which are a dishonor to our nineteenth century at its close.

There were not wanting some incidents in the Emperor's journey which must have spoken to his mind louder than the vulgar applause of the crowd. The Emperor added to the programme prepared for him a visit to the tomb of Napoleon. He was accompanied to the Invalides by a host of generals and aides-de-camp; but he left them all in the circular gallery which overhangs the place where the tomb stands in a crypt; he went down alone, stood for some time with his arms crossed on his breast, without a motion, gazing on the simple and solemn monument beneath which Napoleon sleeps his eternal sleep. What thoughts were his during these moments? "Sic transit gloria mundi." I have been told of another incident, which remains in my mind. When the Emperor and Empress were taken over the palace of Versailles by the very intelligent conservateur, who does all in his power to keep intact this admirable monument of French art and French greatness, they admired the splendor of the *grands appartemens* and the *petits appartemens;* they lingered a moment in the rooms which were inhabited by Marie Antoinette. In a narrow corridor the conservateur remarked to their Majesties, "It was by this corridor that Marie Antoinette escaped when the palace was attacked by the mob on the night of October 5." The Emperor and Empress looked gravely at each other without saying a word. Such incidents make one think of the "Et nunc erudimini" of Bossuet, or of the famous "Dieu seul est grand, mes frères," of the preacher who began with these words the funeral oration of Louis le Grand.

Correspondence.

ENGLISH AT COLLEGE.

To the Editor of The Nation:

Sir: In most of the large endowed academies and high schools a large percentage of each graduating class is made up of those who have been little more than one year in the school from which they have gone directly to college. These boys are able to offer themselves for admission to college with adequate attainments in mathematics, Latin, Greek, French, or German. But early habits have made their clumsy use of the English language almost incurable. The school hasn't the heart to tell them they ought not to enter college on account of their English, and it would seem as if the college had not the courage to do so. These boys, very many of them, have had very limited early opportunities for hearing or reading good English; somewhere about fifteen to seventeen years of age, they have been awakened to the importance of an education and have become ambitious for a liberal education. The first fifteen or more years of their lives have been as good as wasted, so far as culture is concerned, and it would be scarcely less difficult to work immediate and rapid improvement in their English than to teach them to carry themselves with the dignity and grace of the courtier.

Again, there are those who have been the victims of extraordinary and timorous parental supervision—who have not been allowed to go to school for fear of contamination from other children. Perhaps they have spent much time abroad, where, of course, they could not learn English. Perhaps they have been under French or German nurses in childhood, and governesses in later years, from whom they learned French or German, and geography, and mathematics, but from whom, of course, they did not learn English—they were not expected to learn it. The more able their parents were to maintain an expensive home and social life, the more have they been left to the society of servants whose English has not been considered one of the qualifications for their work; and at ten or twelve years of age they have been sent to school illiterate so far as the knowledge of their mother tongue is concerned.

Finally, the English heard and used by children when among themselves and away from the class-room will undo in one day the instruction of many days.

The work of the Harvard committee, therefore, should be to discover, as the schoolmasters claim, what the schools have been *trying* to do, and *how* they have been trying to do it, and *why* the results, in so many cases, have been so discouraging. I believe that a thorough search along these lines will show that the schoolmasters are right in insisting on an examination into their methods and the limited conditions under which they have been compelled to work, rather than the unintelligible and unwarranted exhibition of results that could not, under the circumstances, have been otherwise. The work of teaching children to use accurately, in their examinations, such English as the Harvard committee think they have a right to require and expect of candidates, is often as impossible of achievement as would be the effort to make a silk purse out of a pig's ear. Edward G. Coy.

Lakeville, Conn.

Notes.

A. C. Armstrong & Son will be the American publishers of 'Meissonier: His Life and his Art,' by Vallery C. O. Gréard of the French Academy, with profuse illustrations, full-page and in the text, the former being partly in photogravure and partly in color.

'Driving for Pleasure; or, the Harness Stable and its Appointments,' by Francis T. Underhill, with elaborate illustrations, and 'Master Ardick, Buccaneer,' by F. J. Costello, are in the press of D. Appleton & Co.

George H. Richmond & Co. issue immediately 'The Triumph of Death,' by Gabriele D'Annunzio, with an etched portrait of this Italian novelist.

Henri Rochefort's 'Adventures of My Life,' Englished by E. W. Smith, and filling two octavo volumes, will be published by Edward Arnold.

Houghton, Mifflin & Co. have nearly ready 'The Mycenæan Age,' by Dr. Chrestos Tsountas and Prof. Manatt of Brown University, with a preface by Dr. Dörpfeld; a Cambridge Edition of Lowell's Complete Poetical Works; and a holiday edition of Thoreau's 'Cape Cod,' with a hundred illustrations in color by Miss Amelia M. Watson.

Ginn & Co. are on the point of bringing out 'Napoléon: Extraits de Mémoires et d'Histoires,' edited by Prof. Alcée Fortier of the University of Louisiana.

Henry T. Coates & Co., Philadelphia, announce for immediate publication 'Fireside Stories, Old and New,' collected by Henry T. Coates.

Way & Williams will publish shortly 'The Real Issue,' Kansas stories by William Allen White.

William Doxey, San Francisco, has in forward preparation 'Tales of Languedoc,' folklore stories, by Samuel Jacques Brun of Leland Stanford Junior University, with an introduction by Harriet W. Preston and forty illustrations by Ernest Peixotto; and 'The Itinerant House, and Other Stories,' by Emma Frances Dawson.

Bernard C. Steiner of the Enoch Pratt Free Library, Baltimore, has ready for the press and invites subscription to 'A History of the Plantation of Menunkatuck and of the Original Town of Guilford [the present towns of Guilford and Madison, Conn.], 1636 1896.' The price to subscribers is $2 50, and assurance of a return for the outlay of manufacture is a requisite preliminary to publication. The papers of the late Ralph Dunning Smith have been supplemented by much research on Mr. Steiner's part in the town records and elsewhere.

Mr. Charles Welsh, who, it will be remembered, exploded the long accepted story about the sale and purchase of the MS of 'The Vicar of Wakefield' by his researches into the account-books of the celebrated publisher of St. Paul's Churchyard, to whose business he succeeded, has been for some months in New York associated with the *Art Amateur*. Mr. Welsh has made children's literature, both of the past and the present, his especial study, as his two opuscula on the subject presented by him to The Sette of Odd Volumes in London testify. He is at present engaged upon the revision and extension of his articles on "The History of Books for Children," which appeared in the *Newbery House Magazine*, with a view to their republication in volume form, and perhaps as an intimation that he may one day be again issuing books with his own imprint.

We resume our account of the reprints so numerously put forth this season with the concluding volumes (iii. and iv.) of Shelton's version of 'Don Quixote' (London: David Nutt). This work, we remind our readers, belongs in the admirable series of "Tudor Translations." It follows closely the original text—perhaps too closely in the eccentric punctuation, though this has its archaic effect, as has what Moxon would have called the capitalling. The volumes, we repeat, are in the first rank of book-making, and the binding is both rich and solid. The set makes a charming possession.

T. Y. Crowell & Co. add to the new editions noticed last week Cooper's "Leather-Stocking Tales," with an introduction by Prof. Brander Matthews, and twenty respectable illustrations by Frank T. Merrill. The external appearance of these five volumes is attractive and the typography clear. Presswork and paper fall off a little, with a view to a popular price. The same publishers reissue Mrs. Carey's abridged translation of Victor Duruy's 'History of France,' in two volumes, with a few extra pages by Prof. Jameson, bringing the narrative up to date; likewise Browning's 'Saul,' with unequal but sometimes exceptionally good illustrations by Frank O. Small; and Lucy Crane's translation of Grimm's 'Household Stories,' prettily illustrated by Walter Crane. Quite new are renderings, by Helen B. Dole, of Pierre Loti's 'Iceland Fisherman' and André Theuriet's 'Rustic Life in France.' Both these books, the latter especially, are more elegant than the foregoing, and Léon Lhermitte's designs usefully accompany Theuriet's agreeable text. The translation is noticeably idiomatic and cultivated.

Much taste and good workmanship has gone into the making of Messrs. Lippincott's new edition of Ouida's 'Under Two Flags,' in two volumes with ornamented blue-cloth binding and a handsome page on fine paper. The best of G. Montrard's designs are spirited in action or sympathetic with nature. This latest dress will commend itself to admirers of the story and of Ouida.

A high level is also reached in Charles Scribner's Sons' reproduction of Thomas Nelson Page's 'In Ole Virginia,' to illustrate which no fewer than six of our leading designers have been called in. A very unusual evenness results from this coöperation, which is made interesting by the fact of a Frenchman, A. Castaigne, having his full quota. The eye of a native can see at a glance the deflection from nature which this artist must needs betray. Messrs. Smedley, Clinedinst, Reinhart, Frost, and Pyle offer each something to admire, but among Mr. Clinedinst's five we incline to seek the pick of the two dozen full-page plates.

Lovers of music will welcome the appearance of a new edition of a book by Dr. Hubert H. Parry, of the first edition of which we said that, were we asked to name a single book that every student of music ought to read and reread for its facts and opinions, we should unhesitatingly select the 'Art of Music.' We also referred to the title of the book as "modest and somewhat indefinite." To remove this indefiniteness the author has changed the title to 'The Evolution of the Art of Music,' which much better indicates the scope of the book. The new edition forms a volume of the International Scientific Series (Appletons), and, while the type is smaller, the price has, by way of compensation, been reduced more than one-half.

The eighteenth and closing volume of the beautiful illustrated edition of the works of Mrs. Juliana Horatia Ewing, published by the S. P. C. K. (E. & J. B. Young & Co.), contains a memoir by her sister, Mrs. Eden, and a selection from her letters. Her great industry as a writer is shown by an interesting bibliographical list of her stories and magazine articles; the first of a series of 122 appearing in 1861, the last after her death in 1885.

'A History of Rome to the Death of Cæsar,' by W. W. How, M.A., and H. D. Leigh, M.A., Fellows and Lecturers of Oxford (Longmans, Green & Co.), is thick and heavy, though not very large. It cannot be read. The affected style is an attempted cross between the euphuism of 1596 and the journalism of 1896. To be sure, our authors tell us the book was not meant to be read, it was meant to be crammed. They veil the intent in the phrase "to meet the requirements of the upper forms at schools and of the pass examinations at the universities." On constitutional and antiquarian questions they have bowed to Mommsen's "paramount authority, and even from his somewhat sweeping judgment of parties and persons they have never dissented without hesitation."

A new and well-printed edition of Dante's 'Vita Nova,' by Friedrich Beck, has just been published by Piloty & Loehle in Munich. The text is the result of the collation of thirty-five manuscripts, the variants being printed in the foot-notes. There is an introductory criticism of all existing manuscripts, followed by a complete list of previous editions of the original text.

Two volumes of literary criticism, the contents of which have for the most part appeared in the Paris daily press, come from the house of Armand Colin: the second series of Adolphe Brisson's "Portraits Intimes" and the third series of Gaston Deschamps's "La Vie et les Livres." Of nearly equal bulk, they are of different grades of merit. Brisson is very sketchy, and attaches himself more to the personality of the writer than to the character and value of his work. Some of the more notable of the articles are those on Heredia, Brunetière, Mounet-Sully, Bodinier, and Coppée. Deschamps gives a better return for the time and attention bestowed on his book. He is more purposeful and serious; he both thinks himself and provokes thought. He writes agreeably, in a smooth and flowing style; his education, his reading, and his travels have combined to make him very pleasant, well-informed company. He gives a fair study of Heredia, a better of Verlaine; hits Bourget prettily, and gathers a comically erroneous idea of America from that author's 'Outre-mer.' He has a good chapter on Gaston Paris, and that on 'La Littérature et la Démocratie' is still more to be praised.

With the October issue, Mr. George W. Cable's little circular, the *Letter*, becomes the *Symposium*, adding one more to the host of magazines called into being and competition by the magic wand of "process." The illustrations and the spirit that breathes in this periodical are refined, and will secure entrance into many homes for the editor's well-known humanitarian propaganda. The publication office is at No. 41 Centre Street, Northampton, Mass.

The October number of the *Pennsylvania Magazine of American History* prints for the first time, from a manuscript in the possession of the Pennsylvania Historial Society, Penn's draft of "Fundamentall Constitutions" for the future State, intended to be subscribed by the first purchasers, but probably never submitted to them, though there is evidence some were shown it. It is in all respects a very interesting precursor of the Frame of Government. One provision and one official designation, viz., that of Commissioners of Education, has a very modern sound. These officers formed one of four committees into which the Governor was to divide the Council, and they were to "inspect the breeding of Youth, as to Schools, Masters, Books and the way and Method of Cultivateing and improveing of science truely so called." It is well known that education in Pennsylvania did not respond to this early and high concern for it.

The September number of *Petermann's Mitteilungen* contains a chart, with explanatory text by Prof. Sievers, of the distribution of vegetation in Venezuela. It is so ingeniously colored as to show the position and extent of the different tracts devoted to the cultivation of sugar, coffee, cocoa, and cereals, as well as of the forests and savannas. On a second map are traced the routes of the most noted travellers, from Humboldt to the present day, and it is surprising to see how little of the country has been explored. Dr. Sven Hedin describes, with the aid of a series of charts, the various changes noted since 1720 of the bed of Lake Lob-nor and its tributary streams, owing to the action of the wind and sand. There is further an account of the new boundary treaties between Chili and Bolivia and the Argentine Republic, and a strong appeal for an Antarctic expedition to be headed by Dr. Nansen.

The interest in Russia for geographical research seems to be on the increase. During the year 1895 the Geographical Society published a history of its work for the previous fifty years in three volumes, to which a new map of Russia in Asia (130 miles to the inch) is appended. There were also ten other publications — travels, memoirs, bibliography, an ethnographic periodical, etc. Eight other works, mostly on Asia, are being printed; and still a number of others, including two more volumes of 'Addenda to Ritter's Asia,' are in preparation.

In Russia one observes, too, a rapid development of practical instruction in agriculture in connection with the village schools. In the province of Ekaterinoslav, for instance, according to the biennial report, a résumé of which is given in *Nature*, "nearly one-half of the schools in the province (227 out of 504) are already in possession of small model kitchen-gardens, orchards, tree-plantations, or farms, at which gardening, sylviculture, and sericulture are regularly taught." These farms and gardens have an area of 283 acres, and contained last year 111,000 fruit trees and 238,300 planted forest trees, the province being mostly treeless. There are also a thousand beehives, kept partly by the teachers and partly by the children. In central Russia the culture of cereals principally is taught, while in Caucasia especial attention is given to instruction in the culture of the silkworm and the vine.

A rescript issued by the Prussian Minister of Instruction, and published in the September number of the *Zentralblatt für die gesammte Unterrichtsverwaltung in Preussen*, permits women to attend the lectures in all departments of Prussian universities, provided they have pursued the necessary preparatory studies and obtain the consent of the professors or tutors directly concerned. Heretofore, in accordance with the rescript of August 9, 1886, each special case of this kind had to be referred to the Minister of Instruction for his decision; but this inconvenient and practically almost prohibitory restriction is now abolished.

According to an order just issued by the Government of the Grand Duchy of Baden, physicians wishing to pass the so-called *Physikatsprüfung*, an examination enabling them to hold a medical position in the service of the State, must (1) have attended lectures on psychiatry and medical jurisprudence in a German university; (2) have had three months' clinical instruction and experience in

the treatment of the insane; (3) have pursued a course of study in bacteriology; (4) have practised medicine at least two years in the Grand Duchy of Baden. These conditions do not differ essentially from those already imposed by Prussia and Saxony, which are, however, more liberal in not confining the two years' obligatory practice of medicine to any one German State, but extending it to the whole empire; less advanced than Baden in not requiring either clinical experience as an alienist or special knowledge of bacteriology.

Additional folios of the Geological Atlas of the United States continue to be issued for various parts of the country by our National Geological Survey. A list of folios completed and in preparation may be had on addressing the Director of the Survey, Washington, D. C. The price, generally twenty-five cents a folio, is extremely moderate for work of so high a grade, including explanatory text, topographic, geologic, and economic map, and structural sections. The greatest number of sheets within a single district are in Tennessee and Alabama, where a considerable area is now covered. Other sheets are from widely separated localities. The lithographic work is executed with great skill, the register being practically perfect. The Three-Forks (Montana) folio may be mentioned as exhibiting a particularly harmonious combination of colors in a very intricate pattern, with an effect much more pleasing than that produced by hand-colored maps of the British Survey.

The waterspout on Vineyard Sound, August 19 last, observed by thousands of summer residents for many miles along the shore of Martha's Vineyard and Cape Cod, was well photographed by J. N. Chamberlain, Cottage City, Mass., who sells prints of various sizes at prices ranging from twenty-five to fifty cents. The larger view gives a most impressive picture of the cylindrical spout, majestically suspended from the clouds at the height of a mile, as estimated by Prof. Dwight of Vassar College, its whirling column reaching vertically down to the foaming waters of the Sound. This is by far the best photograph of a spout that has come to our notice. The heavy rain that fell on the island soon after the spout broke up, was found at several points to be salt; and this is naturally ascribed to the ascent of sea water in the spout.

The recent adverse decision of the Court of Appeal at Rouen in the now famous case of scientific plagiarism, Cremieux-Jamin vs. Lombroso, reinforces a good idea that comes from Prof. Michael Foster, secretary of the Royal Society. Prof. Foster suggests an international organization of scientific men for the purpose of registering at frequent intervals the results of contemporary investigation. Such a body would serve not only to protect the investigator from prosecution, but also to prevent him from going over ground already trodden. For the world of science at large, it could perform a valuable service by discriminating what has become common property from what is still in the possession of the original author.

The freshman class of the Johns Hopkins Medical School for the collegiate year 1896-97 shows better than any of the three earlier ones the non-local character of its students, as well as the promptness with which higher standards of admission to professional schools are responded to. The first freshman class under the requirement of a B.A. degree for admission numbered nineteen (three women), and represented ten States and eleven colleges. This year the forty-three freshmen (fourteen women) represent sixteen States and twenty-three colleges, of which seven are co-educational. Yale contributes the largest contingent of men (five) and Smith of women (four). Eight of the men and four of the women—(three of these B.A. Leland Stanford University)—have taken their bachelor's degrees at some co-educational institution. In addition to Smith, the other women's colleges sending graduates are Wellesley three, and Barnard, Radcliffe, and Vassar each one. Not the least interesting fact brought out by the list is the greater proportional increase of women in this year's class.

—Dr. Murray, in his new section of the Oxford English Dictionary (Macmillan), is still in the doldrums of the prefix dis-, casting anchor at *disobservant*. There is a light breeze at *dish* and *disk*, which are both derived, like desk and dais, from the Latin *discus*. "To dish," in the sense of 'to do for,' is first cited from 1798; "dishing the Whigs" was already proverbial in 1869. Phonetic reformers are confronted with the perverse preference shown for the spelling *disc* over *disk* in some branches of science, botany not included. They will hardly accept the plea that the distinction is convenient (for the eye), but the survival of the fittest will have its way. *Dismiss*, we are shown, has beaten out of sight not only its antecedent *dismit*, but "the etymologically more regular forms *dimit*, *dimiss*, and *demit*." In another camp, that of the purists in -our, some alarm should be spread on finding *discolor*, *discoloration* given precedence over *discolour*, *discolouration*, though *dishonour*, etc., still keep to the front. A dead uniformity, again, is forbidden, if only by the exigencies of poetry, in the accentuation of *discrepance*, *-ancy*, and *-ant*. The first form has obviously no rhyming utility (except comic) unless the antepenult be stressed, and this stress is marked dominant by Dr. Murray; *discrepancy* has greater utility for male than for female rhyming and tends in fact to be stressed on the antepenult (in this case the root); *discrepant* follows the one substantive for rhyme, the other for metre. Prose usage selects as it pleases. The United States has merely cherished, not invented, *disgruntle*, the citations ranging from 1682 in the mother country to 1884 in Dakota and the Lisbon *Star;* Mr. Bryce calls it "an expressive American term," but there is nothing piggish about us. "To disguise" with liquor remounts to 1562; the indispensable *disgust* and its derivatives are post-Shaksperian. To Horace Walpole in 1754 we owe *disjecta membra* in a loose borrowing from his Latin namesake. We reserve to the last Dr. Murray's trump card, the etymology of *dismal*, now first worked out: "Old French *dis mal*=Latin *dies mali*, evil days, unlucky days," also known as *dies Ægyptiaci*, "Egipcian daies." The proof of this is quite incontrovertible.

— Mr. Henry Bradley's section (Fish-Flexuose) chances to be somewhat richer in interesting vocables and etymologies, *e. g.*, *flask*, *flag*, *flake*, *fit*, *fix*, etc. American solely is the usage "to fit for college"; and "to fix up," "to fix it," and "fix a jury" originated on this side of the water, along with *fixings* and the more or less synonymous *fixtures*. *Flapjack* is ours only by survival, as it occurs in English literature in 1600 and still lingers in dialect. Something of our due is denied us when *flagpole* passes unrecorded; and might not one of our New England novels supply *flat*, abbreviated from *flat-iron?* "To flat out" is credited to us as indigenous metaphor, and so is "to fizzle," 'to fail.' The transitive verb "to flam," 'to deceive by a sham story or trick, or by flattery,' is set down as obsolete except in dialect or in the United States, the sole quotation for the latter being from 'Sam Slick.' Whether Judge Haliburton in this instance was truly reporting us or not, the word has now no meaning or currency, we believe, here any more than in written English. *Five twenty* (*viz.*, the Government bond so-called) is allowed a full rubric as a well-established Americanism. We must go back to England and the year 1772 for *flabbergast*. Marryat, in 'Peter Simple' (1833), appears to have invented *flapdoodle*, and to have furnished the definition—"the stuff they feed fools on," while *fishy*, in the sense of 'questionable,' shady,' etc., is traced to Disraeli's 'Coningsby' (1844); two instances of the part that fiction may play in extending the popular vocabulary. Many a poet might envy the making such an addition to our counters of speech as Dr. Samuel Clarke's "the eternal fitness of things" (1705). We conclude with a brief extract touching *flee* and *fly*. The confusion between these verbs, says Mr. Bradley, is met with in Old English:

"In modern English the association of the two verbs has the curious result that the ordinary prose equivalent of Latin *fugere* is *fly*, with past tense and past participle *fled* (the forms *flew*, *flown* have only the sense of Latin *volare*), while *flee* has become archaic, being confined to more or less rhetorical or poetic diction. Even *fly* and *fled*, indeed, now belong rather to literary than to colloquial English; expressions like 'run away' being substituted in familiar speech."

—The volumes of Mr. Traill's 'Social England' (New York: Putnams; London: Cassell) continue to make their appearance with commendable rapidity. The fifth is now before us, covering the period from the accession of George I. to the battle of Waterloo, and it is an evident improvement upon its predecessors. There is less incompetent work in it, and more than one of the really qualified writers who have contributed to previous volumes have now reached a period in which they are at home. Some names of weight disappear from the list of contributors, but in recompense there are acceptable additions to the staff. Mr. Sandys of Cambridge, for instance, furnishes us with an instructive little sketch, covering twenty pages, of the history of English scholarship between 1570 and 1742. We welcomed Mr. Saintsbury's arrival in the third volume to take charge of Elizabethan literature; it is, we must confess, with a sigh of relief that we find him giving place in 1784 to Mr. Traill himself. Mr. Saintsbury has much knowledge, some insight, and a good deal of individuality—blessed quality in a book written to order! Some of his happy phrases cling to the memory, like his characterization of Pope as a "performer on the couplet," and his description of the eighteenth century as one of "plain thinking and high living." But it is possible to get a little tired of his scintillations, his affectations, his slipshod ease; and Mr. Traill's more correct and dignified style consorts well with a juster and soberer judgment. When we come to the sections on religion we miss Mr. Hutton's amenity and charity. The writer who takes his place, and discourses on "The Established Church, 1715-1815," repeats with unguarded emphasis the conventional lamentations over Latitudinarianism. He fails to perceive either that the Deistic and Subscription controversies had a natural place in the history of Eng-

lish thought, or that England owes to the illogical compromises of eighteenth-century discussion its escape from the sharp antagonisms of Catholic and atheist, absolutist and revolutionist, which are the curses of Continental life. He might have learned this even from Mr. Leslie Stephen's unsympathetic pages; but we notice that both the 'History of English Thought' and Mark Pattison's well-known essay are conspicuous by their absence from the list of authorities for church history (p. 513).

—Mr. Traill has thought to avoid the charge of partiality by intrusting the history of "Nonconformity, 1689-1815," to Dr. John Brown, the author of the 'Life of John Bunyan'; bnt we fear he has saved his own reputation only at the expense of the book. Like his conformist colleague, but in different phraseology, Dr. Brown laments the "decline in spiritual life," "the wave of lifeless Arian teaching," and so on. That the movement of thought by which Presbyterian Calvinism changed itself into Unitarianism had close parallels in Scotland, in Geneva, and in New England, and is hardly explained with adequacy as "slumber and decay," has apparently never occurred to him. That the Evangelical movement had its reverse side is never hinted at; and the whole account from every point of view is meagre to an unfortunate degree. Twenty-two lines on George Whitefield are surely inadequate in a work on this scale: they are fewer than another writer is allowed to devote to the cut of men's coats between 1786 and 1800 (p. 495). In contrast to the skimped ecclesiastical sections are those concerning the military forces. Major Gretton takes sufficient elbow room, but we do not grudge it to him; for this is, so far as we know, the first popular general history which has attempted to tell us something of the internal life of the army, and it is told entertainingly. So also Dr. Hughes's sections on the history of art are leisurely and complete—among the best in the book. While cutting the pages, we have noticed, more or less at haphazard, two or three questionable statements which may be recorded here, in the interests of a second edition. What evidence is there of any indebtedness on the part of Adam Smith either to Massie or to Anderson (p. 335), except to the latter, perhaps, for a few historical details? Is not "senseless" an over-strong epithet to apply to the laws of parochial settlement (p. 337), seeing how naturally they were begotten by the principle of parochial responsibility? And, finally, can Burke be fairly said ever to have held "democratic views" (p. 488)?

—It is exactly twelve years ago (Thursday, November 6, 1884) that the *Nation* drew the attention of its readers to the appearance of the advance sheets of an important Oriental work, 'Avesta, the Sacred Books of the Parsis,' being the preliminary announcement of a new edition of the Zoroastrian scriptures, in preparation by Prof. Karl F. Geldner, then of Tübingen, Germany, now of the University of Berlin. Since that time the publication of the great work has been steadily pushed forward, and the completed edition now lies before us, a monument of the learned editor's sound scholarship, good judgment, and untiring toil. The royal octavo pages, with clear print on heavy paper, and with initial rubric letters, make up three stately volumes, a bible from which the Parsis in their temples may read with pride, or expound the remains of holy writ of their prophet Zoroaster, who lived at least six centuries before the Christian era. The division *Yasna* of the texts is a sort of prayer-book; the *Gathas* are the Psalms, or metrical sayings of the Prophet; the *Yashts* are heroic tales or hymns of praise; the *Vendidad* is an Iranian Pentateuch. The edition is published in two forms, one with German and one with English foot-notes and introduction. The Prolegomena is of itself an important contribution, for it sheds a flood of light upon many obscure problems as to the relation between the various manuscripts which we have of the 'Avesta,' and it also makes clear the general plan and method which Dr. Geldner has adopted in his editorial task. Those who have watched with interest the progress of this monumental edition will be glad to know that a knightly order was bestowed by the King of Würtemberg upon the editor in recognition of the importance of his contribution to the science of philology; and special favors were conferred upon the publisher, the house of Kohlhammer, in Stuttgart, for the service he had rendered to the cause of Oriental learning.

LOTHROP'S SEWARD.

William Henry Seward. By Thornton Kirkland Lothrop. [American Statesmen Series.] Boston: Houghton, Mifflin & Co. 1896.

THERE have been but few longer and more eventful careers in our history than that of William H. Seward. He took up his political pen in 1824 to denounce the "Albany Regency," and one might almost say that he held it in his hand until he left the Department of State in March, 1869. At different times during these forty-five years he was a leader in three distinct parties. At first he worked secretly with the Anti-Masons; then he wrote their campaign addresses, and drafted the resolutions which became the platform of the first national convention. Before 1850, of course, Clay and Webster were greater and more imposing Whigs than the New Yorker; but, from the beginning of the struggle growing out of the Mexican war, Seward stood at the head of the movement designed to fight the Slave Power with weapons political. His speeches outranked all others, and are to-day the most profitable for reading by the student of politics. He gave a happy name to that "irrepressible conflict" which the abolitionists announced when they directed their attack on the pro-slavery Constitution. From 1861 to 1869 he shaped the foreign policy of the country. He gradually came to have so little sympathy with his old allies that by 1866 he had ceased to be a Republican.

The new volume in the American Statesmen Series is more satisfactory as a general sketch of the history of which Seward was a part than as a study of the life of a great statesman and politician. The author's style is lucid, and he shows much ability in defining the old issues with brevity and force. Those who have read the sketch of Seward which Mr. George E. Baker prepared in vain for the campaign of 1860, and who are familiar with the three volumes of memoirs and letters which Mr. Frederick W. Seward published a few years ago, will be surprised to see how little has been added as to either facts or interpretation, and how much has been omitted. Seward's theory was that "the faults of great men drop out in history," and he and his three biographers have aimed to illustrate this theory. Baker's volume was written under Seward's eye, and the work by Mr. F. W. Seward is largely made up of his own recollections and of the letters which his father wrote to Mrs. Seward. Seward was a devoted husband, and his letters to his wife, whose health compelled her to remain in Auburn much of the time, have much value. They were designed to soothe an invalid whose political ideas were much more in harmony with those of Sumner and of John P. Hale than with those of Seward and Weed, yet parts of these letters are quoted as if they were as authoritative and significant as was the confidential correspondence between Seward and Weed.

Seward was so much greater than his faults or mistakes that it is a grave error, for one who pretends to be an independent biographer, to fail to make entirely independent researches and to draw conclusions accordingly. Mr. Lothrop has been so disturbed by the criticisms of Seward's acts at different times by such scholars as Von Holst, Rhodes, Nicolay and Hay, and others, that his chief concern is to defend rather than to describe his hero. The result is that he gives us very little insight into Seward's character and the sources of his political power; he deprives Seward's career of much of its scope and vivacity. The ambitious, calculating, adroit politician, with a strong flavor of philanthropic zeal, who wrote party addresses, influenced senatorial committees, guided party caucuses, and trimmed his sails to the varying winds, is not to be found in this narrative. But impartial historians and unbiassed contemporaries of Seward so paint him. How, again, he managed to obtain his leadership and to keep an enthusiastic following, we are not distinctly told. Mr. Lothrop lacks neither ability nor candor, but he has made so poor use, or none at all, of such sources of information as the Albany *Evening Journal*, the *Times* and the *Tribune* of New York, the public documents, the *Congressional Globe*, and the unpublished diplomatic dispatches, that he sees only one side of Seward.

The three questions which attracted most attention during Seward's Governorship were his ideas on internal improvements, his recommendations in regard to the school question, and his contest with the Governor of Virginia and the New York Legislature because he would not surrender persons alleged to have violated Virginia's slave code. The present biographer has given a good summary of the discussion about the last question, but the treatment of the other two points is entirely inadequate. If he had explained how Seward came to say in his annual message of 1840, "I do not hesitate, therefore, to recommend the establishment of schools in which they [children of foreigners] may be instructed by teachers speaking the same language with themselves and professing the same faith," and if he had told us how Seward undertook to deny what this language plainly meant, he would have prepared us for Seward's emasculation of his "irrepressible conflict" when the Presidency was in sight. If he had found time to outline Seward's theories and arguments in regard to internal improvements, and to show how Seward favored the payment of State indebtedness by having the surplus revenue of the United States distributed among the several States, and by obtaining from the national Government a large sum for the use of public highways, he would have been describing an ardent paternalist, and would have disclosed one of the springs of Seward's popularity at a time when notions of finance and taxation almost as strange as those of to-day were current.

Mr. Lothrop does not mean to misrepresent or conceal the facts. It is evident that his omissions, his general terms, his failure to notice striking situations and to see and describe the sequence of events, are due to his unfamiliarity with New York politics of the time. Everybody knows, in a vague way, that Seward owed as much to Weed's devotion as he did to his own efforts. We are informed that an accident in Rochester led to "Seward's first meeting with the man whose friendship and influence played so important a part in his whole political career" (page 9). What was the wonderful relation between the two men, and how did Weed manage campaigns and legislatures in Seward's interest? Surely these are not side issues. Weed's autobiography, Seward's letters, and the newspapers of the period supply the whole story, but the present biographer leaves it to our imagination. The range of Seward's abilities was best manifested by the influence he exerted upon President Taylor, and by the arguments with which he confronted Webster, Clay, and the whole South. How did it happen that Taylor accepted such a radical as Seward for his most intimate adviser and public defender in the Senate? Taylor owed the Presidency largely to the manipulations of Thurlow Weed; the community of interests between Seward and Weed brought Seward into Taylor's confidence several days before the inauguration, in 1849. Seward was, what Mr. Lothrop does not show, a shrewd politician as well as a statesman with high moral purposes.

The outlines of the struggle over the great compromise of 1850 are excellent. It is commonly regarded as fortunate that the issue between the sections was not brought to a head in 1850, but Mr. Lothrop maintains the contrary. If he is right, then Seward must be classed as the master statesman of that day. It seems altogether probable that, if Taylor had lived, the fact that he was a Southerner and determined to make a forcible opposition to secession, would have made it impossible to unite the South in favor of disunion.

The wildest of recent Jingoes were tame indeed in comparison with Seward when he discussed the duties of our Government towards Hungary and the Powers that united to prevent her from securing her independence. Mr. Lothrop clearly sees the meaning of Seward's plea, and frankly says: "It advocated a meddlesome foreign policy, inconsistent with the position, the interests, and the prosperity of the United States. . . . The sober sense of Congress saved us from the possible consequences of Seward's rash and Quixotic proposal" (p. 118). This is none too severe, and Mr. Lothrop deserves much credit for having discarded his bias and cut loose from his predecessors. Seward's speech of March 9, 1852, shows that he early had a passion for a dashing foreign policy. A description of his attitude as Senator on several other foreign questions would have furnished an interesting introduction to the great Secretary of State of later years. In foreign affairs, Seward gave his imagination full sway where it would not favor the Southern policy of conquest and expansion. The necessity he was under, as an anti-slavery man, to oppose this policy, led him to make two or three very wise and sober arguments, exactly contrary, in purpose and meaning, to those for Hungary and "Irish Patriots."

Eight pages are given to an attempt to discredit Montgomery Blair's story that Seward told him that he (Seward) had suggested to Senator Dixon of Kentucky the idea of amending Douglas's first Nebraska bill so as to make the repeal of the Missouri Compromise entirely clear. It is a matter of very slight importance whether Seward made this suggestion or not. Prior to 1854, there was no chance of Whig success except by maintaining an alliance between the Northern and Southern wings of the party. During the last three Presidential campaigns, the Whigs in each section allowed their allies in the other section to follow the policy which seemed most likely to attract voters. Their leaders consulted together then just as ours do to-day. The Southern Whigs had lost popularity because the Democrats had shown themselves to be more strongly pro-slavery. At the end of 1853, no one supposed that the Missouri Compromise had been repealed or was likely to be; but men talked of it because it interested Buncombe. If Seward had thought that it would strengthen the Southern Whigs to be more explicit than the Democrats about the repeal of the Missouri Compromise, it would have been perfectly natural and consistent with his methods to make the alleged suggestion. In fact, if he had wished to help the Southern Whigs and at the same time benefit the cause of anti-slavery, the political situation indicated that he could best do so by causing the reference to the repeal of the Missouri Compromise to be made more distinct. This would and did make its passage more difficult, because it set the issue clearly before Northerners; while Southerners were sure to favor as little or as much as they could obtain for slavery. The outcome was a great surprise. Some have inferred from what Blair says that Seward professed to be aiming to form a sectional party. Even the language of Blair, who was a bitter enemy of Seward, does not warrant this; and the reluctance with which Seward gave up the Whig party clearly shows that he had no desire to wreck it.

Seward's ulterior purposes were generally high, and better than those of many of his rivals. He adopted the means which he thought best suited to accomplish his ends. It would be hard to find anything more bitter than his denunciations of Buchanan and the Supreme Court for the alleged conspiracy in regard to the Dred Scott decision. Our author supports Seward in the assumption that Buchanan would not have dared to hint at the nature of the forthcoming decision, if he had not received authentic information of what that decision was to be. This assumption would be warrantable if the character of that decision had not been generally and correctly understood at least two or three days before Buchanan foretold what it would be. When, in 1858, Seward said of the Dred Scott decision (Seward's Works, iv., 595),

> "The people of the United States never can, and they never will, accept principles so unconstitutional and so abhorrent. Never, never. Let the court recede. Whether it recede or not, we shall reorganize the court, and thus reform its political sentiments and practices, and bring them into harmony with the constitution and the laws of nature,"

his language was regarded as revolutionary. In February, 1860, he made a speech in the Senate which was plainly designed to put himself in harmony with the more conservative element of the party, and hence make him an eligible Republican candidate for the Presidency. He carefully avoided his former phrases about the "higher law," the "dominant class," the "Slave Power," the "irrepressible conflict"; and in place of them euphemistically spoke of the "capital [slave] States" and the "labor [free] States." After he had failed to obtain the nomination in 1860, he swung back to his radical course, and was the most brilliant figure in the ensuing campaign. We infer that the biographer does not appreciate the meaning of these changes, for he has failed to call attention to them.

The rest of Seward's public life is an open book in comparison with the part which fell between December, 1860, and April 15, 1861. Scholars do not doubt that his purposes were patriotic, but what pains Mr. Lothrop is, that they maintain that the great New Yorker made many mistakes and miscalculations and was constantly grasping for power. Every student of biography ought to know that no mistake is more common than for a leader or a central figure in a conflict to believe that the success of the cause depends upon his own supremacy. Seward was so thoroughly of this opinion that on March 8, 1861, he wrote to his wife: "I did not dare to go home, or to England, and leave the country to chance." For want of observing this trait, Seward's biographer does not understand why it is that there was so bitter a contest over the question as to who should go into Lincoln's Cabinet and control the Administration. Seward's idea was not to rule or ruin, as some have inferred, but it was to insist on holding the helm so as to prevent others from ruining the Government. Mr. Lothrop thinks, on grounds not set forth, that Seward asked to withdraw his acceptance of a position in the Cabinet because he had heard of Lincoln's remark, that if the Cabinet slate broke again it would break at the top—that is, Seward would be left out. This explanation, it should be noticed, does not explain why Lincoln made the remark, and it overlooks the very bitter recriminations which the friends of Seward and of Chase, respectively, were exchanging, and for which Lincoln believed Seward to be largely responsible.

Mr. Lothrop's chapter on Justice Campbell and the Confederate Commissioners to Washington proves that he has read so small a part of the available material printed or in manuscript that he has no appreciation of Seward's unavailing struggle to outmanœuvre both the Confederate diplomatists and the Republican radicals. If he had followed Seward's acts from day to day, as different sources of information make it possible to do, he would have seen that what Seward said to Campbell was only a part of his determination to rule the Administration and avert war. Our author is quite at sea as to Seward's motive in writing the famous suggestions of April 1, 1861, about a foreign war and a dictatorship. Wishing to defend Seward, but not being in possession of the facts, he concludes that Seward made these suggestions before he knew the President had definitively determined on the expeditions either to Fort Sumter or to Fort Pickens (p. 278). Nicolay and Hay's 'Lincoln' (vol. iii., pp. 436 37) shows, on the contrary, that on March 31 Seward bore to Scott the President's positive orders to reinforce Fort Pickens. The whole sequence of events indicates that Seward's surprising propositions were a final and desperate effort to force the Administration to let him rule, and get up a foreign war as the only means of escaping a civil one.

Considering that the diplomatic history of Seward's eight years in the Department of State has never been carefully written, much skill and industry is displayed by Mr. Lothrop in making a smooth and pleasing summary of it. Were there no unpublished dispatches which throw important light upon such as have been printed, the narrative might be called excellent although brief. We feel

confident that there are many of these dispatches which our author has not read, because he is vague and inaccurate as to several points which they fully explain. One of the best chapters is that on the *Trent* affair. If Mr. Lothrop had known just what led Seward to take the position he did, and had frankly admitted that Seward juggled with international law so as to reach an important conclusion in the way which would cause the least popular anger, he would have greatly enhanced the value of his contribution to diplomatic history. We are especially glad that he has struck an effective blow at a sentimental story which Lossing tells about an interview with Lincoln shortly after the seizure of the *Trent*. All the known facts were against this story, and Mr. Lothrop has put them in such a shape as to make an end of it. In describing Seward's refusal to receive the British and the French ministers together on a certain occasion in June, 1861, we are told (p.300) that they came "to present a joint offer of mediation." Mediation, however, was not the purpose of England and France, who had merely made up their minds to ask both the United States and the Confederacy to agree to follow certain rules adopted by the Congress of Paris in 1856.

There was an excellent opportunity for the biographer to show his powers as attorney for the defence in answering the charges about Seward's treatment of political prisoners prior to February, 1862, when he had supreme control of them. The original records are well known to be in the Department of State, and it is generally supposed that they have not been printed, but this is a mistake. We can only guess why our author has entered a brief general plea instead of making a thorough defence or explanation.

There is only one way for a biographer to do full justice to Seward and to himself: to tell the story of his life and complex character as Parton has Voltaire's, as Lewes has Goethe's, as Schurz has Clay's—fully, frankly, and without concern for results. The narrow compass of a duodecimo volume is doubtless responsible for many of Mr. Lothrop's shortcomings. Notwithstanding these, the public will be grateful for his conscientious efforts to write a popular vindication of one of the ablest, most brilliant, fascinating, energetic, ambitious, and patriotic men in American history.

GODKIN'S PROBLEMS OF MODERN DEMOCRACY.

Problems of Modern Democracy: Political and Economic Essays. By Edwin Lawrence Godkin. New York: Scribners. 1896.

ALL but the first of these essays have appeared in leading magazines during the past ten years; the first, on "Aristocratic Opinions of Democracy," was printed in the *North American Review* for January, 1865. We are thus able to trace the continuity and evolution of Mr. Godkin's views on some of the most important questions of our time. We find, in truth, more continuity than evolution, if by the latter term be implied variation. Mr. Godkin has not changed his principles since 1865; whatever change may be apparent is due merely to their application to new phases in political and social development. Whether in 1896 or in 1865, he is the unswerving supporter of liberty, reason, and individualism, and the unsparing critic of whatever tends, either by excess or insufficiency, to impair any of these.

The eleven essays deal for the most part with the great political and economical questions of the past generation. The earliest paper, written just before the conclusion of our civil war, is a defence of democracy against those critics who, following the conspicuous lead of De Tocqueville, declared democracy to be a system under which arts, science, literature, and statesmanship inevitably tend towards mediocrity, and manners towards a vulgar restlessness. Mr. Godkin, while admitting the existence of many of these defects, shows that these defects do not inhere in democracy, but spring from the conditions under which our country was expanded and settled between 1790 and 1860. In similar fashion he confutes Sir Henry Maine's assertion that popular government has a very fragile foundation by exposing the inadequacy of Sir Henry's comparison. And, indeed, it does not require a powerful logician to explode so much of Sir Henry's argument as may be expressed thus: The governments of Central and South America are unstable, owing to constant revolutions; but these governments are democratic; therefore, democracy is an unstable form of government. In a third article, called out this very summer by Mr. Lecky's 'Democracy and Liberty,' Mr. Godkin comes again to the defence of democracy, not blinking its obvious failures, but laying bare the insufficiency or irrelevancy of Mr. Lecky's data and his incorrect deductions therefrom. In each of these three apologies, Mr. Godkin's conclusions seem to us to gain greatly in weight from the fact that his attitude is avowedly that of the devil's advocate rather than that of the unquestioning champion of democracy.

"I am not an enthusiast for popular government," he says, "or for any other form of government. I believe politics to be an extremely practical kind of business, and that the communities which succeed best in it are those which bring least enthusiasm to the conduct of their affairs" (page 72). Our democracy is suffering, he says in another place, "from unforeseen evils, as well as enjoying unforeseen blessings. It will probably be worse before it is better. It is trying a great many experiments in laws and manners, of which some, doubtless, will be hideous failures. The régime of 'crazes' through which it is now passing is very discouraging, but it is engaged, like most other civilized countries, in a search after remedies" (page 308). Again, addressing himself to critics like Mr. Lecky, he very pertinently remarks, "When a monarchist or conservative begins to complain to a democrat of the defects of his system, and of the gloominess of its prospects, in order to produce any effect he must point out from what period or from what system there has been a falling away. When and where were things any better, taken as a whole? And how much better were they?" (page 283).

As illustrations of Mr. Godkin's ability to apply to special cases the general principles which we have thus sketched, we should cite his paper on "Criminal Politics," in which he describes the rise, vicissitudes, and methods of Tammany Hall, and another in which he analyzes the "Political Situation in 1896." Persons who have hitherto been reluctant to admit that the protective system has fostered the rank growth of many of the evils which now confront us, will find in the latter some stubborn facts against them. And only those who wilfully turn away from Mr. McKinley's record—first, his long patronage of silver while he was a Congressman, and next his disingenuous and cowardly avoidance of stating his position last winter and spring, while he was a candidate for the Presidency—will be apt to disagree with the opinion that Mr. McKinley's nomination marked the culmination of a thirty-year-old tendency "to eliminate men of ability and independence of thought from public life" (page 270).

Turning from political to economic subjects, Mr. Godkin's most important essay is entitled "Who Will Pay the Bills of Socialism?" With characteristic bluntness he puts point-blank the question which neither professed Socialists nor their miscellaneous coddlers and abettors have ever answered. They always talk grandiosely about a vast reservoir of wealth, which would suffice to make every man, woman, and child comfortably well off, if not rich, if Mr. Bellamy or some other philanthropic gentleman were only permitted to wave his benevolent magic wand and bid it pour forth. Wicked or heartless men—millionaires and monopolists—are supposed to be engaged in preventing the Socialist benefactors from consummating a revolution by which, in the twinkling of an eye, the very mud and cobble-stones in our streets would be turned to gold, and society would live happily ever after, like all true citizens of fairyland. Mr. Godkin disposes of these Midas dreams by showing that no such hoard exists, and that the total wealth of the United States in 1890 would, if divided per caput, and put at 6 per cent. interest, yield a per-caput return of but $6 a week—a sum ludicrously inadequate for carrying on even the cheapest of the many proposed Utopias. Hardly less important is his reiterated warning that the large numbers of men of unlimited ability, integrity, disinterestedness, and zeal—whose existence is taken for granted by the prophets of Socialism—do not now exist and never have existed. Without them, and without that imaginary hoard of wealth (*Benjamin* Kidd's Treasure, let us call it), the Socialist ship of state would hardly go faster than would the *Great Eastern* without officers, crew, and fuel.

We must speak more briefly of the rest of Mr. Godkin's book. Such papers as "Idleness and Immorality" and "The Expenditure of Rich Men" mirror the manners of our leisure class, and suggest how much mere wealth needs civilizing. Every other form of government has held out incentives by which a part at least of its leisure class have been drawn to busy themselves in worthy pursuits: will Democracy (or Plutocracy) fail to do this? Mr. Godkin considers elsewhere "The Duty of Educated Men in a Democracy," and finds that this duty can be most easily discharged by them through unremitted, intelligent, and impartial criticism. Let them not suppose, however, that the post of public critic can be held by any one: it calls for tenacity, indifference to social and partisan obloquy, disinterestedness, and clear-thinking, rare even among educated men, rarer still in happy combination. Of the two remaining essays we need only say that that on "The Economic Man" contains pungent reflections on the recent "historical schools" of economists, while that on "Some Political Aspects of the Tariff" presents a diagnosis of the effect which protection had had up to 1887 on the development of "labor" and "capital" in this country.

"If the protectionist policy is persisted in," Mr. Godkin concludes, "the process of assimilating American society to that of Europe must go on. The accumulation of capital in

the hands of comparatively few individuals and corporations must continue and increase. Larger and larger masses of the population must every day be reduced to the condition of day-laborers, on fixed wages, contracting more and more the habit of looking on their vote simply as a mode of raising or lowering their wages, and, what is worse than all, learning to consider themselves a class apart, with rights and interests opposed to or different from those of the rest of the community" (page 121).

Our sole comment on this passage is that every year of the nine since it was written has but emphasized its truth.

We have said enough to give some hint of the substance of this volume. As regards the writer's style, unlike most men who since Mill have devoted themselves to the discussion in print of economics and politics, Mr. Godkin does not affect a dread of being "popular"—that is, of writing so that intelligent readers who are not specialists can understand him; he is, on the contrary, as "popular" as Mill himself, and he has even dared to imbed in his language the political slang of the time, by which he makes it all the more evident that for him politics and economics are not abstractions, but realities, manifesting themselves concretely every day. The great problems of democracy he approaches on their political or on their economic side, whereas the current fashion is to approach them from the ethical or sociological standpoint. Whoever prefers the latter will naturally cry out against the limitations of the former method. It is by no means certain that ethical considerations may not have great influence in solving every one of our present difficulties, or that some sort of socialistic state may not sooner or later be set up; but the merits of Mr. Godkin's work are not affected by these possibilities, for he has spoken so strenuously in behalf of liberty, reason, and individualism that even the enemies of those ideals must reckon with him.

SAYCE'S EGYPT OF THE HEBREWS.

The Egypt of the Hebrews and Herodotus. By the Rev. A. H. Sayce. Macmillan Co.

Mr. SAYCE'S book is in two pieces without visible connection. We shall confine our remarks to the first part, because there is little in the other that the author has not said before, and his unfair estimate of Herodotus has been criticised often enough by competent scholars.

Mr. Sayce begins with Abram's visit to Egypt, placing it after the Hyksos conquest, which must then have been anterior to B. C. 2350. Notice is taken of several objections to the Biblical narrative of Abram's visit and to the story of Joseph: that there were no camels in Egypt in Abram's time; that the name of Potiphar was not in use in Joseph's age; that Potiphar was a eunuch and yet married; that this story suspiciously recalls that of the "two brothers," by Enna the scribe, which some regard as the original. In discussing these, the author states the objections strongly and the argument on the other side in a very half-hearted way; which is remarkable in one who has been recently taken to task by Prof. Bevan (*Contemp. Rev.*, Dec., 1895) as an uncompromising defender of the Mosaic writings. As a result of his studies, Mr. Sayce believes (p. 49) that the Bible chronology "fits in" perfectly with that of the Egyptian monuments. The reader who knows Canon Cook's excursus on Genesis in the Speaker's Commentary may remember that Canon Cook also finds the two chronologies to tally, although Mr. Sayce's date for the Exodus is 1270 B. C., while his is 1647.

The next chapter professes to deal with Moses and the Exodus, but is mainly devoted to the tablets discovered at Tel el-Amarna. These show that Egypt, under Amenophis IV. (Khu-n-Aten), had adopted a monotheistic religion which prepared it to welcome the Hebrews in Joseph's time, while the counter-revolution which restored the ancient faith naturally led to the oppression and the Exodus. This is the best part of the book, as Mr. Sayce is perfectly at home in the field of the cuneiform inscriptions. The uninitiated will be surprised to hear that in the age of Khu-n-Aten the clumsy and difficult cuneiform was the medium of correspondence on a vast scale throughout the region between the Nile and the Euphrates.

The third chapter discusses the Exodus. The reader will agree with Prof. Petrie, that the Pharaoh of the Exodus will never be discovered by chronological computation, but only, if ever, by what further excavations may reveal. We next pass to the relations of Egypt with the Hebrews in Canaan, and then to the Israelite monarchies and their precarious position between Assyria and Egypt. We are now on historical ground, the dates are tolerably certain, and Mr. Sayce is quite at home in all that relates to Assyria. The reader will find here some interesting bits of history, and may be good-natured enough not to observe that they are wholly irrelevant. Such is the fact that under Necho (B. C. 610–594) Egyptian mariners sailing from Suez circumnavigated Africa in three years.

The age of the Ptolemies is the subject of the fifth chapter. Here the connection with the Israelites is of the very slightest—just what is involved in Egypt's occasional interference between the Jews and the rulers of Syria. We are struck here, as before, by the author's candor. He does not disguise the horrible crimes of the Maccabees, nor blink the gross formalism into which the chosen people had fallen, so that, for example, their city was regularly taken whenever their assailants knew enough to attack it on a Sabbath day. This part of the book ends with the fall of Jerusalem in B. C. 63, and with some little reference to the Christian antiquities of Egypt, in which Mr. Sayce is now greatly interested, and especially to the discovery, at Ekhmim, of the "Apocalypse of St. Peter" and the Gospel known to the early Church as that of St. Peter, in which Pilate is exonerated of all blame for the crucifixion.

We have praised Mr. Sayce for his candor, and we should prefer to make no offset to our praise; but fairness compels us to say that he occasionally relapses into professional disingenuousness. When he admits the pious frauds of the early Christian chronologists, when he owns that the Abram of Genesis xii. and the Abram of Genesis xiv. may be different persons, we admire his candor and courage. On pages 37, 38, his criticism of the story of Joseph's famine has no meaning unless the story is judged as a mere romance in which it behooves the narrator to avoid all improbability. He admits that the story betrays a later date by implying the improbable circumstance of a simultaneous famine in Palestine. And yet, with all this, he repeatedly shuts his eyes to truths which only the veriest bigot should ignore. How can so candid a writer consistently argue from a promise in Genesis and its fulfilment in Exodus xii. 40? If "forty years" in the Old Testament means, as he asserts, an indefinite number (page 91), what shall we think of the symbolic forty days in the wilderness and all the argumentative use which is made of it in the New Testament? And when Mr. Sayce, in answer to the objection that Pharaoh, as appears from Egyptian sources, was not drowned in the Red Sea, repeats the old answer that the Exodus does not say he was, does he honestly forget the usual interpretation of Psalm cxxxvi. 15, which he himself seems to accept on page 100?

Mr. Sayce's book addresses itself to "tourists and students." For the tourist it is far too learned, while the student is not likely to be pleased with a work so full of unsupported assertions. For example, we are told at the very start that the Sphinx was a mystery as early as B. C. 2350. Perhaps so; but where is the fact recorded? On page 21 we are told that naturalists have shown that the camel was not introduced into the northern coast of Africa until after the beginning of the Christian era. This point is so important that we should greatly like to be informed who these naturalists were. On page 82 we hear of a remarkable treaty between Ramses II. and the Hittite Khitasir, one item of which protects political exiles from extradition. Who would not wish to know where and in what form the treaty is preserved, and the very words of a proviso so very modern in character! On p. 106 we are told that the true form of Shishak's name is that preserved in the Old Testament. It is so paradoxical that the Egyptians should not have known the true name of the founder of their 22d dynasty that we feel entitled to demand the evidence of a fact so astonishing. For some of these statements the author may have in reserve proofs familiar to the learned; but a book intended for tourists and students is not to be defended on the principle of *φωνᾶντα συνετοῖσιν*.

The reader will feel this lack of foundations the more as he discovers how inadequate is the author's idea of historical evidence, and how loosely he argues from it. Thus, on page 144, Mr. Sayce regards it as proved that a certain tax-gatherer did not know Greek, merely because his son wrote the tax receipts that have come down to us; as if he could have had no other reason for employing his son as a clerk. On page 68 the author of the 'Travels of a Mohar' is said to have been "clearly very proud of his geographical knowledge." Why? merely because in a book of travels he has mentioned the names of many places. On page 22, while defending the Scripture account of Abram's visit to Egypt against the objection that in Abram's day there were no camels in that country, he alleges that dromedaries' bones were dug up from the Nile mud between 1851 and 1854. He fails to show that they did not get there a thousand years after Abram's visit; but he seems quite unconscious that his argument is worthless without this link. Again, on page 110, because the prisoners represented at Karnak have, as he thinks, the faces of Amorites, he is sure that the Amorites were still strong in Palestine. The artist, we suppose, took as his models such of the captives as chanced to be at hand; it is for Mr. Sayce to show that he especially selected those who represented the majority, and this he fails to do. He does not even see that his argument proves too much, namely, that there were no Jews at all in Palestine.

Such is the looseness of Mr. Sayce's work that we are sometimes in doubt whether we are dealing with an inadequate statement or a blunder. Thus, on p. 107, we read that Shishak led his forces against Jerusalem and plundered it, and that a record of the cam-

paign was engraved on a temple at Karnak. Any reader might think that here was a valuable confirmation of Scripture, but on the very next page we have a list of the places taken, and we see with surprise that Jerusalem is not mentioned; so that, after all, the author was relying on the first book of Kings, and not on the evidence of the monuments. On p. 83 Mr. Sayce speaks of the successor of Ramses II. as the fourteenth son of that monarch and calls him Meneptah, whereas Prof. Petrie (*Contemporary Review*, May, 1896) calls him "Mery-en-Ptah (usually Merenptah)," and tells us that he was the thirteenth son. Another loose statement is found on p. 102, where we are told in what seems a general way that the Red Sea of the Authorized Version is the Gulph of Akabah. Of course, as a glance at any map will show, this is not meant to apply to the Red Sea which the Israelites crossed.

That a good deal of this looseness and inaccuracy is due to haste and lack of revision might be inferred from certain peculiarities of style and diction which we do not commonly look for in the works of learned Oxonians. Thus, on p. 45, we are told that certain excavations "have brought to light remains of the Hyksos Pharaohs, including one [one remain?] of Apopi." On p. 113 Mr. Sayce jumbles two statements, that there were no more petty princes in Egypt, and that Egypt and Ethiopia were under the same king, into this: "Egypt as well as Ethiopia obeyed a single head." On p. 123 we read that Psammetichos "had the satisfaction of seeing Egypt under a monarch who claimed to be of native race," by which the author means Psammetichos himself, whose "satisfaction" rested, we venture to say, on considerations altogether more practical if less noble. On p. 161 we are told of "a woman stained with every possible and impossible crime." In spite of all which, we are willing to believe that the spelling of the singular of *savans* as *savan*, without a "t," may be laid on the broad shoulders of the uncomplaining "typo."

The book has an index, which, though scanty, is not too inadequate to be of some use.

History of Oratory and Orators: A Study of the Influence of Oratory upon Politics and Literature, with special reference to certain orators selected as representative of their several epochs, from the earliest dawn of Grecian civilization down to the present day. By Henry Hardwicke. G. P. Putnam's Sons. 1896.

The History of Oratory from the Age of Pericles to the Present Time. By Lorenzo Sears. Chicago: S. C. Griggs & Co. 1896.

The title of Mr. Hardwicke's volume is misleading. It is divided into six chapters—on oratory in Greece, in Rome, in modern times, in England, in France, and in America. Dealing with these various periods and countries, it necessarily embodies much of the material for a history of oratory, but it is rather a collection of biographical sketches, quotations, and anecdotes, accompanied by a quantum of criticism, than an historical treatise. It is made up, of course, out of other books, and the process of manufacture is a little too visible. Considered as a book of anecdotes, it is entertaining, and brings together in a small compass many of the "good things" of a department of literature which is full of them, otherwise only to be hunted up by laborious research through a maze of biographies and histories.

Underlying the author's critical remarks seem to be two assumptions, one of which is no doubt true, the other, we believe, mistaken. The first is that oratory is connected with freedom. This is a commonplace: the instinct of despotism is to strangle free speech. The other assumption is that oratory and debate are very much the same. This is not true. A funeral sermon or panegyric comes under the head of oratory, but has nothing to do with debate. Oratory covers the whole field of speech addressed to any number of people large enough to be called an audience, while debate is only one branch of it. Hence rhetorical rules applicable in debate will by no means cover all oratory. When Fox said, "Did the speech read well? If so, it was a bad one," he must have had in mind extempore speech addressed to a parliamentary body for the purpose of influencing it immediately to action, and not composed at leisure to be read. Such a speech, for its full effect, must be heard by those to whom it is addressed. But it by no means follows that every speech which reads well is a bad speech. Indeed, modern public life has produced a kind of speech having nothing to do with debate, which is apt to read almost as well as it sounds when heard—we mean the orations now delivered so frequently to large public meetings on events of the day, or "issues" in a campaign, which are generally addressed to sympathetic audiences, and are now often prepared very much with a view to their effect when read in the columns of a newspaper the next morning.

Prof. Sears's manner of dealing with the subject is more elaborate than that of Mr. Hardwicke, and covers more ground, but is rather an outline sketch than a history, and even as a sketch it can hardly be called satisfactory. The author's style bears marks of an indifference to accuracy in the use of language which, in treating of an art of which language is the substance, is surprising. "Secretary of the Treasury" is a curiously modern term to apply to the office held by the orator Lycurgus, and to call Aristotle "the Rhetorician" is to apply to him a term which does not describe a writer on Rhetoric at all. There are several references to "demonstrative" oratory, but no clear description of what the author means by the term.

The book suggests, without answering, the question, how far an historical treatment of the art of oratory is possible. There are two great difficulties in the way which do not apply to other arts—first, that a large part of every oratorical style disappears and is lost with the death of the orator; second, that the materials of the art have been, during the historical period, pretty much the same in every age. In architecture, music, poetry, and painting this is not so, at any rate not to the same extent. The Taj Mahal is the same building to-day in all essential respects as when it was erected; the music of Wagner and that of Palestrina can be compared; Homer remains the same whether we believe the 'Iliad' and 'Odyssey' to be the products of one brain or of twenty-five generations; our capacity for judging of Raphael's painting is not impaired by the fact that he has been dead for centuries. But in oratory three-quarters of the art perishes with the man. His voice, manner, and action die with him, or are imperfectly preserved here and there by some auditor happily gifted with a rare power of description. What remains can be repeated, declaimed, and read, but never again spoken as it was delivered by the orator himself. The result is that in a book like Prof. Sears's we feel that we are passing in review the remains of an art rather than the art itself. We have the substance of oratory so far as it can be preserved, but three-quarters of it is now pure literature, and not oratory at all. Any history of it must deal with it as preserved; there can be no history of the evanescent part. There may be continuity, no doubt, where there is no record, and the manner of an orator of to-day may be connected by some hidden process of evolution with that of Demosthenes; but we cannot trace the connection any more than we can that between the acting of Irving and that of the fashionable tragedians at the time of Euripides. Prof. Sears mentions Hortensius, as in duty bound, but we know no more about the art of Hortensius than we do about that of Peter the Hermit, certainly one of the most effective speakers who ever lived.

The fact that the materials of the art have been, during the historical period, pretty much the same in all ages, may be an explanation of its successful study having been thus far mainly analytical, rather than historical. Aristotle, Quintilian, and Cicero analyze the principles which underlie the art of persuasion, and the means of persuasion have not changed since the time of Demosthenes. Human passions and human motives and the human intellect are the same to-day as they were two thousand years ago, and hence the most striking fact about oratory is that we recognize in the great orations of antiquity all the marks of a perfected art.

Prof. Sears points out that oratory has its periods of decadence and revival, and thinks that there are signs of a revival with us at the present time. This raises an historical question which is undoubtedly of great interest—how far the condition of oratory is dependent on the condition of public life. Leaving out of view forensic and pulpit oratory, the nursery of the art is debate, and we should hardly expect to find deliberative oratory flourishing in a period of legislative decay. For the last fifty years our legislatures have steadily declined; the men sent to them have been lower and lower in character, and, what is more, legislative questions have tended to settlement, not by debate, but by private arrangement by those in control of political machines. Legislative debate and oratory have died out *pari passu* with the rise of the boss system. It would be a waste of time to debate what is not to be decided by deliberation. If we are to have a new period of oratory in public life, it must be through a higher class of men going to the legislatures and to Congress: a revival of debate among legislators unfit to debate would only make oratory ridiculous.

Pope Leo XIII. By Justin McCarthy. With a frontispiece. Frederick Warne & Co.

Mr. McCarthy's brief sketch and study of the reigning Pope makes a volume of 260 pages in a useful series entitled "The Ruling Men of To-day." In its paucity of dates and facts, and in the general manner of treatment, the book bears many marks of hasty and imperfect preparation. It is much the same kind of book as our campaign biographies, which have occasionally been written by men of literary ability. If Leo XIII. should read the book, it would certainly please him on the whole, not only relatively as compared with Zola's 'Rome,' but absolutely; yet he would make a great mistake if he imagined that the coming generations will take this for genuine

history and characterization much, if any, more than Zola's novel. It is essentially a eulogy, and is saved from being literally a panegyric only by the consistency of Mr. McCarthy's political principles as an Irish home-ruler and his sympathy with the protagonists of Italian unity. A good many of his readers will probably wonder how he could subdue his convictions to the material he was working in to such a considerable degree, and some of these will fancy that they know now better than ever why he has been comparatively ineffectual in politics, seeing that a literary interest in a great cause is one thing and a moral enthusiasm for it is quite another.

An introductory chapter deals with Pius IX. A single sentence disposes of the hopes which he encouraged in 1848 and their melancholy disappointment. The dogma of infallibility, to which Pius was devoted heart and soul, is minimized as much as possible, but nothing is said to make clear how a Pope who is not infallible in the usual operations of his mind becomes so when speaking *ex cathedra*. Except for the passionate interest of Pius in the matter, we should probably never have had an infallible Pope; nor, again, if he had not long outreigned the average Pope (only eleven of all the Popes having reigned more than seventeen years).

The early life of Leo is passed over rapidly, and no explanation is given of the secret of his succession to the papal throne. In describing his personal appearance, Mr. McCarthy avails himself of varied help, most lavishly of Marion Crawford's, but he also gives his own impressions. "His face is as bloodless as that of a marble statue." No one, he tells us, has impressed him more by his appearance, not even Newman or Charles Sumner or (considerate climax!) "the late Prince Consort." But hardly does the frontispiece likeness bear out this praise, and especially is the note of saintliness on which Mr. McCarthy insists entirely wanting. It is to be hoped that the likeness is a bad one, for it is intensely disagreeable, being compact of all that is shrewdest, craftiest, foxiest in the typical ecclesiastical physiognomy.

Inheriting the *Kulturkampf* from his predecessor, Leo was involved in it from the beginning of his reign, and Mr. McCarthy discusses his attitude towards it and his dealings with it more fully than anything else; and naturally, for it was the brightest jewel in his crown to contend in a battle of diplomacy with Bismarck and win the victory. It may be granted that the *Kulturkampf* was Bismarck's great mistake, but that he was so inordinately and gratuitously silly in the business as he is here represented is too hard for belief. "Perhaps it may be owned," we read, "that for the public opinion of his generation, and of many generations afterwards, Pascal created the Jesuit." But Bismarck certainly never went to Pascal for his ideas of the contemporary Jesuit in Germany. Mr. McCarthy's account of the long and desperate struggle is interesting without being final or sufficient. Not alone the eulogists of Bismarck, but the sedate historians, will qualify to some extent this representation of Leo XIII. as the glorious defender of religious liberty.

Chapter VI., "The Empire of the Pope," adds little or nothing to the value of Mr. McCarthy's sketch. It is highly rhetorical, and it is calculated to excite rather than to allay those apprehensions of undue papal influence in political affairs which are not the exclusive property of the ignorant and the demagogues. We read: "Except as a matter of news in the daily papers, the people of the United States do not care three straws about what England and France and Germany and Russia are doing. [This is pure nonsense.] But the Papacy is an influence everywhere, and it has to look after everything." Mr. McCarthy's sympathy with republican France makes it much easier for him to defend the course of Leo in deserting the Catholic monarchists of France and sustaining the republic. He was, we are told, "always inclined to make the best of things"; a judgment to which his dealing with Italian politics seems to involve an exception of first-rate importance.

Coming to the chapter on Ireland, we are much interested in learning how Mr. McCarthy will manage a very difficult business, for "the Land League was condemned morally and socially by the Vatican," and the Land League "was in reality a strike of the tenantry against an intolerable system." To his credit be it written that he stands fast by the Land League and condemns the Pope, but he is saved from the extremest awkwardness of his dilemma by the happy circumstance that the Pope's condemnation was not delivered *ex cathedra*, and was therefore not infallible. "The sincerest affection inspired, beyond question, the condemnation, such as it was, of the Land League. But the intervention was a mistake all the same, for it was founded on imperfect knowledge and a misappreciation of the whole conditions of the political and social struggle in Ireland."

Mr. McCarthy is hardly less frank in dealing with the Pope's attitude towards the Italian Government, yet he has no word to show how much more was implicated in the taking of Rome for the Italian capital than any merely sentimental regard for the Eternal City. So political is the temper of Leo XIII. that he might have proved an excellent temporal sovereign, but in that case he would have been a striking exception to the rule—the misrule—of Papal government before his day. It is with regard to Leo's assertion of his temporal sovereignty that Mr. McCarthy's book is from first to last a neglected opportunity. The future historian will probably find in this assertion the key of his position. Evidently Leo has been as passionately devoted to his temporal sovereignty as Pius was to his infallibility. His attractions here, his repulsions there, find in it their most adequate explanation. Meantime to Italy he has shown a less friendly disposition than has any other Power. His attitude has been a source of constant irritation, alienating some from the Government, many from the Church. Mr. McCarthy has written many just things in his praise, but, when his account is finally made up, it may appear that all the good he has done, and it is much, is little in comparison with the good he might have done if he had made the best of the Italian situation by declaring, "My kingdom is not political, but spiritual."

Through the Subarctic Forest: A record of a Canoe Journey from Fort Wrangel to the Pelly Lakes and down the Yukon River to the Behring Sea. By Warburton Pike. Edward Arnold. 1896. 8vo, pp. x, 295, 17 plates and 2 maps.

THE map of the whole region traversed by Mr. Pike is on too small a scale to be quite satisfactory, and the lettering leaves us at a loss as to the real relations of the Stikine, Dease, and Liard Rivers; but if we resolve our doubts by consulting even such maps as that of British Columbia published at Victoria by the Commissioners of Lands and Works in 1895, we have no further trouble in tracing the rubricated line of our author's journey. His other map, on a scale of about 15 miles to the inch, is very clear in the region of the Pelly Lakes and eastward, where Mr. Pike's original observations enable him to make some important geographical rectifications. The main discovery thus indicated, and fully treated in the text, is that the river draining the Pelly Lakes, and marked as the Pelly on previous maps, is not the main stream, but an inconsiderable tributary of a much longer river coming from the northeast.

Mr. Pike is already known, like Caspar Whitney, as a wanderer in the Barren Grounds and a slayer of musk-oxen. Some men seem goaded on to such dangerous exploits by a spirit of unrest. They love adventure for its own sake, and almost always make readable books about their exploits; and most of us prefer to have adventures brought to us in this form, instead of going in search of them for ourselves. Mr. Pike is no exception to the average of excellence in such purveying, and has made another notable contribution to the literature of travel, though he modestly characterizes it as "a rough description of what happened in a long journey through a good game country." Some of it was over the absolutely new ground, upon which the author dwells most, in the Pelly and Liard regions, where the discoveries just mentioned were made; with this exception the route is identical, in British Columbia and the Yukon District of the N. W. T. as far down the river as Fort Selkirk, with that explored in 1887 by Dr. George M. Dawson, now Director of the Geological and Natural History Survey of Canada, whose important report was published in 1888. This is accompanied by three large route-maps, in colors, by which Pike's journey can be traced mile by mile with the greatest ease, and is a veritable mine of scientific information regarding the region of which the present volume gives us a straightforward readable account, from a traveller's point of view.

In July, 1892, Mr. Pike started from Victoria to Wrangel, where his canoe route began. He went up the Stikine, and by its tributary the Tanzilla carried over to the Dease; down this to the Liard; up the Frances, and so on by another carry to the Pelly, which he descended, and continued down the Yukon nearly to the mouth of the latter. Before reaching the sea, however, he portaged over to the Kuskokvim and went down this to salt water, finishing with a perilous piece of coasting in his canoe till he found a ship to take him to Ounalaska. He was gone more than a year; his wintering in the wilderness involved great hardship, and his must indeed have been the "lucky boat" he says she was, to have done this immense voyaging without serious accident in the cañons and rapids he repeatedly encountered and was obliged to manage for himself. He must have been a pretty good voyageur to start with, and a first rate one at the finish. He writes mainly as the sportsman abroad, and has much to the point regarding large game, especially moose, which was found to be abundant, and seems to be rather increasing than diminishing in numbers. But what he has to say of the genus homo, both red and white, native and imported, is even more to our mind, and strikes us as very discerning. We have marked a passage as a sample of easy writing which does *not* make hard reading:

"At night we were comfortable enough, as we kept a big fire going. It was at first the

coldest man's business to put on wood, but this led to trouble, and I finally had to establish a regular watch. One of the common tricks of a winter camp is the habit men have of pretending to be sleeping, warm and snug, in the hopes of freezing some other poor devil out of his blankets to make up the fire. You can get up shaking with cold, and throw on big sticks from the wood pile, chop kindling and make as much noise as you like, yet not a soul will be sufficiently awake to lend you a hand. But as soon as the fire burns up brightly and the kettle begins to boil, the least rattle of a spoon against a tin cup will rouse the whole camp as readily as a gunshot."

The book is not quite free from infelicities, as witness Couer d'Alene for Cœur d'Alène, on p. 3; and, p.153, *Scopolax Wilsonii*, intended for *Scolopax wilsoni*, though *Gallinago delicata* is the right technical name of the bird. We also hold that Bering is better spelling than Behring for the name of the sea as well as of the person concerned. The volume is handsomely printed on smooth paper in large clear type, and has a number of good full-page illustrations, besides the two folding-maps, both done in colors.

Adeline, Countess Schimmelmann. Edited by W. Smith Foggitt. Dodd, Mead & Co.

THE ordinarily sensible person generally feels angry when he has perused a column of his newspaper, only to encounter, at the end, the flagrantly improbable announcement of a quack doctor's universal specific, winding up with "Adv." One does not have to read to the bitter end of Countess Adeline Schimmelmann's lucubrations, however, before his mental and moral stomach, so to speak, is thoroughly upset. A fairly strong taste of the quality is afforded by Mr. Foggitt's preface. In the Countess's first chapter, entitled "Childhood, and at Court," she collects all the trivial incidents of her childhood, and converts them into self-advertisements of the crudest description. When she clung to a chair, in her infantile efforts to walk, she mentions: "Thus early did I begin to evince a strong character." Of her education she says: "Nature did much more for me than all my masters," adding that she habitually did her sums "seated at the top of an old fir-tree in the park"—which may serve to explain her present toplofty ideas of herself and of her "mission," as well as her literary style. It must have been about this time that she arrogated to herself the credit for the "conversion" of a murderer. Though she never saw the man or held any communication with him, he confessed his guilt before execution, and professed religion. "My heart was filled with joy when I heard the news," she says, "and I knew that it was in answer to my prayers." Strange to say, she did not venture to mention the fact for fourteen years. It is pretty nearly the only thing she has forgotten to mention—with the trifling exception of the reason why she left the court of Berlin; why she could afford, as she alleges that she did, to contribute £900 to a society which was formed to further her "work" and collect funds for her; why, after she had, nominally, given "all she possessed" to her "work," she still had jewels, court dresses, which her brother stole, and an estate which he damaged to the extent of 21,000 crowns, in addition to the wherewithal to build and run a yacht.

The "work" which she so industriously parades is preaching to the fishermen of the Baltic, and her humility is so great that, when her brother had her incarcerated for five weeks in an insane asylum, asserting that she had been mad for nine years (or more) as the result of the morphine habit, her chief concern is, that the universe is going to swift and certain perdition because she is not at large and engaged in saving its individual and collective soul. Her descriptions of her sovereign influence over the Berlin Anarchists, before whom even the entire police force shook with fear, are equally modest. She incorporates in her book an article by Pastor Otto Funcke, called "A Home Abroad," wherein the good pastor waxes enthusiastic on the rather slender foundation of two exceedingly brief conversations with her, at an interval of several years, and a visit of a few hours to her house on the island of Rügen. The latter dates from 1890, and one wonders whether Pastor Funcke would reauthorize the account under current date after reading the portion of the book which she contributes.

She makes a loud appeal for money, but decidedly overshoots the mark when she ventures on an explicit statement of her programme for her "mission" "(1) to the fishermen of the Baltic, (2) to sailors of all nations in European ports, and (3) to the distressed and troubled elements of society everywhere." This is both too vague and too definite to act upon the sympathies of rational beings, who believe that in no department of human experience is there more need of the rare jewel, common sense, than in that of religion or pseudo-religion. The clever vagueness which leaves the limits of contributions needed for ever undefinable, suggests a sieve like capacity for absorption, and an equally sieve-like expenditure on agreeable yachting trips whose tangible results cannot be given, if any contributor is so unwise as to demand an accounting. On the other hand, the programme is too definite, because, to any thinking mind, it is altogether too ambitious, and quite beyond the powers of any one person; and there is not a hint that the Countess intends to divide the contributions with anybody else, or that she is unequal to her task. On the contrary, she says: "The success of woman's work on the Continent depends largely on the success of the mission which God has intrusted to me." She coolly ignores the existing missions for sailors in every port.

Our conclusions are based wholly on the evidence which she herself furnishes, and in absolute ignorance of her personality, or even of her name outside of the present book. Precisely what is her object in thus attempting to "get even with" her brother and others in Denmark by publishing her book in America, it is difficult to see—unless, perchance, she intends to run across the ocean in her yacht and hold out her contribution sieve to our public with her own fair hands (she assures us that she is handsome, though the portraits do not entirely bear out the assumption), as soon as the leaven of this volume has had due time to work.

Daddy Jake, the Runaway, and Short Stories Told after Dark. By "Uncle Remus" (Joel Chandler Harris). New ed. The Century Co. 1896.

The Story of Aaron (so-named), the Son of Ben Ali. Told by his Friends and Acquaintances. By Joel Chandler Harris. Illustrated by Oliver Herford. Boston: Houghton, Mifflin & Co. 1896.

A PURE coincidence, surely, brings out together a new edition of 'Daddy Jake' and a first edition (may there be many) of 'The Story of Aaron.' They are both snatches of that "Life among the Lowly" which Mrs. Stowe was not the first to depict under the veil of romance, and Mr. Harris will not be the last. In other words, they take their place on the shelf beside 'Archy Moore' and 'Uncle Tom's Cabin,' but with the capital moral and historic distinction that they are the product of a Southern pen.

The art of 'Daddy Jake' was admirable, but the mechanism was all terrestrial and human. It opened directly and in the most matter-of-fact way with "an uproar on the Gaston plantation, in Putnam County, in the State of Georgia," "one fine day in September, in the year 1863." This plantation "lay along the Oconee River" "not far from Roach's Ferry." Uncle Jake, the carriage-driver, strikes and thinks he has killed the overseer, who presumes to give him orders and to assault him, and, fearful of the consequences, takes to the woods. Dr. Gaston's young children, Lucien and Lillian, go in quest of him in a bateau let drift down the Oconee. In 'The Story of Aaron' we are still "on a large plantation in middle Georgia," but Lucien and Lillian are transformed into our classic friends Buster John and Sweetest Susan, with their back-door relations with "Mr. Thimblefinger's queer country," while Daddy Jake gives place to Aaron, the offspring of an Arab slave-hunter who was properly punished by being confounded with the Africans he was marketing, and an Arab girl who shared the same fate and was transported with him to this country. Aaron shows his pedigree in his carriage and in his spirit, was early regarded and treated as a "dangerous nigger," and later passed for a conjurer among his fellow slaves In fact, Brer Rabbit had directed Buster John and Sweetest Susan to him to learn the language of animals, and, this acquired, the story of Aaron is most cleverly pieced out in turn by the subject of it himself, by the gray pony, the track dog, the white pig, the black stallion, and by Free Polly.

We do not mean to spoil the pleasure of younger or older readers by revealing the plot. Aaron, too, becomes a runaway, and seeks refuge in the swamp, the lair of the white pig. The aspects of slavery which Mr. Harris incidentally displays are the slave coffle, the slave auction, the oppression of small proprietors by large slave-owners, and lynch law in operation upon an abolitionist, along with the passion of the Southern temperament and its instinctive resort to the shot gun whether for good or for evil purposes. In the end, the rescue of the abolitionist, before the war, redounds to the security of the Abercrombie plantation when Sherman passes that way on his march to the sea, and the great General figures in the narrative like any other personage, but in the unwonted light (in Southern eyes) of a benefactor. The story is neither as dramatic nor as pathetic as "Daddy Jake," but the skill of it is consummate, and its fidelity to the life not inferior, while its supernatural element will perhaps render it more attractive to that imaginative age which can make a happy family of "Ole Brer Tarrypin," Tecumseh Sherman, and "Miss Meadows and de gals."

Die Maya-Sprachen der Pokom-Gruppe. Zweiter Teil. Die Sprache der K'e'kchí Indianer. Nebst einem Anhang: Die Uspanteca. Von Dr. Med. Otto Stoll, Zurich. Leipzig: K. F. Köhler. 1896. 8vo, pp. viii, 221.

AMONG the Central American regions Yuca-

tan and Guatemala were the first to attract preeminently the attention of the Spanish conquerors on account of their dense population and great fertility. The inhabitants were found to belong to one race or family, and when the whites began to learn their languages, these proved to belong to one common stock; the Maya and the K'iché being the most widespread among them all. At an early period grammars, dictionaries, and devotional books were composed in them, but the real number of the Maya dialects was not known until recently, when exploring linguists fixed it at sixteen. The Huaxtec, representing the most archaic forms, is spoken in the Mexican States of Vera Cruz and Hidalgo, the Tsendal in Chiapas; but the majority of the smaller dialects are heard in Guatemala.

Maya proper has been the object of a more extensive literary culture than all the other dialects taken together, and this had certainly its cause in the large literary productiveness of the people along the coast long before the Spanish armies put an end to paganism. The Maya dialects are remarkable for the brevity and conciseness of their diction, the tendency to monosyllabism, and the suave, well-sounding pronunciation. The verbal paradigms are short, the tenses and moods well defined; the multiplicity of the personal pronouns forms a curious contrast to the pregnant and laconic brevity of all other grammatic forms, while the lexicon is as rich in vocables as that of any other American tongue. No modern scientist has shed more light upon the structure of the Maya dialects than Edward Seler, whose writings on Nahuatl ethnography and language are also as yet unsurpassed. The epigraphic relics of the Maya nations or tribes are likely to take us back, when correctly understood, to a period of American history further remote than that of any other aboriginal people.

But to advance our knowledge the study of the dialects must go hand in hand with that of the stone inscriptions and the codices, and in furtherance of this purpose Prof. Dr. Otto Stoll of Zurich, who explored Guatemala from 1878 to 1883, has published grammars and vocabularies of Íxil, Pokonchí, and Pokomam. To these he has added in the present year a bulky volume on the K'e'kchí dialect (grammar, dictionary, phraseology), spoken on the highland in the central parts of the republic. This book forms volume second of his series on the Pokom group, which consists of the following dialects: Pokonchí, Pokomám, K'e'kchí, and Uspantec. At present this dialect is spoken by about 85,000 Indians. Its most striking characteristic is an excessive abrasion or grinding down (*Verschleifung*) of grammar forms, and this gives it the appearance of being recently formed as compared with the more archaic languages of the Kiché group. Indeed, many K'e'kchí forms can be morphologically explained only by comparing them with the older and more explicit forms of Cakchiquel and Kiché, especially as regards the verbs derived by suffixion.

The grammar occupies 122 pages of the book, and is the result of a thorough comparative study of all the dialects accessible to the author, spoken in Guatemala or in the States adjoining. The syntactic examples are spread over five pages only, the dictionary extends from p. 128 to p 191, the remainder of the volume being taken up by the Uspantec dialect, which at present is limited to one solitary town. In former writings Stoll had placed it with the K'iché group, but, after a clearer insight into its peculiarities, he now classifies it with the Pokom dialects. These peculiarities refer to the verbal inflection; but if we base our judgment upon the lexicon only, Uspantec would stand just as near to the K'iché as to the Pokom dialects, for in the course of centuries Uspantec became separated from its original congeners further west, and borrowed many terms from the K'iché Indians who had meantime become immediate neighbors.

The Great Rift Valley; Being the Narrative of a Journey to Mount Kenya and Lake Baringo. By J. W. Gregory. With maps and illustrations. London: J. Murray; New York: Charles Scribner's Sons. 1896. 8vo, pp. xxi, 422.

THE expedition of which this attractive volume is the description was remarkable for several reasons. Purely scientific in its objects, its leader a British Museum official without previous African experience, unprecedentedly small and imperfectly equipped, it accomplished more in the same length of time than any other recorded African expedition. The territory of the most hostile savages of East Africa was traversed without bloodshed, and the severest hardships from cold, hunger, thirst, and rapid marching were endured with the loss of but a single porter. Though upon the leader, being without a white companion, fell all the burden of the care of the caravan, he made numerous valuable scientific observations, as well as, to quote Sir William Flower, "a very important collection of rocks, fossils, and zoölogical and botanical specimens." This probably unequalled record was due to Dr. Gregory's courage and endurance, but especially to his tactful and sympathetic treatment of his men, who in consequence served him faithfully.

He left the coast in March, 1893, and followed the line of the projected Uganda railway as far as the Rift Valley, where he turned northward to Lake Baringo. On his return march he made a détour to examine the glaciers of Mount Kenya, and reached Mombasa in August, having travelled 1,650 miles in a little less than five months. Notwithstanding the fact that he was nearly all the time on ground familiar to the student of African exploration, with the exception of the few days spent in unsuccessful attempts to reach the summit of Kenya, his personal narrative is unusually fresh and interesting. There are numerous bright and often humorous sketches of life in camp and on the march, and graphic descriptions of noteworthy scenes and incidents. The most important contribution to our knowledge of the region traversed is to be found in the observations upon the Rift Valley. The character of this extraordinary fissure in the earth's surface, which begins at the Lebanons and ends at Lake Nyassa, can best be realized by Dr. Gregory's description of it near the equator. He was marching over a plain covered with thin scrub when, "suddenly, without the slightest warning, I found myself on the edge of a precipice 1,900 feet in height. For some hundreds of feet the cliff was absolutely vertical." At the base of the precipice was a long, narrow lake of an exquisite blue color, "broken by the green of dense growths of alga, or by pink where vast flocks of flamingoes floated on the surface." A series of terraces, like a vast amphitheatre, rising to the summit of a mountain, formed its opposite shore, while twenty miles distant rose the precipitous western valley wall.

The geological history of the earth movement which formed this valley, so far as examination revealed it, is told in the second half of the volume. Here are also general chapters on the physical geography, fauna and flora, and native races, frequently enlivened by illustrative anecdotes of adventure. At the time of Dr. Gregory's expedition the big game was almost destroyed by the cattle disease, but in some places lions and elephants were "still so numerous as to be a serious plague to the inhabitants." Several remarkable instances of protective mimicry are described, one of which, a group of insects so arranged as to resemble a spike of flowers, is beautifully represented in the frontispiece. There is also an admirable characterization of the Zanzibari porter, much berated by most travellers, but for whose endurance and faithfulness Dr. Gregory has no scant praise. He tells, for instance, of one of his men who was willing to die in the snow of Kenya rather than to leave his load "without my master's order." At another time, after they had been without water for forty hours, his headman refused to take his share of a scanty supply, and gave it to the porter who seemed most overcome by thirst. "Later on, I asked him how he had denied himself. He said: 'It was nothing! I've seen Bula Matari (Stanley) do the same thing lots of times, and if he could do it, Inshallah! so can I.'" The closing chapter treats of the future prospects of this part of the British Empire, which our author regards as apparently without great mineral or agricultural wealth, and as unsuited to white colonization, yet certain, under patient and wise rulers, to become the abode of a peaceful and industrious native population. A list of plants collected is supplied in an appendix, and there are several useful indexes, some interesting illustrations, and two excellent maps.

BOOKS OF THE WEEK.

Barnes, Mary S. Studies in Historical Method. Boston: D. C. Heath & Co. 90c.
Biddle, A. J. D. The Madeira Islands. Philadelphia: Drexel-Biddle & Bradley.
Cannan, Edwin. Lectures by Adam Smith on Justice, Police, Revenue, and Arms. Oxford: Clarendon Press; New York: Macmillan.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 12, 1896.

The Week.

For the first time in twelve years Mr. Cleveland's name has cut no figure in the election returns, yet it may be doubted if he ever won a more substantial triumph than in the campaign just ended. His foresight, his courage, his methods have been splendidly vindicated. No man got himself earlier right on the conquering issues of November 3, no one sooner saw that the currency question was one of life or death to the Democratic party, one that could be settled satisfactorily only in a non-partisan spirit and as a matter of national honor. In his letter to the Chicago sound-money conference of April, 1895, he clearly predicted the mad rush into repudiation which the silver agitation was certain to lead to, and declared even then that "the line of battle is drawn between the forces of safe currency and those of silver monometallism." Before and after that date he was called upon to use every power in his office, in the face of a recreant party, a hostile Congress, and the yelping *Tribunes* and Lodges of the time, to maintain the national credit; and he has now lived to see his resolute and almost solitary stand referred to with cheers in the meetings of his political opponents, and endorsed by an overwhelming vote of the people.

In a very lavishness of good fortune, the distinction was also given President Cleveland of having made and triumphed on the other great issue of the campaign —the supremacy of the law. No one supposes that he foresaw in 1894 the way in which the red, fool fury of those days would raise its head in this Presidential year, but he met it then and stamped upon it as if he had foreseen it. His action at that time in taking anarchy by the throat won half the battle in Illinois this year, and his name was daily used by Republican orators in that State to arouse enthusiasm against the civic enemy whom he had faced and disarmed in 1894, and whom the whole nation had to confront in 1896. Such things constitute the truly great achievements and rewards of political life. Party support may come or go; conventions may cheer or hiss; popular enthusiasm may wax or wane. But to have taken a position in advance on the two great issues of a critical campaign, and then to have seen the greatest of democracies swing round to it as by the force of gravitation, while the wrath of political adversaries was turned into praise—this is the thing that makes all politicians look so petty. Nor does it require a towering genius to accomplish such results. As we see, all that is needed is honest thought and the courage of it, and an unshaken constancy. These seem very ordinary qualities, but we wish we could discover a Republican leader in whom they give promise of doing as much, either for individual fame or for the country's good, as they have wrought in the case of Mr. Cleveland.

Mr. Hanna announces that he will accept no office from the McKinley Administration, and up to the time of going to press he is the only eminent Republican who has taken this remarkable position. In many parts of the country there are discernible signs of cabinet and other booms in a state of rapid development, and able editors are already making up lists of those who are "mentioned" for most of the best places, including the leading foreign missions. It is thought that there will be no lack of material with which to fill all places, in spite of the discouraging example set by Mr. Hanna. Candidates for Secretary of State are already numerous, and Bill Chandler has made a bid for the Treasury portfolio by announcing his exclusive discovery that the election is merely preliminary to a verdict of the people in favor of bimetallism. He admits that there was nothing of the kind in the election, since bimetallism did not have any hearing in the canvass. No educational campaign, no matter what its severity, could be expected to affect Chandler's intelligence.

In conversation with a reporter, Mr. Hanna is made to say that "the farmers and laborers in the Western cities" were won over "by explaining to them that we stood on the St. Louis platform, which advocates bimetallism under an international agreement, and that we were not gold monometallists." Now the St. Louis platform was drawn before the Bryan platform, and it is a safe assumption that if it had been drawn after the Bryan platform, this passage would either have been omitted or materially altered. Nothing has done more to bring us to our present pass than the persistent maintenance of the belief that there is going to be an international conference at which European nations will agree with us to establish and maintain a double standard. There is not the slightest reason to expect any such thing. Fancy such an agreement with Spain, Italy, Turkey, Greece, Russia, and Austria! Even if it were entered into, it would be useless unless it included every country in the world with which these nations had commercial relations or communication. But there is not the smallest likelihood that any country would enter into it which was not in financial difficulties. Moreover, if such an agreement were entered into, there is no probability that it would be observed when there would be large profit in breaking it. The last and final objection is, that telling people any commodity can be kept above its market value by treaty is *Bryanism pure and simple*, and naturally leads farmers and laborers to ask why it cannot be kept above par also by statute. Finally, it would be the beginning of unnumbered woes for mankind if civilized governments undertook to substitute artificial treaty money for gold and silver at their bullion value. We could not be sure that any popular government would stick to such an absurdity. The people would speedily break away from it, and where should we be then? Consequently, if this "international agreement" talk be kept up, and the public is kept in expectation of seeing "England brought to her knees," we shall have no sound financial legislation this winter. We shall have only more compromises and makeshifts. The only way out of this muddle, and the only way to prevent a reappearance of Bryanism four years hence, is to stop such talk, to say we are a monometallic nation with a gold standard, and do not care who knows it, and that we use silver only for small change.

The verdict of the elections upon Hill and Gorman, undoubtedly two of the most pestiferous influences in modern politics, is serious enough to satisfy the desires of the most extreme theoretical reformer. Hill disappears in New York State beneath an adverse majority of 273,000, and Gorman is confronted in Maryland with one of over 30,000. In both States the Democratic party has not been defeated merely, but utterly routed. This outcome is the result of the management of the two most entirely "practical" politicians in the party. They were the shrewdest of their kind, and yet the fruit of their years of shrewd management is complete disaster. Hill saw it coming, and sought to escape some of its consequences by hiding himself, but Gorman faced it till the last and has gone down alone before it. He was the most conspicuous Democratic leader who had the bad courage to ally himself with Bryan, and he must fall with him. It is a pity that his term does not, like Hill's, end with the present legislative year. He has two years more of his term to serve, but it is to be hoped that the tide against him in Maryland is strong enough to last until his successor shall be chosen.

So far as the result in New York State is concerned, we shall probably see within a very short time that it is a dangerously complete personal triumph for Mr. Platt, at least in the legislative branch of the government. There is a very large Republican majority in the Legislature,

and it is more than suspected that it is in favor of sending Mr. Platt to the United States Senate in place of Mr. Hill. Tammany has succeeded in electing twenty-three out of the thirty-five Assemblymen from this city, which furnishes additional warning as to the strength which that organization still retains. Nearly all the Republicans elected here and elsewhere are Platt men, and the city will be obliged again this winter to fight for its rights at Albany. With Platt as Senator, and with a Governor and Legislature who will do Platt's bidding, shall we be much better off than under Hill and his machine? This is a question which time alone can decide, for we must give Mr. Black a chance to show that he is capable of being a better Governor than his signing of Jake Worth's application for County Clerk of Brooklyn indicated him to be. It seems incredible that a man who is elected to office by such an overwhelming popular vote as he has received, can be content to act in the office as the mere dummy of a boss.

A study of the Connecticut election figures shows that the Democrats in the agricultural communities in that State were less inclined to do something for silver, or were less subservient to party organization and "regularity," than were the Democrats in the cities and the manufacturing towns. In New Haven County, which contains the largest city in the State, three smaller cities, and several large towns, in each of which the factory employees predominate, the vote for Cleveland in 1892 was 55 per cent. of the total vote, leaving out of the reckoning the Populist and Prohibition vote, which was comparatively insignificant. Last week Bryan polled 39 per cent. of the vote in that county. In comparison, Litchfield County, made up, with few exceptions, of agricultural towns, gave 49 per cent. of its vote to Cleveland and only 27 per cent. to Bryan. The same praiseworthy distinction for the Democratic farmer is found in a comparison of the vote in the agricultural towns in New Haven County with the vote in the cities and the manufacturing towns in that county. In the latter, where Cleveland received 56 per cent. of the total vote in 1892, Bryan received 41 per cent. But in the country towns the Democratic portion of the vote dropped in the four years from 47 to 20 per cent.

"Rock-ribbed" New Jersey furnishes as astonishing a case of political revolution as can be shown in any part of the country. It has been proverbially a State which would go Democratic in Presidential years under any or all conditions. Last year the Republicans elected a Governor by a majority of 26,000, which was itself unheard of and a political portent. But last week McKinley received a plurality of no less than 87,000. The same State was carried by Cleveland in 1892 by 15,000 votes. Such a complete overturn, involving a transfer of 50,000 votes from one party to another, in a State where the total vote does not rise above 350,000, can scarcely be paralleled in the returns from any other State. In other words, the man who wrote the Chicago platform simply wrote off almost one-third of the Democratic vote in New Jersey. This result was no doubt due to the fact that New Jersey is what might be called a city State. The population of its own large cities, and of those many thriving towns which get most of their inhabitants and their tone from New York city, controls the vote of the State. Hence its quick and emphatic response to the Bryanite attack on intelligence and honesty.

Indiana was the closest of all the States in the central West, and the victors in the recent struggle there are entitled to a national hearing. Particular attention should be given them when they come with so admirable a suggestion as was made by the Indianapolis *News*, the chief independent journal of the State, on Saturday last. The *News* insists that "the duty of the hour is to be alive to one thing, and that is, that this campaign has settled nothing except the opportunity to begin a settlement." That such a settlement may be made, "there must be organization as compact as bound together the forces that fought the campaign which has secured the opportunity therefor." What is needed, in the opinion of the *News*, is a movement which shall unite all the boards of trade in the country toward the formulation of a method of procedure. In such a movement it thinks that Indianapolis might well take the lead, since with Indianapolis and Indiana men originated the sound-money protest within the Democratic party, and Indianapolis gave its name to the convention, the platform, and the ticket which more distinctly embodied the great issue of the campaign than any other. The *News*, therefore, advises that the Indianapolis Board of Trade take the initiative in organizing for currency revision; that a special meeting for this purpose be called at a very early day; that the board send out a circular letter to the boards of trade of the country, emphasizing the importance of concerted action, and suggesting that on a certain day meetings shall be held by these boards, at which representatives shall be appointed to confer with the national organization and to prepare a plan for reform; and that the body so created be empowered to invite to its deliberations men who are eminent for knowledge of economic subjects. The *News* believes that "if a wise plan were formulated, as we may almost be sure would be the case, public opinion would compel Congress to legislate on the committee's lines." We trust that the business men of Indianapolis will follow this advice. They may rest assured of coöperation everywhere.

Altgeld has been looking around for reasons to account for his and Bryan's defeat. Here is one of them:

> "We had no sinews of war; we had all the power of corrupt wealth against us; we had to reform under the fire of the enemy, and the time was too short to make a proper campaign."

"No sinews of war." That is what we told you in the beginning. We said that you were arraying all the wealth and intelligence of the country against you, and that when you came to raise money for legitimate expenses, you would not get it at the usual places, but that the very men who usually contributed to your campaign fund would give money to defeat you. We said, too, that in any election where all, or nearly all, the well-to-do classes were on one side, that side would surely prevail, and that experience had sufficiently attested this fact. The election of General Harrison in 1840 was a case in point. The Democratic party was the majority party at that time, and of the two candidates Mr. Van Buren was certainly the wiser statesman, but the panic of 1837 had convinced the business community that the hard times were due to the financial measures of the Administration. This was a mistake, but they believed it pretty generally. So they joined forces for Harrison, not with such unanimity, however, as they joined for McKinley this year. The Bryan theory this year was that mud itself has an irresistible attraction for the American voter, and that if you dive deep enough in it you can afford to dispense with the votes and services of those who believe in soap and water. Nobody was more firmly convinced of this than Altgeld. Consequently his wail that the Bryanites had no money is truly comic.

Kansas now cuts the worst figure of any State in the Union. It has tried Populism once. Years ago it chose a Peffer to the Senate, a "Sockless Jerry" Simpson to the House, and a Lewelling to the Governorship, and gave the Populists control of one branch of the Legislature. As a consequence, it saw its population decrease, the outside capital which had been invested within its borders largely withdrawn, and its good name disgraced. Yet, in the face of all this, it has now elected a Populist State ticket; a Legislature, Populist in both branches, which is to choose a United States Senator; and a Populist Judge of the Supreme Court, whose elevation to the bench will make a majority of that tribunal Populists. Such a performance sets at defiance all the laws by which we have heretofore judged the American people.

The break in the solid South is one of the most striking and encouraging results of the election. For the first time in twenty years, the sixteen States in which

slavery formerly existed have not gone together for the Democratic candidate. Delaware, Maryland, West Virginia, and probably Kentucky have chosen Republican electors. Maryland gives McKinley quite as large a plurality as does New Hampshire. And as respects the States below this border tier, the large Republican vote cast in Tennessee, North Carolina, and in the industrial and commercial centres still further south, shows that the old sectional issue has disappeared, and that the people in that part of the country have at last begun to divide according to their views on the questions of to-day, and not according to race lines growing out of slavery.

We need not wait longer to be assured that the South will not respond to Bryan's appeal for a continuance of the silver agitation; and without support from the South such an agitation must fall perfectly flat. While some prominent journals in the South stoutly opposed Bryan's election—notably the Louisville *Courier-Journal* in Kentucky, the Montgomery *Advertiser* in Alabama, the New Orleans *Picayune* in Louisiana, and the Galveston *News* in Texas—most of the Democratic newspapers in that section gave him a perfunctory support. It was evident enough all along that there was no heart in this support, and no sooner was the election over than the editors made plain their relief that their nominal candidate had been defeated. The Savannah *News*, for example, says that "the reasons for the Republican victory are apparent to every one: the people don't want silver monometallism; they condemn Altgeld and uphold Cleveland." The Macon *Telegraph* says that it "cannot pretend to be surprised at the result," because, "when the Democratic national convention deserted the traditions of the party and defied the conservative feeling of the country, we felt that the success of its candidates would be little short of a miracle." The Jacksonville (Fla.) *Citizen* says that it is "not surprised at the result," because it has "always thought that the support of the free-coinage policy by the Democratic party would prove ruinous politically," as it "could not suppose that the nation would, after sober second thought, endorse this policy." Of the talk about "doing the thing all over again," the Mobile *Register* says that "the repetition will scarcely be seriously attempted," as "what the people most want now is a rest; and we feel sure that when they get it, it will be at such a price that they will value it too greatly to permit themselves easily to be led off into agitation a second time."

The first trial of voting-machines in a Presidential election seems to have been in the main successful. Those which were used in Rochester, N. Y., undoubtedly worked more satisfactorily than those which were used in Worcester, Mass. There were delays in both cities, caused by partial breakdowns or stoppages in the mechanism, but these were not serious in either case. Had the election in either city been close, they might have led to decided trouble by causing the count to be disputed. There are complaints that the Worcester machine did not secure secrecy in the voting, the working of the mechanism being so discernible from the outside as to disclose the nature of the vote which was recorded. No such complaint is made against the Rochester machine, and none could be, for its mechanism is completely hidden. Considering the haste with which the machines were got ready in both cities, the experiments may be regarded as surprisingly successful, but what is demanded before they can be adopted for general use is not partial or probable success, but absolute guarantee against failure of all kinds. In other words, they must be perfected thoroughly before they can be adopted, and it is evident that they have not yet been brought to this condition.

The remarkable success of Monday's sale of New York city bonds is ascribed by the Comptroller partly to advertising and partly to the election of McKinley. Mr. Fitch, quite inadvertently, of course, overlooks the fact that when the attempt to sell the bonds in July last failed, he attributed that failure mainly to the reform administration of the city. He said that "the result of the first year's experiment was that New York cannot borrow money readily, and has to pay 3½ per cent., when before it could get all it wanted for 3 per cent., and instead of currency bonds, the city now has to issue gold bonds." Mr. Fitch was talking for the benefit of Tammany Hall, for he saw an opportunity to do that gang of plunderers a service by misrepresenting the facts of the situation. Out of his own mouth he now convicts himself of disingenuousness, for if it was the failure of reform government which prevented bids for the bonds in July, the same influence ought to have prevailed on Monday, the reform government being still in operation. He would not admit that doubt about the national election was the chief influence in July, though he was as well aware of that fact then as he is now. If he had been simply a Tammany politician when he slandered the city and did his best to injure its credit in the estimation of the world, nobody would have cause to censure him; he would be doing only what was expected of him. But he was the chief financial officer of the city, with loud and vehement and constant professions of sleepless zeal in its behalf, and his utterances were scandalous and indecent because of his official position.

The November *Fortnightly* has two important and well-documented articles on the relations of Great Britain and Turkey. One of them is a damaging exposure of the suddenness of Lord Rosebery's discovery that England could not act alone. Only a little over a year ago, when he was Prime Minister, he was proposing to act alone. On May 27, 1895, the Foreign Office sent a dispatch to the English Ambassador at Constantinople, telling him to insist before June on a categorical reply to the demand for reforms, and adding: "Your Excellency should endeavor also to arrive at some agreement with your two colleagues as to the manner in which pressure should be exercised in the event of the answer not being favorable, for in that case it will be necessary to employ pressure, either joint or *separate*." Even after Rosebery left office, he believed it possible for Great Britain to act alone. What other interpretation can be placed upon his remarks in the debate on the Address, when he said that, should the European concert unfortunately fail, and should Lord Salisbury proceed "even *alone* to deal with this question vigorously and efficiently," the entire nation would support such a policy? Salisbury distinctly threatened to act alone a year ago, but now both he and Rosebery say it would be madness. To either of them the words of Disraeli to Palmerston in 1864 might well be applied: "After a course of menaces unaccomplished and promises unfulfilled, the noble lord comes to Parliament and announces to the country that we have no allies, and declares that England can never act alone."

The other article is a careful discussion of the Cyprus Convention, in which it is made clear that the real *quid pro quo* was the engagement of England to defend Turkey by force of arms from Russian aggression. It was "in return" for this engagement that the Sultan promised to introduce "necessary reforms"; and the cession of Cyprus was made, not as a pledge that the reforms should be carried out, but "in order to enable England to make necessary provision for executing her engagement." Lord Salisbury's dispatches are quoted at large to show that he obtained and regarded Cyprus as a military base against Russia, not at all as a guarantee of Turkish reform. This, of course, with the changed circumstances, only makes the whole thing more grotesque. Lord Salisbury now says that England and Russia are and are likely to remain the best of friends, and that the Sultan's promise of reform is worthless, but that nevertheless not an inch of Cyprus shall be given up. In other words, the club which was got for the express purpose of thwacking two sinful heads, is retained though neither head is to be thwacked at all.

THE SIGNIFICANCE OF THE VERDICT.

Our electoral system serves now again, as more than once in the past, to obscure the nature of the national verdict in a Presidential election. An analysis of the division in the electoral college is therefore necessary, in order that people may comprehend the true meaning of the majority given the representative of sound money and national honor in that body.

There are now 447 electoral votes. A majority is 224. McKinley has 260 without counting Kentucky, South Dakota, or Wyoming, all of which, however, appear to have gone for him. But this figure, whatever the final total may be, by no means represents the relative proportion of the population, wealth, and intelligence of the country that has been cast on his side. The simplest and clearest way of bringing this out is to take a map of the United States and fix in one's mind the fact that all the region between the North Atlantic coast on the east, the Potomac and Ohio Rivers on the south, and the Missouri River on the west has gone solidly and overwhelmingly for the right side. This region includes the six New England States; the four old "Middle States" of New York, New Jersey, Pennsylvania, and Delaware; Maryland; and the great Western States of Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, and Iowa—eighteen in all of the forty-five in the Union. These States have 238 electoral votes, or fourteen more than a majority; and every one of these votes will be cast for McKinley. He has, of course, many others; six from West Virginia, thirteen probably from Kentucky, three from North Dakota, four probably from South Dakota, four from Oregon, and nine from California; but we now consider only the solid block of eighteen States east of the Missouri River and north of the Ohio and Potomac.

(1.) As to population. The United States in 1890 had 62,622,250 inhabitants. Of this total, 35,297,990 lived in the solid McKinley block of eighteen States. In other words, more than 56 per cent. of the inhabitants of the nation are found in this region, which voted as one man for sound money. Other McKinley States outside this block will raise the proportion nearer 66 than 56 per cent., but it is over 56 per cent. here.

(2.) As to wealth. The true valuation of real and personal property for the whole country, according to the last census, was $65,037,091,197. Of this total, $41,717,479,491 was found in the McKinley block of States. In other words, these eighteen States contained more than 64 per cent. of the wealth of the nation. States for McKinley outside this belt would carry the ratio nearer to 74 than 64 per cent., but it is more than 64 per cent. here.

(3.) As to intelligence. The number of persons ten years of age and over in the United States six years ago who could not read or write, was a little more than 13 per cent. The average in the McKinley block of States was only about 6 per cent. An exceptionally large foreign element carried the proportion in Rhode Island up to nearly 10 per cent., and the negro population raised it in Delaware and Maryland to about 15 per cent.; but nowhere else in the East did it reach 7 per cent., while in the West it ranged from 6.7 per cent. in Wisconsin down to 3.6 per cent. in Iowa. For the whites alone the showing was even better—only about 7 per cent. in either Delaware or Maryland, and nowhere higher except in Rhode Island. On the other hand, the number of whites above the age of ten years who could not read or write in 1890 was about 15 per cent. in Texas, 16 in Mississippi, 18 in Virginia and Louisiana, 20 in Florida, 22 in South Carolina, 23 in Georgia, 25 in Alabama and Arkansas, 27 in Tennessee, and 31 in North Carolina.

(4.) As to the cities. Population, wealth, and intellectual forces have for many years drifted into the cities of the country. The last census showed that there were twenty-seven cities in the United States with a population exceeding 100,000—not counting Washington, where the people do not vote. All but seven of these cities are in the McKinley block of States. Every one of these twenty cities went for sound money. So, also, it may be noted, did Louisville, Kansas City, St. Louis, and San Francisco of the seven outside this belt, leaving on the other side only Denver, Omaha, and New Orleans among all the large cities of the country. In many the majority was perfectly overwhelming—about 60,000, for example, in Chicago.

(5.) As to electoral votes. In the McKinley block the great majority are large States, where the two electoral votes allowed for the Senators of a State cut but a small figure—two out of 36 in New York, 32 in Pennsylvania, 24 in Illinois, 23 in Ohio, 15 each in Massachusetts and Indiana, 14 in Michigan, 13 in Iowa, and so on; only Delaware has as few as three, and New Hampshire and Vermont are the only ones with but four apiece. On the other hand, Nevada gives Bryan three electoral votes for only 45,761 people, Wyoming three for 60,705, Idaho three for 84,385, and Utah three for 207,905—twelve for a population of less than 400,000 souls. In the larger part of the South, moreover, the electoral votes represent but a small proportion of the male population. The bulk of the blacks are practically disfranchised under legal forms by the new constitutions of Mississippi and South Carolina; in many other States they are either not allowed to vote, or are counted out after their ballots have been cast.

To recapitulate, we have in what we have called the McKinley block of States (leaving all other electoral votes for him out of the account) more than 56 per cent. of the inhabitants of the nation, 64 per cent. of its wealth, and four-fifths of its great commercial centres. We have a population which has only about 6 per cent. of illiteracy, including all of its foreign element, as against an illiteracy ranging from 15 per cent. up to 31 among the whites of those Southern States where the whites (almost all native-born) decide how the electoral votes shall be cast. We have here, in a proportion larger than any census statistics can show, the great civilizing forces of the republic, as against the still surviving barbarism bred by slavery in the South and the reckless spirit of adventure in the mining-camps of the far West. We have here electoral votes that bear a reasonable proportion to the population and to the number of votes actually cast, as against bulldozing and ballot-box stuffing in one section, and the grossly exaggerated political power of a few thousand electors in the mining States. In a word, we have all the great dominating forces of the nation which make for intelligence and righteousness massed in a solid body, in the most impressive vindication of democracy governing according to law and justice that the country has ever seen.

CURRENCY REFORM.

The time has come when the Republican party must take some step to put the currency of the country on a permanent and sound basis. This is not merely its duty, for as surely as the revolving years move on, the fight we have just passed through will be renewed unless a satisfactory adjustment is reached. There can be no peace until the Government is taken out of the banking business. All forms of Government demand-notes and circulating paper must be retired. To make the victory just achieved lasting, something must be done to make the currency automatic. As long as it is exposed to the nostrums of politicians and the changes of party platforms—as long as it is subject to the caprices of the kind of mobs that dominate national conventions—so long will the gold standard be threatened not merely by silver, but by something much cheaper than silver. Silver is only a half-way house. The standard of the Populists is not the silver dollar, but the greenback dollar.

In view of these facts, how paganish is the statement sent out on Thursday by Senator Sherman, to the effect that we ought to maintain in use the largest amount of silver that can be kept at a parity with gold. This is the kind of talk from Republicans in high places that has done all the mischief in the past, that came near wrecking the republic, and would have done so had not stronger men than John Sherman taken the helm at the St. Louis convention. Who is to determine that largest amount? Is Bryan to be consulted about that? They reckon ill who leave him out. Suppose that Sherman, Bryan, Sewall, Watson, Bill Chandler, and a few others

were appointed a committee to decide how much silver can be maintained at a parity with gold. What a confused mess we should have, to be sure. Bryan believes that all the silver in the world can be so maintained by our action alone. At at events he said so in his campaign speeches. Perhaps Mr. Sherman means that he would determine by experiment how much silver can be so maintained. But no new experiments can be made without new legislation. Under existing law the amount of silver in our circulation can be neither increased nor diminished. Are we to have the whole question reopened in order to enable Mr. Sherman to straddle it a little longer?

Prof. Hadley delivered a lecture in Brooklyn on Friday evening on the financial problem now confronting the people of the United States. He appears to take a rather pessimistic view of the situation, but perhaps that view proceeds from his extremely candid and unreserved exposure of the obstacles to be overcome in restoring our currency to a sound basis. The opposing forces may be all summed up in one. In order to get the Government out of the banking business all fiat money must be retired. Under existing conditions of public income and expenditure, there is no surplus revenue to be applied to this object, and, even if there were, it would seem to involve contraction of the currency. It would not actually do so, since gold would flow in to take the place of the retired greenbacks. This movement would take place as surely as the water of the ocean finds its level, but it would not be visible, and therefore the cry of contraction would be raised by demagogues and would find eager listeners. In fact, the business community—the very classes which joined with such unanimity to crush the Bryanites—would grow uneasy, and, if they should forbid the step, it would not be taken. Therefore, in order that the movement may succeed, there must be some step equally visible to supply a new currency in place of the old. What shall that be? Here arises a fresh difficulty. If we are to have more national banknotes secured by the deposit of United States bonds, how are the bonds to be obtained? Will the public consent to the creation of an interest-bearing debt to take the place of a non-interest-bearing debt? Here is the crucial point of the whole problem. To the well-instructed mind this is as simple as the proposition that a man against whom a large number of small claims are outstanding, which are liable to be called at any time, to his great embarrassment, should fund them and make them payable at his own convenience. But this is not the way it is generally considered.

Suppose this difficulty could be got over—and it is probably less formidable now than it has been in the past, since we have been compelled to issue two or three hundred millions of bonds to meet these demand obligations without extinguishing them or any of them. Suppose the people would consent to the issue of bonds sufficient to retire the greenbacks and form a basis for an equivalent amount of national banknotes. The act of issuing does not put the bonds into the hands of the banks. It does not keep them there even if it puts them there in the first place. As Prof. Hadley shows, the public will compete with the banks for the purchase of these securities. As the country increases in wealth and population, the price will be bid up in the market. There will be a constant pull of private investors against the banks in the future as in the past. Moreover, the Government itself will by and by have a surplus revenue, and then it will itself be a bidder for bonds against both private investors and banks, and its bidding will be the most powerful because, in order to extinguish the interest, it can afford to pay a higher price than anybody else for the principal. It is true that this competition of the Government may be controlled by Congress, but will Congress consent to pay interest for ever after the necessity has passed? Ought it to do so? No.

Permanent relief is not to be found that way. There must be some form of banknote issues different from the present. But here we are confronted with perhaps the greatest political difficulty of all. The national-banking system is so good in most ways—it has so commended itself to the judgment of thinkers as well as of the public in general—that its note-issuing limitations and shortcomings have not attracted much attention. Yet it is demonstrable that, while the other features of the system may last for ever, the note-issuing function is and must continue to be crippled and will surely come to an end whenever the public debt is paid off. Therefore some other system must be devised. The so-called Baltimore plan, which is an adaptation of the New York Safety Fund system, now in force substantially in Canada, is a possible remedy, but we shall not here go into the details of it. We shall close this article with the remark that we have not an unlimited range of choice or an unlimited time within which to make it. The political majority which elected Mr. McKinley is in a state of unstable equilibrium. A very little disturbance of its component parts may put the majority on the other side, and the majority will almost certainly go to the other side unless something is done within the next four years to settle the currency question permanently. Our situation is in many respects what it was in the early seventies. There was just as much financial madness rampant then as now. There was just as fierce opposition to the resumption of specie payments then as there is now to the gold standard. Yet the Republican party, in fear and trembling, adopted a plan for specie payments and carried it through and saved itself by that means.

We may add a word to what Prof. Hadley says about silver certificates. If the fiat money proper—the legal-tender notes—were retired and cancelled, the vacuum created thereby would be such that the silver certificates would be simply the "large change" of commerce, something like the five-franc pieces of France. We are indebted to Prof. Taussig for that term. They would perhaps not give any more trouble than our small change does. At all events, if everything else in our monetary problem were settled, we should have a sufficient breathing-spell so that we could deal with the silver certificates at our leisure.

REDEMPTION OF OUR CITIES.

For the first time in the history of the country all the larger cities in the land, outside the South, cast a majority of their votes, on November 3, on the same side in a national election. Moreover, the cities having the largest population and the largest percentages of foreign-born citizens cast the heaviest majorities in support of sound money and social order. We append the majorities given in sixteen of the principal cities:

City.	Majority.	City.	Majority.
New York	20,000	Baltimore	20,000
Brooklyn	32,000	Cincinnati	19,000
Buffalo	12,000	Cleveland	3,500
Chicago	60,000	Detroit	7,000
Boston	21,000	Indianapolis	14,000
Providence	7,000	St Paul	4,000
Philadelphia	115,000	Milwaukee	9,000
St. Louis	17,000	Minneapolis	6,000

These figures are of great significance. They show in regard to the great cities what we have pointed out in regard to the returns in the chief States of the Union, that the "ignorant foreign vote" is not the main source of our political ills. It has been the habit of most commentators, native and foreign, to ascribe the uniform and scandalous misgovernment of American cities mainly to the presence of this vote in most of them. We have repeatedly dissented from this view, but have been almost alone in doing so. Our contention has been that the chief cause was the division of the native-born, intelligent, and so-called respectable vote into two about equally divided factions, through the introduction of national party issues and names. It has been this division into opposing forces which has made it possible for the most disreputable elements of our great cities to get possession of their governments. While the property-owners and other reputable persons were voting against one another on the tariff, the bloody shirt, and other irrelevant issues, the liquor-dealers and political gamblers were uniting and were organizing the ignorance, cupidity, and criminality of the community into a solid body, by means of which they secured a minority of sufficient numbers to get possession of the offices. There has never been a time when the divided respectable voters could not, by combining, forgetting that they were Democrats and Republi-

cans, and confessing that the tariff and the treatment of Southern negroes had nothing to do with the business of municipal government, have carried every city in the land by a good majority, and secured a government which was representative of the best intelligence and the property of the community.

What the figures in our table do is to prove the truth of this contention beyond dispute. The misgovernment of American cities is due solely to the partisan folly of native-born Americans. These have only to unite in municipal elections, as they united on November 3, to have a permanent majority in every city of the land. The issue which brought them together is presented to them in every city election. They agreed last week that they would sink all minor considerations and unite for the common preservation of their property and the common credit and welfare of their government. That is what they ought to do in every municipal contest. Their own property is at stake; it is their money which must foot the bills of dishonest and extravagant government; it is the American name which is smirched by the notorious misgovernment of American cities. They were able to overlook the tariff issue when the country was threatened by precisely the same type of politicians as those who have so long pilfered our cities. Why not agree to overlook it again next November, or March, or whenever the time comes again to say who shall conduct a great city's affairs?

There is not one of the cities in our list which would not be immensely better off under a strictly non-partisan administration than it ever has been or ever will be under an administration which is either Republican or Democratic. No matter how good a partisan administration may be, it can never be permanent, for change is inevitable within a very short period, and with change comes the "clean sweep" and a new set of municipal employees. But with non-partisan administration there comes in the business theory of municipal labor, the idea that the city employee is the servant of the city and must give it the best service possible. He cannot do this when part of his time must be devoted to politics, and he will not do it so long as he knows that his retention depends, not upon the way in which he does his work, but upon the favor of the man to whose "pull" he owes his position. Col. Waring's men clean the streets and keep them clean because they are a permanent body of freemen who know that, so long as they do their work well, they are sure of their positions. That is the real non-partisan principle, or the application of business methods to municipal administration. Every city in the land can have these methods applied to all branches of its service, and maintained there in perpetuity, if its intelligent citizens will drop party names and issues and combine to control their own affairs. If they do not do this, they must not try to escape the responsibility for their failure by charging the resulting evils and scandals upon the "ignorant foreign-born voter." That excuse will not suffice any longer. The foreign-born voter has shown that he is neither ignorant nor vicious, and it now behooves the native-born voter to show that he is as patriotic as he professes to be.

THE VENEZUELAN SETTLEMENT.

THE only thing to be regretted about the Venezuelan settlement, which Lord Salisbury announced on Monday at the Lord Mayor's banquet, is the manner in which the controversy was begun by Mr. Olney and President Cleveland. We can testify from careful perusal of the correspondence from 1846 down, that never until Mr. Olney's taking office had we made the question our own. All our Secretaries had been careful to appear in the character simply of friends of both parties, and to repudiate the Venezuelan contention that it was our affair. There was nothing to hinder Mr. Olney's taking a new position and informing Lord Salisbury politely that we considered the business to be ours and should like to have it settled. Had this been done, instead of flinging an unmannerly and incoherent lawyer's brief at his head, accompanied with a threat of war from the President, the controversy might have been pushed with equal vigor and have had an equally happy ending. There would have been no panic, and no rousing into activity of the hateful Jingo spirit, and no damaging of President Cleveland's reputation for decency and common sense.

It is true that the sensation which this first outburst created seems to have frightened both the President and Secretary into civil and courteous argumentation, and Mr. Olney has undoubtedly shown since then, that it was want of judgment and experience, and not want of capacity, which caused his earlier indiscretion. But the evil result of this indiscretion, we fear, will not be removed, and will continue to cast a shade of unfriendliness over our relations with England. The coarse, brutal, and Jingo element in the population, which was pleased with the President's dispatch, and joyfully "stood behind Cleveland" when there was prospect of a war, will love to think that the way we opened the controversy was the right American way—that to be ruffianly and overbearing in diplomatic controversies is a sign of strength and independence, and that the proper way to approach Great Britain, in particular, is always with a threat. Far from looking back on the Olney-Cleveland outburst with regret, they are inclined to make it a precedent. When England agreed to accept arbitration, one Boston paper announced the fact with the refined and kindly heading "Victoria Crawls," and one of its congeners in New York heads Lord Salisbury's announcement of a settlement with the heading "England Backs Down"—the object in both cases being the same, to make Jingo Englishmen regret the peaceful ending of the negotiations, and, if possible, to humiliate the peaceably disposed who rejoice over it. They are intent on keeping up the national reputation for bad manners, and making the United States the typical bully of modern civilization.

We do not know the particulars of the settlement, and consequently cannot say more of it than that it *is* a settlement. But we believe it may be said that the Commission has entirely failed to discover the line for which President Cleveland was to fight, for the simple reason that there never was any line. In past times people did not define frontiers through tropical wildernesses in which no one wished to settle, and least of all the Spanish Americans. These frontier lines, like mathematical lines, were imaginary. They were "somewheres along there." It is only now, when railroads have begun to lead to mines, and population to push into waste places, that the necessity of lines in such regions is felt, and the duty of civilized men is to make them by agreement, not lie about them and fight over them when they do not exist.

Lord Salisbury's position has all along been reasonable. He has been willing to arbitrate about the line, but not to surrender portions of territory in which British subjects have settled in good faith. To do so would be very like surrendering British subjects to be tried by Turks or Chinese. No one not born under it, we believe, wishes to live under a Spanish-American Government, and no highly civilized nation like England or America is willing to make him. Lord Salisbury said, therefore, that he would arbitrate on any line which did not cut inhabited settlements out of British jurisdiction. Mr. Olney has met this in an equally rational spirit. He made the following excellent proposal:

> "Provided, however, that, in fixing such line, if territory of one party be found in the occupation of the subjects or citizens of the other party, such weight and effect shall be given to such occupation as reason, justice, the rules of international law, and the equities of the particular case may appear to require."

As we understand, Lord Salisbury has accepted this. The line is to be drawn by arbitration, but if it includes the British settlements in Venezuela, the owners are to be bought out. Ownership is to be ascertained either by fifty years' adverse possession, or by the ordinary legal proof, and by occupation. This is the whole matter, and how simple it seems. Had the controversy been settled by war, the process would probably have cost the whole value of Venezuela and about 100,000 lives besides. All Jingo processes are frightfully expensive, to say nothing of their wickedness.

Now that it is all over, who can look

back on the controversy as conducted on the stump and in popular periodicals without wonder? Now that the Commission has been unable to find a line, is it not marvellous how many of us a year ago knew exactly where the line was, and gave in figures the superficial area of Great Britain's encroachments on the Venezuelan territory? Think how well informed the *Tribune's* "Old Pensioner," and Senator Lodge, and Theodore Roosevelt, and a host of less noisy Jingoes were about the whole matter, and how well supplied the monthly magazines and the weekly papers used to be with their views, and what a hollow hypocritical pretence our profession of ignorance used to be considered. At one time there seemed to be a certain personal danger in not knowing where the Venezuelan boundary was, and in not being willing to die or reduce one's family to poverty for it. In fact, one could tell beforehand who knew all about it and who did not by mere knowledge of their character. A certain kind of man always knew the extent of Great Britain's encroachments, while another kind did not.

IRISH AFFAIRS.

DUBLIN, October 26, 1896.

To judge from the English press, the most notable circumstance in Ireland is the dissension that still exists among Irish members of Parliament. Like every other Irish event, this is both distorted and exaggerated. A trifling affray in an Irish country village is usually described as if it were an incipient revolution, and a squabble at a poor-law board or municipal council is paraded as evidence of the unfitness of Irishmen for self-government. At the same time, serious and prolonged riots such as those which occurred this year at fishing villages in England, where fishermen from a distance landed their fish for sale on Sunday, or gross corruption in municipal bodies, or scandalous personal altercations among members of local councils—matters of frequent occurrence in England—are barely mentioned and evoke but little comment except in the local press.

Among important events that affect Ireland, the first place must be given to the passage of a new Land Act. No Liberal Government could have passed such an act through the House of Lords; but it must be looked on more as an accidental than a designed piece of legislation, for, if it had not been for the collapse of other important Government bills, no time could have been found for this, which apparently was produced for show and for the embarrassment of Irish parties. What construction the Irish courts will put upon this measure remains to be seen. It is evidently meant to remedy certain glaring injustices and defects which arose out of the interpretation by the courts of the Land Act of 1881. That act purported to exempt from rent all improvements made by tenants, but the decisions of the judges laid down that in many cases there was no exemption, and in most only a partial exemption, from rent in respect of the expenditure by tenants on the permanent improvement of their farms. The present law requires an exhaustive enumeration of all improvements on farms where tenants apply to have fair rents fixed, and the court is to assign to landlord and tenant respectively such improvement works as they find to be the property of each party, making a deduction from the full letting value of the farm in respect of all works which are credited to the tenant.

It will be easy enough for partial or prejudiced administrators to drive coaches and fours through this act. Carelessness and ignorance may bring about the same result, and one great difficulty has been to find and secure the appointment of competent and qualified judges. In England there is a large body of skilled surveyors and valuers who are constantly engaged in the estimation of value of real property for assessment, compensation, and such like purposes. In Ireland no such body ever existed, and almost the only professional valuing that was ever done was for the purpose of raising farm rents; a valuer being employed to give a semblance of fairness to a transaction that always ended in the same way. The English Surveyors' Institute requires all its members to qualify, not only by practice and apprenticeship, but by passing a series of examinations in such matters as are necessary to the intelligent practice of their profession. Surveying in all its branches; the law as to value, compensation and assessments; political economy; farming and estate management, are subjects which all practising surveyors and valuers should be theoretically acquainted with. In Ireland there are no tests, no prescribed qualifications for surveyors or valuers under the Land Acts, and it would probably be found that most persons employed or practising as valuers could not pass an examination in the elements of mensuration or political economy. The laymen who are valuers and fair-rent fixers under the Land Law are appointed by the Lord Lieutenant, on the recommendation, it is believed, of persons who have influence at "the Castle." It is needless to say that the farming classes are not represented, and one ground of dissatisfaction on the part of the tenants is their belief that the official valuers not only belong to a hostile class, but are often profoundly ignorant of their business.

The new act is an addition to the many complex and intricate statutes dealing with the relations of landlord and tenant passed since 1860; in addition to these the law has to be found out from a mass of undigested and conflicting legal decisions extending over a period of thirty years. The bill as brought in was hastily remodelled by the Government, incompletely discussed, hurriedly passed with sundry amendments in the small hours of the night, and, as a patch on the former tangle of laws, promises an infinite amount of litigation. It is no more a settlement of the Irish land question than any other act has been.

Another matter of great importance to the future of Ireland has been the final report of the Royal Commission on the Financial Relations of Great Britain and Ireland. A practically unanimous conclusion was that while the actual tax revenue from Ireland is $\frac{1}{11}$ of the total revenue of the United Kingdom, Ireland's taxable capacity is *not more* than $\frac{1}{20}$. This general report was qualified by a number of separate and supplementary reports. The Chairman, O'Conor Don, and four other members reported that the ratio of Ireland's taxable capacity to that of Great Britain is not more than 1 to 20, and *possibly is much less.* Messrs. Sexton, E. Blake, and Slattery found that the true proportion of taxable capacity is 1 for Ireland to 36 for Great Britain; that this ratio is the highest for which any equitable basis can be found, without regard to past over-taxation or the continual increase of disparity between the resources of Great Britain and Ireland. English opinion will probably attach most weight to the separate report issued by Lords Farrer and Welby; the latter for many years principal officer of the Treasury, the former an ex-official of the Board of Trade. They also found that Ireland's actual tax revenue was $\frac{1}{11}$, while it should not have been more in 1893-4 than $\frac{1}{20}$. In one of the concluding paragraphs this report says: "After the exposure of the over-taxation of Ireland made by this inquiry, it will be difficult for the Imperial Parliament to maintain the present taxation of Ireland, at any rate without compensation." The excessive and wasteful expenditure in Ireland is not lost sight of; Lords Farrer and Welby describe it as "a pecuniary loss to the taxpayers of Great Britain and a cause of demoralization to Ireland."

After eighty years of unavailing protest from representative Irishmen, it is at last discovered and officially recorded by English Royal Commissioners that Ireland is over-taxed, and that imperial expenditure in Ireland is to a large extent useless and demoralizing. But unless agitation passing the limits of what is considered "constitutional" both in and out of Parliament, quickens the English conscience into action, another eighty years may pass without any reform of our financial relations with England. This report says: "The evil of excessive taxation cannot be properly remedied unless excessive expenditure be abated at the same time"; but the revenue raised in Ireland is spent wholly under the direction of the Imperial Parliament, and it is against the useless waste of her revenue, as well as against the excessive contribution required for British purposes, that Irishmen protest.

Lord Welby has for years been the principal officer of the Treasury, and it has been his duty to furnish English ministers with figures and arguments against the Irish view of this question. The forces of tradition and prejudice appear strongly in this report; almost all the evidence is ignored, and it appears to be based wholly on the returns furnished by the Treasury, although the fallacious character of these was clearly demonstrated, both by Mr. Giffen, the well-known statistician and economist, and by Mr. Thomas Sexton in his examination of the Treasury officials. By a process of "adjustment" and conjecture as to the amount of articles consumed in England, though the duty is paid in Ireland, Lords Farrer and Welby estimate the Irish contribution to the imperial revenue at six and three-quarter millions. The latest Parliamentary return shows that the revenue collected by imperial officers in Ireland is slightly over ten millions, and though there may be some question as to whether the revenue from Irish duty-paid articles consumed in England should be credited to Ireland or not, the deduction of three and a-quarter millions on this account cannot be justified. In addition to ten millions collected by imperial officers, three millions are collected by local authorities, so that the local and imperial tax revenue raised in Ireland amounts to nearly £3 per head of the population. Any Government with such a revenue would be dangerously rich. The total cost of Government, federal and local, in the United States, was estimated by Mr. Edward Atkinson (*Engineering Magazine*, November, 1895) at £2-16-0 per head, and your adminis-

tration appears to be one of the most generous and extravagant among modern states. In Ireland we have a lavish expenditure on officials, police, soldiers, and generally useless public works. We have a bad and out-of-date system of primary education; no Catholic university, but abundantly endowed Protestant colleges; and in local and municipal matters, taxation without representation is the rule. Irishmen, having no control, have no interest in economical government, for Ireland gains nothing by economy of the imperial revenue; the less spent in Ireland, the greater the gain of the British Treasury.

Another addition to the literature on the subject of what ought to and might be done for Ireland is the report of the Recess Committee, a voluntary body brought together by Horace Plunkett, a Unionist member of Parliament, for the purpose of suggesting what should be done for Ireland in matters outside the sphere of party politics. This Committee has published an interesting report relating the crimes and mistakes of past governments in Ireland, pointing out the deficiencies in our educational system, describing what is being done in other European countries to develop their resources and promote social and industrial progress, and finally making a series of suggestions to the Government for the creation of new departments, agricultural and educational, through which "the State" is to act for the benefit of the Irish people. In other countries held up in this Report as examples, "the State" is the whole body of the people acting through their representatives, but in Ireland "the State" is the British Parliament, which has sole control of the Irish revenue, and in which Ireland is practically disfranchised. The State in this sense crushed Irish industries, trade, and enterprise in the past, passed laws which prevented three-fourths of the population from being educated, or accumulating wealth of any kind, and even in recent years crushed and discouraged attempts made by Irish departments to promote agricultural and technical education, which the Recess Committee hold to be the necessary foundation of any progress.

The reforms proposed by this committee would need (1) legislation in the Imperial Parliament, for which no time can ever be found; (2) ample funds, which are not likely to be got out of the British Treasury; (3) a complete change in the methods of Irish administration and in the minds of the ruling classes. For half a century it has been an accepted principle with these that there were too many people in Ireland. The inhabitants of the country were, dreadful to relate, consuming the greater part of the produce of their native soil, and this was wanted for taxes by the English Treasury and for rents by absentee landlords. The policy of compelling and promoting emigration was establisned, instead of seeking to educate the people and make them more productive. Government favored and helped this policy; it did not hold it to be an undisputed maxim of government that "people are the riches of a nation," and the result has been achieved of reducing the population of a fertile country by one-half in the space of forty years. Lecky says that by the penal laws "nearly all the talent, the energy, the ambition of the country was driven to the Continent"; the land system and the absence of useful education have had a similar expelling effect in later years. This week the Catholic hierarchy, in a manifesto on the education question, speak of "the impossibility of raising a nation in which three-fourths of the population are cut off from the direct and indirect advantages of the full training of their best intellects."

Until some measure of home rule gives the Irish people the control of their own revenue and internal administration, the methods of reform suggested by the Recess Committee could not operate effectively. Experience shows that an increase of departments under the British Treasury, and an addition to the already excessive army of officials, means spending money without receiving any corresponding benefit. Lord Farrer's report says: "We believe that the expenditure of public funds cannot be wisely and economically controlled unless those who have the disposal of public money are made responsible for raising it as well as spending it." But the Recess Committee propose that more money shall be got from the Treasury to be spent by unrepresentative and unsympathetic officials. This recommendation is openly put forward by Mr. Plunkett as an antidote to home rule; so, while the Nationalists are not likely to oppose the spending of money in Ireland, they have abstained as a body from any active coöperation with the Recess Committee.

Another Unionist movement is one for the more humane treatment of the poor and sick in the Irish workhouses. But the excessive centralization of our entire system of local government, the "red tape" of the administrative bodies, the continued refusal of successive Governments to place the poor-law system on a popular and representative basis and to allow the ratepayers to effectively control the present extravagant expenditure, prevent national coöperation and interest in this matter. The Poor Law was introduced into Ireland about fifty years ago, when the country swarmed with paupers and vagrants, largely the result of the wholesale "clearances" of their estates by the landlords. Immense jail-like barracks were built for the accommodation and confinement of these unfortunates. The total number of paupers in Ireland is now one in 46 of the population, while in England it is one in 36. The poor rates have been a continually increasing charge in Ireland, though the number of persons relieved has diminished, while in England the charge has become less than at almost any period of this century. The Irish Poor Law is much stricter and more harshly administered than the English; the Irish Boards of Guardians are largely composed of landowners who become ex-officio members, while the elected guardians are chosen by a system of plural voting which practically deprives the poorer ratepayers of any voice in the matter. The upkeep of the workhouses, built to accommodate treble the present number of paupers, is a serious and useless expense. The workhouse infirmaries are used as county hospitals by comparatively well-to-do-persons, for no other institutions are available in country districts in case of serious and infectious diseases.

Last year the Irish Medical Association made an attempt to investigate the condition and management of the workhouses, of which there are about 160 in all. They were able to get official information as to only 79 of these institutions, the medical officers in other cases declining to answer, generally on the ground that they did not wish to incur the hostility of their Boards. The Medical Association said, "It would be impossible to describe the misery and wretchedness of the unfortunate poor doomed to enter and perhaps end their days in some of these institutions." They reported that out of 79 cases where they got information, 43 infirmaries have no trained nursing; in 65, beds and pillows are merely bags filled with straw; in 6 only is there satisfactory ventilation; in 59, sanitary arrangements are of the most disgusting character imaginable; in 43 the inmates have neither plates, knives, nor forks; in all there is an absence of proper food, nursing, sanitation, and comfort. The first step in reforming the scandalous condition of the workhouses would be that the guardians should be freely elected by the ratepayers, who would then feel interested in economy and efficiency of administration. Few of the well-to-do persons in this district know anything of the internal economy of the neighboring workhouse, containing 700 to 800 inmates. Though a large ratepayer for twenty years, I have never been asked for a vote or had an opportunity of electing a guardian. No person can visit the workhouse without leave of the guardians and master. The object of poor-law reform should be not so much the better treatment of workhouse inmates as the prevention of pauperism, and for this it is essential that children should no longer be confined in these institutions, but that they should be boarded out and sent to village and country homes and schools. This is done in England, but in Ireland the powers of the guardians are more limited, and those they have are not fully availed of.

The condition of the lunatic poor is another illustration of the deadlock arising from excessive centralization and overlapping of authorities. Harmless lunatics are confined in the workhouses, but in yards and cells, and under conditions which make recovery very improbable. The asylums proper are overcrowded. For example, there are at present 1,700 lunatics in a Dublin asylum calculated to contain 1,000. A malignant disease called beriberi, known to arise from overcrowding and bad food in Eastern countries, but of rare occurrence here, is now epidemic among the patients and attendants. Medical officers have called attention repeatedly to the insufficient accommodations in this asylum; the Board of Governors have resolved that more accommodation should be provided, but they have no power to provide it. Over them is a "Board of Control," and this board requires orders from the Privy Council before it can act. Money to build must be got from the British Treasury, which is too fully occupied with the affairs of the Empire to act very promptly; and this supreme authority declines to lend the money for new buildings at less than 3½ per cent., although the value of money indicated by the price of consols is about 2 per cent. The governors of the asylum cannot raise money in the open market unless they are enabled to do so by an act of the Imperial Parliament; this could not be got for a year, and even an unopposed act of Parliament costs an inordinate amount of money in fees and legal costs. While all these boards are resolving, considering, charging each other with delay, and the Treasury with avaricious and unreasonable usury, the poor lunatics are dying of beriberi and other diseases due to the overcrowded and unsanitary condition of their prison.

In every department of local administration, difficulties and insuperable obstacles due to excessive centralization and conflicting jurisdiction are met with. The road authorities are nominated by the Lord Lieutenant; a different body is constituted every year, and only meets twice a year for the hasty

transaction of business, after which they cease to have any existence for six months. There is no control over this body, either by any department of the State or by the ratepayers; and there is no efficient audit of their accounts, nor are the accounts made up in any intelligible fashion. Hardly any municipal improvement can be carried out without an act of the Imperial Parliament authorizing special powers to be exercised; the cost of such an act may run, as it has during the past year, to from £10,000 to £20,000, and a large expense is frequently incurred in promoting improvement bills which may fall through on some trifling and technical point at the last moment. Each bill must pass through the stages of first, second, and third readings in the Houses of Lords and Commons; and fees are charged on an elaborate scale in each house. On a small, unopposed bill of a single clause the House fees alone amounted to £204. This system is a check on all municipal and local enterprise, is very costly to the ratepayers, and most oppressive to private individuals whose rights may be interfered with, as such persons can seldom bear the expense of opposing a bill promoted by railway or other wealthy companies.

It is a mistake to think that the home-rule movement consists even mainly in the land question. The social reformer is met at every turn by obstacles due to excessive centralization; red tape of imperial departments; ignorance, apathy, and neglect of the officials in London whose consent is necessary, or without whose concurrence no private Irish bill can pass through Parliament. The British Treasury, into whose hands 10 million pounds sterling passes every year from Ireland, scents a job in every proposal for expenditure in Ireland; and rightly so, for the system of governing Ireland from London has been and is saturated with jobbery and extravagance. It is impossible for the Treasury to discern the merits and demerits of the proposals laid before them, to decide whether a plan urged on them by "influential" persons in Ireland is meant to create new posts for private friends or political supporters, or to benefit the taxpayers.

In an excellent school-book, 'The English Citizen,' the author, Mr. Wyatt, describes the existing representative government in England thus: "The people send their representatives to Parliament to make laws and control the great executive departments; the people elect from among themselves those who carry on the local government of the village, the town, and the county; the people pay the rates and taxes, and they elect those who have the care of the public purse and the spending of the public money." No part of this description would apply to Ireland except that the people pay the rates and taxes. Representative government does not exist in local affairs, and in imperial matters Irishmen have practically no control in the raising or spending of the taxes paid into the imperial exchequer.

AN IRISHMAN.

BOTTICELLI'S ILLUSTRATIONS TO THE DIVINA COMMEDIA.

FLORENCE, October 22, 1896.

THE publication in a form almost popular of Sandro Botticelli's drawings for Dante's 'Divina Commedia' has long been called for, and is at last accomplished.* Something has been lost in reducing the illustrations to half the size of the originals. One or two have become quite inextricable in their entanglement, and the first sketching in with silver point has nearly disappeared. But these slight losses are more than recompensed by the comparatively small price and the extreme handiness of the present edition, bound in book form. Dr. Lippmann's introduction and commentary leave little or nothing to be desired in the way of information or elucidation.

To many these illustrations will be disappointing. They have heard that Botticelli was a great artist, and they expect him to give them, to an even intenser degree, feelings of the kind and quality that they have had in reading Dante. None of the gloom, the chill dread, the passion, the despair, the luridness of the "Inferno" will be brought home to them as they turn over Botticelli's designs. They will find scarcely an attempt at dramatic expression; they will find many more instances of the unconscious grotesque than of the realized sublime; and, throughout, conceptions as infantile as Fra Angelico's, but seldom so winning. Nor, taken as real illustration, are matters much improved in the "Purgatorio." There is no trace in Botticelli of the feeling of hope and convalescence and early morning which penetrates you as you read these cantos of Dante. And Sandro's "Paradiso" fails no less in communicating the one essential quality of this part of the poem—its sublimity. Here again the artist remains shut up in the Fra Angelico world. All in all, Rossetti's "Blessed Damozel" would have been a fitter subject for Botticelli's fancy than Dante's 'Divina Commedia.'

As illustrator, then, to the 'Divina Commedia,' Botticelli, it must be acknowledged, disappoints, partly because his genius was not at all Dantesque, but chiefly because the poem does not lend itself to satisfactory illustration. Although Dante describes with a vividness and tangibility surpassing all other poets', his effects seldom result from an appeal to vision only. Yet visual form, so small a part of the poet's outfit, is the illustrator's entire tool-chest. All his effects must come through it, and can come by it only. Think of making mere outline, as in the case of Botticelli's illustrations, convey all the manifold sensations, all the passions and emotions, which rapidly succeed each other in Dante's verses! One might as well attempt to render Beethoven's Ninth Symphony or Berlioz's "Dies Iræ" with no other instrument than the French horn.

And even if it were possible to make outline convey feelings as full and penetrating as Dante's, which episodes should the illustrator choose? They follow each other in bewildering number, with no connection in the realm of visually representable things, held together by nothing more tangible than the emotional tone of each canto. The fact is that Dante is not a great epic or dramatic poet. He has none of those stretches of culminating narrative, none of the working up to a climax, which lend themselves so admirably to the exercise of the visual imagination. In spite of the fact that he wrote one of the longest real poems in existence, and that this is apparently a narrative, Dante as a poet is great only as a master of the lyric, or (to make a concession) of the "dramatic lyric." Now the lyric is beyond the reach of the illustrator.

Dante does not lend himself to illustration; and, even if he did, Botticelli was not the man for the task. Then, pray, what is the value of these drawings? The answer is simple enough. Their value consists in their being drawings by Botticelli, not at all in their being drawings for Dante. And at this point the honest showman should warn the public that a drawing by Botticelli is something very peculiar. It does not so much as attempt to be correct; it is not a faithful reproduction of anything whatsoever. A hundred "artist-journalists" now at work publish daily drawings which are far more exact, more life-like, more clever, and more brilliant than any you will find in Botticelli's designs for the 'Divina Commedia.' If that is the only kind of drawing you care for, you will be no less disappointed in Sandro than if you went to him for interpretative illustration. His real place as a draughtsman is not among great Europeans, but with the great Chinese and Japanese, with Ririomin, Haronobu, and Hokusai. Like these, he is a supreme master of the single line. He gives it a swiftness and a purity which in the whole world of sensation find their analogy only in some few ecstatic notes of the violin, or in the most crystalline *timbre* of the soprano voice. His universe was of the simplest. It consisted of things that could and of things that could not furnish themes for rhapsodies in swift, pure lines. Dante happened to find himself among the blessed in this simple division; hence Botticelli chose him as a subject for his art. These illustrations required of our artist no coloring—with him always an afterthought—and scarcely any stereotyped composition. Here he could be free as nowhere else, and here, therefore, we see him in his most unadulterated form. The value of these drawings consists in their being the most spontaneous product of the greatest master of the single line that our modern Western world has yet possessed.

Now let us look at a few of these designs, beginning with the "Inferno," where Botticelli, feeling himself most weighed down by the story, is least himself. What do we see as we turn to the drawing for the opening canto? In the first place, a fretwork arrangement of exquisite pen strokes, by itself as pleasant as light on rippling water. Looked at closer, this smiling fretwork becomes a wood of graceful stems, whose branches cross and recross like the rapiers of courteous fencers. In rhythmic balance to the mass of this dainty forest you have a tangle of flower-bushes. Between, ramp three heraldic beasts, performing a figure with four men whose long cloaks fall into lines as swift and almost as pure as those of the tree stems. I defy any one to read gloom and terror into this piece of lineal decoration. Or turn to the illustration for Inf. xiii. Again a marvellous fretwork of lines which, seen closer, resolve themselves into a tangled wood where decorative dogs leap at decorative nudes, while even more decorative harpies sit upon the branches. We are in the pound of the suicides, but it would take a child with a feverish imagination to get a shiver out of this design. I will not deny that, in other sheets—indeed, in many of those for the "Inferno"—there is somewhat more correspondence with the text, but I doubt whether it ever is enough to be satisfactory as expression, while it is precisely in such drawings that the artist is least satisfactory as pure art. What does occur at times is a fortunate accord between the way Botticelli would naturally treat a subject and Dante's feeling about it. This occurs rarely in the "Inferno," where it would be hard to instance another example than that of the hypocrites under their copes of lead (singularly Japanese, by the way, in movement of line); but,

*'Drawings by Sandro Botticelli for Dante's Divina Commedia.' Reduced facsimiles after the originals in the Royal Museum, Berlin, and in the Vatican Library, with an Introduction by F. Lippmann. London: Lawrence & Bullen; New York: Dodd, Mead & Co. 1896. Imperial quarto.

out of the "Inferno," as we shall see, this accord gets more and more frequent.

But Botticelli's strength was not in arrangement alone. He was, above everything, master of the line in movement. He loved to make it run and leap, to make it whirl and dance. He was truly great only when he had a theme which permitted the exercise of this mastery. Such themes the "Purgatorio" and "Paradiso" offered him in plenty. Examples become too many to cite, and I shall confine myself to a few of the best. You will rarely see a frieze of greater decorative beauty than is formed by the nudes leaping into the purgatorial flames, as if they were the waters of the Fountain of Youth, while Virgil and Statius and Dante pass by discoursing on the relation between soul and body. This is the illustration to Purg. xxv, and, after this one, every consecutive drawing becomes, if possible, more and more beautiful. The flames leap even higher, and the nudes are worked in with them even more harmoniously. And presently you come to a design whose beauty keeps you spellbound: rare trees shoot up with exquisite grace, and between them you see the poets breathing gladly and gazing at the pure ether. One lady, with fascinating movement of figure and flutter of drapery, is gathering flowers, and another addresses the poets. Are we in Dante's terrestrial Paradise, or in Poliziano's Realm of Venus? No matter which, it could not be more lovely. This is followed by a succession of scenes in which Botticelli's talents find their completest satisfaction: the car of the Church, the grandly draped elders, the dancing, flower-scattering angels, the torch-bearers, the streaming smoke, the heraldic beasts—each and all so many exquisitely drawn laughing, leaping, whirling lines in wonderful arrangement. But the crown of the whole work is still to come: it is the design for Par. i. The daintiest trees ever drawn wave softly over a smooth meadow wet by the water of Eunoe's placid stream. Behind the rare leafage of the reed-like trees, Beatrice and Dante, with faces of ecstasy, are wafted gently up to the higher spheres. To convey in words a sensation corresponding to the singular beauty of this page would require Dante himself, or perhaps Shakspere or Keats. Line, movement, and pattern can go no further. None of the remaining illustrations can be put beside this one; yet they are all lovely. The type of them is the one for Par. vi—a pure circle studded with exquisite flamelets, Beatrice pointing upward as she floats, and Dante with his face and hands expressive of the utmost ecstasy. The flicker of the flamelets, the flutters of the draperies, the bending towards each other of the two figures, with the whole enclosed in a pure circle, form one of those happy patterns which, for the very reason of their childlike simplicity, one can gaze at for hours, being soothed and refreshed.

To the few scores, or let us hope, hundreds the world over, who feel the difference between art and illustration, as well as between art and fidelity to nature or mere dexterity, Dr. Lippmann's publication is one of the great events of recent years. B. Berenson.

Correspondence.

THE MORAL OF IT.

To the Editor of The Nation:

Sir: At the present time McKinley appears to have 277 electoral votes, of which but 127 were cast for Harrison four years ago, when the campaign was on the question of tariff reform. Connecticut, New York, New Jersey, Delaware, Maryland, West Virginia, Kentucky, Indiana, Illinois, Wisconsin, and California declared as emphatically against protection in 1892 as they have against free silver in 1896. That any party could carry an election without the electoral votes of a large part of these States is exceedingly doubtful. Would it not be well for those who are demanding a new tariff bill to bear this in mind?

F. L. Bonney.

Boston, November 6, 1896.

PRINCETON'S UNIVERSITY INNOVATION.

To the Editor of The Nation:

Sir: As I have not noticed in your columns any allusion to the Princeton celebration, permit me to call attention to one of its aspects that has been little emphasized in the accounts in the daily and weekly papers. In inviting a number of distinguished foreign scholars to deliver courses of lectures on scientific and literary subjects during the week preceding the actual celebration, the authorities of Princeton took a step which should do more to make the occasion memorable than the burning of any amount of colored fire or the delivery of any number of after-dinner speeches, necessary as these adjuncts may be to a celebration. So far as is known to the writer, this step was a distinct innovation. To be sure, we have frequently had distinguished foreigners lecturing among us, but not usually to adorn such an occasion as this, nor upon such severe subjects. In Germany the excellent custom prevails, and it has lately been imitated in this country, that when a learned professor celebrates his jubilee, some of his former students join in the occasion by contributing pieces of original research, which they publish in the form of a book dedicated to the master. What could be a more suitable and permanent tribute? In like manner, what more appropriate to an academic celebration than the contribution, under the auspices of the university, of something of permanent value to the intellectual public?

As regards the quality of the lectures at Princeton, I will speak only of those of the most personal interest to myself. In inviting Professors Felix Klein and J. J. Thomson, the Princeton authorities secured two scientists of the first order in the departments of mathematics and physics; and the interest aroused in their lectures is attested by the fact that among their auditors were university professors from as far West as Chicago, and from Cambridge to Washington. These lectures were not a presentation of matter familiar even to a European public, but dealt with new, fresh, and extremely interesting problems. In his lectures on the Theory of the Top, Prof. Klein gave in a very concise form a brilliant and extremely suggestive exposition of the application of some of the latest developments of the Theory of Functions to a problem that has exercised some of the greatest minds among mathematicians, physicists, and astronomers. That the very recent subject of Automorphic or Fuchsian Functions should be necessary for the treatment of the motion of an ordinary peg-top shows how much our mathematical methods will bear perfecting. Prof. Thomson, on the other hand, took as his subject what is practically a brand-new field, for while the phenomena of the Discharge of Electricity in Gases have been studied for years, very little of a satisfactory nature has been accomplished until quite recently. Moreover, some of the most interesting of these phenomena, those which occur in connection with the Röntgen Rays, were not known to exist earlier than last December. The lecturer devoted himself largely to the presentation of the results of his own work, giving evidence of an almost incredible degree of productiveness in the last few months, the results being no half-baked heterogeneous data, but fitting into well-considered theories in such a manner as to give rise to the conviction that we are on the verge of important discoveries in the domain of molecular physics.

I feel safe in saying that these two courses might have been attended with profit by every mathematician or physicist in the country, each of whom could hardly have failed to derive some inspiration therefrom. I am not aware that the authorities of Princeton have formally stated what they understand by the transformation of a college into a university, but may we not infer that the step that they have here taken betokens a true university spirit, and forms a fitting introduction to a career under the new and more imposing title? Arthur Gordon Webster.

Worcester, Mass., November 2, 1896.

ENGLISH IN PREPARATORY SCHOOLS.

To the Editor of The Nation:

Sir: I have watched the debates on English teaching in the preparatory schools with surprise that one grave element of the problem should be so generally ignored. The professor and the littérateur might be expected to overlook a financial factor in practical education, but that the teacher should so suffer his case to go by default is passing strange. Permit me to state the problem for which thousands of teachers wish a solution.

Skill in composition is a question of practice under guidance and with criticism. Last year I sent to hundreds of teachers these words: "Long experience in the reading of themes would seem to prove that the careful criticism of twenty pages—letter-sheet size—about four thousand words—is a reasonable hour's work. Every pupil in the high school should write each week at least four pages, eight hundred words." Not in a single instance did this statement meet with dissent, but the teachers knew and I knew that the high school does not exist where these conditions can be satisfied. Any taxpayer whose wrath is great because his son is not better taught in composition, will find his indignation abating if he will but make a brief calculation. If one pupil writes four pages per week, and one teacher reads, with written criticism, twenty pages per hour, for what number of pupils will the whole time of one teacher suffice? Can the taxpayer solve that problem? If he can, the secondary schools can go far towards solving their problem.

But what is the answer as found to-day in our schools? Exceptional opportunities for observation give warrant for the statement that it is common custom with school-boards to require of the teacher of English as many hours in the recitation room as are given by any other teacher on the staff, and that the utmost allowance granted for the criticism of papers is, with rare exceptions, forty-five minutes a day, although the pupils instructed may exceed two hundred. When the day's

work in the class-room is finished, the teacher turns with weary brain to the exhausting toil of criticism, and donates to the public as much labor as her conscience compels or her strength permits.

Assuredly, our masters demand the full tale of brick, but grant us no straw. The profession of English teaching loses many competent teachers, notwithstanding its attractiveness, because the burden of essay criticism, imposed but not paid for, is greater than they can bear. The secondary schools could meet without difficulty the full demand of Harvard—I speak from experience—if adequate provision in time and teaching skill were granted by those who hold the purse-strings.

C. D.

November 4, 1896.

To the Editor of The Nation:

Sir: The ignorance of English among college freshmen has narrowly missed becoming much worse. It is admitted that those students have formed their style, so far as they have any, on the newspapers which they read as soon as they could read at all. In them were their first holiday excursions from dull drilling in readers. To them they owe their vocabulary, their grammar, rhetoric, orthography. In all departments the literary standing of country papers, which have furnished the main reading for the childhood of half our collegians, has been as a rule very low. In many cases a boy would learn from such models more errors than truths. The inevitable result would prove the paradox true, that the more one learns the less he may know; his ignorance growing greater and greater in proportion to his knowledge. Thus in the lowest deep a lower deep was still opening: the greater the quantity of information, the worse its quality.

But half these baleful influences of the rural press have now passed away. A majority of country papers now show on half their pages no bad spelling, nothing ungrammatical, scarcely a word misused or misplaced. If classically dull, all is coldly correct—proper words in proper places. These pages, too, which do not shrink from criticism, contain original articles by well-paid writers which form attractive reading, and the selections in themselves and by pictorial decorations fascinate every country child. This better half (forming the "patent insides" or "outsides") is the half for the last decade or two most read at farmers' firesides by the children who are still in their plastic period. Through the attractions of these non-local portions, the patent insides or outsides, many an element of accuracy and sound speech which cannot be condemned has been revealed unto babes while hid from their wise and prudent fathers, whose eyes seldom wander beyond the uncouth columns of illiterate home talent and home presswork. Had the improvement of preparatory schools during the last score of years kept pace with that of preparatory newspapers, the wall which preparatory students build would have been so propped where it was weakest, that college master builders would find little fault with the foundations laid for their superstructures. James D. Butler.

CHAUCER IN ITALY.

To the Editor of The Nation:

Sir: With regard to a recent correspondence in your columns on "Chaucer's First Italian Journey," I beg to draw attention to the fact that the date assigned there to this journey (December 1, 1372, to May 23, 1373) is the date first given to the world in the 'Fresh Chaucer Notices' published December 20, 1873, by Dr. Furnivall. Dr. F. gives in this publication (which was later added to the 'Trial Forewords'), unfortunately in the succinctness of a "Calendar," the following note (p. 130):

"Exchequer to pay C. for his journeys to Genoa and Florence, 1374 or 3. Exch. L. T. R. *Foreign Accounts*, 47 Ed. 3, Roll 3.

"C.'s accounts for his journeys to Genoa and Florence, from 1 Dec., 1372, to 23 May, 1373."

When I saw this years ago, it became clear to me that May 23 marked the last day of his journey, and was to be accepted as such until some new proof should be brought to show the contrary. I used this "new" date in all the syllabi even of my beginners' classes in Chaucer, and have often been astonished to see this "new" date persistently ignored. This astonishment prompted me to write the following words in my review of Skeat's Chaucer, printed in the *Dial* of February 16, 1895:

"In the annalistic biography I do not miss anything; but when, under 1373, Dr. Skeat says of Chaucer's first visit to Italy, 'All that is known of this mission is that he visited Florence as well as Genoa, and that he returned before November 22, 1373, on which day he received his pension in person,' he does not lay sufficient stress on the fact, brought to light by Dr. Furnivall in 1873, and mentioned by Skeat only in a note, that Chaucer's accounts of this journey run for the period between December 1, 1372, to May 23, 1373. It would be strange indeed if these accounts had stopped in the midst of his journey. The more natural interpretation seems to be, that Chaucer's journey did not last more than six months; and so this document would corroborate what Prof. Lounsbury expressed, for the first time, I think, in the introduction to his edition of the 'Parliament of Foules'—that Chaucer had no time to learn Italian in Italy, but was sent there just because of his knowledge of the Italian language. Besides, the document seems to show that Chaucer returned months before the 22d of November [1373], there being no evidence that he stayed longer than May 23. The burden of proof then rests upon those who assume the later date."

Let me add in conclusion that I am very glad to learn that the document itself will, finally, be made accessible; it will, as the extracts show (*quo die rediit Lond.*), give conclusive proof of what before was only to be surmised from Furnivall's too short abstract. We fortunately have so many documents connected with Chaucer's name that I think it would be a debt of gratitude to Fate to print a whole volume of "Chaucer Documents," and the sooner the better.—Yours respectfully,

Ewald Flügel.

Stanford University, October 15, 1896.

To the Editor of The Nation:

Sir: The conclusiveness of Miss Scott's argument that Chaucer met Petrarch at Padua or at Arqua in 1372 or 1373 rests on the assumption that Chaucer is to be identified with the "Clerk of Oxenford." From the descriptions of the two in the 'Canterbury Tales' we know they both were shy. But, on the other hand, the Clerk is lean (A 287-288):

"As lene was his hors as is a rake,
And he nas nat right fat, I undertake";

while from the Prologue to the Rime of Sir Thopas we are probably to infer that Chaucer is represented in the 'Canterbury Tales' as portly—a description that agrees with the portrait in Occleve (B 1889–1892):

"Now war yow, sirs, and lat this man have place;
He in the waast is shape as wel as I;
This were a popet in an arm t'enbrace
For any womman, smal and fair of face."

Here, however, it is not absolutely impossible to take the second line as ironical rather than the third and fourth.

Moreover, if the Clerk and Chaucer are to be identified, Chaucer himself is the only person to whom three tales are assigned.

Again, the Clerk bears less resemblance to the Chaucer of later years than does the Squire to Chaucer in his youth. In 1359 Chaucer held some position, not clearly defined, in the train of Lionel afterward Duke of Clarence, whom he accompanied on King Edward's expedition to France. The country visited on this occasion was not greatly different from the scene of the travels of the Squire, who

"had been sometyme in chivachye
In Flaundres, in Artoys, and Picardye."

Numerous references to early poems now lost make it probable that Chaucer exercised his poetic faculty very young; and behind the existing early poems, from which some good biographers have inferred unutterable heart-burnings, we may, if we will, see the half-scrutable smile that tells us Chaucer has been only such another "lovyere and a lusty bachilere" as his own Squire.

It is, then, highly improbable that Chaucer intended any one of his pilgrims for a faithful copy of himself, unless it be the slightly sketched figure always mentioned in the first person. Of Chaucer, as of Shakspere, we may say that every line of his that really lives is impregnated with his personality. In his poetry he made freer use of his own personal history than did Shakspere, but his history no less than his personality is subjected to his art, and biographical satisfaction is not often found. With a poet's instinct he has preferred to open to us vistas of charming possibilities, and to leave us to their contemplation unannoyed by the officiousness of a cicerone. Henry Barrett Hinckley.

Northampton, Mass., October 24, 1896.

Notes.

Miss Mary Kingsley, who has inherited her father's love of travel and of nature, will publish through Macmillan her 'Log of a Naturalist in West Africa,' north of the Congo. The same house announces 'Domestic Service,' by Prof. Lucy M. Salmon of Vassar; 'Charles Darwin and the Theory of Natural Selection,' by Edward B. Poulton; and 'Michael Faraday, his Life and Work,' by Prof. Sylvanus P. Thompson.

'Philip Gilbert Hamerton: An Autobiography (1834-1858), and a Memoir by his Wife (1858–1894)' will bear of right the imprint of Roberts Bros., Boston, familiar in connection with this writer's works.

Mr. Frank R. Stockton will contribute the 'Story of New Jersey,' and Mr. Joel Chandler Harris the 'Story of Georgia,' to Messrs. Appleton's "Stories from American History."

'Karine; A Story of Swedish Love,' is in the press of A. C. McClurg & Co., Chicago.

A complete edition of Alexander Kielland's works, in sixteen volumes, is announced by Gyldendal of Copenhagen. Although Kielland's first novel appeared less than twenty years ago, he has published nothing during the past five years, and it seems hardly probable

that any additions will be made to the series here announced.

It is now five years since we essayed an estimate of the taking and the permanent qualities of Mr. John Fiske's 'American Revolution.' We should have been flattered, in the revision the work has undergone, to see the minor blemishes we then remarked removed from the new edition just brought out by his publishers, Houghton, Mifflin & Co.; but we accept as compensation for a neglect of our strictures, as well as for the sufficiently popular-patriotic tone of the whole narrative, Mr. Fiske's new concluding paragraph, ranking the Geneva settlement of the *Alabama* claims above the victories at Saratoga and Yorktown, and breathing a prayer for the success of Anglo-Saxon international arbitration. It remains to speak only of the remarkable beauty of this reprint, as bookmaking, with the wealth of illustrations almost without exception genuinely helpful—antiquarian and historical; carefully selected portraits; contemporary prints; caricatures; maps; views of buildings and places, etc., with a minimum of imaginative work. The portraits are generally engraved and set in the text, but there are numerous and excellent photogravures, and the whole series is indexed with admirable particularity as to source. This history is now assured of a fresh lease of life.

Very dainty indeed and quite another affair for the reader's hand, are the two volumes of Thoreau's 'Cape Cod,' to which the same publishers give a holiday attire. The copious illustrations, nearly all marginal, are from water-color drawings by Amelia M. Watson, and no one familiar with the Cape will deny their characteristic fidelity. They are fairly to be called charming, as are the print and binding; and happily they are mostly "centred" on the page—that is, they square with the text, either above or below. We ask any one to judge whether typographic taste is not subserved better, say, by the offshore view at the head of p. 35, vol. ii., than by the trailing vine on the following pp. 54, 55, or by the diagonals of bayberry on pp. 136, 137, vol. i. But these eccentricities, for which, we suppose, the art of Japan is ultimately responsible, are comparatively few in number. The vignette on p. 30, vol. ii., pretty enough in itself, fails as an illustration, the sun setting over Provincetown (presumably); but if this be possible in nature, it is not what Thoreau saw—*his* sun "set in the Bay," and it seemed odd to him "that at the same moment the sun was setting behind our native hills, which were just below the horizon in that direction."

Mr. Gosse gives, in his introduction to a new edition of Carlyle's 'Heroes and Hero-Worship' (London and New York: Ward, Lock & Bowden), a surprising estimate of the extensive sale of this work in fifty-five years, without present abatement. This latest form of it therefore properly belongs to the series of "Nineteenth Century Classics," and is in all respects attractive to the eye and likely to enlist the curiosity of fresh readers. The frontispiece is after Millais's unfinished portrait.

Mr. Anning Bell's five designs give the chief distinction to Keble's 'Christian Year' as reissued by Methuen & Co., London (Philadelphia: Lippincott). They are simple, slightly archaic, and skilful, and harmonize well with the heavy black type and rubrication of the pretty volume.

The advent of a new and considerably enlarged edition of Prof. Cunningham's 'Growth of English Industry and Commerce during the Early and Middle Ages' (Cambridge (Eng.) University Press; New York: Macmillan), furnishes pleasing evidence of the increasing attention now paid to economic history, and of the author's just reputation and unflagging industry. There are innumerable slight corrections and additions; the treatment of several points, especially in the fourteenth and fifteenth centuries, has been amplified; and some conclusions of the earlier edition to which exception had been taken are restated with fresh evidence. On most points in dispute Prof. Cunningham abides by the opinions he has already expressed; but on the subject of the changes in craft gilds in the sixteenth century he tells us that he has "considerably modified" his view "in consequence of Prof. Ashley's recently published investigation." Oresme's "Tractatus de Origine Monetarum" is no longer reprinted in the appendix, but it is hinted that the Syndics of the Press may shortly issue it in a separate form. We trust that when it comes to be edited, due consideration will be given to Endemann's criticism of Roscher's eulogy. Among the welcome additions to the appendix may be noticed the Anglo-Saxon description of the duties of a Reeve (hitherto to be found only in *Anglia*), with a translation and notes contributed by Prof. Skeat. Whatever may be thought of Prof. Cunningham's general conclusions, the book is an inexhaustible mine of learning and suggestion, and arouses a feeling of personal gratitude in all serious students of the subject.

'American Book-Prices Current' for the year ending September 1, 1896, compiled by Luther S. Livingston and published in a limited edition of 600 copies by Dodd, Mead & Co., turns over a new leaf in respect of arrangement, which in the former and initial volume followed the English example. Grouping by sales is now discarded, but the books sold are alphabetized by author or (if anonymous) by title, with the date of sale affixed to each entry, while the index is of subjects, with classification. The compiler has especially catered to the present passion for American local history and genealogy. A wholly new feature is a section of autograph and manuscript sales, in a separate alphabet. As the minimum price considered is $3, it will be seen that these 7,500 lots embrace nearly everything which has auctionable value. Cincinnati sales have been added to those of New York, Boston, and Philadelphia—whether for the nonce or not remains to be seen. On the whole, one can but praise as improvements the changes we have briefly indicated. The work remains very useful for bibliographical reference in the whole field of literature in English.

'Syria from the Saddle,' by Albert Payson Terhune, published by Silver, Burdett & Co. of Boston, is a record of a trip through Palestine in the late autumn and early winter of 1893. Mr. Terhune entered the country by way of Beirut and Damascus. He travelled alone with a good dragoman, who provided for his comfort admirably, and he enjoyed himself thoroughly. His manifest enjoyment of what he did and what he saw is the one thing which makes the book readable, for he has absolutely nothing new to tell. He alludes frequently to the numerous weighty and uninteresting tomes which, as he alleges, have been written about Palestine, and in contrast with these he seeks to make his own book light. The result is a flippancy which ultimately becomes tedious. In his preface he says that he has tried "to glean a few great historical and sacred facts from the mass of foolish and priestly traditions that surround every landmark of the country." As he is quite ignorant of the history and archæology of the country, his gleanings are worthless and sometimes almost laughable. To illustrate his unfitness for such work, he seems to regard the word "Aryan" as synonymous with "Oriental," and accordingly classes the Syrians as Aryans. The book is well printed on good paper. The illustrations, which are numerous and very fair, are chiefly from photographs taken by the author.

Some nine years ago we reported the publication, then recent, of an elaborate Hindî treatise on the Differential Calculus. To its author, Mahâmahopâdhyâya Sudhâkara Dvivedî, who has since become Professor of Mathematics and Astronomy in the Benares Sanskrit College, his fellow-countrymen are now indebted for a companion work, also in Hindî, on the Integral Calculus, bearing the imprint of the Government Press, Allahabad. Besides a preface and a minute table of contents, it occupies 443 generous pages. Its title, necessarily Sanskritic, is *Chala-râs'i-kalana*. No mere translation or compilation, it propounds numerous new methods, with the claim of their being simplifications of those current among European mathematicians. One of these, in connection with which such accepted authorities as Todhunter, Williamson, Hymers, De Morgan, and De Moivre are taxed with operoseness, is stated at length in English. The volume concludes with much valuable matter on the Calculus of Variations and the Dynamics of a Particle. In the occupancy, by Pandit Sudhâkara, of the chair long so ably filled by the learned Bâpûdeva S'âstrî, the Benares College is conspicuously fortunate.

We have received the first two parts of a Lexicon Frisicum ('Friesch Woordenboek') planned to be exhaustive of the genuine living Frisian speech. We say *genuine*, for the so-called East Frisian Dictionary of Koolman is not a dictionary of Frisian but of the Low German which has encroached upon lands once part of Frisia. The present work is professedly a continuation and expansion of the Lexicon Frisicum of the late J. H. Halbertsma, which covered the alphabet *A—Feer*. The present editors are Dijkstra and Hettema, with whom is associated Winkler for proper names. The work is published by authority of the province of Frisia and the Upper Council of Holland. Definitions and explanations are in Dutch, with an occasional definition in Latin; thus, "āld, adj., *vetus, senescens*, oud." The two parts comprise 80 pages in double columns of ordinary words, ending with *bapekauwer*, and 64 pages of proper names, ending with *Dirk*. These figures will give some idea of the comprehensiveness of the whole work (in about 25 parts). The publishers are Meijer & Schaafsma, in Leeuwarden. James Parker & Co., Oxford, are agents for Great Britain and this country. The price of each part is two shillings. It is hardly necessary to say that we greet the new enterprise most cordially; it will be a valuable contribution to our knowledge of that speech which is probably most akin to our own. On some future occasion, when the work is farther advanced, we hope to speak more in detail of its special features. In the meanwhile we need only say that the names of the editors are a sufficient guarantee of scholarly method.

The domain of Keltic study is to be enriched with a new periodical by the side of the elder *Revue Celtique*. The present enterprise is entitled *Zeitschrift für Celtische Philolo-*

gie, under the editorship of Kuno Meyer and L. C. Stern (Halle: Niemeyer). We are indebted to David Nutt, London, for the first part (pp. 176). The periodical is to be at once scientific and cosmopolitan. The present part contains papers upon General Keltic Philology, upon Gaulish, Manx, Welsh, Breton, and Irish, written in German, French, and English. To give, within our narrow limits, even a slight notion of the range and value of the contents would be of course impossible. All the papers seem to us excellent and valuable, each paper in its own way. We are curious, however, to see whether the elder *Revue* is to maintain its existence in competition with the new *Zeitschrift*, or is to be merged in it. We anticipate the latter. In one feature certainly the *Zeitschrift* gives abundant evidence of editorial vigor: it is no small feat to have brought "under one roof" two such antagonists as Zimmer and Whitley Stokes.

On October 10, Holger Drachmann, the leading Danish poet and novelist, celebrated his fiftieth birthday and his twenty fifth "Author-Jubilee," as the Danes call it. On account of the illness of the poet, who is at present living in Hamburg, the public demonstrations were limited to the sending of an enormous number of telegrams from admirers in Europe and America, and the performance of two of his plays at the Royal Theatre in Copenhagen and at the Stadt Theatre in Altona. English readers, whose acquaintance with Drachmann is limited to one romance, will be surprised to learn that he is the author of no fewer than forty-six volumes of poems, dramas, novels, short stories, and sketches, and of two unpublished dramas. After devoting the first years of his manhood to marine painting, Drachmann suddenly discovered that he was a poet; his new talent finding expression in a volume of lyrics now for the first time republished. His most important novel is 'Forskrevet' (Condemned), which is largely autobiographical; his most attractive, though not his strongest, drama is the opera "Der var engang" (Once upon a Time), founded on Andersen's 'The Swineherd,' with music by Lange-Müller; his best poems and tales are those dealing with the sea. His verse has a splendid sweep like that of the ocean waves he loves to describe, and the waves are Danish waves. For, in spite of his wandering habits, Drachmann is as Danish as Holberg, with that combination of sweetness and strength which Norwegians mistake for weakness. With his great height, broad shoulders, and flashing eyes, Holger Drachmann looks like a true poet, though a poet of the Elizabethan rather than of the nineteenth-century type.

From Copenhagen is announced the death of Emil Christian Count Krag-Juel-Vind-Frijs, the greatest landowner in Denmark and at one time one of the leading Danish public men. Count Frijs was born December 8, 1817. In 1858 he entered the Rigsdag, and in 1865 became President of the Council, in which position he effected the constitutional changes that still obtain. His greatest service to his country, however, was rendered soon after his retirement in 1870, when he resisted public feeling, especially that of the capital, by preserving Denmark's neutrality in the Franco-Prussian war. How great and how difficult a service this was, no people can appreciate better than we Americans of this present Jingo period. But it was to his estate and his people that Frijs's energies were devoted; and his tenants, the majority of whom became independent landowners through his efforts, have always been among the most prosperous and contented in Denmark. Count Frijs was one of the very few persons outside of royalty on whom the order of the Elephant had been conferred.

—It will surprise no one who watches the signs of the times in the magazines to find that in the *Atlantic* for November the foreign and Western elements of our population are subjects uppermost with writers of papers of practical import. The cases which Jacob A. Riis has selected to illustrate, in his article "Out of the Book of Humanity," the burdens of pathetic destiny, are all taken not merely from the immigrant denizens of New York, but from that large portion of them to which our language is a foreign tongue. The German, as he appears in the steerage of an outward-bound ship, and the German-American, as he adds to or detracts from the spiritual as well as commercial welfare of the country, are sympathetically discussed by "Josiah Flynt." That the German-American, having slipped his moorings from a country where manners and etiquette are important, where Government bears heavily upon him, and where earnings are small, should be charged on the side of his losses with giving himself up to a "materialism more or less gross," and inclining to value life purely in dollars and cents, is not to be wondered at. That he, together with the shrewder Scandinavian, is safer than our Americans "in this day of crazes" is a verdict pronounced in his favor by Prof. J. Laurence Laughlin, who, in a graphic paper on the "Causes of Agricultural Unrest," emphasizes the "satanic" skill with which the managers of the silver party, at first stealthily and secretly, and later with noise and open activity, have played upon the discontent of the wheat-farmer and cotton-grower. The developments special to agriculture radiating all over the world and narrowing in upon himself, our Western farmer has not the economic outlook to understand. Hence, and through no fault of his honesty, his present unholy political alliances. Methods of farming which have avoided agricultural ups and downs are described in William E. Smythe's "Utah as an Industrial Object-Lesson."

—How the Chinaman compares in the personal observation of a city missionary with other foreign contingents of the population of New York may be learned from an article in this month's *Century* by Helen F. Clark. Measured by the standards of races out of which citizens are promptly made, this "alien" has various points, in manners, in morals, and in the tone, even, of his amusements, to recommend him. To philanthropists, struggling with the vexed questions of humanity in asylums and penal institutions, he gives cause for gratitude, since he makes it a habit to keep out of these popular retreats and to look after his own poor. General Horace Porter enters in this number upon his reminiscences of campaigning with General Grant. To the eulogy with which his memoirs are introduced in an "Editorial Preface" it would be difficult to find anything fresh to add. "Why the Confederacy Failed" is a paper recommended by the strength of personal conviction and the liveliness with which it is written, whether or not the reader may be disposed to find other causes of failure than the three here given, viz., the excessive issue of paper money, the policy of dispersing troops along an extended frontier, and the neglect of the cavalry. Serial stories are begun by Dr. Weir Mitchell and Marion Crawford, and Boutet de Monvel contributes illustrations of the life of Joan of Arc. But the intrinsic value of the number is centred in Prof. G. E. Woodberry's sonnet-series, "America and England, 1895-1896," in which a grave political theme is warmed and elevated to a high poetic level.

—In *Harper's Magazine* a profitable subject for reflection is brought forward by Prof. Woodrow Wilson's treatment of the character and bearing of "The First President of the United States." This is the dignity with which Washington, although so glad to resign his high office, strenuously surrounded it while he held it; a Governor of Massachusetts, a French Minister, and factions of the people themselves in headlong haste to espouse the cause of the French Revolution, being among those who fell back before the authority they found hedging the President of a republic. There is reason to hope that in the downward plunge from Washington's ideals to the tainted conceptions of the present the lowest depth has been reached. The moral to be drawn from this last of Prof. Wilson's increasingly interesting series of biographical studies is reinforced by Poultney Bigelow, whose first investigations, undertaken in the interest of readers of *Harper's*, of "White Man's Africa," disclose the not unparalleled fact that, "in the memory of the oldest inhabitant of Cape Town, such a thing as an American Consul who could keep sober after twelve o'clock noon was too seldom known"; large interests, not merely at the Cape, but throughout South Africa being nevertheless at the mercy of the Consul. Thomas A. Janvier, delightfully at home in the voluble atmosphere of Marseilles, has needed for the weaving of his picturesque story, "The Fish of M. Quissard," nothing more than trifles light as air, since it is in the artistic manner of doing more than in the thing done that the charm of this bit of human comedy is to be found.

—In the current *Scribner's*, Capt. C. J. Melliss of the Bombay Infantry draws again on his excellent repertory of sporting adventures in the jungle. The several yarns he now spins of panthers bagged in the sweat of the brow in central India deserve to be punctuated by the applause of after-dinner audiences, to which it is a pity they should be lost. Some masterly illustrations of the wily game are Evert Van Muyden's conspicuous share in the success of these stories in article form. Other adventures, involving the hardships of an exploring expedition in frozen Alaska and the British Northwest Territory, are described in an article by Frederick Funston, "Over the Chilkoot Pass to the Yukon," to which a kodak has supplied the basis for illustrations. Illustrations *ad libitum* accompany M. H. Spielmann's article on the "Renaissance of Lithography," but the rewards attending a perusal of the text are inappreciable. Equally unproductive of anything more than a brushing of the skirts of information is a reading of Mary Gay Humphrey's "Women Bachelors in New York," and, with the exception of Wolcott Le Cléar Beard's tale of an Arizona hero, "Specs," search among the short stories brings nothing noticeable to light. An article on "What America Has Done for Whist" will probably find numerous readers among the votaries of Mrs. Battle's noble art.

—Mrs. Bain gives utterance in *Mind* to a thesis which would seem not to need her eloquent presentation of it to secure immediate acceptance—namely, that nothing would con-

duce more to progress in well-being than the establishment of lecture-courses on ethics from a purely practical standpoint. Leaving aside religious considerations, which are already sufficiently well presented from the pulpit, the basis of desirable conduct on which all can unite is the production of happiness in the long run for as many as can be made happy, ourselves included. But there are countless questions, both in private life and in politics, in regard to which the man of action, who cannot give his days and his nights to thinking out long trains of consequences, might be immensely assisted if he could listen to frequent and full discussion of all the consequences of conduct, so far as the good and wise men of the time are able to make them out. And not only a wider knowledge of consequences, but a vivifying of his sympathy for the pains and pleasures of others, would result from seeing how they are regarded by men of feelings deeper than his own. Why should the religious person alone have the advantage of being pleaded with in the interest of more self-sacrificing conduct than he inclines to of his own accord? Why should the newspapers, which, with a few scattered exceptions, are below rather than above the average moral tone of the community, be our only regularly constituted secular instructors in the art of conduct? The only objection to the scheme proposed, aside from the fact that no benevolent rich man has yet arisen who has wished to endow such courses of lectures and discussions, may be put in the words of the poacher who said, in reply to the clergyman who asked him why he did not go to church, "I already knows more than I does." But, in spite of this far-reaching drawback, it cannot be doubted that, for all who are not inherently incapable of sympathizing with their fellow-men, the amplest demonstration of how conduct, directly and indirectly, may injure and benefit others, will do all that can be done (however slow may be the progress) in the direction of moralization.

—The *Revue Encyclopédique* of October 10 contains a brief notice of Miss Ellen Key, a Swedish lady who has attracted much attention in her native land by her efforts to ameliorate the condition of workingmen. Jointly with Dr. Anton Nyström, she founded the Workingmen's Institute of Sweden, which now owns a handsome building in Stockholm and branch establishments in all the provincial towns. It has courses of lectures, by the most distinguished literary and scientific authorities of the country, on historical, philosophical, scientific and literary subjects, adapted to the comprehension of laboring men, who attend in large numbers. Swedish literature is the topic treated by Miss Key, who, in addition to her philanthropic labors, has done not a little literary work, publishing a number of books, chiefly on sociological themes. One of her writings is a biography of Anne Charlotte Leffler, Duchess of Caianello, who is widely known through her sketch of the life of Sophie Kovalevsky. Miss Key is a sort of lay confessor of the working classes, who come in crowds every Sunday to her modest lodging to consult her on every possible question, from their family tiffs to their controversies about wages. She is a believer in Socialism for Sweden, but only as a transitional means to larger ends. She desires the abolition of private property and the enfranchisement of women, but the idea of a machine society is deeply repugnant to her. She believes in individualism somewhat like that professed by Nietzsche.

—The inaugural sessional address given on October 20 at Manchester College, Oxford, was this year characteristically assigned to Mr. Claude Montefiore, who announced himself boldly, but not without a flavor of enjoyment in certain mediæval associations of the phrase, as an "unconverted Jew." His topic was "Unitarianism and Judaism in their relations to each other," and it soon appeared that the Judaism he had in mind was reformed or liberal Judaism. Judaism of this sort, then, needed to learn from Unitarianism that the unity of God may be considered metaphysically rather than as a mere denial of plurality. Again, Mr. Montefiore argued that "Jews might join hands with Unitarians in a common determination, to the advantage of both, to find out the truth, so far as it still can be found, about Jesus and the New Testament." Here the speaker touched upon a hope that some day there might be at Oxford a School of Judaic Theology parallel to Manchester and Mansfield. Though he deemed this an impossible dream, it seems less so now that the Duke of Norfolk and others are actually building a Roman Catholic college at Oxford. The identity of attitude between Reformed Judaism and Unitarianism certainly appeared in Montefiore's striking peroration: "We, too," he exclaimed, "must have our saints, as well as the Orthodox; and let us remember—perhaps the modern Reformed Jew needs to remember this more than yourselves—that no saint ever confused reason with God. Our liberal forms of faith are on their trial; let us attempt to prove their power. Without an infallible Church, without an infallible Book, without an infallible Law, let us ardently proclaim in word, and humbly seek to show forth in deed, that men may still live and work, realizing God's presence, and loving Him with all their heart, with all their soul, and with all their might."

MUTHER'S HISTORY OF MODERN PAINTING.

The History of Modern Painting. By Richard Muther, Professor of Art History at the University of Breslau, late Keeper of the Prints at the Munich Pinakothek. Macmillan Co. 1896. 3 vols., imperial octavo. Pp. 2,304. More than 1,300 illustrations.

It is hard to imagine a more difficult subject for historical treatment than that which Prof. Muther has chosen—the painting of the nineteenth century. That painting has developed so many opposing "tendencies," divided itself into so many "schools," taken part in such various "movements," that it seems a very chaos—a labyrinth without a clue. Yet a clue the historian must find, some thread of logical development running through the mingled skein he must succeed in disentangling, if he is to write a history at all and not a mere catalogue of artists "with some observations upon their works." The chief merit of the present work—and it has many and great merits as well as grave faults—is that Prof. Muther has found such a main thread of development, and has succeeded fairly well in following it through its myriad windings.

This line of development of modern painting which Prof. Muther has set himself to trace is, in a word, the slow reconquest of nature and the gradual loosening of the bonds with which the "classical revival" had bound art. The history of modern painting properly begins with Giorgione. Spanish and Flemish painting was founded upon Venetian, and the English painting of the eighteenth century was founded upon the Flemish, as was the charming art of Watteau. Then came Winckelmann and Carstens and David, and the hands of the clock were set back upon the dial, and painting, everywhere but in England, denied its birthright. In England alone a healthy naturalism continued to exist, and it is with the English painters of the eighteenth century that Prof. Muther begins his history. Reynolds, in spite of his idealistic theory, remained in his art a painter of portraits. Hogarth was the father of modern genre, and Gainsborough, by far the most artistic temperament of them all, founded the school of English landscape which was destined to revolutionize French painting and that of the world.

First came the Romantic revolution, which, in subject, dethroned the Greeks and Romans and substituted for them the men of the Middle Ages, and in technic reconquered color. The school of Fontainebleau began the serious study of landscape, and Millet set man in nature, and, in his peasant figures, brought the modern man into art. What he did for the peasant, the illustrators and Courbet first did for the man of the town. Finally came Manet and the impressionists, with the analysis of light, and the last shackle was struck from the limbs of painting. Art was free to occupy itself with any subject-matter and to develop any manner that suited the idiosyncrasy of the individual artist, and the time was now ripe for a "new idealism," which should interpret the mind of the nineteenth century instead of docilely imitating the methods of past ages.

Prof. Muther's qualifications for tracing the history of this evolution are many. His point of view is perhaps the only one from which such a history could be written, that of a convinced advocate of modernity. His knowledge is vast and his taste is catholic. As a German he is inclined to give more space to the history of painting in Germany than men of other nationalities would be likely to think its due, but it is rarely that he can be accused of undue enthusiasm for German art. No one could be more severe in judgment upon Cornelius, Kaulbach and the other German idealists than he; and the importance of the painting of France in modern art-history is duly recognized. He is not, however, exempt from the defects of his qualities, and his method leads him to be sometimes unjust to those painters who were not directly part of the movement he is chronicling. That a painter "brought nothing new" to the development of art is often, with him, that painter's sufficient condemnation. Now systematizing is all very well, and it is instructive to remark on the historical significance of this or that artist; but, on the whole, the *artistic* importance of a painter is not the same as the historic. A painter may have been a great influence, and so have an historical importance which the success of his own work would hardly justify, while another may have had little or no influence upon his contemporaries or successors, and yet have produced work which, however far it may lie outside the main stream of development, is of an essential quality that insures his immortality. An instance of the first of these types is Édouard Manet, a painter who rarely reached his own ideal, whose work is fragmentary and, on the whole, unsuccessful, but whose influence was

and still is far-reaching and profound. An instance of the second type is Prudhon, to whom, perhaps, Prof. Muther is not unjust, and another is Baudry, towards whom his injustice is noticeable. For it cannot be too clearly understood that the final question about any artist is not, Was he in sympathy with the spirit of his time, or did he greatly influence his successors? but simply, Did he do work of essential beauty, in whatever manner, and which is worthy of the attention of mankind? Judged by this test, Prudhon and Baudry are both among the immortals, and it may be safely prophesied that they will ever be reckoned among the glories of the century.

Another result of Prof. Muther's method is some confusion of chronology. We believe his idea of the main stream of tendency is correct, but individuals have an awkward way of refusing by their dates to fit into his general scheme. Of course the various schools overlap in a puzzling way, and realists and idealists insist on being born when they were least to be looked for. Some painters have taken part in many different movements, and thus the account of the work of Lessing is scattered through two volumes and that of the work of Menzel through three. The Pre-Raphaelite movement in England being considered mainly as a movement toward realism, its history has to be written with scarce any reference to Rossetti, who appears by himself in the last book, devoted to the "new idealism." It is in this book that the strangest freaks of chronology appear, for it begins with Blake, who died in 1828, before the Romantic revolution had begun, and names as the four great exponents of the movement to-day Gustave Moreau, Puvis de Chavannes, Arnold Boecklin, and Burne-Jones, three of whom are veterans of seventy years of age, and the youngest of whom only continues the work of Rossetti, who was born within two years of the other three. Yet is Prof. Muther indisputably right, and these veterans, who have quietly ignored the strife of the schools, and have each gone his own way regardless of others, are the representatives to-day of the art of the future. It is evident that the full completion of the naturalistic evolution was not necessary to render their work possible, but it was perhaps necessary to make it understood and welcomed. They were before their time, not of it, and those who thought they were leading the procession have only now come up with this advanced guard, whom they had thought behind them.

Apart from this perhaps inevitable confusion, a work of so vast a scope must needs show inequalities of execution. In books i. and ii., "The Legacy of the Eighteenth Century" and "The Escape into the Past," the facts were already pretty well digested, and there is small criticism to make. Book iii., "The Victory of the Moderns," is mainly good, though one feels that the categories are somewhat elastic, and that system has sometimes made strange bedfellows. In book iv., "The Painters of Life," the vast output of the painting of to-day is attempted to be arranged by countries; France, Spain, Italy, England, Belgium, Holland, Denmark, Sweden, Norway, Russia, America, and Germany being given each a chapter. No man knows this output well enough to give any clear view of it, and here the book drops necessarily into the catalogue vein. Name follows name with no sense conveyed of relative importance or real significance. The book becomes quite unreadable, a mere cyclopædia useful for reference only. In the last book, "The New Idealism," things become better again, and the history moves to a comprehensible conclusion.

The chief fault of the book, however, is its inordinate length. It is not only what the French call an *œuvre de longue haleine;* it may fairly be called in English a long-winded work. Again and again a simple thought looms through a haze of words; again and again, with truly German laboriousness, the Professor says in three pages what might be said better in three sentences. His ponderous volumes are a trial to the spirit and a weariness to the flesh, and one wishes with all one's heart that the work might be written over again by a Frenchman with his countrymen's knack of clear and concise statement. An abridgment would hardly be possible, because the dilution of phrase is so constant that nothing could be cut out without destroying the meaning. There may be six words where one would answer, but none of the six is that one, and it takes all the six to say anything whatever. The explanations are endless, and the descriptions, which too often take the place of real criticism, intolerably verbose. It is here that one feels the lack of technical knowledge which is the gravest handicap of the literary critic of art. When we would have a clear description of the methods of a painter, of his pictorial aims, and the means he has chosen for their attainment, of his accomplishments and shortcomings, we get only a disquisition on his subject-matter and his sentiment. What we are told of the sentiment is generally true, and what is said of the subject-matter is obvious; but we would give pages of such writing for a few lines of that technical insight which only a very few writers, most of them painters themselves, have ever possessed.

One whole chapter of the book might have been omitted, and no harm done—that on Japanese art. That modern painting has been more or less influenced by the introduction into Europe of Japanese prints is indubitable, but all that is to be said on this subject might be comprised in a page or two. A short and clear account of just what the influence of Japanese art has been and how it has modified European painting, would have been welcome. This we do not get, but in place of it is an elaborate history of Japanese painting, with long lists of names and dates which, like the flowers that bloom in the spring, "have nothing to do with the case." It is a pure *hors d'œuvre*, and the book was long enough, in all conscience, without it.

As to mere statement of fact, it is impossible that so vast a work should be impeccable. It is equally impossible that any one critic or a legion of critics should be in a position to control the truth of each statement. A few mistakes we have noted which we submit for the consideration of the author for a new edition which is pretty sure to be called for. Reynolds was not a baronet, but a knight; there is no evidence that Angelica Kauffmann ever "declined his hand," or had the opportunity to do so; and his discourses were not delivered at the "dinners of the Academy" (i., p. 35). David's picture in the Louvre is not of the "Rape of the Sabines" (i., p. 164), but of "The Sabine Women" interfering in a battle between their husbands and their fathers and brothers. Should not Millet's "Man with the Hatchet" (i., p. 190) be Man with a Hoe? "Great heroes" (i., p. 324) should evidently be "Gros's heroes," but this is a mistake of the translator's. Delacroix's "Tasso" is wrongly described (i., p. 352), though the picture is reproduced on p. 351. "The Death of Marat" was far from the "first" picture of Baudry (i., p. 420). This curious use of the words "first picture" occurs more than once. Baudry's "Punishment of a Vestal" is so far from being "a reminiscence of 'The Death of Peter Martyr'" (i., p. 422) that it bears not the slightest resemblance to that celebrated masterpiece. If Toudouze painted a picture of the "Fall of Sodom" with "Lot's wife, dying and half consumed by fire" (i., p. 430), he was singularly untrue to the Biblical story. Corot's friends did not bring him, "in the hour of death," the medal which was struck for him, nor did he "pass away" with the words quoted (ii., p. 425). They were spoken at a banquet at the Hôtel Drouot in 1874, and Corot did not die until the 23d of February, 1875. In the quotation from Millet (ii., p. 493, seventh line from the bottom) *que* must have been omitted before "*de la nature.*" Millet can hardly have painted a picture of "cows coming down to drink *at the sea*"! (ii., p. 499). Carolus Duran was not born "across the Flemish border," but in France (at Lille), and it is misleading to speak of "Léon Bonnat, the pupil of Madrazos," to say nothing of the final *s* (ii., p. 547). The passage of Ruskin referred to (ii., p. 573) and the cartoon of Raphael both deal with "the charge to Peter" and not with Christ's walking upon the water. It is far from true that Turner never sold any pictures (iii., p. 631). Finally, Mr. Whistler cannot have been born both in Baltimore, as stated in the text, and in Lowell, Mass., as correctly stated in the Index of Artists; and even his taste for "arrangements" never led him to do peacocks with "blue tail-feathers and iridescent golden plumage around the necks" (iii., p. 662).

The translation of the first volume is by Messrs. Ernest Dawson, George Arthur Greene, and Arthur Cecil Hillier, that of the second and third volumes by Mr. Hillier alone. We should judge it to be faithful, but it is seldom either elegant or idiomatic, and is occasionally unintelligible. The illustrations are abundant, generally well chosen, and fairly satisfactory in execution. It is strange, since Watteau is dealt with at all, that only one of his pictures is reproduced, and that one an early and entirely uncharacteristic example. As a final summing up, we may say that the book is the best, so far as we know, that has yet appeared on the subject, but it is by no means a definitive work, or one that need, by its quality, discourage others from attempting the task.

RECENT LAW BOOKS.

Mr. Augustine Birrell, in addition to being an essayist and humorist, is also a member of Parliament and a barrister. His 'Duties and Liabilities of Trustees' (Macmillan) is a little volume of 183 pages, containing six lectures, recently delivered in the Inner Temple at the request of the Council of Legal Education. They are intended chiefly for law students, but still more, perhaps, for trustees who are not lawyers—themselves a large class. The book is primarily for English readers, and this fact makes part of it inapplicable to this country, as important changes in the law of trusts have recently been introduced by Parliament. With this qualification, however, Mr. Birrell's handbook is an excellent exposition of the fundamental principles of the duties and liabilities of trustees as they exist on both sides of the Atlantic. Lawyers are familiar enough with the rules; but they ought to be understood by the laity as well, and that they are not is

not due to any want of inherent simplicity or intelligibility. Mr. Birrell in fact shows that trustees' duties in England may be all summed up in nine rules, the observance of which by any trustee will absolve him from any necessity of inquiry into what his liabilities may be. These duties are, first, to make himself acquainted with the terms of his trust; second, to bear them in mind; third, never to depart from them; fourth, to take as much care of the trust property as a prudent man would of his own; fifth, to invest in nothing except what the trust-instrument or the *rules of law* permit; sixth, to give those beneficially interested such information as to the trust funds as they may from time to time require, and to render accounts; seventh, not to make a sixpence of profit out of the trust business except in so far as he is expressly authorized to do so; eighth, to coöperate in a reasonable spirit with co-trustees, to consult with them about all matters connected with the trust, and *to retire on being requested to do so by all concerned;* ninth, as to any question of difficulty, to take the opinion of the judge in chambers. This last is under a recent English statute which puts it in the power of a trustee to obtain a summary decision on difficult points. The first eight rules, however, contain the substance of a trustee's ordinary duties, and they are really nothing more than the application of the fundamental requirements of prudence and honesty to the questions which grow out of the relation of trustee and beneficiary.

One of the most important rules is the seventh. In the case of the others, self-interest dictates their observance; but the principle that a position of trust cannot be used for a trustee's own profit is at once a rule on which the whole business of trusts rests, and one which is at war with the trustee's self-interest. It is a striking illustration of the fact that the law of trusts is merely an application of the moral law, that a judgment of a great lawyer, cited by Mr. Birrell, is perhaps as simple and clear a statement of what the honest discharge of duty means as has ever been made. "The rule really is, that no one who has a duty to perform shall place himself in a situation to have his interests conflicting with that duty." A trustee, for instance, as to acts which he might employ others to perform, must employ others, and not first employ and then pay himself, for it is his duty to watch the employees, and decide upon the propriety of their charges; and experience teaches us that no man is fit to be a judge in his own case. Lord Cranworth's rule is the golden rule of honesty, without which trusts could not exist. One of the most certain marks of a high state of civilization is the increasing opportunities it affords to the thrifty and the benevolent to place property on such a footing that the law will stand guard over the administrator of it, and help him by a stern code of retribution to remember to avoid temptation. For the code is, as Mr. Birrell points out, very strict. No one whose property is in trust can complain that the law is lax. Generally, when beneficiaries meet with losses it is due to their own lack of care in supervising or inquiring into the doings of their trustees, or of carelessness on the part of a trustee in leaving everything to a co-trustee.

Mr. Birrell gives an interesting account of recent changes by statute which have been introduced in England, and some of which will undoubtedly sooner or later be copied here. One of them we have already mentioned. Another is the fixing of a statutory period of limitations, so that in cases of honest breaches of trust—*i. e.*, mistakes in investments, etc.—the beneficiary, to recover, must sue within six years, as in the case of any other loss of money. The statute is not allowed to apply, however, if the trustee still have the proceeds of the breach of trust, or has converted them to his own use, for, as the author very justly observes, the fact that the beneficiary has been out of his property for six years is no reason of itself why he should be kept out of it for ever. The proper case for a bar is where the property is gone through an innocent mistake or imprudence, and the question is, on which of two innocent parties shall the loss fall. Here there is no hardship in requiring a suit within a fixed time.

'A Handbook to the Labor Law of the United States,' by F. J. Stimson (Charles Scribner's Sons), is an extremely valuable compilation of law as well as guide to the principles which govern the relation of laborer and employer. It is intended chiefly for laboring men and labor organizations, though a knowledge of what it contains is equally important to employers; while it is lawyers who will really find it indispensable. It explains the elementary principles governing the contract for labor; the effect of the constitutional guarantees relating to it; the police power; the statutory regulation of hours of labor; restrictions in children's and women's labor; fines for imperfect work; company stores; piece-work; strikes; boycotts; trade-unions, and a great variety of other subjects. Mr. Stimson writes law in such a way that it can not only be studied, but read—a rare gift, and one which only sound lawyers, and very few of those, possess. Most of the trouble caused by the labor problem is produced by pure ignorance, and if an additional labor law could be passed compelling every one before he undertakes to discuss labor questions or agitate for any new labor reform to read this handbook, we are satisfied that there would be a saving of a very considerable percentage of the annual pecuniary loss to the country which comes from useless strikes and boycotts. One of the things which labor agitators seem to have the greatest difficulty in getting into their heads is that they live under a government of *law;* that constitutional law means a system of uniform rules, governing all alike, making the right to contract equally free for the laborer and his employer, and prohibiting unlawful interference with freedom of contract as much in one case as in the other. Consequently, when they get statutes passed to protect Labor against Capital, it generally turns out in the end, to their utter amazement, that they have also protected Capital against Labor. The Anti-Trust act of 1890 was, as Mr. Stimson points out, probably passed only to prevent combinations among employers; but it necessarily applies, on the principles just stated, to any combination or conspiracy in restraint of trade or commerce among the several States, or with foreign nations, no matter whether among employers or laborers; if it did not, it would not be constitutional, for it would be a gross invasion of the most elementary rules of common right guaranteed by the Constitution. Consequently, the courts have been forced to hold that the prohibition would include combinations to tie up railroads by means of a strike, especially when taken in connection with the words of the Interstate Commerce act—another statute designed to operate against Capital, but which, for the same reason, has turned out to be a help to railroad companies against strikers (p. 337).

A 'Handbook on the Law of Bailments and Carriers,' by William B. Hale (West Publishing Co.), is the latest addition to the rapidly multiplying Hornbook Series. This series, and the 'Cyclopædia of English and American Law,' seem to show that we are now on the verge of the Trust period of legal writing; already, in the case of very important publications, the motive power, instead of being furnished by the learning of men like Coke, Kent, Story, or Cooley, is supplied by the capital of a "hustling" publisher, who gathers together, under the comfortable shelter of his copyright, the younger limbs of the law, and, through their ready pens, supplies a regular flow of "up-to-date" jurisprudence. We can see nothing to prevent a glorious "combine" of such capitalists, which should have the aim of doing perennially for the modern world in this novel way what Justinian, in his ignorance, attempted to do for the Roman world once for all. There is no doubt that the system tends to keep down competition and expenses. Mr. Hale's book is a creditable performance, accurate where we have had an opportunity of verifying his law, and well filled with cases. The rules of law are fairly well stated; the definition of bailment itself does not seem to us especially successful. The conception of contract is not mentioned, and redelivery or delivery over is put down as essential. Memoirs or papers are intrusted by A B to C D, in contemplation of death, on the understanding that in a certain event they are to be destroyed. Is not this a bailment?

Mr. W. B. Hale's 'Handbook on the Law of Damages' (St. Paul: West Publishing Co.) aims at stating, explaining, and illustrating "with elementary clearness and accuracy all the rules and principles governing the award of damages in civil cases," for the use of students as well as practitioners. Mr. Hale thinks that "much confusion" has been caused

> "by the loose and unscientific use of terms both by law writers and in judicial opinions. This is notably true with regard to nominal damages. That subject has been made almost unintelligible by the lack of consistency and precision in the use of the terms 'wrong' and 'damage.' The notions embraced in these words have been very carefully analyzed in the first chapter. The fundamental nature of legal rights and wrongs has been looked at from a new point of view; and while no new theories are advanced, it is hoped that the subject has been made clearer. The question of damages in actions for injuries to land by the erection of permanent structures, upon which the courts are almost hopelessly confused, has also been looked at from the point of view established in the first chapter, and it is hoped that the results there reached will be helpful."

We have examined the book carefully to see what Mr. Hale's new point of view is, and, if we understand him, it consists of a new analysis of legal wrongs, which he sums up as follows: "A legal wrong is committed whenever (*a*) conduct which is either (1) forbidden, (2) malicious, (3) negligent, or (4) done at peril, (*b*) result in damage which may be either (1) actual or (2) presumed." Under this classification, what are ordinarily called nominal damages become damages conclusively presumed. But whether we say that if A trespass on B's lands, B has a right to recover nominal damages in any case, or that damage is conclusively presumed, the meaning is precisely the same, while there is a serious objection to the theory of a conclusive presump-

tion in the fact that there is no authority for it. The whole classification is misleading, as can be seen by looking at what the author says about damage caused by a permanent structure (*e. g.*, public works, such as railroads): "Reverting to first principles for a moment, the whole matter becomes clear. If the structure is expressly authorized, there is no liability for the damage necessarily resulting." But this is not the law. A railroad roundhouse, a permanent structure expressly authorized by law, is built near a church, and becomes by means of the noise and smoke produced a nuisance to the congregation. The church may recover damages. This was decided by the Supreme Court of the United States in the well-known Fifth Baptist Church case, cited by Mr. Hale in another part of his book, and the principle adopted underlies the elevated-railroad cases in this State as does also the maxim, *Sic utere tuo ut alienum non lædas.*

Mr. Hale's view of the subject is also defective from his failure to insist more emphatically upon the distinction which every one who has ever tried a jury case knows to be at the threshold of the subject—that between tort and contract. This is not the question of the form of the action (all writers are agreed that this has become a matter of little or no consequence), but of the *nature of the injury.* There are some actions as to which it is hard to say whether the injury complained of is a tort or breach of contract, or both at once; so there are organisms in the physical world which it is difficult to classify as either animal or vegetable. We do not, however, therefore say that the distinction between animal and vegetable is unimportant; neither can we ever discuss the right to redress an injury from assault and battery in the same terms as we discuss the right to damages for non-payment of a promissory note. The legal conceptions are different because the injuries produced by a blow on the head are different in kind from those produced by a violation of a promise to pay money. We hardly think that Mr. Hale's analysis of the subject of damages can be considered safe; the book, however, is very full of authorities, and the practitioner will find it useful.

Mr. John R. Rood's 'Treatise on Garnishment' (West Publishing Company) is a book of more than six hundred pages, and cites nearly four thousand cases. The author's preface declares that "the day of the commentator is past"; when a point of law arises nowadays "we want the authorities upon it. We want them all. We want them quick. . . . We have no time to read the fine-spun theories of the text-writer who takes us on an observation-excursion all over the subject in a balloon." Holding these views, the author has in general wisely refrained from expressing opinions of his own; his effort has been simply to state the cases intelligibly, and classify them conveniently, and in this he seems to be successful. Comparing it with the latest edition of Waples on 'Attachment and Garnishment,' it seems to have many cases not referred to by the latter writer.

Mr. Walton Denton Smith's 'Manual of Elementary Law' (West Publishing Co.) is intended as "an introduction to the study of the law." As the author is an instructor in the Law Department of the University of Michigan, it is, we suppose, his design that students should use it under his direction. This may account for the fact that it can hardly be understood without the aid of much additional exposition; for the legal public at large it is deficient in cases and too much like a hasty draft of a scheme of study. Under these circumstances the vice which taints most of this whole Hornbook Series—that of ill-considered statement of rules of law—is not likely to be conspicuous for its absence. *Stare decisis*, for instance, is said to require that a "rule of law," once "recognized by the courts and applied to a case," "forms a precedent" and should be followed in "all similar cases," unless "*flatly absurd or unjust*," or repealed by legislation. The rule may, for all we know, have been stated in this form before, but it is certainly very misleading. A precedent is a *case*, and it is not at all necessary that the decision of a case should contain any explicit rule of law. Our law books are filled with precedents which consist of nothing more than a statement of the facts of the controversy followed by the judgment of the court, which is an order or command that certain specific acts be done or refrained from by somebody. The rule of *stare decisis* requires that if *those precise facts* (not similar cases) arise again, the same judgment should follow, because it is important that the law should be as stable as possible, and that those affected by it should be able to know their rights in advance. The rule of law involved in the decision is a matter of inference, and it may be explicitly stated by the judge, but even he may state it wrongly, and this continually happens, as we see every day in cases reversed on appeal for legal error committed by the judge in the course of a trial. A rule, to be binding, must be recognized by the *final court of appeal*, as inferrible from a case or cases; but even here no rule may be laid down, and the judgment may take the form of a particular command only. It is none the less a precedent. No doubt if the rule turns out to be flatly absurd or unjust, judges may modify it, and this they constantly do, sometimes going so far as to overrule it, but this is generally on the ground that some fact was overlooked in making the inference, or that some fact exists in the case before them which makes this rule inapplicable—in other words, that the cases are not "on all fours." *Stare decisis* is a rule of common sense. The extraordinary importance attached to it in our system is probably due to the pains we take to discriminate fact and law, and this again to trial by jury; but without the rule that decisions must be followed, no law could exist at all.

Volume viii. of the publications of the Selden Society (London: Bernard Quaritch), edited by Prof. F. W. Maitland, contains select passages from the works of Bracton and his master Azo. Volume ix. contains select cases from the Coroners' Rolls A. D. 1265-1413, with a brief account of the history of the office of Coroner, edited by Prof. Chas. Gross of Harvard. The latter are extraordinarily modern and monotonous. Prof. Gross makes it clear that very little is known about the origin of the Coroner's office; it was probably Norman, and yet within our knowledge it has always been elective. The Coroner's function was undoubtedly to look after the Crown's business, and this covered not merely inquiry into sudden and violent deaths, but a wide range of criminal matters and even of civil pleas. The case of John of Barford (p. 21) seems to cover assault with intent to kill, highway robbery, and mayhem. It is all brought before the Coroner in the County Court of Bedford, Nov. 2, 1271. The defendant Simon is "exacted" three times without his appearing. On the fourth time (March 21, 1272) he finds bail. The whole proceeding is for the purpose of making sure that a trial shall be had, and this, on the surface of the matter, would seem to be the connecting link between the functions of the Coroner acting in such a case and his functions in the case of an ordinary inquest, in which he inquires into a death solely because there is some reason to suspect violence, and because, if so, a trial should follow.

Mr. Maitland's parallel passages from the works of Bracton and Azo, the great Bolognese civilian, are an important contribution to the study of the common law. The position of Bracton as a father of English law has long been unquestioned, but the nature and extent of his work in sowing the seed of Roman law in English jurisprudence has been a matter of much question. Reeves declared that all the Roman law which Bracton transferred would not fill three whole pages of his book. A later generation of critics found in Bracton's work proof that much of our common law is Roman in origin; Sir Henry Maine went a step further and said, in his 'Ancient Law,' that Bracton had "put off" on his countrymen as pure English law a compendium of which the entire form and a third of the contents were directly borrowed from the Corpus Juris. Mr. Maitland shows that he did not take the trouble to borrow directly from the Corpus Juris when he could borrow directly from Azo, but that Maine's indictment is greatly exaggerated. All the passages taken from the Corpus Juris might be printed on ten of the 444 folios; what he took from Azo may amount to a fifteenth of the whole. Further, he was no instructed Romanist at all, and his abstract was "not a good intelligent abstract of Azo's text." The sum and substance of the whole matter is that the part of Bracton which is really valuable is the English part, and that he did extremely little to Romanize the English law. As to "putting off," he does not seem open to the charge of representing the Romanesque part of his book to be his own, for he refers the readers to his sources; while, if he used materials which did not belong to him, it must be remembered that printing had not been invented, books had no commercial value, and every lawyer of Henry III.'s time copied from his predecessors, as he expected in his turn to be himself copied. The notes scattered through the volume are full of learning. We may notice, as bearing on a point much discussed in the courts of late years, the note at p. 217 on the father's or master's right to sue for injury to members of what Romans called the *familia*. Bracton tells us that the formula in common use in his day was "so that I would not have suffered that damage for so many shillings or that *shame* for so many." This seems to be an indication that there is nothing in the principles of the English law to exclude damage for mental suffering, in a proper case.

Mr. Leonard A. Jones's 'Treatise on the Law of Real Property' (Houghton, Mifflin & Co.) is the seventh legal work published by that author, all dealing with property law—a subject which, within certain limits, he has made his own. His aim is practical, and accordingly, in the present volumes, he confines himself to the law as applied between vendor and purchaser, and more particularly to estates in fee and their transfer by deed. Mr. Jones is not only learned and accurate, but unusually modest as to his own performances. His Table of Cases shows that he has cited more than 15,000 decisions, and as the same case is constantly cited to several points, a

rough estimate would give about 25,000 citations in all—a collection involving a stupendous amount of labor. His own description of his book, however, is that it is only a statement of "general principles, with a meagre citation of authorities." In such a work, which does not profess to be historical or philosophical, arrangement is everything, and Mr. Jones's arrangement is such that what is looked for can be easily found. Mr. Jones's reputation as a writer of practical law-books of this species is established, and is not likely to be impaired by these volumes. Wherever we have examined them we have found the statements of law exactly such as a practising lawyer wants.

Mr. Robert Ludlow Fowler's 'Charitable Uses, Trusts and Donations in New York' (Diossy Law-Book Company) is a carefully reasoned and interesting essay on the subject to which the title refers. The author's thesis is that, by recent legislation, in 1893 (ch. 701 L. 1893), charitable uses have been restored to a situation which they have not enjoyed in this State since the Revised Statutes went into effect. This statute, as has been declared by the Court of Appeals in the recent case of Dammert vs. Osborn (140 N. Y. 30), indicates the intention on the part of the Legislature to enforce and uphold charitable bequests not heretofore recognized as valid—*i. e.*, trusts for the benefit of indefinite and uncertain persons. The curious feature of the change is, that it marks a return to a principle which was probably enforced by the English chancellors before this country was discovered. The long contention in the courts of this State over charitable uses is an illustration, not only of the confusion sure to be introduced into the law of property by any legislature which once contracts the habit of meddling with it, but also of the singular effect which may be produced on the course of decision by historical research. It was at one time supposed that the whole jurisdiction of the English chancellor over charitable trusts came from the statute of charitable uses, passed in Elizabeth's time. In 1788 the New York Legislature abrogated this statute altogether, and this, it was generally inferred, abrogated the entire English law of charities. But the publication of ancient documents in chancery soon showed that the Chancellor's jurisdiction was a very ancient one, and independent of the statute of Elizabeth. The result is, that "the later opinion of the courts, discussed at length in these pages, is to the effect that, as it was commonly thought both in England and in this country until the exhumation of ancient documents in chancery, that the Chancellor's jurisdiction did depend upon the statute of Charitable Uses, the repeal of that statute in 1878 is conclusive evidence of an intention by the Legislature to abrogate the entire English law of charities," and consequently it was abrogated. *Communis error facit jus.* The subject forms an interesting chapter in the history of the law of property, and is illuminated by judgments delivered by some of the best judges New York has produced—Denio, Duer, Selden, and Wright—to say nothing of the arguments of counsel no less eminent. Mr. Fowler's sketch is a valuable and interesting contribution to the learning of the subject. The book contains appendices giving forms and lists of statutes.

CHILDREN'S BOOKS.

If the author of 'Alice in Wonderland' had foreseen the long procession of his imitators, particularly if he had been doomed to read them all, surely he would never have written that classic tale, and we should have had to do without the gryphon and mock-turtle, the walrus and the carpenter, and all those prized possessions. Since oddity is their principal charm, such creations cannot be indefinitely multiplied without becoming stale, flat, and, let us hope, in a pecuniary sense unprofitable. Still, if there be any children who prefer an imitation to reading the original over again, let them get 'The Wallypug of Why,' by G. E. Farrow (Dodd, Mead & Co.). It is a close and clever imitation, and more refined than many, though its "Alice" is named "Girlie."

In a book for young children by Sheila E. Braine (Scribners) some old friends from 'Mother Goose,' 'Alice in Wonderland,' and "Midsummer Night's Dream" start off together 'To Tell the King the Sky is Falling.' Besides Henny Penny and the others who went the same road so long ago and left their message untold, a certain small pair of twins, named Max and Molly, join the company, and, being guided by Titania's fairies, they have such delightful adventures by the way that the momentous errand is all but forgotten a second time.

The rare distinction of being written by a real queen, "Carmen Sylva," will be to children, who always worship royalty, an added recommendation of the Rumanian 'Legends from River and Mountain' (Dodd, Mead & Co.), though they need none beyond their own freshness and grace. With a poet's art, she pictures the wild mountains and dashing rivers of her home while relating the legends that give them human interest. The translator, Alma Strettell, adds about an equal number of other stories gathered from various German collections. They are modified folk-tales, full of the mystery and magic so dear to childhood's heart.

An unpretentious but pleasing little book, by Eliza Orne White, is called 'A Little Girl of Long Ago' (Houghton Mifflin & Co.). It is not strictly a story, as it has no beginning, middle or end, but is simply a picture of the home life of a well-born Boston child early in this century. The children of her old-fashioned home seem to be contented and merry without making life a burden to the older people; and they enjoy their little jokes and frolics in happy ignorance of their hard fate in being born a couple of generations before the "children's age."

The children about whom Mrs. C. V. Jamison writes are always angelic, so no one need wonder at her last title, 'Seraph, the Little Violiniste' (Boston: W. A. Wilde & Co.). When arrayed in white chiffon, or any other of the toilettes so fondly described, no doubt the young lady needed only wings to live up to her name. But as we cannot see her beauty or listen to the ravishing music of her violin, and as these are her only claims to special consideration, it would be unreasonable to expect us to join the circle of her abject admirers.

The 'Short Stories for Short People,' by Alicia Aspinwall (E. P. Dutton & Co.), while somewhat unequal in interest, are on the whole very bright and original. The quick-running squash in particular is "a character" likely to be remembered. The stories justify their title of short, having no padding of description or sentiment, and they know how to stop the minute they are done, which is just what the short people will like.

The ways of all wild living creatures have a fascinating interest for most children, but unfortunately their parents and friends are usually too ignorant to answer their reasonable questions. To such inquiring minds 'Tommy-Anne and the Three Hearts,' by Mabel Osgood Wright (Macmillan), should be a boon. They will hear the unappreciated garden snake's plea for toleration, and the mole's account of his own good deeds. They will have a peep into Bob-o-link's wardrobe, and a glimpse of Madame Duck's nursery, and will learn many surprising things about our small familiar beasts and the common plants which we all think we know. A pleasant thread of story binds together the bits of information, making them easier to hold, and the child who reads will be charmed while he is instructed and led on to make new discoveries for himself.

The reader of 'Bushy,' by Cynthia M. Westover (The Morse Co.), certainly gets his money's worth of excitement. The author counts that day lost whose low descending sun sees not some hair-breadth escape for the young heroine. A mere catalogue of this little girl's adventures in her strange home among the miners of a Rocky Mountain camp would be enough to make one's hair stand on end. But, after following her through a dozen or so, seeing her kill her buffalo, shoot her horse-thieves and Indians, swim the freshets, strangle the rattlesnakes, etc., one grows calm, realizing that nothing will happen that she cannot cope with. The story purports to be "founded on fact," and the title-page bears the needed reminder that truth is stranger than fiction.

Capt. Mayne Reid was an Irishman, who lived 1818–73, won his military title in the Mexican war, wrote more than fifty trashy novels which perished of inanition, and meanwhile won a warm place in every healthy boy's heart by such imperishable books as those now republished in the Nimrod edition of Messrs. Putnam. No better books of the sort have ever been written, if to fascinate the youthful mind be any test of goodness; we recall the revelation they made to us about forty years ago, and suppose boys of one generation are much like those of another. In the present volume, 'The Young Voyageurs,' the original "boy-hunters" of Reid's invention—Basil, a sort of juvenile Daniel Boone, Lucien, a young naturalist modelled after Audubon, and the jolly François—who were sent trooping after a white buffalo robe for Prince Charles Lucien Bonaparte, are turned into Canadian voyageurs, and set adrift on their adventures in search of fur-bearing animals in British America. Reid's plan of entertaining his young readers while he lectures them on natural history is wholly admirable; the verisimilitude is perfect, and the science is quite as much as most boys can assimilate. He has in a high degree the art of satisfying their normal craving for excitement without stimulating it unduly. In a solitary instance he is our authority for a technical name—that of *Ursus richardsoni*, the Barren Ground bear, now recognized as a distinct species. But that is a small affair, in comparison with reading about the way Basil killed the moose, and the bison bull did not kill Basil, and how all three of the boys fought the wolves; it makes us feel young again—almost.

Soldiers in King Philip's War. By George Madison Bodge, A.B., chaplain of the Mass. Society of Colonial Wars. Leominster, Mass.: The Author. 1896.

John Eliot's First Indian Teacher and Inter-

preter, Cockenoe-de-Long Island; and the Story of his Career from the Early Records. By William Wallace Tooker. New York: Francis P. Harper. 1896.

Mr. BODGE'S handsome volume is a monument of antiquarian industry and research, in the interest rather of genealogy than of history, as being the chief concern of the legion of recent patriotic societies like that of which our author is chaplain. Hence his plan has been to follow the fortunes not of campaigns but of military companies, preceded, to be sure, by a summary account of the general course of events. The repetitions thus made inevitable are much less annoying than they would have been in a connected narrative, and indeed serve to impress the recurring incidents upon the reader's memory. The whole mass of facts, names, and dates has, since the first edition in 1892, been thoroughly gone over in comparison with the original documents, and the accuracy of these annals thereby insured in an extraordinary degree. Moreover, a large amount of new matter has been incorporated and added, the most significant being an introductory chapter relating the Indian wars of New England from the beginning, and the lists of Narraganset Grantees who profited by the promised reward of lands held out by the General Court to those who served against Philip. The final index of names fills thirteen pages in four columns of fine print, and limited must be the New England (or at least Massachusetts) connection of six or eight generations which does not find here one or more ancestors, direct or collateral.

Mr. Bodge seldom pushes apology of the Puritan treatment of Indians too far, and frequently points out what Massachusetts suffered by not putting confidence in the friendly converted Indians as scouts and as instructors in Indian warfare. Popular clamor and mob violence more than once paralyzed the authorities, and stifled their better instincts for the protection of Eliot's wards, the distrust of whom, as reclaimed pagans, bore a singular resemblance to that still so widely entertained at the South towards the educated freedmen. A still darker parallel subsists in the atrocious shooting down of Indians *qua* Indians, or their execution as captives—in one case recorded here a squaw having been torn to pieces by dogs set upon her. Southerners have often retorted Northern charges of pro-slavery inhumanity by reference to the Puritans' semi-superstitious dealings with the Indians. The retort has little weight or meaning if the tender mercies of the slaveholder are, at the same time, either denied historic existence or sanctioned from Scripture texts. The Puritans, too, could handle these texts for their own justification. Capt. Underhill, one of the leading participants in the capture of the Pequod fort on May 26, 1637, as well as its historian, says, after telling of setting fire to the wigwams, "Many courageous fellows fought most desperately through the palisadoes, while scorched and burnt by the flames; mercy did they deserve for their valor, could we have had opportunity to bestow it." He added: "It may be demanded, Should not Christians have more mercy and compassion? But I would refer you to David's war. Sometimes the Scripture declareth women and children must perish with their parents. We had sufficient light from the word of God for our proceedings." On the other hand, when, in April, 1677, Massachusetts sent commissioners to the Mohawks to enlist them against the Indians harassing her northern and eastern borders, the measure, says Mr. Bodge, "was questioned by many as to its lawfulness, in employing heathen to fight the battles of the Lord; but the General Court fell back upon the scriptural precedent of Abraham employing the Amorites."

Two chapters are devoted to the hostile Indians and to the much suffering Christian Indians respectively. In the former we see Weetamoo, Wamsutta's widow, drowned in escaping from her white pursuers on a raft, and her head, severed from her recovered body, placed upon a pole and paraded in the streets of Taunton; while the dead body of Philip was "chopped in quarters and beheaded, and left unburied; his head and one hand were given to Alderman [his Indian slayer] as a reward, and in Mr. Church's account it is said that he got 'many a penny' by showing the hand." In the other chapter we see "Maj. Gen. Gookin and even the saintly Eliot . . . loaded with reproaches and threats, and insulted in the streets, because of their advocacy of the rights of the Christian Indians"; and these Indians, cooped up (as on a Confederate Belle Isle) on Deer Island in Boston harbor, the objects of a plot of indiscriminate slaughter, which happily miscarried.

Eliot and the "praying Indians" fall within the scope of the second work named above, a thin volume addressed to the Suffolk County (N. Y.) Historical Society by one of its members. Mr. Tooker's investigations make it entirely probable that he has identified Eliot's anonymous first teacher and interpreter, without, however, quite warranting the monument to be thus inscribed which he would have erected on Fort Hill at Montauk Point, Long Island. With much ingenuity, some conjecture, and a large amount of documentary evidence, he traces the career of Cockenoe (whose name was variously disguised by illiterate spelling) from the time he is supposed to have left Eliot's service to the end of his days, or rather to his disappearance from the records, towards the close of the seventeenth century. Cockenoe's eminent usefulness in witnessing the purchase of lands from the Indians, and in fixing and recovering boundaries, entitled him to this intelligent biography and to the remembrance which it will insure. It was something to connect him with the island off Westport, Conn., which has for more than two hundred years borne the interpreter's name. This too is a beautifully made book.

Wages and Capital: An Examination of the Wages Fund Doctrine. By F. W. Taussig, Professor of Political Economy in Harvard University. Appletons. 1896. Pp. 325.

IN reading much of the modern literature of economics, one is apt to sigh for the robust militant spirit of the old-fashioned writers who had theses to support. Prof. Taussig is so impartial, so anxious to do justice to every view which he discusses, that it is extremely difficult, in spite of the lucidity of his exposition and the directness of his reasoning, to make out what is the net result of his exhaustive discussion of the wages-fund theory and its history. It may well be that this is inseparable from the nature of the subject, and that such is the case may not unreasonably be inferred from the fact that the wages-fund controversy, which has been in a more or less acute stage for the whole of the past quarter-century, is probably more full of obscurities and misunderstandings than any other economic dispute. For this very reason, however, it seems that the most useful contribution that could be made to its discussion would be one that gave little prominence to analysis of the exact merits of the various views which have been advanced, but rather insisted on bringing into bold relief the elements which the author deemed most helpful to an understanding of the question at issue. Indeed, Prof. Taussig was probably himself impelled, partly at least, by this consideration to the adoption of the unusual plan of devoting the first of the two parts into which his book is divided to the exposition of his own views, and the second part to the history of the theory; though the reason that he assigns for it in his preface is that his criticism of the views of others, proceeding as it must from the point of view he himself adopts, can be much better understood after that point of view has been made clear. It is, perhaps, in consequence of this ulterior purpose—the utilization of the exposition in the first part for the historical criticism of the second part—that Prof. Taussig's statement of his own position is, as we have intimated, less concise and straightforward than might be desired.

Whether wages are paid out of the product of past or of present labor, whether there is such a thing as a wages-fund in any sense or not, and whether, if there be such a fund, it is rigidly fixed by the general conditions prevailing in the community or is capable of alteration by combinations of laborers—these are the questions that pervade all discussions of the relation of capital to wages, and one or other of them is ever near throughout the pages of the present work. The first of these three questions is the one which is not only most fully answered, but most instructively illumined, in Prof. Taussig's discussion. He attaches great importance to the notion of the constant progression of all forms of capital—his definition of capital is "inchoate wealth; all the possessions that do not yet serve human wants"—through successive stages of approach, to the form of commodities ready for the enjoyment of consumers. The lapse of time involved in the use of capital is thus not only asserted, but made vivid by detail; and the mechanism by which the labor of to-day receives its reward from the product of past labor is exposed. "Present labor produces chiefly unfinished things; but the reward of present labor is finished things. Real wages are, virtually to their full extent, the product of past labor" (p. 17).

As regards the evidence of a "fund" for the payment of wages, while, in accordance with the analysis just indicated, Prof. Taussig naturally adopts the view that a steady "flow" of capital more accurately expresses the actual state of things, he seems to admit that for many, if not most, purposes of theory, the notion of a fund may legitimately be substituted for that of a flow. We cannot ourselves regard the distinction as of great importance for the discussion of the live questions which have given the wages-fund theory its chief interest. That interest has centred about the question of the limits within which combinations of laborers can affect the rate of wages—the determinateness or indeterminateness of the amount of capital which will go to the payment of wages, the conditions of industry being given. It does not seem that the answer to this question, in the sense in which it is of deep importance, is helped or hindered by observing that, strictly speaking, wages are paid not out of a fund which is continually being replenished, but out of a flow which is continually being kept up. We say "the sense

in which it is of deep importance," for we cannot help thinking that Prof. Taussig has given entirely too great prominence to the bearing of the wages-fund theory on the question of "market" or temporary wages as compared with its bearing on normal wages. The conclusion at which Prof. Taussig arrives on the subject of the elasticity of the wages fund is that the fund is roughly predetermined, but that it is elastic within limits so wide as to make the predetermination of no great importance in practical economic discussion.

The examination of the history of the wages-fund theory is full of interest and instructiveness. We find the imperfections of author after author pointed out, and see again and again how the unguarded expressions of great writers have been made the basis either of wrong conclusions on the one hand, or of profitless wrangling on the other, by their successors. One of the best traits in Prof. Taussig's criticism is that it is never supercilious, flippant, or acrimonious—qualities that are, unfortunately, displayed in great abundance by some of the younger economists of Great Britain. His criticisms are so delicately balanced that it is impossible to indicate without inaccuracy, in a brief review, his position in relation to the various writers whom he discusses. This part of the work, unlike the expository part, is "addressed more particularly to special students of economic theory," and even they will have to keep their wits about them if they would retain their grasp on all the fine distinctions that are made. It is sometimes rather dizzy work, and the not too clever reader will feel a little consolation in noting a curious blunder of the author's, which may fairly be ascribed to the strain of the hair-splitting work he is engaged in. The following passage (p. 305) flies in the face of the logical rule, which "every schoolboy" knows, that *All A is B* and *All non-B is non-A* are equivalent statements:

"Not only did he [Jevons] lay it down that all capital is subsistence (which is true if properly explained), but he came perilously near to saying that all which is not subsistence is not capital (which requires much more explanation to be intelligible and true)."

To sum up, Prof. Taussig's discussion is refined, thorough, accurate, and impartial; but, paradoxical as it may seem, we are convinced that it would have been more useful if it had been less refined, less thorough, less accurate, and less impartial.

A Little Tour in Ireland. By an Oxonian (S. Reynolds Hole, Dean of Rochester). With Illustrations by John Leech. London and New York: Edward Arnold.

Dean Hole very modestly ascribes the demand for a third edition of his youthful work to the fact that it contains some "splendid illustrations" by John Leech, to whose memory he therefore dedicates it. Leech's admirers regard everything of his with an affectionate eye, yet there are few who would not candidly confess that (the frontispiece excepted) his illustrations and initial letters for this book are far below his ordinary achievements in *Punch*. The author's preface so disarms criticism of his share in the partnership that one is glad to be able to say that his text is quite as good as the pictures. To speak frankly, both belong to a bygone day. They fail to give a distinct impression, even where they succeed in giving any at all. The illustrations, of course, are only caricature, however close to nature; and the substance of the book is something similar, for Nature is lost in an attempt to evoke her by continued apostrophe. The modern French "word-painter" is a tedious fellow; but, even at his worst, he is attempting seriously to describe what he sees, and impart some sensation of the contour and color of scenery as it appears to his eyes, whereas exclamations over "glorious panoramas," reinforced by the quotation of a minor poet's ecstasies, bear the same relation to description that clamor does to argument.

The book has, accordingly, little real value, yet it contains some amusing anecdotes, and occasional bits of half-serious observation which show that the author could have done better if he had followed a different model—for example, this paragraph on a little Catholic church at Oughterarde:

"We found little to admire as to architecture without or ornament within; but a priest, who went with us from the car, said it was 'beautiful,' and looked as if to him it was so indeed, as he knelt with others reverently praying there. I thought of our grand old churches at home, locked and barred, most of them, except for a few hours on Sunday (as though the soul should be treated, like a boa-constrictor, with six days' sleep, and then a rabbit); and I envied that poor pilgrim through a prayerless world his privilege and opportunity."

A-birding on a Bronco. By Florence A. Merriam. Boston: Houghton, Mifflin & Co. 1896. 12mo, pp. x, 227.

We notice this booklet mainly to call attention to some of the pictures it contains. About a year ago we had occasion to speak of some artistic work done by Mr. Louis Agassiz Fuertes, a student in Cornell University, whose paintings of birds were much admired when exhibited before the Ornithologists' Union at its last meeting in Washington. He is self-taught, and his technique is still crude; he needs disciplining to keep him from straining for effect; but his power is unmistakable, and we miss our guess if he does not become a great artist in birds in due course, if he perseveres. Thus far his genius overreaches his talent; but his pictures are better than Audubon's were to begin with, and we suspect that the mantle has fallen upon Mr. Fuertes. In the present case, his first appearance in print, the pictures are very small and very slight sketches, mostly an inch or two square, and printer's ink does not give him full scope for his brush; but strength is there. Every bird speaks for itself on sight, needing no label. Ability to draw a live bird instead of a stuffed one, from the very first, is an accomplishment rare enough to deserve more than passing comment.

The rest of the illustrations in this book show the fatal facility of "process" in reproducing anything that one may have kodaked in peering about after birds; and the text hardly calls for remark. The young lady has been properly coached in the technicalities by an elder relative; the Latin names are correct; the same story has been told over and over again by Mrs. Miller and too many others; and since Miss Merriam goes to Shakspere for the affected title of her lucubrations, we may remind her that one of that poet's plays is entitled "Much Ado about Nothing."

BOOKS OF THE WEEK.

Abbott, Dr. C. C. Bird-Land Echoes. Philadelphia: J. B. Lippincott Co. $2.
Amory, Esmerie. The Epistolary Flirt. Chicago: Way & Williams. $1.
Aylesworth, Barton O. Song and Fable. Des Moines, Iowa: The Kenyon Press.
Bain, John, jr. Tobacco in Song and Story. New York: Arthur Gray & Co.
Barrie, J. M. A Window in Thrums. The Little Minister. Vol. I. Scribners.
Bates, Herbert. Songs of Exile. Boston: Copeland & Day. 75c.
Bellamy, William. A Second Century of Charades. Boston: Houghton, Mifflin & Co. $1.
Bernhardt, Wilhelm. Baumbach's Der Schwiegersohn. Boston: D. C. Heath & Co. 30c.
Besant, Sir W. The City of Refuge. F. A. Stokes Co. $1.50.
Bigelow, P. History of the German Struggle for Liberty. 2 vols. Harpers. $5.
Blanchard, Amy E. Life's Little Actions. Philadelphia: G. W. Jacobs & Co 35c.
Blanchard, Amy E. Taking a Stand. Philadelphia: G. W. Jacobs & Co. $1.25.
Brown, Miss Anna R. Culture and Reform. T. Y. Crowell & Co. 35c.
Brown, Vincent. My Brother: A Novel. London: John Lane; Chicago: Rand, McNally & Co.
Bryce, James. The American Commonwealth. Abridged Edition for the Use of Colleges and High Schools. Macmillan. $1.75.
Burgin, G. B. Gascoigne's "Ghost." Harpers. $1.
Carlyle, Thomas. On Heroes and Hero-Worship. Ward, Lock & Bowden.
Caro, E. Idylle Nuptiale. Paris: Lévy.
Cartwright, Julia. Jean François Millet: His Life and Letters. London: Sonnenschein; New York: Macmillan. $5.
Dickens, Mary A. Some Women's Ways. R. F. Fenno. $1 25.
Erskine, Charles. Twenty Years before the Mast. Philadelphia: G. W. Jacobs & Co. $1.
Evil and Evolution. Macmillan. $1.50.
Fields, Annie. Authors and Friends. Boston: Houghton, Mifflin & Co. $1.50.
Fisher, Prof G. P. A Brief History of the Nations and of their Progress in Civilization. American Book Co. $1.50.
France, Anatole. Tales from a Mother-of-Pearl Casket. G. H. Richmond & Co. $1.25.
Furtwängler, A. Intermezzi: Kunstgeschichtliche Studien. Leipzig: Giesecke & Devrient; New York: Lemcke & Buechner.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 19, 1896.

The Week.

It is pleasant to note the quiet gratification with which the Venezuelan settlement is received on both sides of the Atlantic. Some able journalistic diplomats, whose views and predictions have been coldly ignored by the real negotiators, are looking a little puzzled and pained, and are advancing it as a cogent argument against the agreement that they "cannot understand it." But as nearly all the 100,000,000 people involved never did understand the Venezuelan controversy anyhow, they are not going to insist that the London *Chronicle* must be satisfied before any treaty is made. The fact is that, as far as this country is concerned, the whole angry dispute had long ago been consigned to the limbo of things which we are not a little ashamed of and which we should like to forget. In England the affair appears to have been regarded with more apprehension. Both Sir William Harcourt and Mr. John Morley have spoken in grave terms of the serious possibilities involved in leaving the controversy unsettled, and the latter, in his speech on Tuesday week, declared the happy ending of the business to be more important than any international occurrence of the time. He said this, of course, on the understanding that a general treaty of permanent arbitration was to follow. That is what all must now hope and work for in order to complete "a splendid and beneficent example" of settling international differences, not like wild beasts, but like gentlemen and Christians.

One of the oddest results of the Venezuelan controversy has been the blotting out of Venezuela as an independent government, so far at least as the present settlement is concerned. She does not appoint a single member of the arbitration tribunal. On the face of the papers she is not consulted about anything. Her contention all along has been, not merely a demand for arbitration, but that the United States should be the arbitrator. Even this has been denied to her. The real arbitrator is the King of Sweden. If he should decide that British Guiana is entitled to every inch of territory that has not been in actual occupation by Venezuela for a period of fifty years, she would have nothing to say against it. This is a strange outcome for the orphan republic, yet it is the logical result of Mr. Olney's diplomacy, which set out with the proposition that our interests were threatened by the extension of British rule on the banks of the Orinoco. If that were true, they would be equally threatened whether the extension were made with the consent of Venezuela or not. In other words, the assertion of that doctrine was itself a denial of the sovereignty of Venezuela and her right to dispose of her own property.

The consequences of this claim were pretty fully discussed at the time when the President's Venezuelan message was a more exciting subject of debate than it is now. The most important of these was the assumption by us of responsibility for all the countries between the Rio Grande and the Straits of Magellan in their dealings with European Powers. The fact that these Powers might have something to say about so extensive a claim was not much considered in the beginning, but their newspapers have begun to tell what they think of it. Those of both France and Germany say that the treaty between England and the United States is no precedent for them. The Cologne *Gazette*, in an article which is accepted abroad as semi-official in character, says: "We wish to take the first opportunity to declare that the precedent is only English, and in no way European. Germany, at least, will never tolerate the intervention of a foreign state in the protection of German interests in South and Central America." It is to be hoped that she will not. No greater calamity of a foreign sort could befall us than to assume responsibility for the behavior of those Spanish-American countries, whose natural tendencies to insolence and disorder would be greatly multiplied if they understood that we were to assume their quarrels. For the present, however, the matter of most prominence is the snuffing out of Venezuela as a government having a voice in the determination of her own boundary.

Mr. Cleveland is not likely, as respects Cuba, to take steps at the close of his administration to initiate a policy for his successor. It is true that Mr. Harrison attempted to do this for his successor by recommending the annexation of Hawaii, but the ill success which attended the step would hardly commend it to Mr. Cleveland as an example to be followed. Mr. McKinley is entitled to a fair field in foreign as well as in domestic affairs. He ought not to be embarrassed by any gratuitous action at Washington. This principle applies with equal force to Congress, with whom the power to declare war rests exclusively. We have learned to our sorrow, however, that the executive, although forbidden to declare war, may scare Congress into a war at any time on the flimsiest of pretexts. Such a revelation would have struck both Thomas Jefferson and Alexander Hamilton dumb. It is a fact that we shall always have to reckon with hereafter. If Mr. Cleveland should say now that the state of affairs in Cuba is such that we ought to interfere on grounds of humanity, or on grounds of near neighborhood, or on any grounds whatever, the probability is that Congress would "stand behind him" as it did in the Venezuelan matter. If restrained from doing so at all, it would be only for the reason that the matter ought to be left to McKinley. But there are no grounds for our interference in the affairs of Cuba that have not existed from the beginning of the present struggle in the island. Moreover, it is the growing opinion, both here and abroad, that Spain cannot put down the rebellion, that she is near the end of her resources, and that she will not be able to make another campaign if she fails in this one. How insensate, therefore, is the policy which would plunge us into a foreign war, contrary to the law of nations, and contrary to our own precedents, against the country that sent Columbus out to discover the New World, and that has never done us a wrong from our birthday to the present hour.

Kentucky, South Dakota, and Wyoming were the closest of the forty-five States in the recent election, and ten days were required to show that McKinley had 258 plurality in the first and Bryan about 400 in the second, while Wyoming is apparently for Bryan by from 225 to 400 for the different electors. So narrow is the Republican margin in Kentucky that one Democratic elector is successful, as was one in Ohio four years ago, while the rest were for Harrison, through mistakes of voters in marking their ballots. The closeness of the result, however, should not obscure its great significance. Four years ago Kentucky gave 175,461 votes for Cleveland and 23,500 for Weaver—a total of 198,961, against only 135,441 for Harrison. This year McKinley has 218,055, or nearly 83,000 more than Harrison received in 1892, and Palmer 5,018—a total of 223,073 for sound money; while the combined vote of Bryan Democrats and Populists for their Presidential ticket was only 217,797. In a total poll 100,000 larger than four years ago, Bryan has less than 19,000 votes more than Cleveland and Weaver together, while McKinley and Palmer have nearly 88,000 more than were given Harrison. This is a tremendous political revolution. Counting all but one of Kentucky's thirteen electors for McKinley, and the other two close States for Bryan, the sound-money candidate will have 272 electoral votes against 175 for the Populist nominee. There will be continued figuring that a change of some 25,000 votes in Indiana, Kentucky, and four other States

would have given Bryan a bare majority of the electoral college; but what makes Bryanism hopeless in the future is the fact that Indiana, and the solid block of States from the Atlantic to the Missouri River of which Indiana is the heart, will be even more strongly against it hereafter than now.

The only answer needed to Bryan's speeches of Saturday in favor of renewing the free-coinage agitation is furnished by the official returns of the vote in the South, which are now coming in. The returns from Georgia are no less significant of the demoralization in Democracy caused by the surrender to Populism than those of Kentucky above. Here are the figures, contrasted with those for 1892; the Democratic and Populist votes being given separately and together for 1892, and together for 1896:

	Rep.	Dem.	Pop.	Dem. and Pop.
1892.....	48,305	129,386	42,939	172,325
1896.....	60,190	.....	.....	94,332

There were, besides, 2,707 votes for Palmer this year, but all told the total is only 157,230, against 220,630 four years ago. While the Republicans increased their vote about 25 per cent., the fusion candidate this year secured less than 55 per cent. of the vote cast for Cleveland and Weaver four years ago. Evidently more than half the Democratic voters of 1892 refused to support the Populist candidate of 1896. No wonder that Southern Democratic newspapers say, in the expressive words of the Memphis *Commercial-Appeal*, that "the only reply to a proposition for a renewal of the silver fight is, 'Rats!'"

Two senatorial seats from the South were practically disposed of by Democratic caucuses in Alabama and Georgia on Monday. Pugh is the man whose term is expiring in the former State, and, although he has nearly completed his seventy-sixth year, he was anxious for another term. There has been no little apprehension that he might succeed through an appeal to what may be called the eleemosynary motive—the plea that he is an old man and needs the salary—for there is no doubt that this has helped to keep more than one antediluvian office-holder in his place. But the spell has at last been broken in Pugh's case, and the Legislature will send as his successor Gen. Pettus, of whom little is known, but who can hardly fail to be an improvement upon Pugh. In Georgia the seat falling vacant is that of Gen. Gordon, who is by no means a Bourbon of the Pugh school, but has of late years seemed to lose his interest in public affairs. His predestined successor was ex-Speaker Crisp, who would have been no help to his State, but his death left the field open to all comers, and the prize has been carried off by Alexander S. Clay, a comparatively young man, who has been Speaker of the House and President of the Senate in the Georgia Legislature, and has made a good reputation in each body.

The suggestions of the Indianapolis *Journal* that Mr. McKinley should offer a cabinet position to Gen. Buckner or Mr. Bourke Cockran, or should recognize the sound-money Democrats in the distribution of general patronage, and of the *Iowa State Register* that he should retain Mr. Carlisle as Secretary of the Treasury, are gratifying proofs that the splendid services of the sound-money Democrats in the campaign are appreciated, but this is not likely to go beyond the expression of good feeling. The men who went to the Indianapolis convention had higher aims than the procuring of office. If they had wanted cabinet positions or patronage, they would have supported Bryan. What they really wanted was to save the republic from degradation and ruin. This was their first aim. Their second was to keep the Democratic party alive as one of the great conservative forces of the nation and as an ark of safety for the future. Both of these aims have been secured. We are convinced, from our knowledge of these men, that all the offices that have ever been created, since the beginning of the world, could not give them a tithe of the satisfaction that they have derived from the consciousness of duty performed for their country. These men want no appointments to office. We do not believe that they would accept any if offered. To do so would be to neutralize the moral support they now have among their own rank and file. Any election coming to them from Republican voters at the polls, or from a State Legislature composed wholly or largely of Republicans, would rest upon a different basis, and would not be open to this kind of objection; yet even such preferment should not be solicited.

The comments of the London *Spectator* upon McKinley's election are delightful reading. Only a week before the election this wonderful journal was discussing the probabilities of Bryan's success, with preternaturally wise observations about the "arrogant assurance of the money power," and solemn quotations from the prognostications of "Mr. Moreton Frewen, who generally knows what he is talking about." When the news of the election arrived, and the awful fact that, as usual, Mr. Moreton Frewen had not the slightest knowledge of the things he was talking about, was disclosed so plainly that even the *Spectator* was able to see it, a sharp corner had to be turned. The task was accomplished with visible signs of anguish. "We underrated," said the editor, "the strength of the conservative forces in the Union," and then added: "We never doubted that Mr. McKinley would prevail in the electoral contest, but we believed, as we know some of the ablest Americans also believed, that his opponent would reach more nearly to the goal." The identity of these "ablest Americans" is, of course, a secret in the editor's bosom, but we have little doubt that their names are Jones and Teller. The usual two columns of profound speculation follow these confessions, with this important admission: "We doubt if a vote was ever given that was better calculated to dispel, or at least diminish, the fears of those who, while they do not question that Demos, the new Sovereign, is well intentioned, are full of alarm as to both his knowledge and his wisdom." And again: "The result will greatly diminish alarm as to the future course of democracy in America." Let us hope also it will diminish English capacity for swallowing blatherskite information about Americans and American affairs.

The returns which candidates for Congress in this city are filing of their election expenses make curious revelations. Mr. Quigg, the absurd person who was reëlected in the Fourteenth District, swears that he spent $6,615.45 in order to get an office for two years at a salary of $5,000 a year. Did he pay this out of his own pocket, or did he get help from Platt and other generous friends? Why should he spend so large a sum when he was certain of election? The returns show that he would have won if he had not spent a cent. The tide for McKinley was so strong in that district that every candidate on the Republican ticket was absolutely sure of election, no matter what his calibre. Voters were so anxious that their ballots should not be invalidated by any possible blunder in marking, that ninety-nine out of every hundred of them voted the straight Republican ticket, taking Quigg with the rest, without considering his merits at all. This being the case, Quigg has simply thrown away more than half his salary, provided that he spent his own money, which is of course very doubtful. Mr. McClellan spent over $3,000 in his district, but he had more need to do so than Quigg had, and Mr. Shannon spent $3,431 in his district, although he was sure of election. It is a queer business, this willingness to pay such ruinously high prices for public office, and the wonder is how the comparatively poor men who so often pay it manage to live afterwards.

The sworn return of the Hon. James J. Belden, who was reëlected to Congress in the Syracuse district, confirms once more the immortal remark of Jake Sharp concerning him, that "Jim Belden is a man who don't stir round for nothing." He admits that he paid $13,180 in campaign expenses, or $3,180 more than the salary of a Congressman for the full term. Of this amount $10,180 went to the McKinley League, which is the anti-

Platt organization in the State, and to which the allegiance of Belden, as chief financial backer, adds a moral grandeur which can scarcely be overestimated. All candidates for Congressmen seem to have paid very heavily for their nominations this year, though none of them came anywhere near to Belden's figures. The most reprehensible showing which the sworn returns of expenditures have thus far made, is in regard to the sums which seem to have been levied upon candidates for judicial offices. Judge Vann, who was elected to the Court of Appeals, swears that his expenses amounted to $3,555, of which sum $2,500 was contributed to the Republican State committee and $1,000 to the Republican committee of Onondaga County. William W. Goodrich, Republican candidate for Supreme Court Justice in the Second District, swears that he spent $3,590, of which sum $3,500 went to the Republican State committee. Why should either of these men pay a penny to any committee, and what did the Republican State committee do with the money? The Republican canvass in this State this year took care of itself, and had no need of large sums of money; but even if it had needed money, no judicial candidate ought to have contributed it. We ought to have a law forbidding not only assessments upon judicial candidates, but voluntary contributions by them. In this way alone can the political managers be prevented from putting a price-mark upon every judicial vacancy.

The situation in Constantinople does not improve; and although our duty to meddle in it may not be clear, the duty of having a first-class man at the post whose judgment would be clear, who would have some knowledge and experience of diplomacy, and whose words would have some weight with somebody, is very plain indeed. Instead of this we have a perfectly raw and ill-educated man from one of the least diplomatic and wildest States in the Union—Texas—in the person of Mr. Terrell. We have excellent authority for saying that he is the laughing-stock of diplomatic circles in Constantinople. He knows nothing of any language but his own, and is therefore at the mercy of his dragoman in a city where English is rarely spoken. Last April he wrote the Sultan a letter of advice of such abounding folly that Mr. Gresham gave him a rebuke which would have caused any man even one-quarter fit for the place to resign promptly. Moreover, there could not have been a severer piece of condemnation for the Administration, for it confessed the extreme badness of Mr. Terrell's appointment, made when Turkish affairs were becoming really threatening. Not only does Mr. Terrell know nothing of diplomacy, but nothing of Turkish diplomacy, which is the wiliest and most inscrutable of all. The news he sends home of the promises of indemnity for murders and injuries to American property, made to him by the Sultan, and of the love and admiration of Americans which prevail at the Yildiz Kiosk, simply show the contempt the Turks entertain for the man. They are civil to him simply because they know there is no harm in him. Not a cent of indemnity will ever be paid him. Nothing could well be more humiliating to us than his preparations to sign a new treaty with the Porte which is almost the facsimile of the one which has been in existence for the last sixty years, and has received little or no attention from the Sultan.

The French Government is the latest one to plume itself on having at last got those Turkish reforms started. Foreign Minister Hanotaux said some ugly things about the Sultan a few days ago, the French Ambassador at Constantinople made urgent representations, and, lo, the reforms begin! France at once lays her hand on her heart to receive gracefully the congratulations of all Europe. Just think of it, the Sultan has promised to let out of prison every man who has been rotting there for a year charged with no crime! True, these reforms, in sixteen beautiful chapters with supplementary regulations, were solemnly promised in an imperial irade of October 17, 1895. True, not one of them has been put in execution or an attempt made to do so. True, the Sultan has given a smirking promise to this, that, and the other ambassador that he was going to begin the work. But now he has given one more lying promise, and the welkin of diplomacy is ringing with hallelujahs. Nothing so ludicrous has been seen since Mr. Winkle took off his coat and announced in a loud voice that he was about to begin.

The London *Economist* makes a terrible showing of the way in which South African mining shares have been manipulated on the London Stock Exchange. From the highest valuations recorded this year there has been a tremendous falling off, amounting to from 15 to 50 per cent. in the leading companies. The worst of it is that all the evidence points to inside selling for the fall by way of the Continent and Johannesburg. In other words, those very firms of the Rand that were going to sustain the "boom" prices of last year have been quietly and steadily cutting the ground out from under the English investors whom they had persuaded to come in at top prices. The troubles in the Transvaal have been a godsend to these speculators, who have not failed to have them magnified in the organs they control, along with many gloomy reports of the prospective giving out of the deep-level mining, and so on. All this, the *Economist* shrewdly suspected, was preliminary to the engineering of a "bear squeeze," and its prediction seems already to have been verified in the glowing account of the future of the Rand mines given in London ten days ago by Hammond, the American whom Krüger caught. The mixing up of these vulgar stock-jobbers in England's South African policy is a scandal which the Parliamentary Commission of inquiry should probe to the bottom.

Emperor William can never swear in troops without leaving it a little doubtful whether the oath is taken "so help me God," or "so help me William." This confusion was more than ordinarily noticeable in his address to the recruits in Berlin on Thursday. The only thing that saves his language from being shockingly profane is the conviction, which now must be profound in all those who have studied his symptoms, that it is the language of an insane person. His thinly veiled appeal to the officers to go on fighting duels with everybody who questions his absolute wisdom, will cause a great sensation in Germany, where efforts to put down army duelling have of late been strenuous; while his defiant assertion that the nation would shed "our last drop of blood" to keep Alsace and Lorraine, is plainly meant as a challenge to the Franco-Russian alliance to come on if they dare. There have been mad monarchs before, but never, we believe, has one been left at large with such terrible power for evil, both to his own country and to all Europe, as is in the hands of the mania-driven Emperor of Germany.

Monday's debate in the Reichstag resulted in an almost unalloyed triumph for Prince Bismarck. It was not that his methods were justified. His policy in making a secret treaty with Russia in 1884, undoing to a certain extent the Triple Alliance to which he was bound to be faithful, is evidently a galling thing to the present rulers of Germany. His reckless disregard of the public interest in revealing the secret at this juncture, they make no pretence of defending. But they have no stomach for a fight with him. Even rash Emperor William has no desire to pick up the challenge of the bitter and defiant ex-Chancellor. That is the kind of triumph which Bismarck most enjoys. He has not won respect but has inspired fear. His opponents gnash their teeth at him, but they do it helplessly and leave him master of the field. All this must be delicious to a man whose diet for eighty years has been blood and iron. Yet there can be no doubt that his cynical revelations have given a rude blow to European diplomacy. Italy and Austria are putting on the best face possible in the presence of this treachery of their ally, but they must be keeping up a terrible thinking. Other statesmen must be anxiously asking themselves what treaties are worth the paper they are written on, what alliances are secure, if such diplomatic methods as Bismarck's are possible nowadays.

THE PRICE OF WHEAT.

SINCE election day there has been a further advance of nearly 10 cents per bushel in the price of wheat. This advance has not been so exceptional in the general movement of commodities as was the 25-cent rise before the opening of November. As a matter of fact, the majority of marketable articles in this country have gained in price, to a greater or less extent, since the nation's vote of November 3. This is not an unusual phenomenon; it is largely in the nature of reaction from abnormally low prices, caused by the recent period of uncertainty and dread. Disordered trade, especially when occasioned by the prospect of disordered currency, results logically and invariably in a shrinkage of commercial demand. The fabric of credit being threatened with destruction, dealers and middlemen will not lay in a stock to provide for needs other than those of immediate consumption. While, therefore, through the producer's eagerness to convert his produce into cash during the period of hard times, the supply of commodities on the market becomes even larger than usual, demand at the same time shrinks continuously. From such a situation there can be no other outcome than the stagnant markets and the generally declining prices which this country witnessed during the late campaign for repudiation.

To this declining tendency wheat was a remarkable exception. Yet it is altogether probable that wheat would have advanced still further during the autumn months, and that much more of the gain would have accrued to the American farmer, but for the blow at trade and credit inflicted by last July's convention at Chicago. This view was expressed a month ago, officially and very plainly, by the Agricultural Department's European agent, who naturally reflected expert foreign opinion on the question. It is, in fact, notorious that the profit from the advance in wheat during September and October was chiefly gained by foreign purchasers. The home demand for future markets was paralyzed as a result of the domestic trade convulsion; credit was quite disorganized, and farmer and middleman alike sold what they had to the Liverpool grain-importer at the low prices of August. Since the election this situation has been completely reversed. This month it is the American owner of the unsold wheat who holds the key to the market.

Under such circumstances, the future of the wheat market becomes a peculiarly interesting study. That there will be a very material reduction in the world's supply this year is nowhere questioned. India, which exported during the fiscal year ending with March, 1892, no less than 56,566,000 bushels, and which sent out 18,672,000 in the fiscal year ending last March, is in a state of famine, and instead of sending wheat abroad, is importing largely from this country. Australasia, whose wheat exports in one recent year reached 24,000,000 bushels, has had two successive partial harvest failures, and will probably be compelled to turn importer. The Argentine Republic, one of our two chief competitors in recent years, which sent out 37,000,000 bushels in 1895, has had such ill fortune with its harvests as to remove that country, for the present, from active competition.

Estimates of the total anticipated shortage for the world vary widely, as is usual, but the lowest responsible estimates would place the total crop of 1896 at a smaller aggregate even than that of 1891. The *Financial Chronicle* has lately pointed out one fact which may have its influence in checking an extreme advance —the fact that in 1891 the harvest failures were especially disastrous in the great producing and consuming states of Europe. This gave a peculiar impetus to the immediate demand for wheat in the fall of 1891. The present situation is different, in that Europe's own crops, probably excepting Russia, are on the average fairly good. It is interesting to observe, however, that wheat at its highest last week was selling 25½ cents per bushel above the price of the corresponding week a year ago, 32 cents above 1894, 24 cents above 1893, and 13½ cents above 1892. The present level is 7 cents a bushel higher than the best price touched in the violent advance of June, 1895. I is only 19 or 20 cents below the highest price in the fall of 1891, and this comparison is made more noteworthy from the fact that wheat in 1891 reached its maximum price during the second week of November, after which followed a continuous decline. The well-known reason for that decline was the unexpected increase in supplies sent out by the very Asiatic, Australian, and South American producing states which are this year crippled by the drought.

That the profits of our farmers, and their contentment, therefore, with the situation, have increased with this advance in wheat, unaccompanied by a general harvest failure in this country, will not be doubted. In some quarters, however, it is complained that, even with this sudden decrease in foreign competition, the price of wheat is only back at the average level of a quarter of a century ago. In 1877 the failure of a wheat crop in two or three of the world's great wheat-producing nations meant nearly $2 a bushel at New York; in 1855 it meant $2.50. Has not the farmer still, then, something to complain of?

The assertion that what may be called the "famine maximum" in the price of wheat has been more than cut in two within the last twenty-five or fifty years is quite correct. We believe, however, that unbiassed minds select this fact as one of the most cheering landmarks in the progress of civilization. For half-a-dozen centuries the darkest blot on civilized society was the possibility that the deserving poor, because of an unfavorable harvest season in one quarter of the globe, would die by hundreds of thousands from absolute lack of food. Until a comparatively recent epoch the recurrence of such horribly destructive famines was an outcome chiefly of ignorant methods in agriculture and of wholly deficient means of transportation. When these obstructions to the welfare of humanity began to disappear, the greedy search for Government protection to producers, for prohibitory import duties at ordinary times and prohibition of exports in deficient harvests, was instituted to fill their place.

The result of such provisions in the public laws may be imagined. During the two famous years of European famine, 1739 and 1740, when the price of wheat rose 200 per cent., a French historian has estimated that more citizens of France died of starvation than fell in all the wars of Louis XIV. In 1753, it is said, 800 people died of hunger in one month in a single quarter of Paris. Taine and Lecky have pointed out the very essential part played by the harvest failure of 1788 in bringing to a focus the forces which resulted in the worst atrocities of the French Revolution. In 1756, Tooke observes in his 'History of Prices,' there were insurrections throughout England, "on account of the scarcity of corn and the high price of provisions." In 1775, in France, a contemporary chronicler remarked, "bread in several places could not be procured for money." In England "troops were stationed to protect the markets and the roads and rivers by which they were supplied." In somewhat mitigated form, the same evils continued into the nineteenth century. "Bread riots"—a term which this generation hardly understands—were frequent incidents in London during the first half of the present century. The theory of Malthus, that the world's food supplies could not possibly keep pace with unchecked increase in its population, obtained at the opening of the century a popular vogue which can be explained only by that generation's familiarity with the spectacle of wholesale famine and starvation.

The last great English famine—that of 1845 and 1846—cut the final prop from under this wicked system of prohibitory import charges on food. Until one or more of the great consuming nations had taken such a step, it was impossible that agriculture in other quarters of the globe should extend further than was required to meet consuming needs of the producing state. Nobody will raise grain which the law prohibits from a market. But the repeal of the British corn laws was followed by the extension of farming area; first in the United States, then in northern and southern Europe. Finally, during the last twenty-five years, when ingenuity had provided means by which wheat could be brought from far south-

ern climates in fit condition for the milling process, southern Asia, Australia, and South America were added to the list. Actual famine, in the civilized states of Europe and America, is no longer a possibility. The time will come, moreover, when such a famine as this year's in Central India will be equally inconceivable. Such another forward step in humanity and civilization will be the plain result of the mighty forces at work throughout this generation, forces against which the bimetallic orators are beating out their brains—the spread of intelligentagriculture, increase throughout the world in means of quick and economical transportation, and the consequent general lowering of the cost of food.

THE TARIFF QUESTION.

THE recent political campaign brought together in a spirit of amity those who favor and those who oppose what is called the "high-tariff policy." What particular schedules or rates of duty come under the definition of a high tariff nobody pretends to decide. A great many people consider the present average rate of duty too high by comparison with those which the Republican party was satisfied with before 1890, when the McKinley bill came up. Many others consider the present average rate too low merely because it was passed by a Democratic Congress. Others, with more reason, think the average rate of duty of small consequence, while the particular rates on certain articles, such as wool and sugar, are of much importance. There is a division in the Republican party itself between those who would make revenue the chief consideration in the tariff, and those who would give the leading place to protection. There are those who have been zealous protectionists heretofore, and who may be called protectionists on principle, who think that the system has become somewhat antiquated, and that we are nearing the time when we can compete with Europe in many leading articles, such as iron and steel. Finally, there is an influential and growing body of opinion among Republicans that a fresh overhauling of the tariff would put in jeopardy the revival of business which has been so gratifying a result of the election of McKinley, and that it would cause a disintegration of the elements which contributed thereto, and a redistribution of votes which might prove politically disastrous in the near future.

If anybody had ventured to predict twelve months ago that politics would take such shape that Congressman Dingley and ex-Congressman Wilson, or, for that matter, Mr. McKinley and Mr. Cleveland, could sit down and discuss the tariff question without partisan rancor, but with a view solely to the good of the country, he would have been considered a visionary. Yet that odd condition seems to have been reached. From nearly all quarters we hear the same story. Newspapers that were most determined last spring to have an extra session of Congress called to pass the Dingley bill, preparatory to some more radical and comprehensive measure, are now counselling their party friends to go slow. These words of caution are nowhere more frequent than in Pennsylvania. The Philadelphia *Bulletin* finds that the leading Republicans of that State desire to "avoid another prolonged season of tariff agitation in the next Congress as well as a fresh disturbance of business." The *Ledger* of the same city, in its Washington correspondence, tells us that it is a great mistake to suppose that Mr. McKinley himself is wedded to the McKinley tariff, or that he entertains extreme views on the subject. Whether he was in favor of all the prohibitory clauses of that measure, or whether they were forced upon him by the mob of private interests that came flocking to Washington when they understood that there was to be a new deal, we are quite prepared to believe that he has got new light on the subject from events which have occurred since. In other words, we shall not be surprised to find the new President taking a conservative position on this question. We shall be greatly surprised if he puts at risk any votes by which his election was secured and without which his party would be in a minority to-day.

It is hardly necessary to enforce the view that the business of the country needs time to recover from the shocks it has suffered during the past three or four years. Whatever the causes may have been, the great want now is freedom from disturbance. Everybody can see that we are getting on our feet once more. We want to avoid being knocked down again—at any rate until we get our wind. It is true that the Government ought to have more revenue, perhaps $25,000,000 or $30,000,000 more a year in normal conditions, although receipts vary so much with the state of general business and the probabilities of new legislation that we hardly ever have normal conditions. Quite as much as added revenue the country needs industrial prosperity, and that immediately. This will not be possible during a general overhauling of the tariff again, however satisfactory things might be at the end of the task. As soon as the importers know that a higher tariff is coming, they begin to stock up the bonded warehouses with foreign goods, taking advantage of the lower rates while it lasts. This produces a big revenue for the time being, but by so much overloads the country with manufactured articles. This in turn shuts down the American factories, and during the period of uncertainty as to the outcome of tariff legislation a paralysis of industry is inevitable. Two recent experiences of this sort have warned us that it is very risky business to revise the tariff when revenue and a steady and uniform industrial development are desired. Under both the McKinley and the present tariffs, there was this stocking-up of the market in anticipation of changes, or unloading of the market when a drop in rates was anticipated. Moreover, it by no means follows that more revenue is to be gained by increasing the rates of duty. The amount may be lessened by that very means, and usually the protected interests prefer that it should be.

It is safe to say that a large and increasing number of Republicans are opposed to fresh tinkering with the tariff. In fact, the only section of the party likely to give trouble is the wool-growers, under the lead of the Ohio triumvirate, which has been reduced to a duumvirate by the death of Columbus Delano. They are already at work on a new tariff, and for this purpose got what they call a farmers' congress together at Indianapolis, whose exercises were directed by Judge Lawrence, one of the duumvirs. The object of this "congress" seems to have been to "bring pressure" on McKinley to call a special session of the other congress—the Congress of the United States—to enact a new tariff bill. The Dingley bill, now pending, does not satisfy Lawrence; the duties on wool being altogether too low, in his judgment. He considered the duties in the McKinley bill too low, and was engaged in a vigorous fight to have them increased when the Wilson bill was passed. The wool duties in the Dingley bill are only six-tenths of those in the McKinley act of 1890. Of course that would not satisfy the duumvirs; hence their eagerness to have an entirely new bill and an extra session. We think that they will not get either. The Republican party has too lively a recollection of the consequences of following the lead of this same Lawrence in 1890. The McKinley tariff was initiated by him. The party leaders allowed him to start the avalanche which buried them all in the elections of 1890 and 1892. They may make other mistakes hereafter, but they are not likely to make that one again. Curiously enough, ex-President Harrison was one of the speakers at this so-called congress, and he exhibited some common-sense when he advised them to speak out and tell what they wanted and not continue beating the air. What they really want is a prohibitory duty on wool. We agree with Mr. Harrison that they ought to say so, and not veil their desires under vague phrases about "the most ample protection to agricultural products."

As regards the Dingley bill itself, there is very little likelihood of its passing. Even Mr. Dingley himself does not expect it to become a law—perhaps does not desire that it should, seeing that it was only a makeshift intended to expire by limitation on the 1st of August, 1898. That is to say, it would be in force only a year and a half if it should be passed this winter. But if it could get a majority vote in the

Senate (which is unlikely), it would probably be vetoed by President Cleveland, whose tariff policy from the beginning has been based on free wool. Although the Dingley bill comes far short of satisfying the Ohio duumvirate, it nevertheless runs counter to all Mr. Cleveland's views on the subject. He might very well say that it was not worth while to pass a haphazard bill like this to last only a short time and upset the calculations of the commercial world twice in eighteen months, besides bringing upon us retaliatory measures in other countries. The Argentine Republic has actually made preparations to meet a reimposition of duties on her wools by discriminating against our manufactures. Senator Teller, in an interview, says that he has not found any reason for changing his mind or his vote on the Dingley bill. Consequently it cannot pass the Senate this winter unless bolting Democrats can be found to take the place of bolting Republicans.

THE SOUTHERN STATES AND THE "MONEY POWER."

THE *Manufacturers' Record* of Baltimore, after recounting the difficulties the South had to contend with in the late canvass, the fear of negro domination, the fear of a force bill, and the strength of the silver sentiment among the agriculturists (the bulk of the population), and showing what a large minority voted for McKinley, has the following rather amazing passage:

> "If the business people of the North will study these facts, they will see that the South should receive unstinted praise for its magnificent work in behalf of sound money. They will see that never before has any section given greater proof of the moral courage of its people, and in these facts they will find abundant reasons for regarding with favor the South as a field for investment. Now that the South has made such a showing, fulfil your promises and turn the capital seeking investment, the farmers looking for homes, the manufacturers anxious to build mills where raw material is most abundant, to this favored land. Here is a field for the display of good business judgment and for patriotic work that has no equal. Here is the supreme opportunity presented to the capitalists of America and to the Republican party as a party."

The facts are that twelve States of the old sixteen composing the solid South voted for Bryan, although in two of these twelve there are suspicions of fraud; that the great bulk of the press—there were a few honorable exceptions—teemed during the canvass with abuse of bankers, capitalists, and of the Northern sound-money press, and with notions about currency which, so opposed were they to the experience of the human race and all ages and nations, would discredit an Indian council; that a great many of its leading men swallowed their own convictions publicly, and agreed to vote for the ruin of their country and support its assailants, simply because they had attended the Democratic caucuses or primaries, which is very much as if, having attended a meeting of Molly Maguires, and the meeting having, unexpectedly to you, voted to murder a man, you felt bound to lend a hand.

To understand the full gravity of all this, from the business point of view, we must remember that the Bryan platform tacitly proposed to make the Supreme Court subject to the will of the majority at each election. The Supreme Court is the guardian of the Constitution, and what is most important to investors is, that it is in an especial manner the guardian of that clause of the Constitution which makes contracts inviolable by State authority. Without the Supreme Court this clause would not be worth the paper on which it is written. State Legislatures would constantly authorize breaches of contract, and the elected Populist judges would find fifty excuses for giving no remedy. This is over and above the enormous currency danger. To invite people to invest in a community which proposes to debase the currency in order to make it easier to pay debts, and to make judges elective in order to punish them for a decision, makes their appeal to moneyed men to come down and trust them seem little short of a joke.

The fact is, the South has made its greatest mistake since going to war for slavery, in supporting Bryan in his attack on our government. The line drawn across the continent by the elections, leaving the great bulk of property and intelligence on one side, and poverty, colored men, ignorance, want of capital and manufactures on the other, is a most unfortunate advertisement for the South to make to the world. We know the allowances that have to be made for what has occurred, and how largely the Democratic majorities fell off in all the States, and what a provocation such things as the force bill and the pension laws have been to the South; but, as we strongly disap prove of a man's cutting off his own nose in order to spite his enemies, so also we strongly disapprove of a poor community's making proclamation that it has no fixed standard of value and has no respect for plighted faith. A man who would rush with his children's money to such a community would, in all countries which have anything to lend or invest, be considered little short of crazy.

Nor is the matter mended for the moment by the conversions of newspapers or of men of which we hear every day. These are good things politically, but they will not be, for some time to come, very valuable from a business point of view. In business, confidence is a plant of slow growth. Business men trust character, not opinions. Character means a long course of rational and orderly behavior. Opinions a man can change when he pleases. All we know about them is what he tells us. He may change them for five dollars or for an office, or through fear that he will not get a nomination, when the time comes. Capitalists and investors are not taken in by these things. When a man who has been yelling for silver for six months suddenly says he is now for gold, and never yelled for silver sincerely, he inspires not respect but contempt. The last thing that occurs to the investor is that it would now be a good thing to lend him some money.

In supporting Bryan the South has, for the time being, parted company with civilization. To read some of the articles in such papers as the Atlanta *Constitution* about the "money power," one might fairly suppose that the editor sat at his desk with a breech-clout, and had his face ornamented with red ochre. There was no answering them from the civilized man's point of view, because to answer arguments on such subjects as currency and government the disputants have to have some common ground. The ridiculous ogre which they dressed up and called the "money power" means simply the savings all over the world of the thrifty, the frugal, the shrewd, which keep civilization from perishing by the process of continual renewal. Neither Rothschild, nor Vanderbilt, not Rockefeller would get a cent of income from their enormous fortunes if they did not invest them judiciously in great and profitable undertakings which employ millions of people. Neither the South nor any other community can profit by turning the world upside down. Industry, and fidelity, and common sense will, by and by, restore its fortunes, but it must not expect such a debauch as the Bryan business to be forgotten at once. Our belief is that the South will suffer until the support of rational legislation this year and another Presidential election show that the late lesson has had its effect, and that the people are once more clothed and in their right mind. To abuse capitalists and in the same breath try to borrow from them is not rational. There must be a little interval.

BIOGRAPHY AND AUTOBIOGRAPHY.

MR. P. G. HAMERTON began the account of his own life, which has just been published, with the assertion that he could write his own biography better than anybody else. He added that most biographies are necessarily autobiographic in any case. That is to say, in the nature and amount of the material which a famous man leaves for his biographer to work with, there is inevitably such an element of personal selection, such guiding hints, such a giving or withholding of data, as largely determine the result. The literary form is the biographer's, but the dead hand that provided the documents really writes the life.

The force of this remark might be illustrated by reference to many biographies published since Hamerton wrote. Whatever blame has been imputed to Froude's Life of Carlyle, for example, really strikes back to Carlyle himself. It

was he who furnished the letters and the manuscripts—he who turned over all that gunpowder with unlimited discretion given as to when and how it was to be exploded. If he thought that Froude would be more discreet than he proved himself, that fact itself is of the highest biographic value: the deliberate choice of an indiscreet biographer is alone significant of much, as Carlyle would say, in the character of a great man. We incline to think that Froude is not so much accounted a sinner above all that dwell in Jerusalem as he was a dozen years ago. Subsequent black deeds by other biographers may have made the world more tolerant. Purcell's 'Cardinal Manning,' for instance, has been called an attempt on the life of that prelate. But, however that may be, the justification of Hamerton's observation is apparent. Positively and directly, every man who arranges to have his own life written, practically writes a good part of it himself.

Negatively and indirectly the case is as clear. Everybody has read of the holocaust of letters and private papers which Tennyson and Browning made before their death. They were doubtless acting under terror of the new smutch of publicity on the fine and delicate things of life, of which they had seen so many warning examples. They and their friends should not be smeared in that way if a little timely burning of correspondence could prevent it. Similarly we had Taine a few years ago carefully destroying all papers and letters relating to his own life, and leaving solemn injunctions, like Thackeray, that no formal biography of him should be written. This was, in a sense, writing one's own biography by determining that none should be written. It pointed inquirers to facts already public, and referred them to the author's works as the sufficient mirror and expression of his life.

Mr. Hamerton also took up the question of printing allusions which would hurt the feelings of the living or cast a slight upon the memory of the dead. Who is least apt to offend in these ways, the biographer or the autobiographer? The latter, he contended—that is, if he undertook his work as Mr. Hamerton did his. He began to write years before his death. Who could know how better to shield the sensibilities of his friends and correspondents than he himself? But his autobiography was not to be published until after his death. Who could be more considerate of the defenceless dead than a writer who knew that he would be one of themselves when his book saw the light? All this is perhaps more nice than convincing. The taste and delicacy of the man who does the actual writing are more critical in these matters than the fact of his writing about himself or another, whether for immediate or posthumous publication. Certainly we have seen memoirs, such as those of Talleyrand and Barras, which seem to argue in their authors a fiendish delight in contemplation of the malicious flings and vitriolic personalities that would come, after long years, from their graves. Actual death may extinguish envy, but the anticipation of death does not necessarily do so.

A recent English biography, that of Archbishop Magee, has shown how biographer and autobiographer may work together to create scandal. Magee was as unlikely archiepiscopal timber as one would be apt to find. An impetuous, witty Irishman, with a fatal gift of irony and epigram, he blazed his eloquent and unconventional way along in defiance of all the traditions of ecclesiastical preferment. He was the sort of man who would get up in the House of Lords and make fun of all the dignitaries to their faces, who, on occasion, would assert there that he would rather see England free than England sober, and who was, in private life, prodigal of such epithets of sweetness and light as "unmitigated ass!" Such a man's letters and conversations could not but be full of blazing indiscretions, and his clerical biographer has printed some of them calculated to wring more than one bosom high in the English hierarchy. Yet what was to be done, and who was at fault? Magee was the author of the wicked characterizations, and left a mass of them for the use of his biographer. Should the latter have blurred the picture he was undertaking to draw? One sees how difficult a matter it is to apportion blame in such cases.

Mr. Hamerton also touches on the old question of the autobiography behind the autobiography. He maintains that an autobiographer is truthful in spite of himself. Whatever suppressions or concealments he may essay, the murder will out. Nature is too much for the most consummate actor, and fatally catches him off his guard now and then, however skilful the disguises he puts on. The idea of Rousseau which we get from his 'Confessions' can scarcely be the one he intended to convey. It is as if he unconsciously wrote some of his pages in an invisible ink which time made legible. Behind Goethe's apparent frankness in acknowledging an idealization of his own life in 'Dichtung und Wahrheit,' there lurks a certain elusiveness that of itself tells a truth to which he did not suppose himself to be giving utterance. Who will say that even the extraordinary lack of self-consciousness and the crystal objectivity of a Franklin always told the true story of his life?

Whatever the answer to these queries, their very propounding again and again, with the repeated discussion of the proper methods and limits of biography, witnesses to the indestructible charm of this branch of literature. "Don't read me history," exclaimed Horace Walpole, "for I know that cannot be true." But biography, whether wholly true or not, has a perennial interest, which indiscretion cannot wither nor plodding stale.

THE ROYAL PAGEANT IN ITALY.

Rome, October 25, 1896.

It was King Humbert's desire that the marriage of the Crown Prince to Helen, third daughter of Prince Nicholas of Montenegro, should take place in one of the great Roman basilicas. To this effect, Monsignor Anzino, his Majesty's private chaplain, sought to obtain his Holiness's consent. But, as on every occasion when the Vatican has it in its power to make difficulties for the Quirinal, the Pope refused to let the Prince's marriage be celebrated in any of the Papal churches, or even any cardinal or bishop assist at the ceremony. His Holiness suggested that the Prince should be married at Florence, in which case the Bishop should perform the service at Santa Maria del Fiore. That the Crown Prince should not be married in Rome was inadmissible; the King therefore decided that Santa Maria degli Angeli, the church which Michael Angelo designed after the tepidarium of the Baths of Diocletian, and which, having been declared a public monument, was under the control of the Ministry of Public Instruction, should be prepared for the marriage, and that Monsignor Piscicelli, the Grand Prior of the Palatine Church of St. Nicholas at Bari, in which Princess Helen was to make her abjuration of the orthodox faith and to be received into the Catholic Church, should come to Rome after this function and officiate at the marriage ceremony. The priorate of St. Nicholas of Bari is an office dependent on the Government, preferment to it being in the royal appointment.

Rome has always been ready to keep festas, and the entrance of the Montenegrin Princess on Thursday with her father, Prince Nicholas, her brother, Prince Mirko, her sister, the young Princess Anna, and her suite of Montenegrin ministers and attendants, was a very fitting occasion for all Rome to turn out to meet the bride and honor the occasion. Accordingly, from an early hour the streets were alive with people; country folk bent on sightseeing were pouring into the city from all its gates, while each train brought people from the provinces to join in the welcome to their new princess. The Prince of Naples, who had been with his uncle, the Duke of Genoa, to Montenegro, to accompany his bride to Italy and to be present at the ceremony of abjuration at Bari, arrived by an earlier train and was enthusiastically greeted by cheers on his way to the Quirinal, where he was hurrying to take his place in the cortège for the reception of the Princess. The weather, after weeks of intermittent rain, was gloriously bright and sunny—a good omen in itself, and allowing the royal carriages to be open for the show. A temporary theatre of wood had been erected around the semicircular Piazza delle Terme adjoining the railway station, for those who could pay for seats, while the sidewalks from the station down Via Nazionale to the Quirinal had been packed with sightseers in two dense bands, kept back by files of troops, full three hours before the train was expected to arrive.

At a few minutes past eleven, the Royal March was heard, and the procession of carriages from the Quirinal started on its way to the station. Twelve court carriages came first with scarlet-liveried outriders, followed by four municipal coaches. After the grand master of the ceremonies and the guard of

honor came the carriage of the King and Queen, with the Prince of Naples. The Queen looked radiant and quite young; she was most becomingly dressed in golden-brown velvet embroidered with gold and trimmed with fur. She bowed graciously right and left, evidently delighted at her reception on her return to Rome; the King bowed with his habitual inexpressive automatic movement. Their Majesties were followed by Queen Maria Pia of Portugal, sister of King Humbert; her young son; the Princess Letizia; Helen of Orleans, Duchess of Aosta; the Duchess of Genoa, mother of the Queen, and her son, the Duke of Genoa, with the Duchess Isabella, his wife; Prince Victor Napoleon, the Duke of Aosta, and the Count of Turin. After the princes and princesses of the house of Savoy, came all the ladies of the Queen's household, those just appointed to be ladies in-waiting to the Princess Helen and those of the princesses. Then came the Prefect, Syndic, Senate, and other functionaries of state. It was a brilliant cortège to meet the young bride.

Those who saw her arrival in the station thought she seemed bewildered and shy, which was but natural, with all these new relatives to be introduced to her as soon as she stepped out of the train. On the return, the order of the carriages was changed: the King came first, with the Prince of Montenegro on his right hand, in Montenegrin costume. The acclamations of the crowd were most enthusiastic, and the King signified by bowing to the Prince at his side that they were in *his* honor. Nicholas of Montenegro looked immensely delighted at being thus received by a Roman crowd; his intelligent face beamed with satisfaction as he saluted in Montenegrin fashion. Then came the Queen with the bride and the Prince of Naples. The Princess Helen was dressed in green velvet embroidered in gold, with a green toque and gold aigrette. Twenty-two years of age, she is tall, dignified, graceful, and strong as a child of the Black Mountain should be. She has handsome features and an olive complexion; her large dark eyes are especially beautiful. She was educated at school in Russia, and is said to have a great love of art and to have inherited her father's gift of poetry. On the present occasion she looked pale, but smiled, and bowed responsively to the crowd, who cheered incessantly. The impression she made was excellent. She was dignified, but very gentle and modest. Her journey and the ceremony in the church at Bari, with the night journey following, and then the finding herself in the blazing sunshine, the observed of all eyes, would have been an ordeal for most young girls. The Montenegrin suite, in their red, white, and gold costumes and white-plaited tunics—brown, solid men and good-looking—attracted much observation as they went by in the carriages assigned them. As soon as the last of the Court carriages had passed, the crowd, as usual, broke the files of troops and poured down Via Nazionale to the Quirinal, where their acclamations brought the royal family on the balcony in acknowledgment.

On Friday nothing in particular happened—only an interchange of visits among the royal people at the palace of the Consulta, where the Montenegrin princes are lodged, and the Quirinal, and the reception in the afternoon of the Senate and the Chamber by the King and Queen and Prince of Naples. Meanwhile preparations for the religious ceremony were going on at Santa Maria degli Angeli with more speed than is at all usual in Rome. The façade, which had never been finished, was extended by two stucco pilasters with appropriate inscriptions, between which a handsome baldaquin was erected, very effective in color—blue, white, and gold—on which the arms of the houses of Savoy and Petrovitch were blended. On the summit of the pilasters were vases of flowers, while before the door hung a tapestry curtain on which an angel was represented with the arms of the two houses woven together, with the date October 24, 1896. The Piazza delle Terme looked, when all was ready on Saturday morning, like a vast amphitheatre. The graduated seats of the scaffoldings in quarter circles on either side the church were covered with bunting, and adorned with gold imperial eagles and baskets of flowers at equal distances; the great fountain in the centre played over a vast parterre of flowers.

All was ready as we entered the church at nine to take our places in the remote tribune to which our tickets for the press admitted us. The church seemed transformed into a vast reception-room, with its scarlet carpet and rows of chairs for the invited guests. To right and left were graduated scaffoldings divided into tribunes for the ticket-holders of different categories. The gigantic pillars were half hidden by groups of tall palms and plants at each of the corners of the Greek cross. The high altar had been moved forward to make room for the choir and organ, and on either side hung the precious tapestries Napoleon had given to Pius VII., representing our Lord washing the feet of Peter, and the Last Supper. The altar-piece, newly varnished for the occasion, is by Vanvitelli, a painter of the early part of the last century. By ten o'clock the places were mostly filled. The ladies were all in court dresses and trains with white veils, the gentlemen in uniform with their orders. It was amusing to note the difference in the manner each lady had of wearing her veil and managing her train. The day was a chilly one, with gray sky and threatened rain, so prudent dames came in large white-fur pelerines, which were very unbecoming, making them look like mounds of snow on account of the large puffs of their sleeves beneath. Those who cared for their appearance had their veils adjusted high on their heads, tightly gathered round them, and hanging down to the waist, so as to lose nothing of the outline of neck and shoulders. They dropped their trains on entering, and walked along to their places like proud and graceful peacocks. The ladies of the diplomatic corps were all splendidly dressed and wore magnificent jewels; the trains were all four metres on the ground. The favorite colors were light blue and yellow, dark blue velvet; violet and mauve of various tints for the older ladies, and white brocades of every variety for the younger.

The chapter of the church met Monsignor Piscicelli at his arrival at the door and accompanied him to his place. The entrance of Crispi just before the arrival of the royal party excited the curiosity of the crowd. As the elder of the wearers of the collar of the Annunziata, people were curious to see whether he would shake hands with the Marchese di Rudini, who had the day before received this honor, the greatest in the King's gift, and whom he had to pass before. He walked quietly to his seat, not noticing Rudini, and was greeted by the other wearers of the collar, Gen. Cosenz, the Hon. Farini, President of the Senate, and Donna Laura Minghetti, widow of a knight of the Annunziata. The organ began the music composed for the entrance of the Princess by the Roman organist Capocci, and the Queen's ladies-in-waiting with the Montenegrin suite hastily filled the vacant places, while the representative of the Palatine clergy and the vice-rector of Santa Maria degli Angeli at the door of the church offered holy water to the royal party just entering. The King and Queen came first, taking their seats to the right of the altar; the Queen wore a gold brocade train. Then came the bride in white, with a train on which silver marguerites were woven. She wore a diadem of large pearls and diamonds, the gift of the King, and a long mantilla of exquisite lace, which Queen Margaret had given her. Her father, Prince Nicholas, on whose arm she leaned, was in a splendid red velvet and gold costume, with white tunic. The Prince of Naples followed, with Queen Maria Pia and the other princesses of the House of Savoy in their prescribed order of precedence, taking their places immediately behind their Majesties, while the princes were to the left behind the prie-dieu to which the bride had been led by the side of the Prince of Naples. A silver baldaquin was held over the heads of bride and bridegroom, while Monsignor Piscicelli performed the ceremony of the giving of the ring. The Gregorian chant of the introit was exquisitely given by the choir, as also some of the music of Palestrina from the Missa Brevis, and a gradual, offertory and communio expressly composed for the occasion by Bossi. The nuptial benediction played by the organ was Sgambati's. While the music was excellent, it inconsiderately lengthened out the service, the bride kneeling almost all the time, reading a book of the service which the Queen had had prepared for her. The Prince of Naples stood, as did the King and all the princes. The Duchess Helen of Aosta (the French princess) looked remarkably graceful and handsome in her silver petticoat with pale-blue velvet train, and was in marked contrast with Princess Letizia, who looked her best also in her becoming dress of white and orange velvet.

After the mass and a short sermon which Monsignor Piscicelli read to the royal couple, the procession left the church, bride and bridegroom leading the way. The return procession to the Quirinal was more enthusiastically vociferous than before, and bride and bridegroom had to appear on the balcony again. The civil marriage had taken place at the Quirinal before the religious one. In the afternoon the Prince and Princess of Naples drove about the city together, looking happy and amused at the enthusiastic greetings they received on every side from the people. To-day, Sunday, at 10, they went to pray at the tomb of Victor Emanuel in the Pantheon. On Tuesday there will be a grand review of the troops. A gala night at the opera, on which occasion "Puritani" will be given, a state concert at the Quirinal, and a general reception of all who have been presented at Court will be the climax for Rome of the wedding festivities. The streets are illuminated every night, flags are flying from almost every house, and the sound of military music is heard at all hours. A modest display of fireworks will be let off on the Janiculum this evening. M. S.

GEN. TROCHU'S MEMOIRS.—I.

PARIS, October 31, 1896.

As Governor of Paris during the long siege of 1870, Gen. Trochu will always have a name in history, a name which will be associated with one of the greatest misfortunes that

France has ever suffered. After the peace which followed the capitulation of Paris, Trochu ceased to play any part in our history; he died recently in a dignified solitude, but he left Memoirs which will be read with a painful interest.

When Émile Ollivier published memoirs, some years ago, Bismarck is said to have passed on them this severe judgment: "When a man has brought on his country such misfortunes as Émile Ollivier brought on France, the only thing for him to do is to be silent and try to be forgotten." General Trochu does not fall under this condemnation; he did not bring on his country the misfortune of the war of 1870, he was not one of the members of the *camarilla* which surrounded the Empress, which persuaded her that a war with Germany was the only way to secure the throne for her young son, and which was aware of the increasing weakness of Napoleon III., caused by an incurable disease. In fact, General Trochu, far from being *persona grata* at Court, was considered as a *frondeur*, as belonging to the Opposition.

Trochu's military career had been passed in Algeria; he had become attached to the staff of Marshal Bugeaud, who held him in very great esteem. He followed this commander in all his expeditions, from the repression of the great insurrection which followed the disaster of Sidi-Brahim; he assisted him in the conquest of Kabylia, which crowned the conquest of Algeria; he was at his side at the battle of Isly. In July, 1847, Marshal Bugeaud left Algeria for ever and returned to France. Trochu returned with him and stayed some time with him at his château of Durantie, in Périgord. "Come, we have never taken any rest, and I need you," wrote the Marshal to him. "I intend to write the history of the Algerian conquest." "The history," says Trochu, "was begun, but what became of it after the death of my illustrious chief, and what became of Durantie—fallen into the hands of strangers? Hardly had a few years elapsed before a part of the descendants of the Marshal were dead and the rest dispersed into obscurity." The Marshal, in his retirement, said one evening to Trochu: "You are, I think, the youngest superior officer of the army. More fortunate than I, you will reach the summit without going, as I have done, through an almost uninterrupted series of revolutions and of wars."

"'I should not be surprised, Monsieur le Maréchal, if I saw more revolutions and wars.' The Marshal, extremely surprised and almost out of humor—'Your opinion,' said he, 'is very paradoxical; mine is very natural. We have a king who is a model of experience and wisdom. Moreover, he has gone through a long period of revolution and wars; he has suffered by it, and his whole programme of government sums itself up in views of prosperity at home and of peace abroad. He has realized the first by the application of the liberal ideas with which he is imbued. After some years of struggle the factions are now vanquished. Agriculture, industry, commerce have taken on the happiest development. As for our foreign relations, the prudence of the constitutional Government has finally reconciled the monarchies which surround us with the France of 1830.'"

And so the old Marshal went on, insisting on the "relays of sons" who surrounded the King, sons who had been brought up with their contemporaries in the French public schools. Trochu, who was fond of argumentation, explained in his turn the reasons of his pessimism, which he opposed to the old Marshal's optimism. His chief argument was the absence in France of what he called public spirit—"a conservative force, at once social and political, found only in nations which have not been subjected to the assault of several successive revolutions. In England, for instance, which has had no revolution since 1688, this force, this public spirit, establishes between all classes of English society, from the Queen to the Thames boatman, a tie of solidarity and of respect which preserves the crown in a crisis. There are parties in England, and at certain moments factions, which might become as revolutionary as ours; but public spirit contains them. I believe that in France the uninterrupted succession of our revolutions, which are alternately democratic or autocratic, or of a mixed character, like the revolution which founded the Government of today, have divided and enervated the nation to such a point that all public spirit has disappeared. In this ruin of the conservative national element the Government has no other support than the vote of the assemblies. The edifice which has such weak foundations may fall in a day of revolutionary commotion."

These words were prophetic. Marshal Bugeaud soon afterwards returned to Paris, and Trochu followed him. The campaign of the banquets, which preceded the Revolution of 1848, was in full swing. These banquets had for their object to create an agitation in favor of electoral reform. On the morning of February 23, 1848, the Marshal had a visit from the military commander of Paris; firing had taken place between the soldiers who were on guard at the Foreign Office and some men who had fired pistols on the soldiers without any provocation. The Marshal set out with Trochu for the Tuileries. He wished to see the King. They went together in a cab. It was near dinner-time; the King detained the Marshal and his aide-de-camp at dinner.

"You will believe me," says Trochu, "if I say that, never before having attended a royal dinner, I well remember this. The guests were at least forty, all unknown to me, who had just come from the army in Africa, where all my youth had been spent; but, from portraits which I had seen a hundred times, I recognized the King, the Queen, the Duchess of Orleans, the Princes. There were no presentations; the dinner passed in great silence, interrupted only by the intermittent appearances of certain officers coming from outside with news which they gave to General Christian Dumas, whose physiognomy revealed no uneasiness when he reported them to the King. Shall I add that during this dinner, the last which the Tuileries was to see, a singular circumstance (which was perhaps characteristic of the composure of King Louis Philippe in these grave conjunctures) struck me? He had before him a large ham, and he himself cut with much care thin slices which a servant, standing behind him, carried to some of the personages who were present."

After dinner Marshal Bugeaud retired with the King and the ministers. When he reappeared he looked very red and agitated. He left in a hurry with his aide-de-camp, and said to him at the head of the great staircase, "I have offered myself. M. Guizot and the other ministers do not think the gravity of the circumstances such as would necessitate my intervention in the command. They judge that it would, in the eyes of the Parisians, appear an untimely threat. There is nothing to do; let us go." It was ten o'clock; at midnight the Marshal was summoned in great haste to the Tuileries by the King. A new ministry was formed, with the mission of announcing to the populace the concession of electoral reform and the convocation of the national guard.

At an early hour of the 24th of February, Trochu was advised that the King was going to review a few battalions of the National Guard in the Court of the Tuileries. He accompanied Marshal Bugeaud, who received the King, mounted on a superb horse, in the uniform of the National Guard. "Some of those present were not convinced that the King would be comforted by warm acclamations from these choice battalions to whom he paid the honor of this national visit. How shall I express the disappointment which seized us when the King, riding slowly before the front of the first battalion, was received with very rare cries of 'Vive le Roi,' smothered by the concert of 'Vive la Réforme'? The impression made on the King must have been painful, for, not long afterwards, interrupting his review, he reëntered the Tuileries." This episode was the beginning of the end. Louis Philippe thought himself abandoned by the National Guard, which was representative of the middle classes. He resolved to abdicate. Marshal Bugeaud had been asked by the new cabinet, the cabinet of an hour, to quit the command of the troops. Trochu thought it his duty to join the King and the Princes, as firing was heard very near the Tuileries. With a brother officer, he rode to the Tuileries; they tied their horses to the grille and entered.

"In a small salon, receiving a great light from the windows on the garden, King Louis Philippe, in civilian clothes, bent over a table, is engrossed in writing, from time to time lifting his head as if to collect his thoughts. We see only his back. In the middle of the room Queen Marie Amélie, pale under her white hair, is sitting on a chair looking at the King. Near her, standing, a German prince, young, distinguished-looking [it was the Prince of Saxe-Coburg, married to Princess Clémentine, one of the King's daughters]; near him, standing also, the Duke of Montpensier, who seems agitated, and who goes twice to speak in the King's ear, with a sort of vivacity. Behind the King's table stands motionless an aged and respectable looking man, whose aspect has nothing military. My companion tells me it is Marshal Gérard; he is in civilian's clothes."

Nobody seemed to object to the presence there of a journalist, Émile de Girardin, who had come in and who was discoursing loudly while the King wrote.

"The King gets up, with a piece of paper in his hand, turns towards the bystanders, especially the Queen, and, with a firm voice and attitude, reads the act of abdication which he has just written. The Duke de Montpensier receives it from the King and hands it to Marshal Gérard, who retires. The King joins the Queen, the Duke de Montpensier, the German prince, and they reënter the interior of the palace. But, before disappearing, the Queen stops a moment, lifts her arms to heaven, joining her hands in a movement full of painful and striking dignity: 'Oh, how they will regret us!'"

Trochu was thus accidentally the witness of the principal scene in the beginning of the revolution which, a few hours afterwards, ended in the proclamation of the Republic.

"This revolution," he says, "passed, so to speak, between the legs of our horses, unattacked, unattacking; and the explanation which the legend (which, as usual, became history) found for this easy and extraordinary invasion is imaginary. This revolution was or seemed irresistible merely because, from the beginning of the agitation of the banquets to its consummation, public spirit never and in no degree was a support to the Government. It sufficed, to throw it down, that a few thousands of revolutionists should scream 'Vive la Ligue!' without any act of aggression, and that they should be assisted by as many politicians and loafers of Paris, screaming 'Vive la Réforme!'"

Trochu had become in Africa the friend of all the generals who appeared on the political stage during the Second Republic—of Cavaignac, of LeFlô, of Lamoricière, of Duvivier, of Bedeau; he remained to the end the aide-de-camp of Bugeaud, who died in his arms at

his château in Périgord. After the funeral, as he returned to Paris, the first visit he received was from an officer of Prince Napoleon, who had been named President of the Republic. Napoleon offered him a place on his military staff, in memory of Marshal Bugeaud.

Correspondence.

HOW THEY VOTED IN VIRGINIA.

To the Editor of The Nation:

Sir: Probably all your readers will be interested in the following extract from a letter just received:

"The status of things in Virginia is very painful to any one who has the interest of the State at heart. In 1888, when we had a pretty fair election, Cleveland's majority was about 1,500. In 1892, when many Democrats didn't vote for him, it was about 50 000. There was outrageous cheating everywhere, and several Congressmen were unseated on contests. A number of prominent 'workers' in Richmond itself were indicted before a federal grand jury, and their indictment subsequently quashed by a friendly commonwealth attorney. This year for the second time the Australian ballot system has been used in a Presidential election. Bryan's majority as returned was about 20,000. In the *white* counties the returns show a Republican gain of 30,214. In the *black* counties they show a Democratic gain of 9,176, a net Republican gain of 21,038 in the State. If the darkies had been allowed to vote, the gain would have been larger, naturally. I believe the returns are pretty fairly counted, although a big percentage of the votes was thrown out everywhere by reason of improperly marked ballots. The ballot would have puzzled a Philadelphia lawyer. It took me 1½ minutes to mark mine. The whole fact of the matter is, that with a free vote and a fair count the State would have gone for McKinley by about 20,000 and elected 7 or 8 Republican Congressmen instead of only 2. Contests will be made though, and sound-money clubs have kept up their organization and employed attorneys to vigorously prosecute fraudulent registrars, judges of election, etc. There will be hard times ahead for some of these gentry. I enclose a clipping from the editorial of the Richmond *Times* of November 6, the most important newspaper in the State.

"The method of fraud was very interesting. This precinct, which includes the little town of Ashland and some nearby portions of the county, has about 1,000 registered voters. There were 629 minutes in all from sunrise to sunset of November 3, which naturally required pretty quick work on the part of election officers to get everybody voted. We had anticipated delay tactics, so we got two or three hundred darkies and white men who were known to be anti-Bryan in line 'while it was yet night.' Certain of the knowing ones among us went in early to see what the ballot looked like and to try to head off frauds if possible. It was well we did. In this State the ballot is a dead secret, as to its contents and the order of names upon it, until election day. The candidates for Congress were a certain Mr. Lamb, Bryanite, and Mr. L. L. Lewis, Republican, generally and universally spoken of as Judge Lewis, seeing that he was President of the Supreme Court of the State, a most excellent gentleman. He had been, as I said, practically known as 'Judge Lewis.'

"The ballot read:

John Lamb,
W. H. Lewis,
L. L. Lewis,
Elisha L. Lewis,
John Mitchell.

"Naturally, with this profusion of Lewises the poor nigger who could read didn't know once in a dozen times which one to vote for. It may be said, *en passant*, that to this day nobody knows who the two strange Lewises and Mitchell are.

"Not content with this, they had provided with the ballots pens and a fluid made up of copying ink and mucilage, wherewith to mark the ballots. Now our law is that the voter must cross out the names of all but one candidate for each office with a mark at least three-fourths the length of the name as printed. It required 14 marks to vote a straight ticket. The ballot was about 5 inches wide and perhaps 16 inches long. Imagine the result of 14 heavy black ink-and-mucilage marks on this folded half-a-dozen times.

"Inasmuch as pencil marks are permitted, we had only to warn our friends to use pencils and to see that they had pencils to use. The count gave Bryan a majority of 14; Cleveland's majority in '92 was 265. The total vote for all three Lewises was in excess of that for Lamb, but Lamb got the biggest vote for any one name. About forty ballots were thrown out.

"The gold Democrats had no judge of election representing them. The rule is that there shall be three judges, two from the dominant party in the last election and one from the next. We had, in consequence, two hard-shell silverites and a negro; with the best intentions in the world the latter could make no stand against the two white men.

"This is the true and veracious history of the election here. The effect of it all is perhaps best illustrated by what took place election night in Richmond at the Westmoreland Club. This club is the most select and representative body in Richmond, having a membership of 250. It is largely composed of the older and more solid men of the city, and is to Richmond about what the Knickerbocker or Century Club is to New York. The gold men are about five to one in its membership. Election night they had wires put in and two operators to receive the press returns. About 200 gentlemen were present in the big parlors to hear the result. It had been tacitly understood that no demonstration of applause was to be made, on account of those members whose feelings might be hurt. Things were pretty quiet until, about eleven o'clock, the news of Altgeld's defeat in Illinois and the certainty of McKinley's carrying that State came in. Then the irrepressible applause broke out, and for the first time in the memory of man a gathering of the best men in Richmond, lawyers, merchants, and all sorts of men, cheered a Republican victory. It was great, and it made me feel good to see that the best of us could rise up superior to party, and vote for the good of the country."

The editorial from the Richmond *Times* of November 6, 1896, on "Virginia's Vote," is herewith enclosed.—Cordially yours,

J. S. B.

New York, November 11, 1896.

AMERICAN STUDENTS IN FRANCE.

To the Editor of The Nation:

Sir: A communication having appeared in your issue of October 8 ("American Students in France," by W. H. Schofield), whose tendencies may have been misleading, I beg to submit a letter written by M. Michel Bréal of Paris, Member of the Institute, Professor of the College of France, and Chairman of the Comité Franco-Américain. The words of M. Bréal may serve to correct any erroneous impressions to which the statements of your former correspondent may have given rise.

Very respectfully yours,

Harry J. Furber.

Chicago, November 12, 1896.

Paris, 30 Octobre, 1896.

Cher Monsieur:

J'ai lu l'article de la *Nation* de New York que vous m'avez communiqué. Je vois avec regret que des rivalités de personnes menacent de se mêler à un mouvement qui devrait réunir dans un même sentiment tous ceux qui s'intéressent au progrès de la science et à la bonne union des peuples.

La part que vous avez prise à ce mouvement est incontestable. En pareil cas, l'initiative est le fait capital. C'est vous qui l'avez prise, en soumettant un mémoire au ministre de l'instruction publique de France. Vous avez, de cette manière, saisi l'opinion de la question.

Vous avez aussi visité nos Universités de province, si peu connues de l'étranger, et vous êtes ainsi assuré des ressources variées d'instruction que possède la France. Ces faits ne peuvent être niés.

Je quitte ce sujet pour vous dire que probablement l'année scolaire ne se passera pas sans que la licence ès lettres (philosophie, histoire, littérature, philologie) soit rendue aussi accessible aux étrangers que l'est déjà la licence ès sciences. Vous savez qu'une fois pourvu du grade de *licencié*, rien ne s'oppose à ce qu'on prenne le titre de *docteur*.

Vous voyez que de notre côté nous faisons ce qui dépend de nous pour faciliter de plus en plus les rapports entre les universités françaises et les universités américaines. Il faut espérer que tout cela aboutira à un heureux résultat.

Je profite de cette occasion, cher Monsieur, pour vous renouveler l'assurance de mes sentiments bien sympathiques.

(Signed) Michel Bréal.

À Monsieur Harry Furber de Chicago.

SUMMER SCHOLARSHIPS FOR TEACHERS.

To the Editor of The Nation:

Sir: There is to-day no method by which a teacher's knowledge is so well refreshed and strengthened as by study at the summer schools now instituted in connection with many of our colleges and universities. These schools are better, as a rule, than those that have been organized in the form of summer institutes under State or private control, for, instead of dissipating and tiring the attention, they concentrate it on one or two subjects that the student selects from a large list of offerings. While many of the college summer courses are not particularly related to common-school teaching, others are very pertinent to the needs of the teacher. It is true that they do not dwell on the minutiæ of method, but they supply in fresh and vigorous form just such expanded knowledge of a subject as the progressive teacher needs for her own comfort and peace of mind while she is teaching its elements. Although these summer schools involve a certain measure of mental effort, this is of a kind so unlike that called forth in school teaching, and the whole occasion is so free from the wearing responsibilities of the school-room, that a teacher in good health finds the change of thought and scene an invigorating rather than an exhausting experience.

But if it is now suggested to a teacher that she might to advantage spend a month or six weeks of her vacation at some college perhaps a hundred or more miles from her home, she may fairly answer that her small salary will not enable her to enjoy such a luxury; and here is the point of the whole matter. Teachers cannot, as a rule, afford on their present salaries to pay for the summer instruction that they need; hence the payment should be made, under certain restrictions, by the school authorities. Their duty is not done when the school building is erected, warmed, provided with desks, books, apparatus; when teachers are engaged and set to work on a certain programme. Besides all this, systematic opportunity for study on the part of the teachers must be afforded, and sooner or later this must come to be recognized.

This phase of the problem was last spring brought to the attention of the Woman's Education Association of Boston, and, as an experiment, a fund of nearly four hundred dollars was thereupon accumulated, partly from the treasury of the Association, partly by special subscription, to provide scholarships for Boston teachers in some approved collegiate summer school. After consultation with the officials, ten teachers were nominated for "nine and a half" scholarships—the fund did not quite provide ten—and, according to a report lately made to the association, all took advantage of the opportunity thus afforded, with pleasure and profit. It is probable that a similar effort will be made next spring, when the number of teachers reached may be somewhat increased.

It will be a long time before the public funds will suffice to provide any considerable number of scholarships of this kind, and in the meantime the plan should be brought to the attention of local organizations, such as village-improvement societies, women's clubs, teachers' associations, and the like, from which at least one or two scholarships might be provided in every large village or small city. The school authorities might then appoint the beneficiaries. It does not seem advisable that the less competent teachers should be thus "patched up"; they should not be reengaged when their incompetence is discovered. The competent, progressive teachers are the ones in which a village can best invest its scholarships, thus raising the standard of competence higher than before.

Two practical results may be expected to follow from the local establishment of summer scholarships in this way. The local and even the State authorities will in time be led to consider the formal adoption of the scheme; and even if only one scholarship is allotted to a town having twenty teachers, the investment will be a good one, yielding visible dividends. Furthermore, generous testators will here find a new direction in which they can give assistance to their native or adopted home; and a bequest of moderate amount, as bequests go nowadays, would thus yield a long-lasting benefit. The Gregg Fund of the Indianapolis School Board is thus applied. It seems that Thomas D. Gregg, a native of Vermont, but for some years resident in Indianapolis, dying in 1876, left his property, valued at $25,000, to the city "for the benefit of its schools." It is hardly necessary to say that the will was contested; but the city received about $10,000, and since then this sum has increased to $22,000 in the hands of a judicious trustee. In 1894 it was decided by the school board, led by Mr. Jones (now Superintendent of Schools at Cleveland), to apply the income of the fund, about $1,400, to providing scholarships for teachers. No teacher over forty years old is eligible. The beneficiaries receive half their usual pay, as well as the scholarship, and obligate themselves to teach for at least five years in the city schools of Indianapolis. Some have thus spent a year in Europe; others have attended summer schools in this country, as advocated above. It can hardly be doubted that as soon as the knowledge of this excellent fund is widely spread, similar funds will be generously provided elsewhere.

There is one direction in which those who are interested in the plan here outlined may even now exert pressure on school officials with some fair chance of success. This is on the State boards of education, under whose control the normal schools are conducted. A very moderate expenditure would suffice to send a teacher from each normal school in a State to some summer course; and whether the normal teachers are college graduates or not, the result of such refreshment in their special fields of work would be most advantageous. It will be interesting to note the first State in which this practical plan finds adoption. D. V.

ELEMENTARY ENGLISH IN THE SCHOOLS.

To the Editor of The Nation:

Sir: To get at the trouble in this matter we have to go back of the high schools to the grammar schools. The mistakes that shock one in candidates for a freshman class are generally such as ought to have been shameful in candidates for a high school three or four years before.

A few weeks ago one of my children entered the fifth grade of a grammar school. I had to provide two drawing-books, four blank-books, and seven text-books. This experience discloses one of the causes of the weakness of pupils in the ability to write English. The children have so many things to do that they have no time to learn quietly to write simple English correctly.

I do not think that the teachers like this condition of affairs. If there is one wish common to every one engaged in the work of education, it is the desire to have young people learn to write simple English correctly. The "classical" men and the "science" men and the "practical" men all agree on this point. One will hear from a professor of Greek, from a professor of chemistry, and from a business man the same complaint, that the young men who come to them do not write English with decent correctness.

This is a homely subject, but one in which I believe most readers of the *Nation* are interested. I therefore beg leave to say, speaking from considerable experience in primary work, that I think two changes are necessary. First, school-boards and superintendents must consent to simplify the programmes of the upper grades of the grammar schools. Secondly, they must throw away the nice looking "language lessons" and substitute a simpler method, with more practice and less rule. Nothing is so good for teaching the correct writing of English to young pupils as the simple practice of dictation exercises, chosen, to suit the pupil's age, from some well-printed edition of a classic author. The "language lessons" give a great deal of theory and direction, while the need is constant practice and correction.—Very respectfully,

James H. Dillard.

Tulane University, New Orleans, Nov. 14, 1896.

CHAUCER IN ITALY.

To the Editor of The Nation:

Sir: From a communication in your last number it appears that I have been unwittingly driving a furrow in the Chaucer field already traced by Prof. Flügel. Now that my attention is for the first time called to his review of Prof. Skeat's Chaucer in the *Dial* of February 16, 1895, it is clear that the "new" Chaucer date, for the end of the first Italian journey, was then first given to the reading public as an ingenious surmise; first raised to certainty by a line of Latin in my communication to the *Nation* of October 8. The ratio of credit for the "new" date I am quite content to leave to Prof. Flügel's generosity, joining him heartily in the wish that all Chaucer records may soon be printed in a single volume.

In justice to Prof. Flügel, however, I must insist that the date as then given by him was "new" to Chaucer scholars as well as to the general public. The description of the roll in "Fresh Chaucer Notices" (1873) is not only ambiguous, but wrong as it is there punctuated. As it stands it can mean only that the accounts, not the journeys, lasted from December to May. Prof. Skeat, not unnaturally, so read the description, and Prof. Flügel alone among Chaucer scholars appears to have seen the true, behind the literal, interpretation of the notice. Appreciating the value of his surmise, one could wish that he had published it more conspicuously, while he cannot but be gratified to see it vindicated by the publication of the roll.

Oddly enough, since I learned of these foreign accounts, through the personal kindness of the president of the Chaucer Society, the Chaucer Society notice came under my eye only after I had printed the roll in the November *Modern Language Notes*. A communication already in the hands of the editors of that journal will make due amends.

Regretting that my ignorance of Prof. Flügel's review made it obviously impossible for me to acknowledge its priority in the communication of October 8, I gladly make good that omission at this earliest opportunity.

Frank Jewett Mather, Jr.

Williams College, November 13, 1896.

MR. NOGUCHI AND HIS PUBLISHERS.

To the Editor of The Nation:

Sir: In justice to Mr. Yone Noguchi, the Japanese poet, and in defence of our own rights as his editors and publishers, we would call attention to the misleading character of an announcement that appears in the *Philistine* for November. It is stated therein that a book of verse by Mr. Noguchi will be put out by the Roycroft Press about Christmas. In point of fact, Mr. Hubbard has no manuscripts of Mr. Noguchi but three, which he has refused to return, one of which he prints in the current number of the *Philistine*, ignoring the author's desire that it should not be published in the shape it appears. As regards the issuance of a book of poems, Mr. Hubbard has no authority for announcing anything of the kind, and can base his action only upon an assumption of Mr. Noguchi's consent.

He further errs in stating that Mr. Noguchi is a pupil of Joaquin Miller, for such is not a fact, in any wise.

Of the purpose of the Society of Philistines to give a dinner to Mr. Noguchi, it need only be said that that gentleman has not been consulted, and has given his enterprising host no encouragement whatever.

Very truly yours,

Gelett Burgess & Porter Garnett.

24 Montgomery Street,
San Francisco, Nov. 5, 1896.

Notes.

Way & Williams have nearly ready 'The Acrobatic Muse,' humorous verse by Richard Kendall Munkittrick; and 'Hours with Famous Parisians,' by Stuart Henry.

A Life of Roger Sherman is announced for

speedy publication by A. C. McClurg & Co., Chicago.

Henry T. Coates & Co., Philadelphia, will make a holiday edition of Charles Yriarte's 'Venice,' with index, map, and twenty-eight photogravures.

Copeland & Day are about to issue 'A Boy's Book of Rhyme,' by Clinton Scollard.

Early next month, Gelett Burgess & Porter Garnett, San Francisco, will publish 'Seen and Unseen,' poems by Yone Noguchi.

Charles Scribner's Sons will issue directly 'On the Trail of Don Quixote,' by August F. Jacacci; 'How to Listen to Music,' by H. E. Krehbiel; 'Songs of Childhood,' composed upon twenty of Eugene Field's lyrics, by Reginald de Koven, Arthur Foote, and others; the Complete Poems of the late H. C. Bunner; 'A Winter Swallow,' by Edith M. Thomas; 'That First Affair, and Other Sketches', by J. A. Mitchell; and 'Margaret Ogilvy,' by J. M. Barrie.

The diligence of T. Y. Crowell & Co. in communing with the past continues unabated, and we have from them Adolphus William Ward's edition of Pope's Poetical Works in two volumes, illustrated—more comely externally than in its condensed typography; Bourrienne's Memoirs, also in two volumes with illustrations, but more agreeable to the eye; and a presentable little reprint of Hawthorne's 'Wonder-Book.' The Bourrienne has been, by the aid of thin paper, reduced from four volumes, and has therefore not been promoted, but for reference it answers every purpose, and there has been a reduction in the price.

We are not surprised that a third edition of Mr. John Dennie's readable and scholarly 'Rome of To-day and Yesterday: The Pagan City' has been called for in three years. Seldom does one meet with more animated description in a field where it is difficult to escape being as dry as a guide-book. Since we gave the book welcome, the imprint has been changed to that of G. P. Putnam's Sons, who now send it out in a very elegant dress. The fifty-eight illustrations from photographs are unhackneyed in a quite unusual proportion, with fresh points of view even for familiar objects. No better popular introduction to Roman antiquities could be named. The amount of information compressed in it is enormous.

As usual at this season, the Messrs. Putnam put their chief effort into Irving, and we have 'Bracebridge Hall' in two volumes, dubbed the Surrey Edition. A deep border in green surrounds the letterpress, with a change of two patterns, both designed by Margaret Armstrong, and well designed for their purpose. Mr. Christy's initial letters are hardly in keeping with this framing, nor do they call for praise as invention; but they do not offend. The illustrations, by numerous well-known artists, are of excellent average quality, and, were they less harmonious than they are, are separated by broad spaces of text and have a full page for each plate. Miss Armstrong, again, furnishes the successful cover design, in white and buff and gold. Altogether, the publishers have not fallen short of their previous efforts in this line, while attaining a novel effect.

"Shakspere and no end," in a dozen 16mo volumes contained in a trim case, comes to us from J. B. Lippincott Co. The set has been manufactured in Edinburgh, with the customary good workmanship of that city. The print is fair and open, the paper of good quality, the volumes light and ready to the hand. There are no notes, and the only apparatus consists of a linear glossary in fine type for the more obsolete expressions, and of a chronological table at the end of the third volume, for the plays. It is no longer easy to rank this class of minor Shaksperian issues, but the present one should be an acceptable possession for anybody.

Meanwhile the delectable little Dent-Macmillan "Temple Shakspere" proceeds to its happy conclusion with 'Venus and Adonis' and 'The Rape of Lucrece'; and the same combination produces two more of the admirable Balzac series, 'Beatrix' and 'The Peasantry,' while Macmillan alone brings out the fifth of Björnson's novels, 'The Bridal March, and One Day,' stories just twenty years apart in time, and the last a temperance idyll.

Miss Wormeley's translation of Balzac (Roberts Bros.) has for its latest production 'Juana.'

The uniform Riverside Edition of Mrs. Stowe's Writings (Houghton, Mifflin & Co.) goes rapidly forward with three additional volumes; two being given up to 'Dred, and Other Anti-Slavery Tales,' and the third to 'Stories, Sketches, and Studies,' in which is included the memorable sketch of "Sojourner Truth, the Libyan Sibyl"—and orator, if one were to describe her fully. 'Dred' has its own little 'Key,' in the guise of an appendix. Richmond's flattering portrait of the author, with two imaginative illustrations, form the frontispieces.

Finally, Messrs. Scribner send us two more volumes of their solid and handsome "Thistle Edition" of Barrie's novels, tales, and sketches, namely, 'A Window in Thrums' and 'An Edinburgh Eleven,' and the first part of 'A Little Minister.'

Dr. Carl Horstman continues, with unabated zeal, his activity in the publication of Middle English religious works. The second volume of 'Richard Rolle of Hampole and his Followers' has just appeared (London: Sonnenschein; New York: Macmillan). It contains nearly four hundred pages of important texts, the most extensive of which is the metrical Psalter often ascribed to Rolle, and formerly edited by Stevenson for the Surtees Society. Perhaps the most interesting piece in the volume, however, is certainly not by Rolle; it is entitled "A Talking of the Love of God," and is an ecstatic and ejaculatory meditation, written in a strange mixture of prose and verse. Dr. Horstman's plan is to "follow up the Northern manuscripts which contain, or may contain, Rolle's works," and to lay the results before his readers in the mass. His method of editing is well known, and, though open to criticism in several points, is yet, on the whole, a sound and useful one. We wish he could be persuaded to give, if not an index, at least a table of contents! The introduction is an intensely interesting study of the life and character of Richard Rolle, who was certainly one of the most remarkable men of his time. Dr. Horstman promises an edition of the Latin works, which will be very welcome, in "one of the next volumes" of the series. We wish him all success in his arduous task.

Archæologists have learned to look for original research and independent views in every new work of Mr. Cecil Torr. His latest, 'On the Interpretation of Greek Music' (H. Frowde), has these qualities in a high degree. The author regards the recent interpretation of ancient music as radically defective, because, by using the modern scale of equal temperament, it represents different ancient notes by one and the same modern note. Mr. Torr's own notation, by letters, numbers, and dots, is cumbrous, liable to confusion, and, after all, not much easier than the original note-letters. Mr. Torr, after manipulating the mathematical ratios of the Greek scale in an ingenious but somewhat abstruse way, had himself a series of tuning-forks made according to his discoveries. He declares that the sequence of tones, semitones, and quarter tones is exceedingly pleasing to the ear. However this may be, his calculations are of great value as finally disposing of Mr. D. B. Monro's absurd notion that the Greek modes differed in nothing but pitch. In treating of the duration of notes, Mr. Torr finds a curious analogy between the octave with its six tones of three steps each and its two semitones of two steps, on the one hand, and the hexameter, with its dactyls of three syllables and its spondees of two, on the other, the analogy being made closer by the cæsural division of the verse and the two tetrachords of the scale.

Leach, Shewell & Sanborn, Boston, have issued, under the direction of C. A. Duniway of the Harvard Graduate School, the handbook of (American) 'Graduate Courses, 1896–97,' with a useful account of the academic careers of professors and instructors, and much other information desirable in making a choice of institutions (twenty-four in all).

We had occasion, not long ago, to speak of Mr. D. H. Fisher's transformation of Boissier's 'Rome et Pompéi.' The same enchanter has been at his spells again, and, in 'The Country of Horace and Virgil' (Putnams), we have what he has made of Boissier's charming second series of 'Promenades Archéologiques.' We can honestly congratulate Mr. Fisher upon his improvement in writing English; the book reads easily, and the style and subject are both attractive. But we cannot help thinking that when a man meddles with Roman subjects, he ought at least to be fairly well acquainted with Latin. Whether one has such acquaintance who puts periods into the middle of Latin sentences, and who prints such things as *ahi*, *flacco*, *ocupletem*, *deerent*, *Marullus* (twice on one page, for Marcellus), and *credas adduction* (for *dicas adductum*)—this question we leave to the answer of the reader.

Mr. Shuckburgh, in his edition of Suetonius's 'Augustus' (Cambridge [Eng.] University Press; New York: Macmillan), deals with the work almost entirely as a biography. He accepts in the main the text of Roth, and does not contribute much towards its improvement, although he makes one or two useful suggestions in his introduction, and his preface contains a few hints on the author's diction. The notes consist largely of passages from Dio and other historians, quoted to expand and explain the somewhat sketchy narrative of the biographer. In an appendix we find the *Monumentum Ancyranum*, a genealogy of the Emperor's family, and an account of what became of the assassins of Cæsar. The introduction, too, contains a helpful chronological table of the principal events during the lifetime of Augustus. The book will be a valuable auxiliary to all interested in the great Emperor.

Much of Dr. J. Asbach's 'Römisches Kaisertum und Verfassung bis auf Trajan' (Cologne; New York: Lemcke & Buechner) has already appeared in periodical literature. It is in three parts, the first dealing with the development of the imperial system down to the accession of Vespasian, the second

with the changes under the Flavian dynasty, and the third with the reigns of Nerva and Trajan, together with an inquiry into the historical and political judgments of Tacitus. Indeed, the whole book has grown out of the learned author's interest in Tacitus, and it will be welcomed by all who are engaged in teaching or studying the brilliant historian.

Among a varied group of entertaining articles in the current *New England Magazine*, the well-written and restrained account of "A New England Village in the Southern Pines," by B. A. Goodridge, will not fail to impress the reader. All experiments in autocratic town-building challenge our American curiosity, and Pinehurst, in Moore County, North Carolina, was created and is controlled by a benevolent despot, Mr. A. W. Tufts of Boston. This capitalist employed the most eminent landscape artists in the country to lay out his town in the sandy, long-leaf pine region, where the soil, the altitude, the climate, the aromatic groves are so favorable to consumptives in the early stages of the disease. He built hotel, casino, and cottages, furnished water and drainage to the settlements, lighted it with electricity, gave it a trolley connection with the railroad, shut out from it the liquor-saloon and the razor-back hog, and made it not the resort of fashion, but the inexpensive refuge of invalids of moderate means who cannot endure our Northern winters. The article is captivatingly illustrated.

The Pilot Chart of the North Atlantic, issued by our Hydrographic Office, gives, in the November issue, besides the usual information for the past and the current months, a special discussion of antarctic icebergs, appropriate in this period of renewed interest in south-polar exploration. Some of the bergs are deservedly called "ice islands," as they measure 300 feet in height above water and 25 or 30 miles in length, being the offspring of the great antarctic ice sheet, to-day the most remarkable unexplored area of the earth's surface. Temperature of air and water is not regarded as a sufficient indication of the neighborhood of a berg; various instances being quoted where no change was noted close to large ice masses. Two southern circumpolar charts accompany this report.

An elaborate discussion, by Dr. Cæsar Puls, based on a large collection of original observations of temperature and currents over the equatorial Pacific Ocean, has been published with twelve monthly charts in the *Archiv der Deutschen Seewarte* at Hamburg. The most interesting results concern the equatorial counter-current, which is explained as chiefly a compensation current, to dispose of the excess of water carried west by the south equatorial current. There seems to be no escape for much of this water but by flowing eastward in a narrow belt, for about eight thousand miles, a little north of the equator. Just as the north and south equatorial current vary in strength through the year with the known variations in the power of the driving winds, so the counter-current is alternately stronger or weaker, as the winds favor or oppose it in our summer or winter. At its east end this current does not turn south, as one might expect from the southeast trend of the coast, and as it is represented on some charts, but wheels sharply around to the north and west, joining the north equatorial current. The waters of the counter-current thus cross the Pacific three times—twice westward, once eastward. They moreover continually carry a considerable volume of water from the southern to the northern hemisphere at the surface, being comparable in this respect to the more direct cross-equator current of the Atlantic. Another result of importance is that the cool water of the Galapagos district does not all come by the Peruvian current from far southern latitudes, but is supplied in good part by water upwelling from deep layers along the South American coast, to make good the withdrawal of surface waters by off-shore winds.

An especial interest is given to an article on the ancient course of the Oxus in the *Annales de Géographie* for October from the practical bearing of this question on the development of Central Asia. The author, a Russian engineer who has spent several years in exploring the country between the Caspian and the Oxus, contends, on geological grounds mainly, that the river never flowed into the Caspian. The Russian Government, however, regards the question as an open one, for an expedition started in September last to see if the turning of one of the supposed ancient beds into a navigable canal would not be less costly than the construction of the proposed railway from Orenburg to Tashkend. Another question of Asiatic geography, the sources of the Irawadi and Salween Rivers, is satisfactorily discussed by M. E. Roux, the companion of Prince Henry of Orleans in his daring journey from China to Assam. The region watered by the upper Nile and its branches is the subject of an interesting study, illustrated by several maps showing the variety and extent of the characteristic forms of animal and vegetable life, the density of the population, and the occupations of the various races inhabiting it.

—The *American Journal of Germanic Philology* is announced to begin its career with the opening of 1897. Thus far the only periodical of the kind in this country has been the *Modern Language Notes*, with probably the addition of the Transactions of the Modern Language Association. The new undertaking is started under the management of Prof. Gustav Ernst Karsten, head of the German department in the University of Indiana. Prof. Karsten has been in America about ten years, and by his constant and thorough work has won a high reputation as a scholar and investigator. He was graduated in 1878 from Marienburg College in Prussia, and continued his studies at the Universities of Leipzig, Königsberg, Heidelberg, and Freiburg, winning the doctorate at Freiburg in 1883. The next two years he spent in study at Tübingen, London, and Paris. He has always been active in the Modern Language Association of America, and is now the leader of the section of this Association for the Central and Western States. The *Journal* is not to be American in the strictest sense, but to be the result of coöperation between scholars on both sides of the Atlantic, to which end Prof. Karsten has associated with himself as co-editor Dr. Georg Holz, who has risen to a high place in the Germanic department of the University of Leipzig. Nothing but articles of real scientific value, written by competent specialists, will be admitted. The reviews will give a critical account of all important work done in Germanic philology, and, for the first year or so, they will be somewhat retrospective, so as to acquaint the reader with the present status of the various topics. While the German and English departments will be most prominent, all related branches will receive appropriate consideration. About six numbers, constituting from five to six hundred pages a year, will be published. The subscription price for this country will be $2; for foreign countries, $2.50.

—Immunity from acts of vandalism is not among the advantages of an older civilization upon which our cousins over sea can safely plume themselves. No spot in England is of more romantic interest than the bold headland which is approached through the ancient village street of Tintagel, and upon which stand the fragmentary remains of King Arthur's Castle. Near this site it is proposed to build a hotel in the "castellated style." Not an American visitor to Tintagel would for an instant hesitate in a choice between being thus sacrilegiously housed and putting up inconveniently in one of the pretty cottages, when, as often happens, the modest "Wharncliffe Arms" is taxed beyond the limits of its capacity. Unsatisfied with this threatened desecration of the cliff itself, Cornwall's unique glory, the spoiler now proposes to put buildings upon Barras Head, the piece of rocky and heather-clad land which faces it across the waters of King Arthur's Cove. In order to stay his hand, the National Trust for the Preservation of Places of Natural Beauty and Historic Interest issues an appeal for subscriptions to a fund of £505 wherewith to purchase the Head and its fourteen acres of waste. Americans are, as usual, generously included in the opportunity to subscribe. It is to be hoped their response will be helpful. The address of the treasurer of the National Trust is No. 1 Great College Street, Westminster, S. W.

—The first half of Mr. James Schouler's 'Historical Briefs' (Dodd, Mead & Co.) is made up of miscellaneous pieces contributed from time to time to periodicals, or read at the meetings of the American Historical Association. Several of the magazine articles here reprinted have been already noticed in these columns, and hence do not call for particular comment in their present dress. The two relating to President Polk's administration, published last year in the *Atlantic*, are of the first importance for their revelations of the evils of the spoils system and of the origin of the war message of May 11, 1846, and raise again the hope that we may before long be permitted to know still more of the diary and correspondence on which they are based. The papers read before the American Historical Association treat generally of various aspects of historical writing, under such titles as "Historical Grouping," "Spirit of Research," "Historical Industries," and "Historical Testimony." To complete this general range of discussion, Mr. Schouler has added brief papers on "Historical Monographs" and "Historical Style," this last being somewhat in the nature of a reply to critics who have not found the author's own style wholly commendable. Of Mr. Schouler's substantial and enduring merits as a historian there is, of course, no question; we fancy, however, that readers of these "briefs" will value them more for the knowledge they afford of the author's methods of work than for any very original contribution they make to the general subject of the study and writing of history. As to the matter of style, we still cannot think that Mr. Schouler has quite made out his case. To have written a history of the United States with which all students must reckon, is unquestionably a great achievement; but no amount of substance can ever quite offset a pervading inelegance of manner, of which not only Mr. Schouler's chief work,

but the present volume as well, furnish constant illustrations. A biography of Mr. Schouler, by an unnamed hand, based upon material furnished by the historian himself, fills the remainder of the volume before us. If its prevailing tone is one of almost ful some praise, it is at least interesting, and will doubtless find many readers among that large class who long to know much about the private lives of distinguished men. It is not often that an author is permitted to read so elaborate an account of himself, or has the dubious satisfaction of seeing the story form part of a volume of his collected writings.

—The latest development of Lord Macaulay's scheme of competitive examination, as applied for recruiting the high-salaried and much coveted India Civil Service, is of interest, in a general way, not only to Englishmen. At present the subjects recognized for the examination in question, with the maximum of marks assigned for each, are as follows: French, German, English, Sanskrit, Arabic, English Composition, 500 each; Greek, Latin, 750 each; Mathematics, Advanced Mathematics, 900 each; Elementary Chemistry and Physics, Higher Chemistry, Higher Physics, Geology, Botany, Zoology, Animal Physiology, 600 each; English History, 500; Greek History, Roman History, 400 each; General Modern History, Political Economy, and Economic History, 500 each; Logic and Mental Philosophy, Moral Philosophy, 400 each; Roman Law, English Law, Political Science, 500 each. None of these subjects are obligatory. For the Open Competition of August, 1896, the Report on which has recently been issued, there were 193 candidates for 62 vacancies. The age of a candidate was fixed at above 21 years, and under 23, on the first of last January. Of the 62 successful competitors, as was likewise the case with the unsuccessful competitors, a large proportion also competed for less eligible appointments, namely, 8 for Eastern Cadetships, 10 for the Home Civil Service, and 32 for both. Out of the 62, at least 38 are said to have qualified themselves at Oxford, and there are no more than three natives of India. Only two of the candidates who passed, and five of those who failed to pass, brought up Sanskrit as one of their subjects; and, with the exception of a single unfortunate (presumably a Muhammadan) who was rejected, No. 94, no one brought up Arabic. The selected candidates will now, enjoying a stipend from the Government, devote themselves to certain prescribed studies till next October, when, on testifying to the Civil Service Commissioners a sufficient acquaintance with them, and satisfying the Medical Board of their physical fitness, they will enter on the performance of their duties as servants of the State. By no means, however, should the fact remain unnoticed that the list of successful candidates mentioned above is headed by a Bengalee. This remarkable Oriental, who was not a twelvemonth past his majority at the beginning of the year, bears the name of Chatterjee, as it is the fashion to write Chatojî, which is substituted, by corruption and otherwise, for the scholastic Chattopâdhyâya. His ten subjects and the marks he scored for them are given as: English, 324; Sanskrit, 279; English Composition, 405; Mathematics, 179; Advanced Mathematics, 27; English History, 365; General Modern History, 423; Political Economy and Economic History, 249; English Law, 211; Political Science, 389. While his marks reach the total of 2,851, those of the sixty-second candidate amount, for eight subjects, to only a trifle more than four-sevenths of that number, viz., 1,648.

—At the inaugural meeting of the Oxford Society of Historical Theology, held on October 23 at Balliol College, the President, Dr. Edward Caird, Master of Balliol, spoke on "Christianity and the Historical Christ." Having drawn a parallel between the recent harking back to Kant of Cohen and other idealists and the movement in recent theology back to the image of the original founder of Christianity as expressed in his authentic words and deeds, he pointed out that both movements, though useful and fruitful, involved to a certain extent an illusion. Striking passages from Jowett's note-books served to point this objection. "Even if we knew exactly what came from Christ," said Jowett, "it is in perpetual process of depravation, and needs to be restored; it is in process of being narrowed, and needs to be enlarged, or rather in any case it needs to be enlarged if it is to comprehend the world. There is a fallen Christianity if there is a fallen man, and man is always falling." The speaker declared that the utmost uniqueness to be claimed for Jesus as embodying "the deepest and most comprehensive principle of religion" could only be that of one "in whom the different elements which had existed in the previous religious experience of man were reconciled." Indeed, if we could suppose "spiritual food to be introduced into man's mind which it was incapable of assimilating, it would not only be useless, but fatal to his growth." Christ must be interpreted, he said, by that which sprang from him, "by the whole impression which he made upon his own and the immediately succeeding generation." We must take him in this way if he is to be regarded as the centre of our religion. Jewish prophecy, Rabbinical doctrine, Greek philosophy, had already mingled their colors upon the palette from which Christ, who knew not their language, was painted. St. John's Gospel is the record of one whose mind was "steeped in ideas kindred to those of Alexandrian philosophy," St. Luke's shows poetic power and the influence of St. Paul's universalism, St. Matthew's is preoccupied with the realization of Messianic prophecies, and the earliest narrative of St. Mark, though clearly showing traces of growth in the teachings of Christ, and recording the awe with which their originality inspired the disciples, shows us a Jesus already surrounded by an element of thaumaturgy which sprang from the habits of contemporary thought. Indeed, the distinction between Jesus and his Jewish predecessors might all but fade away if we were able to narrow down his thoughts to their first Jewish expression; or, if it did not, it would be mainly because we should still read his pregnant utterances by the light of the whole subsequent development of Christianity. We seek a new freshness and fulness of meaning in the first immediate expression of the Christian consciousness of human brotherhood. But what we thus try to brush aside —St. Paul's idealizations and expansions, the scrupulous clearness aimed at in Scholasticism, the great experiment of medical asceticism, and the new effort of modern thought to remould its ethics and theology—has not been a waste of force. The philosophy of Nietzsche is a symptom, which might become a malady, the speaker argued, if we had not learned, "through the long discipline of the mediæval Church," the vanity of any "limited effort for the self-realization of the few at the expense of the many."

—It was suggested several years ago by one of our correspondents that to prevent the reading into Dante of much that he could not possibly have meant or felt, we should study the illustrations made for the 'Divine Comedy' before Florentine Naturalism, the study of classical antiquity, and the new cosmography had so radically changed the visual imagery of the European mind. As if in sequence of this suggestion, M. C. Morel of Fribourg now publishes (Paris: H. Welter), under the title of 'Une Illustration de l'Enfer de Dante,' reproductions in heliotype of seventy-one miniatures for the 'Inferno,' executed by an Italian artist during the earliest years of the fifteenth century, and now to be seen in two fragments—the larger in the National Library in Paris and the smaller in the town library of Imola. The artist quaintly attempts to illustrate every important episode. He is childish, but circumstantial, and with an occasional touch of that poetry which can be imparted by form and color only. Thus certainly was Dante imaged in the average mediæval mind, and Dante's own visual images were no doubt of much sublimer import, but scarcely different in kind. M. Morel's introduction is far too long and too dull. He believes that these miniatures were made for the bloodthirsty Filippo Maria Visconti, tyrant of Milan.

VAN DYKE'S FRENCH MASTERS.

Modern French Masters: A Series of Biographical and Critical Reviews by American Artists. With thirty-seven wood-engravings and twenty-eight half-tone illustrations. Edited by John C. Van Dyke. The Century Co. 1896. Pp. xiii, 262.

A BOOK on art written entirely by artists must needs have, for good or evil, a different quality from that of the general run of books on art. Whether better or worse, its critical tone will be different, and so will its literary style. Fifteen American painters, all of them of good standing in their profession, and many of them of the highest, have here given us critical and biographical notices of twenty of the foremost painters of France. The result cannot but be interesting in the extreme. Five of these notices have already appeared in the columns of the *Century Magazine*, but the other fifteen are new. Each artist-critic has, however, written independently and in the vein that best suited him, and the book can hardly be said to have a general plan. Perhaps the editor might have advantageously supplied a connecting thread of historical comment which should have bound his grain-spears into a sheaf; but he may well have thought that his material was too various to be treated in this way, and that it was best to let each of his writers say his own things in his own manner, so he has confined himself to a short introduction, in which he merely poses the question of the relative advantage of criticism of painters by painters as against that by professed critics. Symmetry and proportion are therefore not to be looked for in the book, and the essays it contains must be judged of separately as so many isolated articles, each on its own subject.

Several of the painter-authors are already well known to the public, through the columns of current magazines and reviews, as writers on art subjects. These have given us, as was

to be expected, balanced and satisfactory pieces of critical writing. Others have written in a vein of personal reminiscence, and their work may be considered rather in the light of contributions to biographical knowledge than to criticism. Still others are almost entirely inexperienced in literature, and have not the advantage of a stock of personal anecdote to communicate, their claim to be heard resting merely on their technical knowledge and their artistic sympathy with the painter of whom they write. How does the criticism of these painters compare with that of the trained writers who have written of art? We think it compares very favorably indeed.

The objection most frequently made to criticism of art by artists is that the artist is necessarily too biassed in his views to deal out abstract justice; he is in the midst of a battle for his own views of what is right in art, and cannot pause to be just to his opponents. He is generally supposed, indeed, to be narrow, pig-headed, violent, and it is even said, with some plausibility, that he must be so to be a successful artist. Narrowness is taken as a measure of intensity, and it is, in some degree, true that he who is to greatly succeed in one thing must be blind or indifferent to everything else. The obvious answer to this objection is, that criticism may be valuable though biassed, and that an intense perception of one truth may be worth more, though accompanied by oblivion of others, than a lukewarm impartiality that sees everything alike because it sees nothing sharply. A better answer is an appeal to facts. Read this book carefully and see if there are to be found anywhere within its covers such exaggerations of enthusiasm or such extremes of denunciation as mar the pages of, we will not say Ruskin, the mad-bull of literary criticism of art, but of any one of hundreds of such critics down to the merest smart scribbler for the scavenger press. Knowledge, in the long run, begets moderation, and while, in private conversation, the artist and, above all, the art student, is apt to express his feeling strongly, and to confine his appreciations to "stunning" or "rot," put a pen into the hand of the painter who has really learned something and ask for his sober judgment of another painter, and his knowledge of how much that other has really learned and accomplished will show itself.

The second objection sometimes made to the painter as critic is that he rarely has sufficient general and literary culture to tell intelligently what he knows. At strongest, however, this is but an objection against some painters' writing, not against all. Years ago Mr. Hamerton thought it necessary to show "that certain artists should write on art." To-day it would be more necessary to show that not all artists should write on art. It has long been conceded that literary men should criticise literature and musicians music; nowadays the criticism of painting is falling more and more into the hands of painters. Occasionally these hands are incompetent, but the reader of the present book is likely to be surprised at the high general level of competence.

Among the painters already well known as writers who contribute to this volume are Messrs. Blashfield, Coffin, Kenyon Cox, and Will H. Low. Each of them contributes two papers, Mr. Blashfield writing of Bonnat and Laurens, Mr. Coffin of Rousseau and Dagnan-Bouveret, Mr. Cox of Baudry and Puvis de Chavannes, and Mr. Low of Gérôme and Boutet de Monvel. Mr. Blashfield has written most judiciously of the two masters that have fallen to his share. One of them was his own master, and for him he doubtless feels a personal affection, but the art of neither of them can have been particularly sympathetic to him. All the more noticeable is the breadth of view, soundness of judgment, and perfect balance which his articles show. They are not enthusiastic, but are eminently sane. Mr. Low's account of Gérôme shows similar qualities, while his criticism of Boutet de Monvel is that of a personal friend and a sympathetic temperament, full of delicate appreciation, yet making no extravagant claims of greatness. Mr. Coffin's sterling article on Dagnan is already well known, and that on Rousseau is a no less admirable piece of clear insight and lucid statement. Mr. Cox's study of Puvis de Chavannes has already been highly praised in these columns. In that on Baudry he has perhaps allowed his honest enthusiasm for that great artist to lead him into too great a strength of statement for the easy attainment of conviction, though the careful reader, who will study exactly what he does say, and not content himself with a rough estimate of what he seems to say, will find that the proper qualifications are duly stated.

These eight articles are alone sufficient to prove that "certain artists should write on art," but there are others, from less practised hands, that would answer the purpose almost equally well. There is nothing sounder or better in the book than Mr. Samuel Isham's critical account of the work of Courbet, and nothing more delicate than the charming appreciation of Corot by the regretted Theodore Robinson, while Mr. Beckwith, Mr. Tryon, and Mr. Watrous have each something to say that was worth saying. In a different vein the late Wyatt Eaton's reminiscences of Millet are well known as among the most valuable contributions to a knowledge of that painter, while Mr. Weir and the late G. P. A. Healy each give some interesting facts about Bastien-Lepage and Thomas Couture respectively. The former gives his recollection of the legendary crowning of Bastien's picture, after his failure to gain the Prix de Rome, which differs entirely from the current version of the story. The scene was in reality a cheap Latin-Quarter restaurant; the picture crowned was not the unsuccessful picture, but an earlier work, and the chief actor was not Sarah Bernhardt, but one of the artist's fellow-students.

Another question on which, according to Prof. Van Dyke, the present volume was intended to throw some light, is that of the relative value of reproduction by wood engraving and by "half-tone." This is a matter, he says, "about which not only the painter and the public disagree, but about which artists among themselves differ." We have often threshed out this subject in these columns, and will only say here that we have never known an artist who did not prefer a good half-tone reproduction *of his own work*, whatever he might think of the merits of wood engraving in the abstract. The illustrations of both sorts are very good in the present volume, as was to be expected from the publishers, but we are of opinion that the best of the half-tones indisputably bear away the palm in the matter of fidelity to the originals.

The editor furnishes a very brief biographical notice of each contributor. The paper and print are of the handsomest. Altogether here is a book which those interested in art cannot afford to neglect.

HUGO'S FAMILIAR LETTERS.

The Letters of Victor Hugo, to his Family, to Sainte-Beuve, and Others. Edited by Paul Meurice. Boston: Houghton, Mifflin & Co. 1896.

SELDOM has the Nemesis of posthumous publication borne more heavily on greatness than in this first instalment of the letters of Victor Hugo. As there is no preface by the editor to explain what principle of selection was applied to a correspondence presumably vast, the responsibility of issuing a volume most of which will prove irredeemably dull to the best disposed of readers must be laid to the charge of Hugolatry, pardonable, perhaps, in a devotee. The book does not add to the fame of Hugo or to literature in general, but it will serve as a partial corrective to the bitter prejudice of M. Edmond Biré, whose opinions of the poet's character have been widely influential in the reading world. The letters are arranged, not in chronological order, but in groups addressed respectively to Hugo's parents, to his wife and friends, and to his children, with a specially important collection, forty-nine in number, to Sainte-Beuve. Two appendices contain communications with the secretary of the Académie des Jeux Floraux of Toulouse, chiefly concerning technical details in the poet's earlier work, and several letters which did not enter conveniently into the scheme of classification. Nothing being here published subsequent to 1845—the date of the last note to Sainte-Beuve—later volumes may offer some compensation for the disappointments of the first.

Of the family and friendly letters it may be briefly said that they present to us a good son, an affectionate husband and father, and a thoroughly sincere friend, who appears as much interested in petty chronicles relating to the daily lives of those dear to him as in any fame he is steadily building up for himself. He abounds in warm-hearted assurances of friendship, in praise of ability where he thinks it is due. This is noticeable in his hearty greetings to Alfred de Vigny (iii., 6, 8, 19, 20, etc.), to Lamartine (iii., 25, 58, etc.), but above all to Victor Pavie (iii., 28, 30, etc., etc.), a literary youth in Angers, who won Hugo's favor by his enthusiastic notice of 'Odes et Ballades' in a local sheet, and was rewarded with the following hazardous panegyrics, which time has not ratified:

"Young as you are, you belong to a distinct category, the only privileged one that nature creates; you have the *mens divinior* which raises a man above his fellows. And although I have seen but very little from your pen, I have no difficulty in foretelling your future (p. 107)."

"They [Pavie's verses] possess the characteristics of the best specimens of our renovated poetry, the union of grace and vigor, of youth and maturity, which is the stamp of all our great poets (p. 110)."

"Go on with these articles; make our Paris papers blush for their inferiority to a provincial paper [p. 114]. . . . Only the great articles in the English reviews are fit to be compared with yours [on Hugo's "Cromwell"]" (p. 116).

If we acquit Hugo of deliberate "log-rolling," because of the private nature of these remarks, it must yet be admitted that praise was a shuttlecock which he returned with more vigor than accuracy in aim. In commending his friends his eagerness gets away with his discrimination, as, for example, in the case of the third-rate poet, Alexandre Soumet (p. 85), "who . . . has . . . finished his 'Saül,' which I prefer to his 'Clytemnestre,' which again I prefer to everything that

has appeared on the French stage for the last fifty years." At that time (1822) the great man was still young, and perhaps a trifle given to gushing. But the most remarkable feature of these letters to friends is their apparently studious avoidance of all specific literary discussion; for, although frequent mention is made of literary work, the epithets used to describe it are merely superlative or vague. Vigny's "Symétha" is "adorable"; "La Consolation d'une Mère," by Jules de Rességuier, is a "touching and graceful elegy," and so on in the consecrated phraseology of booksellers' circulars. Regarding the definite merits of his own poems he was, naturally enough, more keenly solicitous; and the letters to the secretary of the Floral Contests at Toulouse (1819 20), given in Appendix A, testify to his scrupulous care for word, rhyme, and metre.

As for the letters written by Hugo to his children and to his wife, the world might well have dispensed with them. Here the poet sits down, as it were, in dressing-gown and slippers, for a simple chat with those whom he has left at home. No one who has read 'L'Art d'être grandpère' needs further evidence of Hugo's love of children, or of his characteristic and happy knack of talking to them without a trace of the patronizing manner, but with a constant flow of geniality, good spirits, and tender consideration. By far the least acceptable are the letters to Mme. Hugo, which might have been written by almost any loving husband to any beloved wife. There is, we think, something that savors of indelicacy, not to say indecency, in this exposure to the general gaze of the secret affections of a great man's heart, and it seems inexplicable that none of the immediate relatives should have attempted to put some check on this part of the publication. Although one may detect signs elsewhere in the correspondence that Hugo was not free from the vanity that looks for a possible future publicity, one may rest assured that these letters were never written with a thought for any one but the woman to whom they were addressed. When the poet chose to take the public into his confidence, he did so in verse, as in "Date Lilia," the last of 'Les Chants du Crépuscule'; but there is no sign of his usual histrionic pose in what he writes privately to his wife.

The correspondence with Sainte-Beuve is merely an exhibit of Hugo's side of a once celebrated case, for the intimate details of which literary quidnuncs have long been on the alert, though the real secret of the dispute was let out years ago through the indiscreet gossip of candid friends. Once again the trite cynicism of *Cherchez la femme* proves painfully true, and explains the origin of the coolness that entered into the friendly relations between the poet and the critic, and finally effected their hopeless separation after many trials (chiefly on Hugo's part, it seems) to preserve the intimacy. We may keep up the mockery of omitting a name unmentioned in the letters, but it is obvious that Sainte-Beuve's misfortune in losing his heart rendered frequent meetings undesirable. It would be worse than cruel to join in the insult of a French *sabreur* of letters who, a week or two ago, compared the critic on this occasion to a "toad venturing to look up at a star." Hugo makes a fair, even generous, showing for himself throughout, as the accompanying extracts testify:

"We have talked a great deal about you with all our friends. Your ears must have tingled. Not a line has been heard in my hermit's cell but has made me long for your poetry" (p. 181). "If you only knew how much we have missed you of late! How sad and empty it seemed to us, even amid our family life, even with our children around us, to move into this deserted town of François I. [Blois, though the letter is dated from Paris], without you" (p. 186). "I may have said that you were *changeable* in your opinions on art and such like trifling matters, but not in your affections. Do not let us bury our friendship in oblivion; let us keep it pure and sacred, as we have always done" (p. 189). "Let us give up seeing each other, then, for some time to come, so as not to cease loving each other" (p. 195). "The friendship between you and me, Sainte-Beuve, is too firmly and durably cemented to allow petty, personal questions to divide us for a single moment" (p. 206). "I think I have already told you, Sainte-Beuve, there can be no *literary* question between us. There were two friends, no more and no less. I admit that absence has produced an opposite effect on us both. You love me less than you did two years ago, while I love you more. On reflection, the explanation is very simple. I was the offended party" (p. 210). "I should have preferred less praise and more sympathy [in Sainte-Beuve's article on Hugo's novels, July, 1832, among the 'Portraits Contempo rains'] . . . Victor Hugo is overwhelmed with praise. Victor Hugo thanks you; but Victor, your old friend Victor, is grieved" (p. 214).

If Hugo's vanity had been touched in a sore spot by the qualified praises of his former friend, it is by no means proved that Sainte-Beuve's change of tone from earlier days was altogether the outcome of disappointment which led to spitefulness. Enough has been said of late years, by the latter's detractors, of his touchy and jealous disposition, but in this instance it is only charitable to wait for full testimony on his side. The amazing part of all this remains, that, in spite of injunctions from his correspondent, these letters were not at once destroyed; but it is the fate of such documents to be pigeon-holed and to serve in the end for the rekindling of old scandals.

So few of the other communications possess any sort of interest that they call for no notice. What, indeed, could be expected from a man who, in a letter to his wife telling of the coronation of Charles X. at Reims (1825), to which the young poet had been bidden by special royal command, finds nothing livelier than the following schoolboy sentence to convey his impressions? "We have seen the coronation, my Adèle; it is a deeply interesting ceremony" (p. 67). And a few days before, his chief preoccupation seems to have been the cut of his court coat and the fit of his knee-breeches. Truly, it is to be hoped that later volumes will contain matter more worthy of serious attention than this, and thus offer a fair field to the conscientious efforts of the anonymous translator.

The Island of Cuba: A Descriptive and Historical Account of the "Great Antilla." By Andrew Summers Rowan and Marathon Montrose Ramsey. Henry Holt & Co. 1896.

THE writers of this volume state in their preface that they have had occasion recently, "in connection with the discharge of official duties," to make some investigations respecting Cuba and its relations with this country, whence the present production. It is a small compilation, partly historical, partly descriptive, mainly designed to give correct information. One of the authors is a lieutenant of infantry in our army; the other a professor of Romance languages in Columbian University at Washington.

So far as concerns climate, physical geography, statistics, and facts strictly historical —*i. e.*, wholly disconnected with present questions—the book seems reliable; but when the authors undertake to discuss the Cuban problem as it exists to-day, their statements cannot be followed blindly. For instance, at the outset they exhibit five "points of view," of which one is that "England and France are appealed to by the bondholders for protection, and are unwilling to see Cuba pass into the possession of any one strong enough to make any real use of it." This is wholly unsupported by evidence, and is antecedently most improbable. Assuming that England and France, as governments, are undertaking to protect the interests of holders of Spanish bonds, their only interest in the matter is to see that the bonds are not repudiated; and if they could be assured that the bondholders would be protected, the substitution of a better government on the island for that of Spain would necessarily be welcomed by England and France. The authors themselves, in their third "point of view," call attention to the importance of the bondholders' interests, which makes it all the more strange that they should imagine England and France to be trembling with jealousy and anxiety lest Cuba should fall into the hands of a "strong" Power. What the bondholders fear is dishonesty, not strength. The truth is, that the Spanish Government has been for years putting on the market and is now putting on the market bonds which (p. vii.) pass into the hands of religious, educational, or charitable institutions, widows and orphans, and for the payment of these bonds the faith of Spain is pledged. The obligation is inviolable, whether Spain possesses Cuba or not, but the revenue of Cuba is absolutely essential to enable the mother country to pay its interest. Consequently, the loss of Cuba without indemnity means for Spain repudiation. The feather-headed Jingoes in Congress who talk glibly of the independence of the island and whoop for annexation will very likely pass all this by with a smile; but it is really this which makes the Cuban question so difficult; the other branches of it are much simpler.

There is every reason why Cuba, like the rest of the Spanish-American world, should govern itself. It is miserably governed now by Spain, and there is no hope of any improvement. As things are at present, prosperity and commerce are out of the question. The island is garrisoned by some 200,000 troops, or about one soldier to every male Cuban capable of bearing arms. Spain has possession of all the cities and lines of communication, and the Cubans, far from being organized as an independent and responsible people, are "more like outlaws" (p. 213). The authors seem to think that they may be entitled to recognition as belligerents; but recognition as such would not alter the facts. It would make our position more difficult, because our ships would be liable to stoppage on the high seas, and Spain would escape all liability for damage to American property in any locality which we refused to regard as Spanish territory. Filibustering expeditions from our shores would be as illegal as they are now. What is wanted is not belligerency, but peace and self government, free from the oppression of a tyrannical and foreign rule. With peace and self-government, Cuba would attain the condition which other countries have attained that have thrown off the Spanish yoke. No doubt there would be revolutions and corruption, but the Cubans prefer to plunder themselves and provide their own dictators, rather than be plundered by a distant

government, and to be obliged to pay, besides, for having their efforts at self-government put down by it. All this is very natural, and excites much sympathy in this country, but it does not advance the solution of the financial question in any way.

The authors give an account of the *Virginius* affair which is very inadequate, and serves to still further becloud a case made foggy enough already through diplomacy. The *Virginius* was stopped on the ocean, and taken into a Cuban port, where many of those on board, American and British citizens among them, were taken out, courtmartialled, and shot. For these wholly unjustifiable executions indemnity was demanded and paid. We also made a point of the arrest of the *Virginius* at sea, because she was flying the American flag. But this came to nothing, for, as the authors say, she had no right to fly the flag. They describe her, however, as a "smuggler and ocean tramp, sailing under false colors," while she really belonged to Cubans and was in use in aid of the insurrection. Our contention was that, assuming her right to the flag to be established, the Spanish had no right to stop and search her because *no state of war existed*. This is made very clear in Grant's message on the subject. On account of the fraudulent character of her register, we abandoned our demand for a salute; but the important fact remains that we were ready to go to war with Spain for stopping an American vessel when no *state of war* existed. The Cuban sympathizers are now always clamoring for a recognition of the very state of belligerency which gives the belligerent the right to stop ships.

Rubáiyát of Omar Khayyám. English, French, and German translations comparatively arranged in accordance with the text of Edward FitzGerald's Version; with further selections, notes, biographies, bibliography and other material, collected and edited by Nathan Haskell Dole. Boston: Joseph Knight Co. 2 vols.

THE Omar Khayyám cult has the unique distinction of claiming to add at one stroke a new classic to the world's brief list. Since Goethe, no other name than Omar's has been confidently announced as being in this category. Even those who claimed that Browning or Emerson was, so to speak, of Classic Size—as a rising American statesman is said by admirers to be of Presidential Size—have made their claims tentatively and, as it were, under privilege of withdrawal; but the claim in behalf of Omar Khayyám is definitive. Hence the propriety of a variorum edition; and to this are to be added the remarkable circumstances under which the work came into English. Introduced by one of the most gifted and most daring of translators, the very question how much belonged to the Englishman and how much to the Oriental was for years left open. From the moment that FitzGerald began also to arrest attention by his other versions, and especially by his "Agamemnon," the distrust grew greater of the authenticity of his previously known work. He added outright to the tragedy of Æschylus passages of such noble thought, such superb poetic rhythm, as to show how easily he created such things for himself, and if with Æschylus for a basis, why not with Khayyám? The only test, of course, was in such an edition as Mr. Dole now offers us—that, by a comparison somewhat resembling the comparison of equations in algebra, we may readily ascertain what the different versions have in common, and may thus reduce the problem to its lowest terms.

The result, it must be admitted, is two-fold. It is shown beyond a doubt that the Omar element is larger and the FitzGerald element smaller than was at one time feared; and, on the other hand, it is also made clear that some of the most striking features of some of the very crucial passages in the book are as absolutely interpolations as is the fine passage "Call not on death, old man!" in FitzGerald's "Agamemnon." This does not affect the beauty or power of the lines; it simply removes whatever share of interest was imparted by their supposed origin at a certain place or time. This applies especially to that which is, by general agreement, the high-water mark of this book, in respect to force and daring, viz., the passage which not merely holds the Deity responsible for the creation of the sinful being whom he rules, but presses home the appeal with such Miltonic vigor and directness as to lodge the thought for ever in the mind of the most unwilling reader:

> "O Thou who Man of baser Earth didst make,
> And ev'n with Paradise devise the Snake;
> For all the Sin wherewith the Face of Man
> Is blacken'd, Man's forgiveness give—and take!"

There is probably no other verse in the whole Rubáiyát to which so many readers will turn for verification, through the comparative process; and the result will be a disappointment. In the three varying forms given of FitzGerald's version from successive editions, the symbol of the snake and the final, defiant proffer of forgiveness remain substantially unaltered; but neither in the version of Nicolas, nor of McCarthy, nor of Whinfield, nor of Bodenstedt is there the slightest trace of either. The inference is irresistible that both are of FitzGerald's own creating, and this is confirmed by Prof. Cowell, FitzGerald's first teacher of Persian, who says that this is unquestionable as regards the snake, while the latter interpolation may be attributed to a mistake made by FitzGerald in the original language. He adds that he himself wrote to FitzGerald from Calcutta and urged an alteration, but it was never made (Dole, p. 159). It would be strange if it had been. With FitzGerald's daring theories as to the liberty due to the translator, it would not have been at all like him to abandon his own most stirring passage.

This is perhaps the most salient instance of the value of this first variorum edition. It is due to Mr. Dole to say that he could scarcely have found an author to whom it would have been so hard to apply any such comparative method. Not only are the successive editions of FitzGerald full of variations, but, inasmuch as in even these the verses or *rubaiyát* selected are also very different, and as each translator has, moreover, selected what he pleases, the result is very much as with the Greek Anthology, in dealing with which each editor or translator is apt to take what he fancies and let the rest go. The method adopted by Mr. Dole is to give (1) an elaborate and careful introduction, (2) FitzGerald's sketch of the author, (3) the reprint, without annotation, of FitzGerald's second edition, in order to present it in complete shape before the eye, (4) to repeat it verse by verse, giving two pages to each verse, with one or more variant FitzGerald renderings and from two to six parallel translations—usually one in French, two in German, and three in English. This occupies the first volume, and nothing can be better arranged or more laboriously and conscientiously executed. The whole second volume is devoted to appendices—these varying from two or three pages to a hundred (the annotated bibliography including a hundred and six). Mr. Dole justly remarks that "all the extant references to Omar in all languages would require a lifetime and make a library in itself" (p. 544). Even Mr. Dole himself comes so near to this that it might almost be said of his edition, as Emerson said of Swedenborg, that it furnishes "a sufficient library for a lonely and athletic student."

With such a profusion of matter it is impossible to avoid some repetition and even occasional confusion, of which some critics have complained; yet there is little which can be spared, nor is it often that one has to criticise an editor for too great affluence of information. When it is considered that Mrs. H. M. Cadell has examined eleven MS. copies of Omar (p. 438), of which seven are in England and four in Paris—these ranging severally from 158 quatrains or *rubáis* (in her phrase) to 516—and that there are probably a thousand quatrains attributed to the poet, of which nearly three hundred are undoubtedly genuine, it becomes evident that it is all a mighty maze; and that Mr. Dole, who is not himself a Persian scholar, has simply done his best to achieve a coherent whole. He certainly merits the profound thanks of all who love the fascinating old pagan bard. We are glad to see that he recognizes the great services of American scholars in bringing his author before the public, paying tribute to Professor Norton, Mr. Garner, Mr. Siller, and—in a different way—to Mr. Levi L. Thaxter, whose misprinted middle initial is the only typographical error we have found in the two beautifully printed volumes.

Walton's Compleat Angler. A new edition, with an introduction by Andrew Lang and illustrations by E. J. Sullivan. London: J. M. Dent & Co.; New York: Macmillan.

THE feature of this last of the many editions of 'The Compleat Angler' is the introduction by Andrew Lang, who has treated his well-worn topic with grace, skill, and much piscatorial knowledge, which adds greatly to the charm of the essay. The introduction is in four parts, (1) "His [Walton's] Life," (2) "Walton as a Biographer," hitherto a neglected aspect, (3) "The Compleat Angler," and (4) "Fishing Then and Now." Mr. Lang has succeeded in finding new and interesting matter for all these divisions of his subject, of which the last two are angling essays by themselves, though none the less relating to the topic in hand.

While the Anglo-Saxon race retains its love for nature and for angling, and for him whose simple art in their description excels that of all pastoral writers, many men of fame in letters will write introductions to many future editions of Walton, but it is safe to say that it will be long before another reaches the mark Mr. Lang has set in this edition of 1896. After reading his introduction one feels that he has learned more of Walton's character, thoughts, and associations than he ever knew before, and the knowledge that Izaak "greatly loved the society of the clergy, connected himself with Episcopal families, and had a natural taste for a bishop," that "Walton, like Cyclops, had known love," with other information as to his habits and inclinations, brings us into a pleasing intimacy of companionship with the kindly philosopher. Of course Walton was an ardent Royalist, and on the

return of King Charles in 1660 he "produced an eclog":

> "The King, the King's returned and now
> Let's banish all sad thoughts and sing
> We have our laws and have our King."

Anent this, Mr. Lang says: "If Izaak was so eccentric as to go to bed sober on that glorious 29th May, I greatly misjudge him."

Walton was sixty years old when 'The Compleat Angler' was published, and his last book, the 'Life of Sanderson,' was written in 1678. Of this he says: "'Tis now too late to wish that my life may be like his, for I am in the eighty-fifth year of my age, but I humbly beseech Almighty God that my death may be; and do as earnestly beg of every reader to say Amen."

The manufacture of the book is satisfactory, and so are in general the illustrations by Sullivan, although somehow he does not seem to be fully in accord with the spirit of the book and age, and on p. 308, where the drawing is entitled "Let's now rest ourselves in this sweet, shady arbour," the arbor, with its "contexture of woodbines, sweet-briar, jasmines, and myrtle," is left entirely to the imagination, and Piscator and Venator are sitting at a table apparently placed in the middle of a barren ten-acre field.

BOOKS OF THE WEEK.

A Book of Old English Ballads. Macmillan. $2.
Balzac, H. de. The Peasantry. London: Dent; New York: Macmillan. $1.50.
Carus, Paul. Karma: A Story of Early Buddhism. Chicago: *Open Court* Publishing Co.
Dana, Mrs. W. S. Plants and their Children. American Book Co. 65c.
Fenn, G. M. In Honor's Cause. Dodd, Mead & Co. $1.50.
Hawkins, Rush C. Better than Men. J. W. Bonton.

HENRY HOLT & CO.,

29 WEST 23D STREET, NEW YORK.
HAVE JUST PUBLISHED

The Elements of Commercial Law.

By ALBERT S. BOLLES, Ph.D., L L.D., Lecturer in the University of Pennsylvania. 16mo, $1 00, *net*. A most useful book for every business man or woman, in simple language that any one can understand.

CONTENTS: Parties—Consideration—Assent—Written Contracts and the Statute of Frauds—Seller and Buyer—Shipper and Carrier—Principal and Agent—Partnership—Negotiable Paper—Checks—Guaranty—Surety—Payment—Interest—Shipping—Marine Insurance—Fire Insurance—Life Insurance—Deeds and Leases—Corporations.

Beal's Grasses of North America, Vol. II.

For Farmers and Students. By PROF. W. J. BEAL, of Michigan Agricultural College. 8vo, 707 pp., $5, *net*.

Descriptions of about 1,000 species and varieties of grasses, native and introduced, with carefully drawn illustrations of at least one species of each group, together with a chapter on the geographical distribution of the plants of this family and a list of some of the most important contributions to their study.

Of Volume I. (ill'd, 457 pp., $2.50, *net*), PROF. I. P. ROBERTS, of *Cornell*, says: I consider it very valuable, especially to teachers and students of agriculture.

PROF. G. E. MORROW, of *University of Illinois*, says: Fills a place not before occupied. It will be of great value for reference, and I hope to make direct use of it in my classes.

Cuba.

The Island of Cuba. By LIEUT. A. L. ROWAN, U. S. A., and PROF. M. M. RAMSAY. With bibliography, maps and index. 16mo, $1.25.

Boston Advertiser: "A genuine multum in parvo . . . answers clearly and concisely just the questions which a thoughtful reader mentally asks; without dogmatism, it is definite, . . . the style is so graphic, at times picturesque, that reading for information is an intellectual delight."

Philadelphia Inquirer: "It has been difficult to find up-to-date and reliable books about Cuba . . . this complete and useful publication."

LONGMANS, GREEN, & CO.'S NEW BOOKS.

The Sanctuary of Suffering.

By ELEANOR TEE, author of "This Everyday Life," etc. With a Preface by the Rev. J. P. F. Davidson, M.A., Vicar of S. Matthias, Earl's Court. Crown 8vo, 387 pages, $2.00.

The Principles of Ecclesiastical Unity.

FOUR LECTURES DELIVERED IN ST. ASAPH CATHEDRAL ON JUNE 16, 17, 18, and 19. By ARTHUR JAMES MASON, D.D., Lady Margaret Professor of Divinity at Cambridge, and Canon of Canterbury. Crown 8vo, 162 pages, $1.00.

Lecture s on Religion.

By the Rev. LEIGHTON PULLAN, A.M., Fellow of St. John Baptist College, Oxford; Lecturer in Theology at Oriel and Queen's College. Crown 8vo, 345 pages, $2.00.

LONGMANS, GREEN, & CO.,
91-93 Fifth Avenue, New York.

MR. BARRIE'S GREAT NEW NOVEL.

Sentimental Tommy.

The Story of his Boyhood. By JAMES M. BARRIE. With 11 full-page Illustrations by William Hatherell. 12mo, $1.50.

"Those who know a prize of life when they find it, and who care for the ultimate charm of a bit of pure literature, will read and re-read Mr. Barrie's masterpiece."—*Hamilton W. Mabie.*

"Mr. Barrie's new contribution to the annals of Thrums comprises some of his finest imaginings of human life and ironical destiny, and some of the most charming studies of boy nature and girl nature to be found in English fiction."—*London Daily Chronicle.*

"The character of Tommy is so fascinating, so touching, and so true that all the other noble work in the book serves but as a background for the luminous central figure. In 'Sentimental Tommy' Mr. Barrie has written one of the books of the year. As a piece of true art it is unsurpassed."—*Philadelphia Telegraph.*

Ready November 21st. MARGARET OGILVY. By her son, James M. Barrie. With Portrait. 12mo, $1.25.

An affectionate sketch of Mr. Barrie's mother, which is necessarily also a sketch of much of his own life and surroundings, as well as his work.

CHARLES SCRIBNER'S SONS, 153-157 Fifth Ave., New York.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 PICCADILLY, LONDON, W.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 26, 1896.

The Week.

SPEAKER REED made a little speech before the Duluth Board of Trade on Wednesday of last week in which he preached vigorously the new Republican doctrine of tariff for revenue only. We must increase our national revenue by from $30,000,000 to $50,000,000 a year, he affirmed, or we can "never expect to hold up our head among solvent nations." But there are two ways in which a man in embarrassed circumstances can manage to hold up his head. One is to get some trusting person to lend him more money, and go on squandering it with lavish hand. The other is to cut down expenses—to give up his carriage, sell his box at the opera, rusticate at Mamaroneck instead of Mentone, and wait for better times. But what did Speaker Reed's Congress do in its last session? It appropriated $52,000,000 more than the estimated necessary expenses of the Government submitted to it by the Secretary of the Treasury. In addition, it authorized contracts for $78,000,000 more, for which other Congresses will have to find the money. That is the way our Congress undertook to hold up its head among solvent nations. Speaker Reed closed the session with regret that he had had to say "no" so often. But a "no" from him would undoubtedly have saved in extravagant appropriations that very $50,000,000 which he now says we must have. As for retrenchment and economy, he has nothing to say about them. His soul is as much above such things as was that of the bankrupt duke whose creditors made an investigation of his affairs. They found him employing two French chefs at $5,000 each, and advised him to dismiss one. "Hang it all," exclaimed the duke, "a man must have a biscuit."

The Speaker and the country should remember that $50,000,000 is just as surely added to the resources of the Treasury by not wasting it as by raising it through new taxation. The experiment will be well worth trying this winter. The chances are that it will have to be tried anyhow. Mr. Reed appeals anew for the Dingley bill, but that makeshift is now practically disowned all round. No enthusiasm can be aroused for a bill which would not certainly increase the revenue, which is acceptable to neither party in Congress, and would be almost surely vetoed by the President. Nor is there a reasonable prospect of any other revenue measure passing in the coming short session. Some Republicans are looking about in the effort to do what Burke said was impossible—namely, "to tax and to please," The only tax they will consider is one that nobody will have to pay and everybody will be delighted with. While they are trying to find that, the crowded session will probably slip away with nothing done. This will give Speaker Reed a splendid chance to make a stand for economy. If he chooses to do so, he can hold down the appropriations to the revenue. If he succeeds in doing that, he may hold his head as high among the solvent nations as he pleases.

The *World* publishes a signed interview with Mr. Dingley, chairman of the committee on ways and means in the present Congress, and probable chairman of the same committee in the next Congress, on the subject of the Dingley bill and of tariffs in general. The interview is perhaps put out now in order to prepare the public mind for the shelving of the Dingley bill, for although its author expresses considerable confidence in it as a revenue measure, and hopes it may pass Congress this winter and become a law, yet he has no such expectation. He seems to be easily reconciled to its failure to pass, partly because there will not be time to frame a satisfactory measure this winter, partly because the bill expires by limitation within a few months, and partly because it had no scientific basis—that is, it made no distinction between different articles, but raised them all, with a few exceptions, by 15 per cent. As these views of the Dingley bill are shared by Senator Aldrich, the tariff leader of the Republicans in the other branch of Congress, it is safe to say that the Dingley bill will not pass. If it does not pass this winter, it will of course be dropped altogether. What may be done under the McKinley Administration, time alone can tell.

That the sectional issue has been eliminated from our politics is now accepted as a fact, both South and North. When the whites of Alabama recovered control of their State at the end of the reconstruction period, and made a new constitution, they changed the time of electing State officials from November to August, in order to escape the presence of federal officials at the polls. In his recent message to the Legislature, Gov. Oates urges that two elections a year every other year are too many, and advises a consolidation of the State election with that for federal officials in November. Recalling the fact that fear of federal interference was the cause of the change made in 1875, he says that the federal election laws were repealed three years ago, "and now no reasonable person apprehends their reënactment, or the passage by Congress of a 'force bill.'" A bill providing for a consolidation of elections has been introduced in the Legislature, and there is every promise of its passage. It will be remembered that the people of Florida in October by an overwhelming majority ratified a constitutional amendment changing the time of their State election to November, showing that they, too, no longer have any fear of a force bill.

The announcement comes from Boston that the Immigration Restriction League is about to renew its campaign for the passage by Congress of a law which will check the tide of incoming settlers from Europe. There are, however, abundant indications that such a movement will secure far less popular support since the recent election than formerly. Fear of "the ignorant foreign vote" was the chief element in making most people think that something ought to be done to save our institutions from the ruin threatened by this element in the electorate. The revelations made by the returns of the voting in the central States of the Union have entirely disposed of this argument. It has been clearly demonstrated that the success of the sound-money cause in this pivotal region was due to its support by an overwhelming majority of the voters of foreign birth and parentage. The Omaha (Neb.) *Bee* makes this frank admission:

> "But for the support which those citizens gave to the sound-money cause, it would probably have been defeated. Eliminate the foreign-born vote given to the Republican Presidential ticket in Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, and Iowa, and it will be found that most, if not all, of those States would have declared for free silver. Nearly all of the sound-money Congressmen elected in those States owe their election to the foreign-born voters. In the Northern States the vast majority of these citizens were on the side of national honor and a sound currency."

The Republicans in Congress cannot fail to be affected by these developments. The Republican press in the West is already declaring its opposition to anything in the way of rigorous legislation against further immigration. Referring to the intimations that the new Administration and Congress will be found favorable to more restrictive legislation, and that strong pressure will be brought to bear in behalf of such action, the *Bee* says that "the Republican party cannot afford to forget how greatly the country is indebted to its foreign-born citizens for the result of the late general election," and that it "is bound to give respectful heed to the sentiment of this element," which it believes to be nearly unanimous against any further radical restrictions upon immigration. The recent report as to the number of immigrants during the fiscal year ending with last June shows that the only element about which any apprehension need be entertained is that which comes

from Italy, Austria-Hungary, Russia, and Poland. These countries are now sending a larger proportion of immigrants than ever before, and they represent the lowest class of the population, 40 per cent. of those over fourteen years old being unable to read and write their own language, against less than 4 per cent. for the United Kingdom, France, Germany, and the Scandinavian countries combined. New Orleans is attracting Italians, and in one day recently 1,200 Sicilians of the most ignorant and degraded type were landed at that port. Some restriction upon such immigration would be desirable, and the easiest test which would bar it out without turning back English, Scandinavians, and Germans would be the prohibition of the landing of persons above fourteen years of age who cannot both read and write their own language. Congress may be induced to go as far as this, but anything in the way of wholesale restriction upon immigration is plainly not to be expected.

Two subjects are treated in the annual report of the Secretary of Agriculture, just published, which are of decided current interest. Most people will remember the contests which raged last summer over the question of farm mortgages. On the free-coinage stump, the Western farmer was represented as absolutely crushed under his burden of indebtedness. We took occasion, in the course of the campaign, to explode this fiction of a bankrupt farming community; the Secretary of Agriculture adds the weight of his official information to what was then set forth. Briefly, the Secretary shows that only 282 farms out of every thousand in the United States are under any mortgage whatever. While, moreover, 72 per cent. of the American farmers own their farms and farm property without encumbrance, three-fourths of the farm indebtedness actually existing, according to the Secretary, was created, not to meet any deficit in income, but to purchase new farms or to improve farm property already owned. This is, in fact, what every one at all familiar with American farming knew in a general way already. The burden of debt is not at all felt by the farmers East or West who have developed their property in conservative and prudent fashion. There have been other farmers, however, who undertook the business differently; who, when they had secured a good return from 100 acres, borrowed at once sufficient money to purchase 1,000 acres more.

Three or four years ago no spectacle was more familiar in Kansas and Nebraska than this kind of operation, which of course involved the largest imaginable risk. The first bad harvest brought down such enterprises to the verge of wreck—precisely as the first bad trade season would overwhelm an incapable merchant making a similar experiment. The fact that two or more Eastern mortgage companies, from whom these unsuccessful farmers raised their money, have themselves been brought into bankruptcy as a result of trans-Missouri investments of the kind, is proof enough, one would suppose, that the farmers in question were not ruined through the oppression of their Eastern creditors. The Secretary's second point of special interest deals with this very question of interest on farm mortgages. He shows by official figures that, in a large percentage of Western farm States—including Iowa and Kansas—the rate of interest on farm mortgages is below the mortgage rate on other realty. In Kansas, on the average, the farmer gets his money at ¼ to ½ of 1 per cent. per annum less than the rate allowed to the borrower on other real estate. That the farmer, even in the West, has suffered no loss from his comparatively high rates of mortgage interest, the report proves by the fact that actual increase in farm-land values, between the census years 1880 and 1890, was more than enough to offset the entire interest charge for the decade. We may add to this the fact, based upon personal examination of the price records of Iowa farms in recent transfers, that the gain in actual selling value of the farms, when they were wisely chosen, has continued to increase since 1890.

The most expressive way of describing John R. Rogers, who has just been elected Governor of Washington by the Populists, is to say that he lived in Kansas for a dozen years before going to the Pacific Coast, and was universally recognized as one of the greatest cranks ever bred in that State. The platform on which Rogers ran is found in 'The Irrepressible Conflict,' a book which embodies his ideas of finance, government, and society. The author declares that "at the present time the people of the United States confront a world-wide and world-long evil, of far greater magnitude than chattel slavery was—the private monopoly of money"; that "the bar, the bench, and pulpit have become, with some notable and soul-rejoicing exceptions, mere minions registering King Mammon's decrees"; that "good Christian gentlemen—as the world goes—are reaping enormous gains by creating in this fair land an earthly hell"; that "gold is of no real value to humanity, and is only used as a means of extortion, being dependent upon ignorance and prejudice for its power"; and that "the average banker has ruined more homes and blasted more lives, a hundred to one, than the traffic in alcohol." One would say that the writer of such stuff must be either a fanatic or a fool. But Rogers himself says that he is neither. Since his election he virtually admits that he wrote this sort of thing purely in a Pickwickian sense—"I did it to arouse the people"; in other words, that he is an unscrupulous demagogue, ready to adopt any means to obtain office.

The *Yale Review* suggestively sums up what may be called the evolution of the campaign literature circulated in such enormous masses during the last five months. At first the advantage was largely with the silverites. Being old hands at the business, they had long been making use of quotations from the Bible and sentimental pictures and cartoons, and, when they captured the Democratic party, they had ready a vast amount of ammunition of this sort. It broke readily through the first rather feeble defence of the Republicans. Of what use was it to protest that you were friendly to silver when there was an authentic cut of you in the act of pursuing and assassinating that helpless metal? What good did it do to show by accurate tables that silver had largely increased in use since 1873, when you were sure to be confronted with a picture of a one-eyed or one-legged man, and asked to explain wherein bimetallism differed from having two eyes and two legs? But it was not long before the sentimental argument was turned against the emotional silverites. Moving cartoons of Chinese and Mexican and Japanese silver-users were got up, and the poser put to the free-silver campaigners if we were all to become even as those Dagoes and heathen. Finally, the Republicans got their second wind and took the aggressive. They demanded answers to the specific question how free silver would affect specific classes. They showed what would be its sure effect on wages, on savings, on industry and commerce and farming. This put the Democrats on the defensive, and then it was all up with them. Their whole campaign, for the last two months of it, was one of dodging and trying in vain to change the issue.

There seems to be no doubt that the spoilsmen of the Platt machine are planning an attack upon the civil-service laws of the State for the purpose of getting control of the offices. Their plan, as openly revealed, is to pass a bill through the Legislature which will give each department of the State service control of the examinations for vacancies in its own force. That is to say, Mr. Aldridge of the Public Works Department would have power to appoint the examining board for all his employees, Mr. Lyman of the State Excise Bureau similar power in his department, and so on throughout the State. In this city the Fire, Public Works, Dock, and other departments would each have the same power. This was the desire of Messrs. Ford and La Grange of the Fire Board last winter, when they were trying to get control of all the patronage of that department. It has been the desire of all opponents of the civil-service laws everywhere since they went into operation, for it means merely "pass examinations" for the men selected by the political machines. The people of the State should

not be deceived for a moment about the character of this raid. It is a deliberate attempt to get around the new Constitution by pretending to enforce its requirements while at the same time it really nullifies them. There is only one way in which the raid can be defeated, and that is by arousing public sentiment against it. The Civil-Service Association has declared its purpose of opposing the measure by all means in its power, and should have the support of all friends of honest and decent government.

The Canadian Ministry are finding it as hard as the framers of our Wilson bill to reform the tariff without crippling the revenues of the Government. With customs and the excise almost the only sources of revenue for the general Government in Canada, the possibility of actual or even approximate free trade is seen at once to be very small. The case in a nutshell is as follows: Revenue to the amount of $20,000,000 must be had from customs duties. These may be levied on a total value of imports amounting to about $125,000,000. But, under the present tariff, something like one-half these imported goods comes in free. The problem is, therefore, to raise $20,000,000 revenue on $70,000,000 of imports. There you get at once a *prima facie* ad-valorem duty of nearly 30 per cent., and no way of twisting the figures can make it much less on any considerable items. It is clear, then, that Mr. Laurier's promised revision of the Canadian tariff in the interest of freer trade must, in the nature of the case, be a very meagre and tentative affair. But he was clear-sighted enough and frank enough to perceive and declare this to be the fact before his triumph at the polls last June.

The fact is, that, neither in Canada nor in the United States nor in the Australasian colonies, can a general tariff for revenue fail to be sufficiently protective. A few articles may be singled out, as in the British tariff, simply and solely for customs revenue, and the great body of imports left untaxed. But if you tax all along the line and count upon your main income from duties on imports, you cannot avoid giving incidental protection to domestic manufactures. The only resort is to some other form of taxation. Without the income tax and death duties, England would be obliged to have what would be in effect a protective tariff. Historically, the income tax preceded free trade in England. Sir Robert Peel had an income tax of 7d. in the pound in operation and yielding a revenue of from $25,000,000 to $30,000,000 a year for four years before he repealed the corn laws in 1846. But a country long accustomed to the ease and secrecy, even with unjust incidence, of indirect tariff taxation, will not take kindly to an income tax, or any other form of direct taxation. It would undoubtedly be highly unpopular in Canada, and Mr. Laurier is said to have no intention whatever of experimenting with it.

Spain congratulates herself, and with good reason, on the success of her popular loan to prosecute the Cuban war. With a corresponding success in the field, many people would be inclined to think that the trouble was all over. But this would be far from being the case. The misery of the Cuban situation, looked at from the most hopeful Spanish point of view, is that pacification and orderly government of the island seem now more impossible than ever. If this rebellion should be stamped out, another one would break out in the mountains before the next rainy season is over. There is absolutely no promise of governmental or commercial stability in the island for long years to come, no matter how victorious the Spanish arms may be. Moreover, it is one thing to get a loan and another to be able to meet swelling interest charges. It is the opinion of the best European judges that Spain is now staggering under every ounce of financial burden that she can possibly carry. With Cuban industries ruined and Cuban revenues cut off, and Spain compelled to make good her guarantee of Cuban bonds, the prospect is gloomy enough to appall the stoutest Spanish heart. Success in the field means but new perils in the council of ministers. The spirit of the Spanish Government and the Spanish people through all these trials has been lofty and worthy of their best traditions. European capitalists no doubt admire it as much as everybody else, but they have said, as they have refused to lend more money to Spain, "It is magnificent, but it is not business."

The killing of an artisan for rubbing against an officer's chair in Carlsruhe has caused more excitement in Germany than any other incident of the kind has ever done, and it is not likely to be allayed by the proposed reform in military procedure. The reform consists mainly in the publicity of the proceedings. It does not affect the composition of the tribunal, or the nature of the evidence, or the sentences. The code of honor by which officers of the army live in relation to civilians, will remain unchanged, and the Emperor openly urges its maintenance in full vigor, with the qualification that he advises officers not to appear in public when excited with wine. This code makes each officer the judge in his own cause. It is for him to decide when he is insulted, when his honor is impugned, and what the penalty of the offence should be—whether death or simple apology. If, for instance, you brush past or jostle him on the sidewalk, it is for him to say whether you must die or may be let off on begging his pardon. If it should get abroad that he had been jostled and had not threatened you with death, it would ruin him. He would have to leave his regiment.

The military men in Germany maintain that this cultivated ferocity of disposition, which goes by the name of "honor," is necessary to keep up the martial spirit of the army. The theory from the earliest period of the modern world has been that a man-at-arms must be touchier than other people, and must now and then take the law into his own hands, in order to keep up his stomach for fighting in the field. Lecky discusses this in his 'History of Rationalism.' The first blow ever struck at the theory was in England about fifty years ago, when duelling even in the army was abolished. It was then found that the theory had its chief support in the duel, and that when officers were compelled to treat "insults" as civilians treat them, their "honor" ceased to be more sensitive than that of other people, and that their courage or military spirit was in no way affected thereby. In fact, the theory was found to be quite hollow, like the football theory with us, which maintains that unless our young men "buck and tackle" each other, they will shrink from facing the foe in the field in time of war. Since military honor was abolished in England, English soldiers have fought with the old courage on a score of fields. The whole subject is a ludicrous comment on the notion that war elevates character. Tens of thousands of young men, in Germany and in France, have to-day to be kept in a state of readiness to commit murder for trifles, in order to prepare them for the exercise of their profession. And yet they all go to church regularly, have prayer at the guard-houses, and the German court has a "chaplain."

In the debate in the Reichstag last week, Herr Bebel, the spokesman of the Socialists, boldly said that the Emperor's talk about insult to the uniform was that of an insane person. Herr Bebel meant the words in their literal sense, and thousands of Germans believe him to be telling the exact truth. Some day, it is to be hoped, the most intelligent nation in the world will refuse longer to be made the victim of the mad pranks of a monarch who ought to be under medical surveillance. Certainly it must be profoundly humiliating to enlightened Germans to have to sit still under such sentiments as the Minister of War gave utterance to in the same debate under the Emperor's direction. He practically defended the killing of civilians on sight by army officers, on the ground that any remark disrespectful to the Emperor was deserving of death. As any impoliteness to an officer is also, constructively, an insult to the Emperor, the invitation to commit murder with impunity seems to be as freely extended in Berlin as in Constantinople.

THE INDIANAPOLIS MOVEMENT.

THE most hopeful movement towards reforming the currency and reaping the fruits of the victory for sound money is the one initiated on Wednesday week by the Indianapolis Board of Trade, which adopted the following preamble and resolution:

"Whereas, The result of the recent national election signifies clearly a determination on the part of the people to have a sound-money system of currency, and it is manifest that reforms in the existing systems are necessary;

"Resolved, That the boards of trade of Chicago, St. Louis, Cincinnati, Louisville, Cleveland, Columbus, Toledo, Kansas City, Detroit, Milwaukee, St. Paul, Des Moines, Minneapolis, Peoria, Grand Rapids, and Omaha be invited to send four delegates to a preliminary conference to be held in Indianapolis on December 1, 1896, for the purpose of considering the advisability of calling a larger conference, composed of delegates from the boards of trade and commercial organizations of the cities of the United States, to consider the propriety of creating a non-partisan commission to which shall be assigned the duty of formulating a plan for the reform of the currency, to be reported to a subsequent meeting of the conference."

Not only is the movement itself in the right direction, but the place where it takes its start is the best possible. Indianapolis is the city where Palmer and Buckner were nominated. It is identified by that fact with the cause of sound money. It is in the centre of the central West, which routed the Bryanites so magnificently in the recent election. It is the capital of a State on which a great many anxious thoughts were centred during the campaign, and it was from Indianapolis mainly that the influences went forth that finally rolled up 22,000 majority for McKinley and Hobart. It has ably conducted newspapers heartily supporting the movement. No other place could more appropriately take the necessary step.

What it is that we call a necessary step we may again briefly explain. During the past four years we have had a money panic of great severity, followed by a disastrous collapse of trade and industry lasting till the present time. During this time the Government has bought nearly $300,000,000 of gold, and issued interest-bearing bonds therefor. This has been rendered necessary by the existence of its outstanding demand-notes and the presentation of them for redemption. The issue of bonds was absolutely indispensable, since in no other way could the gold standard have been preserved and the solvency of the Government maintained. Yet the very fact of issuing them put a weapon in the hands of demagogues which might have destroyed the republic. They said that the banks were drawing out the gold in order to force the Government to issue the bonds for them to speculate with, and that the banks repeated this operation as often as they pleased. They found some millions of voters who either believed this falsehood or who voted as though they believed it, and these millions, although a minority of the whole people, are still here ready to vote the same way again. Shall the material out of which such a conflagration is likely to arise be left for any incendiary to touch with a match?

It is very easy to say that we have passed that danger, that we shall now have better times, and that everybody will forget the panic of 1893 and the long trail of stagnation and business failures that followed it. How do you know that? There never was a period in our history when such conditions seemed less likely to occur than the year 1890. What happened in that year may easily happen again. Three things took place which conspired to produce the disaster of 1893. There was an alliance between the silver Republicans and the Southern Senators which led to the passage of the Sherman Silver act. There was a McKinley tariff law which set out to reduce the revenue, and so far succeeded that the Government's income very soon fell below its expenditures. There was a financial crisis in Europe, known as the Baring panic, which led to the selling of a great many American securities by foreign investors. Exactly how much was contributed by each of these factors will never be known, because nobody will ever be able to disentangle all the elements of the scare. It is sufficient to point out that the gold reserve began to run down, that it fell rapidly and enormously in 1891 and 1892, so that, in the spring of 1893, measures of replenishing became necessary. If the Government had had no demand-notes outstanding, it would have been under no necessity of replenishing its gold reserve. Although it might have needed some money to meet the deficiency of current receipts, its borrowings would have been limited to that deficiency. Moreover, as the cause of the borrowing would have been perfectly understood, it would have led to no political discontent, but would probably have resulted in a wholesome popular demand for reduced expenditures. As the cause was not understood, the door was left open to the wildest surmises and the most dangerous heresies, and is still open.

We repeat that there is nothing, either in the nature of things or in the temper of the people, or in the wisdom of such Congresses as we have reason to look for hereafter, which can be relied on to prevent a recurrence of these or other equally baneful circumstances. It is the unexpected which most generally happens in this world, and we cannot be at all certain what kind of a Congress may be elected two years from now. There may be another panic abroad. Such events are not infrequent. We may have short crops, or a foreign embroilment of some kind—there are plenty of Jingoes ready to provide us with one. Any number of eventualities may occur which shall bring us face to face with a diminished gold reserve and the necessity of a new issue of bonds. How many such can we have—we ask the question in all seriousness—without throwing the majority of electoral votes into the Bryan column? Does anybody who voted against Bryan on the 3d of November want to take the risk of the next election after a few more bond sales shall have been made? And is there any certain method of avoiding such sales while the Government's demand-notes are outstanding?

THE CREDIT OF THE SOUTH.

Two of the best of the Southern papers, the Charleston *News and Courier* and the Columbia (S. C.) *State*, have replied to our observations on the financial situation in which the South has left itself, through its part in the election, in terms of haughty indignation. They protest against the idea of "punishing" the South, and against the idea that the South will ever "beg" or "pass around the hat." This reminds us much of certain excellent remarks in Mr. Rae's work, the 'Country Banker.' In his advice to the manager, he says:

"In the course of your management you will not always be the medium of pleasing intelligence from your directors to your clients. You have to intimate to Mr. Bareacres, perhaps, that the loan of a few thousand pounds for a year or two at 3 per cent. without security, for which that gentleman has applied to the directors, cannot be granted. The fact probably is that, apart from other fatal objections to the transaction, Mr. Bareacres is not safe for anything like the amount. But you are not obliged to tell him so. Without impugning his credit to his teeth, the refusal of the loan, even if conveyed to him in the mildest language, will be disappointment enough to a man of sanguine disposition, which I take to be the normal temperament of that variety of borrower who makes periodical applications to bankers for ridiculous advances on impossible terms. Mr. Bareacres will either accept the decision of your board with good grace, or he may resort to irritating comment, in which case it will be well to put a guard upon your temper. Among other remarks, he may suggest, perhaps, that your bank hasn't the money to spare. Nevertheless, it would be a mistake to fly into a passion or bandy words with him. Rather accept the sneer as a drollery on his part, and offer to lend him twice the money on approved security and rational terms. He will thus be discomfited on ground of his own choosing, and leave you master of the situation."

We simply pointed out to the South, in as mild terms as seemed consistent with lucidity, that its political course was calculated to destroy its own credit; and we based this conclusion, not on hope, or fear, or love, or hatred, or any other human passion, but on human experience and on principles of human nature. The first wish of an investor or lender is, not to be friendly or humane, but to be safe. He does not part with his money for the purpose of obliging somebody or because he admires somebody. He parts with it for the purpose of getting it back with interest or profit. This is what is meant by "business."

Now all men and communities of whom we have ever heard, who are civilized enough to borrow or invite investors, and who wish to do so, are careful to hold out the prospect of safety to them. They

tell, it is true, of their natural advantages, but they tell above all of the goodness of their laws, of the purity and learning of their judges, of the high morality of the community touching the payment of debts and fulfilment of contracts. It was through these things, in fact, that all communities of whom history tells us anything, rose to wealth and renown through trade—Venice, Genoa, Holland, the Hansa towns, England. They were all most particular in proclaiming to the world that the foreigner and his money were safe among them, that whatever he put into their hands he was sure to get back undiminished and unadulterated. All these states have made a great point of having a fixed money standard of value, and letting the world know about it by telling it the exact weight and quality of their standard coin. They always made boast, too, of the purity of their courts. We all remember how, in the "Merchant of Venice," *Antonio* hopes nothing from the Duke's mercy, because

> "The Duke cannot deny the course of law;
> For the commodity that strangers have
> With us in Venice, if it be denied,
> Will much impeach the justice of the state,
> Since that the trade and profit of the city
> Consisteth of all nations."

Now, bearing all this in mind, consider what a large part of the South has done. It wants capital to develop its extraordinary natural resources and employ its labor. This capital it has to borrow, yet cannot borrow without making those who have to lend sure that the money will be repaid in exactly the same value —not simply in the same name—in which it is lent, and that in all disputes touching the lenders' rights the local courts will decide the matter on principles of justice and equity. It therefore endeavors, by means of a long, tumultuous agitation and a most exciting election, to convince the world that if its candidate for the Presidency be elected there will thereafter be no fixed standard of value at the South; that the existing one will be immediately lowered, in obedience to a strong popular demand, and will probably be revised and changed quadrennially by the popular vote controlled and influenced by strolling orators of all kinds; and that anybody who complains of this, or protests against it, is probably a minion of an indefinite influence called "the money power," and ought to be hanged or driven out of the country.

To prevent the investor's supposing that he has a legal protection against this extraordinary programme, the Bryanite States also inform him that their intention is, owing to the bad conduct of the Supreme Court about a popular tax, called the income tax, to "reorganize" the Court also, once in four years or thereabouts, by adding to the number of judges, so that its decisions on questions of constitutionality may always accord, as they ought to accord, with the views of the party having a majority at the last preceding election; and that if, for instance, this majority should decide that leather or iron money was good enough for foreign creditors, the court should so declare, through a majority of the judges created for that purpose.

The above is a true description of what the Bryanite States said to "the money power" through the last election. All we have done is to point out to the South the probable effects of this on the mind of "the money power." We are no more responsible for these effects than for any other phenomenon of human nature—for a man's fear when he is going to be hanged, for his joy when he hears he has inherited a fortune, or for his sorrow when he hears that his chief debtor has "burst up." To be angry with us about it is therefore most ludicrous. The proper way to answer us is to show that the South at the last election did not make these declarations to the world; that it has a known standard of value, and clings to it; that it attaches great importance to judicial independence; and that Bryan, its candidate, was a distinguished and well-known citizen, renowned for his sagacity and business experience and juristical attainments, and long familiar with financial problems and financial history. By showing these things to be true, it would cover us with shame.

BRYAN AND PLATT.

We think we may assert confidently that the opposition to Bryan, at least in this State, was due more largely to his attack on the Government of the United States, his proposal to change the character of the Supreme Court and deprive the President of the power to keep the public highways open in case of the treachery or inability of the local authorities, and to his attempts to excite class hatred, than to his silver heresies. It was felt that his governmental theories were, in fact, far more dangerous than his currency follies. Why were they dangerous? They were dangerous because every government owes its strength, not to the paper documents in which it is defined, but to its hold on the minds of the people who live under it. There are several countries which have paper constitutions as good as or better than ours; but they do not work, and for the simple reason that they have not secured popular comprehension, respect, and acquiescence. But Bryan's crusade, large amount of support as it received from the more ignorant and unthinking portion of the population, was prevented from being really dangerous by his frankness. In several hundred speeches in all parts of the country he set forth his plans and theories with the utmost candor. There never was, from the beginning, the slightest doubt about his aims except what came from the somewhat muddled and contradictory character of his arguments. Everybody knew, or thought he knew, what would happen if Bryan were elected. He alarmed the community as it has not been alarmed since the war of 1861. He made women, as well as men, tremble for the political constitution which had for one hundred years been their boast and glory.

We wish to point out, in all seriousness, that there is an agency at work in this State to-day far more dangerous than Bryan, because it is secret and silent. It is engaged much more effectively than Bryan in destroying the popular respect for American institutions and confidence in American government as set forth in the written constitution and laws. That agency is Thomas C. Platt, the President of an express company at No. 49 Broadway, and a legal resident of Owego, Tioga County. He took charge of the Republican party some years ago, with the apparent acquiescence of the voters; and within that period, without ever making a speech or writing an article under his own name worth serious consideration, he has been successful in so completely changing the government of the State that, if his scheme were put on paper, it would be found to bear hardly more resemblance to our State Constitution as amended in 1894 than the government of Italy. This, too, has been done so privately that probably four-fifths of those who voted against Bryan, or were frightened by Bryan, will suppose that, in saying this, we are either greatly exaggerating or giving expression to party malice. But a generation is growing up and coming on the stage which is becoming so familiar with Platt's system that all memory or thought of any other is passing out of their minds.

Suppose he were as frank and open as Bryan, and went about the State making speeches in which he set forth his plan, what would he say? Something like this:

"Fellow-Citizens: You all know that I am a plain, blunt man, who stayed only one year in college and got very little instruction while I was there. I am not an orator, or what is called a 'thinker.' I am not in any sense an authority on any subject outside of politics. Nobody believes much of what I say, except my immediate adherents, but I write articles secretly which I send to the country newspapers, praising myself and my own work, and they are extensively circulated. I believe that the best way to select a Governor for the State is to let me select him, and I would never select him without getting from him pledges beforehand to appoint certain men to office, also to be named by me, and to sign certain bills which I get up for my own purposes. I am utterly opposed to the election of any Governor on the ground of his character and eminence, who acts in any office under any advice but mine, or from the humbug called a 'sense of public duty.' I believe, in short, the gubernatorial office is best filled when there is a good man like myself behind the Governor's chair to tell him what to do. I am entirely op-

posed to the civil-service clause in the Constitution, but I would not oppose it publicly. I recommend that it be secretly evaded, with the Governor's connivance, either by openly disregarding it in making appointments, or by selecting Commissioners who will not carry it out. My own idea is that it is not best to appoint men of good character and regular occupation to office at all. The best men to carry out the system of government which I believe in, are ignorant and unscrupulous men of bad reputation. If they have been indicted for crimes of violence, or the lighter kinds of fraud, so much the better. Such men are much more obedient to me, and therefore more useful, than those produced by Chinese examinations. In fact, I think a State civil service should generally be manned by poor characters. The Mugwump talk about 'fitness' makes me sick, as I am sure it does you.

"As regards the Legislature, I do not think any one should be elected to it without my consent or approval. Such candidates I am willing to assist with contributions from the fund which I collect from the corporations, and of which I neither keep nor render any account. I always make a return to the corporations, however, either by protecting them from blackmail legislation set on foot by myself, or by selling them such legislation as they may desire. I would not allow any legislator to appear in his own character in either branch. I do not allow legislators to debate or vote out of their own heads. I require every legislator to have an 'owner' in the person of some outsider, who can be arranged with for his services. I require all legislative measures to be submitted to me for my approval before their introduction, on pain of being defeated without debate. In fact, I do not allow discussion of measures at all, except in very extreme cases, and I think the notion that American government is 'government by discussion' a mischievous delusion. I have contrived another and more effective process for the passage of bills, called 'jamming through.' To what is called 'good city government' —that is, government of a city for the convenience and according to the wishes of the majority of the inhabitants—I am utterly opposed. I consider all talk of this kind disgusting cant. My plan of governing cities is government by commissions appointed by myself, and consisting of adventurers of poor character dependent on me for a livelihood."

Now suppose Platt were to do as Bryan did—go through the country addressing people on the stump in favor of a plan of this sort—what should we say? And yet, without speaking on the stump at all, he has introduced this very plan, and it is now in operation among us, and tens of thousands of our young men have ceased to think of any other government as possible. A more striking illustration of the way republican governments decline and fall there is not in history, and teachers of political science ought to make more use of it than they do.

A CONSERVATIVE PEOPLE.

VERMONT has always required a majority vote for the election of legislators. Every other State in the Union has adopted the plurality system. A bill to substitute this system came before the Vermont Legislature on November 17. Its advocates showed that the requirement of a majority vote for election, compelling, as it often does, prolonged and even finally fruitless balloting, frequently disfranchises the old, the infirm, and the weak, who cannot endure the weary hours consumed in balloting; and that it almost always leaves some towns in the State unrepresented in the Legislature, because no candidate can get a majority, even when the struggle has been kept up into the second day. But such arguments were of no avail, and the proposed innovation was rejected by a two-thirds vote of the House.

Massachusetts has always chosen State officers and legislators annually. Every other one of the old States (except Rhode Island) and all the newer commonwealths have adopted longer terms, and the system has stood the test of experience wherever it has been tried. The advocates of the reform, after prolonged efforts and frequent rebuffs in the Legislature, finally succeeded in having a biennial-election amendment to the Constitution submitted to the voters three weeks ago, but it was rejected at the polls by a large majority.

The question of calling conventions to frame new constitutions was submitted to the voters of New Hampshire and Minnesota on the 3d of November, and various constitutional amendments were passed upon in many other States. The proposals for conventions were defeated in the States just named, and the amendments were rejected in almost every case, whether good, bad, or indifferent—the only striking exception being the majority cast for the woman-suffrage proposition in the thinly settled State of Idaho.

In almost every one of these cases the result was due simply to the conservatism of the people. "I hold to the old practices and ideas that have been tried and not found wanting"—this remark of one speaker at Montpelier was the keynote of the opposition to plurality elections of legislators in Vermont. "Where annual elections end, there tyranny begins," said John Adams in the last century; and there were plenty of eminent citizens in Massachusetts a hundred years later to reëcho the declaration, undeterred by the spectacle of scores of commonwealths with less frequent elections which are apparently as free as the Bay State. "Let well alone," even if it is not very well—that was plainly the mood of voters almost everywhere, even when changes in the Constitution which had much of promise in them were suggested.

The disinclination to change here shown is common to all the States. Mr. F. J. Stimson of Boston has for many years studied the work of lawmakers throughout the country. In the last issue of the *Yale Review* he says that "no one who attempts a summary of the legislation of the forty-five States and three Territories of the Union for recent years can fail to be struck with the wave of conservatism passing over our many sovereign legislatures." Mr. Stimson is able to contrast recent laws with those passed in the seventies, and he declares that this wave of conservatism "is so marked as to convince the student that it is more than a temporary eddy, and betokens a permanent and rational conviction in the minds of the people and their representatives that the fundamental principles of the common law had better be left alone."

The conservative tendency thus shown as to State laws and constitutions has received a most striking illustration in the recent national election. It is not too much to say that no question has ever been presented to the voters of the United States which afforded a clearer test of the readiness of the American people to try a radical change. A long period of hard times had, as always, inclined the unthinking to look with favor upon any policy which promised relief, and the most abundant material for successful appeals to ignorance and prejudice was diligently used by cunning demagogues during the canvass. But the overwhelming majority against the proposed change of the monetary standard showed that the people are essentially conservative.

Foreign critics of our institutions have noted this characteristic of our people. Mr. Bryce, in the 'American Commonwealth,' after remarking that Americans are, in a sense, "a changeful people"—as shown, for instance, by the suddenness with which the Know-nothing party of forty years ago rose and fell—says:

> "After this it may seem a paradox to add that the Americans are a conservative people. Yet any one who observes the power of habit among them, the tenacity with which old institutions and usages, legal and theological formulas, have been clung to, will admit the fact. A love for what is old and established is in their English blood. . . . They are like a tree whose pendulous shoots quiver and rustle with the lightest breeze, while its roots enfold the rock with a grasp which storms cannot loosen."

The most significant feature of the recent election was its demonstration that the conservatism which Mr. Bryce attributes to the "English blood" of our people is not less characteristic of the foreign strains which have been infused into the electorate. Grave fears have been entertained that the spirit which had animated New Englanders of native descent, living for the most part in small agricultural communities, would not be found dominant in great cities made up of heterogeneous foreign elements, nor in

agricultural commonwealths at the West where the majority of the voters are men who were born in other countries. This fear has been effectually dispelled when Chicago, a city where 60 per cent. of the males twenty-one years old and upwards were born abroad, gives 70,000 majority on the side of conservatism, and North Dakota, a farming State without one large city, where almost two-thirds of the men are of alien birth, gives 6,000 majority on the same side out of 40,000 votes —the equivalent of 90,000 majority in a poll as large as that of Indiana.

Doubtless we shall continue to try more or less foolish experiments in government, and suffer more or less for our folly. But the composite people which now make up the nation have certainly demonstrated that, as regards the fundamental principles, they are quite as conservative a race as the more homogeneous elements which set the new government in operation a century ago.

CABINET CHANGES IN JAPAN.

TOKYO, October 19, 1896.

WHEN the war with China was brought to a close and the treaty of peace signed, it was generally believed in Japan that Count Ito had his most brilliant record still to make. The Premier was neither by inclination nor ability a war minister. His *forte* had always been supposed to lie not in the execution of a policy requiring dash and courage, but rather in the construction of a plan slowly and carefully elaborated. When, in addition to the victory of peace, he secured the coöperation of the Jiyu to, or Liberals, and induced their leader, Count Itagaki, to enter the Cabinet as Home Minister, he seemed to give double assurance to the public that his real genius was at last about to manifest itself. He commanded a majority of the votes in Parliament, he had the undoubted favor of the Emperor, he had derived some prestige from the conduct of a successful war, he had an indemnity to conjure with. What more, was the natural inquiry, is necessary for a man of his type of mind and character to enable him to guide the country to solid prosperity after the inevitable excitement and losses of war?

And truly at first the Ito Cabinet had a certain show of success, especially in elaborat ing various measures in regard to taxation, banking, and shipping, and further in securing their passage through Parliament. But this success was as brief as it was solitary. The Cabinet steadily lost the support of public opinion. Affairs in Corea went from bad to worse. Every diplomatic failure in that unfortunate country, instead of spurring the Japanese Government to a more energetic and enlightened policy, led only to fresh failure. The Tokyo press in vain clamored for reform. The final upshot of all the Japanese Government's efforts in Corea was to leave that country in almost the same state of demoralization as at the beginning. In Formosa, also, the attempts of the late Cabinet to reorganize the administration were not beneficial. The work of the army in the island has been probably free from any serious error, but the civil administration is rotten, and the Japanese workmen dispatched there by the Government have acted in a way to bring contempt on the people and policy of Japan. In the month of June the Prime Minister went to Formosa and had an opportunity of personally inspecting the situation there. It might have been expected that this visit would lead to some decisive measures of reform, but the public was again disappointed. Not a few Japanese newspapers pointed out that the conduct of affairs in Formosa, so far from being an improvement on the slipshod methods of the Chinese Government, was actually in comparison a detriment to the interests of the island.

Besides all these evidences of failure, the finances of the Government were not properly dealt with, or at least the financial policy of the Government did not inspire confidence. Rumors were circulated that the Minister of Finance was at variance with the heads of other departments in regard to the expenditures for the coming year. The estimates were forty millions (yen) in excess of the probable revenue, and the Finance Minister threatened to resign if his colleagues were determined to augment the budget for the coming year to such an extent. This state of indecision and confusion in the Cabinet was reflected in the condition of the business interests of the country. Trade and manufactures, which had been buoyant during the past year, suffered a check. As a consequence the stock exchanges showed a reaction in the prices of securities, and Government bonds fell several points. The Cabinet was everywhere discredited. It suffered from internal contentions as well as from outward attacks, and the general feeling grew that its duty was to make way for a new Government. Accordingly, Marquis Ito and, with a single exception, all his colleagues tendered their resignations on the 28th and 29th of August, leaving the difficult work of constructing a new Cabinet to a fresh combination of the Sat-cho statesmen.

So general and various were the causes of the downfall of the Ito Ministry that the political parties of the Opposition found difficulty in assigning a definite reason for it. It was in reality a general breakdown, originating in a want of decision, absence of unity, and lack of moral stamina in the Cabinet as a whole. The immediate occasion of the failure was simple. Count Ito, in allying himself with the Liberals and attaching Count Itagaki to his Cabinet, had definitely made a political enemy of those parties and party leaders to whom the Liberals were in opposition. As soon as it was seen that the Departments of Foreign Affairs and Finance were without ministers of sufficient authority to establish a satisfactory policy, a widespread demand arose that Count Okuma and Count Matsukata should respectively fill these important offices. The former is believed to be the most capable man in Japan for administering the foreign relations of the country, while the latter at present enjoys the confidence of all the industrial and commercial classes to a remarkable degree. To admit these two men into his Cabinet, however, was out of the question, as in that case Marquis Ito would have proved entirely disloyal to his late allies and their leader, Count Itagaki. As the difficulty of filling these two departments satisfactorily increased, it was finally accepted as an excuse for the resignation of nearly the entire Cabinet. The truth, however, is that this was merely a pretext. The Premier left the reins of government to other hands not on any specific point of principle, but because the entire political and financial situation of the country had become too complicated for his resources. The exit of the Cabinet, coming, as it did, at a time when one would naturally have expected a successful and energetic prosecution of various post-bellum measures, was distinctly of a character to suggest a lack of moral force and of political insight. One has only to recall the work accomplished by Germany after the war of 1870-71 to perceive the failure of the Ito Ministry in all its length and breadth.

The very condition of hopelessness and uncertainty in which the Cabinet left the affairs of state made the work of finding a suitable successor a matter of the greatest difficulty. At first Marquis Yamagata was spoken of as the probable head of the next Cabinet, with Matsukata as Minister of Finance and Okuma of Foreign Affairs. But the Marquis had but little inclination for the honor. He was suffering from an illness, and did not wish to risk his health still further in undertaking to steer the Administration at a time when failure would bring disgrace, and success would hardly bring honor. It was perfectly understood that, whoever might be the nominal head of the Government, the real men in authority would be Okuma and Matsukata; consequently Marquis Yamagata probably did not relish the hardships he would have to encounter, especially when he could hardly do anything to add to his present reputation. Whatever the hidden political undercurrents that may have affected his judgment, they finally decided him to reject emphatically the premiership.

Still another doubt, however, was whether Marquis Yamagata could secure the services of Count Okuma on any fair terms. The sympathies of the Marquis are necessarily with the military wing of the Government, and the leading spirits of the army are strongly opposed to making any concessions to the desire for the so-called party system of government. Could Marquis Yamagata decently invite into his Cabinet a statesman who had done more, during the past six years, to precipitate a wholly popular method of government than any other public man in Japan? Or if the Marquis was ready to do this for the sake of getting the services of a competent minister, would Count Okuma be justified in accepting the office without making almost impossible conditions? Would the latter not stultify himself and justify the charge of his political enemies that he stood on a platform of opposition to the Sat-cho merely as a means of climbing into office? He could not decently accept a ministry in any cabinet that was in all likelihood definitely opposed to the principle of party government, however ready he might be to accept a portfolio in a cabinet not specifically pledged to this principle.

Meanwhile, affairs of state were hopelessly drifting. Within the group of statesmen who have during the past twenty-five years controlled the action of the Government (the so-called Genkun statesmen, composed mainly of men of Sat-cho affiliations), no one could be found to construct a cabinet under the given conditions, viz., that Count Okuma should have the Department of Foreign Affairs and Count Matsukata that of Finance. These two statesmen at last saw the situation approaching which their long opposition to the Ito Government had in some degree brought about. After two weeks of experiment, it was at last seen that affairs of state had reached an *impasse* from which the two statesmen alone could extricate it. There was undoubtedly prevalent much opposition to a Cabinet presided over by Count Matsukata. The conservative elements feared him as well

as his associate, because they felt that at any time these two men might precipitate without any reservations the system of party cabinets; and however much Count Ito did to promote the same end, yet he never publicly uttered a word in favor of the system.

It was little more than sheer necessity that induced the Conservatives to accept the fiat of the two principals. The difficulties in the way of Count Matsukata were very great. Three times he asked the Emperor to release him from the task of forming a cabinet, but he was clearly indispensable and he was urged to continue. For ten days the newspapers were filled with contradictory reports, sometimes going to the length of stating positively that he had absolutely refused to make any further effort. But every threat on his part to retire merely brought into clearer relief the impossibility of arranging the finances or of settling the pressing problems of colonial administration, and finally his opponents were forced to silence. On the 18th of September he formally accepted office, and a day later he was in a position to announce his new cabinet. He himself became Premier, and besides took charge of the Department of Finance, while Count Okuma, of course, was the Minister of Foreign Affairs. The other members of his Cabinet are for the most part Satsuma men, who will, however, have to fall in line with the demands of the two leaders or resign.

The press of the country assumes a curious attitude towards the new Administration. Nearly all the newspapers confess that it was born in weakness, that it has no sufficient backing at present in the Parliament, and that it may be short-lived. However indispensable the new Cabinet may be at this stage of affairs, yet it is believed that when Parliament opens it may have to reorganize on a more definite basis. It is almost a certainty that the question of government by party has been discussed at the meetings of the present Cabinet, and very near the surface at all events is this issue of issues. While no definite answer has, as yet, been made to this burning question, it may be fairly supposed that, when another crisis does arise, the power of the Satcho will fall and the so called clan system of government disappear for ever. It is possible that the leading spirits of the two most powerful clans may make one last struggle for survival, but even this, while hardly likely to occur, can do little more than prolong their authority for a brief period. G. D.

Correspondence.

MORE ANTI-BRYAN CITIES.

To the Editor of The Nation:

Sir: In your enumerations of majorities given in sixteen principal cities, you have named ten cities having a less population than Pittsburgh-Allegheny, which together gave McKinley a plurality of 28,000. "Greater Pittsburgh," which is virtually Allegheny County, with a population of 700,000, gave a Republican plurality of 49,000, and yet over 40,000 registered voters failed to vote. Many of these delinquents gave as an excuse that "Pennsylvania was sure, anyhow." Probably three-fourths of them were Republicans. One district, composed wholly of market gardeners, gave Bryan but two votes out of 85. In an exclusively farming district, Bryan got but 10 votes out of 160. Our "American" labor is mostly performed by Poles, Hungarians, and Italians, many of whom are included in the registration list, but do not vote. The party which demands the highest protection for this American labor always carries Allegheny County by a large majority.

Yours truly, W. Howels.

Pittsburgh, November 17, 1896.

To the Editor of The Nation:

Sir: In your issue of November 12 you mention Denver, Omaha, and New Orleans as the only cities of over 100,000 souls which were found on the wrong side in the recent election. This unenviable distinction does not belong to Omaha, which gave McKinley 1,272 votes over Bryan.—Respectfully,

Newton M. Mann.

Omaha, November 17, 1896.

THE FOREIGN VOTE.

To the Editor of The Nation:

Sir: Will you permit one of the foreign-born American citizens of the United States to thank you most sincerely for your editorial utterances in your issue of November 12? I refer to the article entitled "Redemption of our Cities." That a journal of the standing of the *Nation*, reaching, as it does, a very great proportion of cultivated and influential readers, should take this stand at this peculiar period in our national history is certainly very significant. It is also an act of justice for which every foreign-born American citizen has special reason for earnest gratefulness.

Permit me to call your attention to the enclosed publication, especially prepared by the undersigned, pending the last national campaign. It deals, as you will observe, exclusively with the Scandinavian aspect of the political field of the United States. You will notice that over 90 per cent. of the entire Scandinavian press, numbering more than one hundred journals, all their institutions of learning, or, more correctly, all their presidents and teachers, and, for all practical purposes, the entire Lutheran priesthood, were on the side of national honor and national conservatism in the body politic.

I have not had the opportunity to prepare a similar object-lesson as regards the other leading foreign divisions of our country, but I believe as good a showing would have been made for most of them. Altgeld and all he stands for are as much of an anachronism to the representative foreign-born workman in field or shop as is Tillmanism to the enlightened business judgment of the "New South." The "crackers" and their uncouth spokesman are not the real South; even less, if possible, do the Altgelds and their would-be blatherskite followers represent the hard-working, thrifty foreigner, whose main ambition, next after obtaining the boon he has travelled thousands of miles to obtain—remunerative employment—is the establishment of a home, either rural or urban. No commonwealth is in any danger whatever from its home building class of citizens, and that such are the actual facts in the case, and that our foreigners are above all home-builders, the census will prove, and the last election has magnificently vindicated the cold figures of that report.

That the *Nation* is among the very first to discern and publicly state this is, I repeat, one of the most satisfactory and significant results of the last great campaign.

Olaf Ellison.

Chicago, November 21, 1896.

FRENCH UNIVERSITIES AND AMERICAN STUDENTS.

To the Editor of The Nation:

Sir: Several notes and communications have recently appeared in the *Nation* relative to the Franco-American Committee and the movement in France to make the universities of that country more accessible and profitable to American students. In order to correct certain misapprehensions apparent in at least one of these publications, I deem it proper to make a statement on the subject.

In May, 1895, a private gentleman, then resident in Paris, called the attention of the Minister of Public Instruction to the comparatively small number of American students who availed themselves of the advantages so freely offered them by the universities of France. The contrast with the large number who flock to the German universities was set forth, and the causes of the superior attractions seemingly offered by the latter country were discussed. The memorial led to the formation in Paris of a "Comité Franco-Américain," made up of a number of the most eminent of French educators, some of them holding high official positions in institutions of science and learning. This committee went at its work with a spirit which showed a warm desire to strengthen the bonds of intellectual sympathy between France and America. It was soon found advisable to know what measures would best conduce to the objects in view, especially that of rendering French university teaching useful and attractive to American students, and whether such measures would meet with a response in our own country.

Under these circumstances the writer was asked to form an American branch of the committee, which should serve the double purpose of expressing the feeling of American educators on the subject and, if that feeling proved favorable, of advising the French committee as to what should be done. At first he demurred to the proposition on two grounds. One was, that American educators could not assume the attitude of petitioners before a foreign Government, asking them to change their rules and regulations in favor of our students. Another was, that he did not wish to engage in any movement which would imply unfriendliness towards the German universities, or a desire to dissuade American students from visiting them. These objections were, however, satisfactorily met by the assurance that the movement was not conceived in any spirit of rivalry with Germany, but solely in a desire for closer intellectual sympathy with America; and, so far as the measures proposed were concerned, the American committee would act only as an adviser to that already formed in Paris, and would not be expected to hold any communication with the official authorities in France.

A few of our eminent representative men who held official positions justifying them to speak with authority as representatives of American education, were then invited to make known their views on the subject, and, if favorable, to allow their names to be used as members of the proposed American branch. The responses were, with scarcely an exception, such as to show the French committee that their friendly feelings towards us were cordially reciprocated. The committee formulated a brief statement of what seemed to it the best measures to attain the end in view, and it is expected that these measures will be adopted as soon as circumstances permit.

The writer availed himself of a visit to

Paris last spring to discuss the subject personally with some of those most interested. The general outcome of the whole movement, so far as developed, is that American students desiring to avail themselves of the instruction of those French schools which are not designed exclusively for aspirants to the Government service will receive a most cordial welcome in France, and will find the treasures of French learning open to them on a scale and with a liberality which cannot be exceeded. The only important question which, so far as I am aware, remains undecided is that of the doctor's degree. The conditions on which this degree is conferred differ very widely in France from what they are in Germany and this country. In France the doctorate is awarded for some important work of original research, far beyond the ordinary doctor's thesis of other countries, and it requires no examination beyond what the aspirant is presumed to have already passed in obtaining the intermediate degree of *Licencié*. Some modifications of this system are in contemplation, but the writer is not advised as to the final outcome. SIMON NEWCOMB.

WASHINGTON, November 21, 1896.

TIVARONI'S ITALIAN RESURRECTION.

TO THE EDITOR OF THE NATION:

SIR: In the Notes of No. 1634 of the *Nation* there is a paragraph on the very comprehensive history of the Italian resurrection, by Tivaroni, which seems to me to do very great injustice to that writer. It is true that there is no attempt at declamation or special pleas in his history, but the entire series is one of the most remarkable works of the historical spirit that I have ever come across, and I have had recent occasion to examine nearly everything that has been written on Italian history. It is so far from being "a ponderous mass of citations," as your note intimates, as to be, in my estimation, the most admirable summary of all the phases of the evolution of Italy from the end of its mediæval condition to the nation as it now exists, which can be found in all literature. It is true that the style is not attractive, and that as literature it is dry, but so far from being, as one might conclude from your note, the work of an "historical hodman," it is the statement, in the temper of a judicial and impartial critic, of the complicated and (to one who has not taken a part in the history itself) incomprehensible tangle of the real national life of Italy. It is not merely the sifting and verifying of that history in all its development, and the reduction to a clear and intelligible statement of everything that needs to be known of it, but it is such an impartial judgment of the men who have taken any considerable part in the formation of Italy as I do not believe exists with reference to any other country. It is to me delightfully free from rhetoric and special pleas, and I do not believe that a reader ignorant of the part taken by the author in Italian politics could guess to what party he belongs.

To any one who knows by actual contact the passionate perversion and exaggeration that disfigure more or less all the contemporary Italian histories of Italy, this is praise enough, but the merit does not limit itself to that. Tivaroni's work is the impartial examination of all these histories and the summing up, with a Rhadamantine impassibility, of their testimony. Everything has been read and weighed, from the bitter partisan records of La Farina and Gualterio to the verbose Corsi and Bersezio; and, simply taken as collation, it is rather the building of the solid framework of the house, to be decorated and stuccoed by others, than the heaping together of the facts of history for the use of later men. It is the work of a man who has lived and taken part with the men and in the events with which he deals; and that there should be no shade of partisan color in it—that it should render such justice, on the one hand, to Cavour and Charles Albert, and on the other to Garibaldi and Mazzini—that, but for knowing something of the life of the writer, I should never conjecture which of the rancorous parties in Italian politics he had belonged to, or rather come out from, is the highest praise which could be given to a contemporary historian, and this Tivaroni deserves. His history will be the basis for all forthcoming histories of Italy, and, diluted with rhetoric and fable, with the advocacy of political idols and partisan fads, will be disguised in innumerable works on Italy; but whatever is wanted to be learned on the growth and present decay of Italian institutions is to be found in these volumes.

Perhaps I mistake the drift of your note, and what was said was meant for praise and to distinguish Tivaroni from the "historical hodman"; and in that case I am only glad that I have had the opportunity to give my testimony to the value of one of the most remarkable and colossal works of modern history, from which I have in my own studies learned more of the growth of Italy than from all other works put together. In future centuries Tivaroni will be as indispensable to the student of the history of modern Italy as Herodotus to that of Greece. It is true that he records many details which are important only to an Italian reader, like the names and condition of the hundreds of martyrs to Italian liberty; and in the profusion of this detail the massive completeness of the work is sometimes disguised. But beyond the mere records of the facts, the author has given in the "Svolgimento del pensiero nazionale" the only existing complete summary of the development of Italian individuality, as distinguished from constitutionalism, and in this he has shown a philosophical acumen which is even more remarkable than the research of the purely historical portion of his work. To have maintained from the beginnings of Italy, through all her tortures and transformations, such a judicial temper, only broken over when it is a question of the inhuman suppressions of the Italian despots, in a pardonable and momentary flash of pious indignation, but never so far as to suppress or distort the facts, and, for the rest, with such calm and impartiality as to seem almost passionless, is, in a man writing of the events of his own time and country, an achievement which places Tivaroni, with all the defects of style and excessive condensation, in the front rank of modern historians.—Yours truly,

W. J. STILLMAN.

ROME, November 5, 1896.

OUR IMPROVED METHODS OF TEACHING.

TO THE EDITOR OF THE NATION:

SIR: A dozen years or so ago, an engineer residing on the Pacific Coast, desiring to give his boy the best education possible, and influenced by glowing accounts of the new and improved methods of teaching introduced in the Eastern States, brought his boy to Boston, the focus of intellectual improvement.

At the East certain surprising facts were encountered. Thus, the number of college students was not increasing in proportion to the increase of population. Again, the age of the young men entering college was considerably greater than it had been thirty or forty years previously. At Harvard this increase of age is at least eighteen months on the average, as shown by data published by the University. The opinion was everywhere expressed that nowadays young men of seventeen are not mature enough to go to college, although in previous times the sufficiency of their maturity at this age was not seriously questioned. Moreover, there were mutterings concerning the attainments of candidates for admission to the colleges, culminating in the publishment of the Harvard examination papers, which were so poor that no boy writing such stuff could have been graduated from the preparatory school where the engineer studied in the late fifties.

These and similar facts bothered the newcomer. Trained by his professional work to judge theories by their practical results, he did not understand how, with such improved methods of training, the relative number of those desiring a college education could be lessened, the time needed to prepare students for the universities be increased, and perhaps, despite this increased time, the amount of useful knowledge of the languages be sensibly diminished. The excuses offered were to him unsatisfactory. The requirements for admission, it was explained, had been increased; but had not the methods of instruction been immensely improved? The examinations, it was said, are not fair tests of knowledge; the ignorant boys can be "crammed" through, and the good boys "get rattled." This, if true, is sad, for of what use is knowledge which is not utilizable when needed; and how can one discover whether it exists or not, except by such examinations? In practical life, both in business and in the professions, examinations are being held constantly, and men who do not pass them successfully, including those whose knowledge is so loose that it is rattled out of them by the tests, are relegated to the rear. As to the cramming business, it might be argued, with a fair show of reason, that this indicates the need of more numerous or more severe examinations quite as much as the necessity of abolishing them.

Desirous of solving the puzzle, the engineer has been visiting schools, from Massachusetts to Pennsylvania, during a dozen years, observing the methods of instruction, seeking to ascertain what the results actually are, and comparing these results with those obtained in the old-fashioned schools which he attended in his youth. Starting with a faith in the statements which had attracted him from the West, he has been forced slowly to the conclusion that these statements were greatly exaggerated, and that the results obtained by the new methods, under existing social conditions, are not only not so good as had been claimed, but to a certain extent positively bad.

Under existing social conditions, probably owing to them, the school-days in a year are considerably less in number than the holidays. A doctrine has become very popular, that children must not "use their brains" while they are very young. Few children go to school before they are five years old, very many not until seven. In numerous families school education is made entirely secondary to the pursuit of social pleasure. Under the delusion that brain-exercise is detrimental to

health, thousands of fond parents limit to a minimum the school-work of their children, whom they indulge in almost unlimited social dissipation, blindly attributing the evil effects of this dissipation to an imaginary "overworking" of the brain by study. Favored by this delusion, and ignoring the accumulated experience of the past, doctrinaires have introduced patent processes for making learning easy, whereby children are to be enabled to read without bothering about the individual words, to use language elegantly and grammatically without taking the trouble to study grammar, etc., etc. Such processes are based, apparently, on an undeveloped theory that knowledge can be imparted, like electricity, by induction, or in some other occult manner, without any effort on the part of the recipient. The teacher is to do all the work—to be, as it were, the dynamo and main-line circuit—while the pupil, under the influence of a gentle induced current, glides effortlessly along the path to knowledge. The results of these processes are in accordance with such a basal theory: when the main current is switched off, the induced current ceases, leaving a "dead wire."

In the schools visited, these new and improved methods were found in all stages of development. In some places they were carried to an extreme, in others they were radically modified, but everywhere they had been introduced to a greater or less extent. They had become so fashionable with parents and school committees that the teachers could not resist them. A private school openly rejecting them would have been left without patronage; a public school would have had a change of instructors.

One universally adopted change from the old methods, the results of which change were observed with especial care, was the discarding of the grammar and the dictionary in the study of the dead languages. The use of the dictionary seems to have gone entirely out of fashion. In some schools the grammar also has been practically abolished. In others the declensions, conjugations, and a limited number of the rules are still memorized from the book. In no school visited was the grammar learned by heart as in former days. The universality of this change indicated, *a priori*, very beneficial results. But search *a posteriori* failed to disclose such results. The useful drill of the memory has been lost. The mental exercise of interpreting and applying the rules, which was demanded of the pupils by good teachers under the old system, has been abandoned. Definite information, expressible in clear language, seems to have been replaced by hazy ideas communicable only in stumbling sentences. The simultaneous acquisition of a knowledge of the English language has vanished. English now seems to have become a separate study entirely unconnected with any other. By weary verbal iteration the conscientious teacher now seeks to impart the necessary grammatical knowledge to the pupil and to fix it in his memory. Often the instructors in the secondary schools are found teaching the elementary grammatical principles of English which have been taught before in the primary schools by the new methods, and, apparently, have been entirely forgotten. It is said that the professors are obliged to teach them a third time in the colleges.

Another general change is the abolition of exact marks. The students are no longer ranked singly from No. 1 to No. *x*, but are lumped in masses A to E. No one now stands at the head of his class, for the classes have been decapitated. This change seems to have been introduced by the teachers without any strong demand by the parents and with none at all by the scholars. The beneficial results seem perceptible only to the teachers, who, nevertheless, are deploring the decadence of popular interest in scholarship, and wondering at the prominence of athletics, where, untrammelled by sentimentalism and of their own free will, young men subject themselves to the severest competitive examinations, the prizes of which are publicly awarded amid the enthusiastic approval of thousands.

To note all the changes observed would require far too much space. But one other may be mentioned, because it has been adopted in public schools against the judgment of the majority of instructors and on account of its unfortunate results. This is the multiplication of studies. The Frenchman's criticism of the sermon is applicable here—"An immense amount of nothing at all without any place to put it." CALIFORNIA.

TAYLOR THE PLATONIST.

To the Editor of The Nation:

Sir: I am writing a book on the life and works of Thomas Taylor the Platonist, which I want to make as exhaustive as practicable. The favor of any information about Taylor's life or writings, the names and addresses of any of his descendants, or inedited letters and MSS. by him, will be most heartily appreciated. I am specially desirous to borrow or purchase copies of 'A New System of Religion,' Amsterdam, 1789, and 'The Spirit of All Religions,' Amsterdam, 1790, which are said to be by Taylor. These titles perhaps represent only one book.

Thomas M. Johnson,
Formerly Ed. of the *Platonist*.

Osceola, Mo., November 16, 1896.

Notes.

J. M. Dent & Co., London, having brought to a successful termination their original little separate-volume "Temple Shakspere," under Mr. Israel Gollancz's skilful editing, now purpose following it up with other old English dramatists, beginning with Webster and his "Duchess of Malfi," edited by C. Vaughan.

A. C. McClurg & Co. have nearly ready 'Mistress Spitfire,' by J. S. Fletcher, and 'On the Red Staircase,' a Russian romance by Imlay Taylor.

In behalf of the New York History Club and of "civic enthusiasm," three ladies, Maud Wilder Goodwin, Alice Carrington Royce, and Ruth Putnam, purpose editing "The Half Moon"—a series of papers on historic New York, conformable to the Boston Old South Leaflets. The contributors will be of both sexes. Brentano's will have the pamphlets for sale.

Francis P. Harper is about to publish 'Walt Whitman, the Man,' by Thomas Donaldson; 'Was General Thomas Slow at Nashville?' by Gen. H. V. Boynton; 'Rainy Days in a Library,' by Sir Herbert Maxwell; and Peter Cunningham's 'Story of Nell Gwyn.'

A new selection from the Poems of William Wordsworth, made and edited by Prof. Dowden, is announced by Ginn & Co.

One of the most timely as well as most pleasing revivals in the present publishing season is De Amicis's 'Constantinople,' translated by Maria Hornor Lansdale (Philadelphia: Henry T. Coates & Co.). The two volumes are printed in an open text, very decoratively and tastefully bound, and illustrated with a goodly number of well-chosen photogravures of the city and its inhabitants. The qualities of De Amicis's narrative are notorious, and this work has run through at least fifteen editions in the original Italian. We should not omit mention of an index and a generous folding map.

The green and gold volume in which Macmillan combines 'The School for Scandal and The Rivals' owes its distinction to Mr. Augustine Birrell's airy introduction and to Mr. Edmund J. Sullivan's pen-and-ink illustrations. These last are numerous and sufficient in draughtsmanship and composition; natural rather than stagey in the meagre accessories to the character figures. The text is bold and the binding rich.

The two-volume complete Browning just brought out by the same publishers (Globe Edition), though extremely well printed, attracts attention chiefly by its cheapness. Since the frontispieces show the youthful and the aged Browning, the poor effigy stamped upon the cover might well have been dispensed with. Mr. Birrell's hand appears here, too, in an editorial advertisement and in the occasional brief explanations which usher in the poems. In 'The Ring and the Book' the lines are numbered.

Mr. Birrell, once more, in standing as sponsor for the new Boswell of the Messrs. Constable (New York: Macmillan), confesses to a holy zeal for the book itself, and cries anathema on any editing that should turn the reader's eye away from the all-important text. He had made many notes, but, on reflection, had stricken most of them out: suppose they were to lead some school board to commit *lèse*-Boswell and prescribe that immortal biographer for an "exam"! Besides, Mr. Birkbeck Hill is the king whose monumental edition speaks woe to any man coming after him. Mr. Birrell wisely and frankly declines the competition, and gives us little beyond Malone's text and notes. On the other hand, these six light and attractive volumes ingratiate themselves with the reader rather more than do Mr. Hill's heavier tomes, and thus we must pronounce Mr. Birrell's edition well fitted for its avowed and pious end.

A very pretty book is 'The Lives of the Troubadours,' translated from the mediæval Provençal, with introductory matter and notes, and with specimens of their poetry rendered into English, by Ida Farnell (London: David Nutt). At the same time it makes upon us the same impression of curious ineffectiveness which we derive from almost all English essays in this field. The chief matter of the book is an English rendering of those biographies of the Provençal lyric poets which are preserved to us in manuscripts of the thirteenth and fourteenth centuries. In general, Miss Farnell's version is trustworthy; and yet we cannot help being surprised that she has followed the Provençal text as given by Mahn, instead of the more recent, as well as more complete and accurate, edition of Chabaneau (Toulouse, 1885). Apparently she has never heard of this latter publication, nor of several of the most important studies upon the subject-matter of the biographies; *e. g.*, O. Schultz's "Lebensverhältnisse der italienischen Trobadors" (*Zeitschrift für rom. Philologie*, Bd. 7). As a consequence, her notes are often defective in important information, and at times

very misleading. The translations of Provençal lyrics, of which many are given, are in the main pleasing, often really graceful. They make no attempt to reproduce the intricate forms of the originals, and in many cases depart somewhat widely from the exact sense. Still, they will give the unprofessional reader a good idea of the kind of poetry that flourished in Southern France in the Middle Ages. But why, we ask of this book as of several others of a similar kind, when so much was done, could not the author have done a little more, and made her work really adequate for the needs of all classes of students? We confidently believe that, in real truth, a dilettante treatment of such a subject is in the long run as unsatisfactory to the general public as to technical scholars.

Another translation of 'La Petite Fadette' has been made by Mrs. James M. Lancaster (T. Y. Crowell & Co.). It scarcely seems to be needed after the admirable one made by Miss Sedgwick and published only two years ago by Geo. H. Richmond & Co. That was good enough to serve for all time; but this is good too, though lacking in literalness, and the ever-fresh waters of the story cannot be distributed through too many channels. If only translators of the same book would avoid the same mistakes! It will be a pleasant day for the admirers of George Sand's style when some translator will get the very first sentence of this book right. One and all they begin, alertly: "After the terrible days of June, 1848. . . ." They never attempt to reproduce the wave-like flow of the words: "C'est à la suite des néfastes journées de Juin, 1848, que. . . ." It would be quite worth while to translate the whole book still once more to show that an English-speaking mind can feel and express the difference between "à la suite" and "after," "néfastes" and "terrible," "journées" and "days." A translation made by the pen that could communicate the impression conveyed by that simple sentence would be a translation really worth having.

'In Jail with Charles Dickens' is the sensational title of an entertaining little book of no very permanent value, by Mr. Alfred Trumble (New York: Francis P. Harper). It consists of chapters on Newgate, the Fleet, the Marshalsea, the King's Bench Prison, the New York Tombs, and "Philadelphia's Bastile" (that is, the Eastern State Penitentiary at Philadelphia)—all of them prisons to which Dickens gave special attention. To the Penitentiary, indeed, he gave a kind of attention which those of our readers who remember the appearance of 'American Notes' may be trusted not to have yet forgotten. Mr. Trumble knows his Dickens and writes clearly and without flourish. His book, though not a contribution to knowledge or to literature, is good reading for a leisure hour. The frontispiece is worthy of preservation, being a well-executed copy of an old print representing the destruction of the King's Bench Prison by the rioters of 1780.

Prof. O. F. Emerson's 'History of the English Language,' which appeared some two years ago, has apparently met with the success it so well deserved, and has taken its place among the most approved manuals for college study. The author now comes before the public with a 'Brief History' of English (Macmillan), designed for more elementary classes, which merits an equally favorable reception. It is not a mere abridgment of the larger work, but is carefully revised throughout and in great part rewritten. We know of no book on this difficult and important subject which can with greater confidence be put into the hands of beginners. It is also heartily to be recommended to that large class of mature readers who wish to get an accurate knowledge of the history of our mother tongue, but have scanty leisure and are frightened by technicalities.

As there were good reasons for deploring the death of that eminent and useful citizen of Baltimore, the late Severn Teackle Wallis, there was a good reason for a memorial edition of his Writings (Baltimore: John Murphy & Co.). Two of the four volumes constitute a reprint of his 'Glimpses of Spain: Notes of an Unfinished Tour in 1847' (1849) and 'Spain: Her Institutions, Politics, and Public Men' (1853)—works now as much lost sight of as the official errands which took their author to the peninsula, but possessing a permanent value and the former not a little charm. Mr. Wallis's memory would, in our opinion, have been more honored by furnishing these standard works with indexes than by compiling the remaining two volumes of miscellaneous addresses, reviews, and poems. These, too, have their value, partly as autobiography, and partly as the product of a Southern and an irreconcilable Confederate mind; but who of Mr. Wallis's posterity might not blush to *commemorate* his joint review of Barnum's Life and Mrs. Stowe's 'Sunny Memories of Foreign Lands,' with its bracketing of a "common impostor" and a "spiritual inebriate"? The poems as a whole are mediocre, but are often animated by a pure and deep feeling, as in the verses on his dead boy; more rarely by a touch of humor, as in the album stanza—

> "I only beg that not too glad
> Nor bright your dreams may be,
> For then—the chance were very bad
> That you should dream of me."

Our Chimmie Faddens have tempted not a few persons of refinement to venture into the gutter for a pastime, and a new resource is offered to these in 'Phil May's Gutter-Snipes'—fifty sketches in pen and ink by the artist on whom Du Maurier's *Punch* mantle has fallen (Macmillan). They mostly bear descriptive labels, with rarely a legend in dialogue; the Street Arabs are oftenest shown at play, sometimes at their tricks, once annoying a drunken woman. The caricature is not of a high order, and does not, to our mind, betray a real humorist. These are gutter "kodaks," and little more.

Readers old enough to remember George T. Lanigan's delicious 'Fables "out of the World"' will find the text of 'Fables for the Times,' by H. W. Phillips (New York: R. H. Russell & Son), flat, stale, and unprofitable. Nor has his colleague of the pencil, T. R. Sullivant, produced animal caricatures, properly so called. He should go for lessons to the genial artist of the Idylls of the Desert in the *Fliegende Blätter*.

It would be ungracious to speak disparagingly of any of the writings of Miss Margaret Stokes; for, whatever be the defects, they are outweighed by the merits. Her latest book, 'Three Months in the Forests of France: Pilgrimage in Search of Vestiges of the Irish Saints in France' (London: Bell; New York: Macmillan), judged in the light of accurate scholarship, will not satisfy our present requirements. The writer adds little or nothing to our previous knowledge of Columba, Fursa, Gobain. Such was doubtless not her purpose or expectation, the book being made up in great part of letters to friends, and dedicated to the Church History class of Alexandra College, Dublin. Its style is the epistolary, *i. e.*, rambling and diffuse. For all that, the book is profitable reading. It imparts a realizing sense of early Frankish Christianity and of the distinctive Irish character and the part played by it in shaping Western civilization. The theme, an interesting one, does not lose in interest or in dignity under the hands of Miss Stokes. Especially would we commend the illustrations; they are both numerous and good. Some are of ancient monuments, others are of modern scenes in France, Ireland, and even England. Not a few are from the pencil of the writer herself, and these we reckon among the best. They suggest artistic repose and the spirit of the scene. No. 16, the Vale of Annegrai, though somewhat blurred in the printing, is unmistakably French.

'The Elements of Gaelic Grammar,' by H. C. Gillies, M.D. (London: Nutt), is an attempt to present in 176 pages the chief phenomena of the living Celtic speech of Scotland. The author, though not wholly unacquainted with the methods of historical grammar, is evidently not familiar with them; witness his remarks upon Aspiration and Eclipsis. Also, his treatment of "broad" and "slender" in Celtic phonetics is unsatisfactory. The print is remarkably clear but wasteful of space, and the book is in general too narrowly planned for its subject. In the hands of a practised teacher it might be of service, but to one who wishes to study Gaelic without such a master it is quite inadequate.

A booklet on 'Fra Angelico' by Domenico Tumiati (Florence: Paggi) has no scientific value, no illuminating or even humbly guiding purpose, but contents itself with interspersing vague sentences of praise with copious extracts from Ruskin and Rossetti. Were these translated, Signor Tumiati might actually have been of some service to his equally aspiring but less privileged countrymen. As it is, we can recommend the book only to students of retarded "movements."

One turns from it with relief to a book recording travels in a rickety cab over the length and breadth of Umbria ('Pèlerinages Ombriens,' by J. C. Brousolle; Paris: Fischbacher). The author is a lively Frenchman who writes with unusual *verve*. He certainly has seen all the places he describes—a great merit in books on Italy—and has much to say of his impressions and small adventures. His information is exact, and of course is chiefly about works of art. The numerous illustrations are modest but helpful.

The issues of the *National Geographic Magazine* for September, October, and November contain numerous articles of current interest, freely illustrated with views and charts. Such are Mrs. Scidmore's paper on the recent destructive earthquake wave on the coast of Japan, Consul Man's account of the Nansen Polar Expedition, and Mr. George F. Becker's temperate and impartial review of the Witwatersrand and the revolt of the Uitlanders—what he justly calls "a capitalist revolt." This last deserves to be read in connection with Mr. Bryce's articles on the same subject in the *Century*, and is especially valuable for its statement of the attitude of the American Uitlanders towards the rising. Mr. Becker predicts a great future development in a direction different from gold-mining, when the extensive coal and iron deposits are used for manufacturing purposes.

The principal articles in the *Scottish Geographical Magazine* for November are upon the Yukon country in Alaska, and Angola in Africa. This latter country is described as one of the most fertile in the world, yet almost wholly undeveloped, though the Portu-

guese have been in possession of it for four centuries. This is due mainly to defects of administration, the officials being chosen, not for their capacity to govern the natives, but often as a punishment for some offence. The European army consists chiefly of military convicts. Another reason for the lack of growth is that, of the two crops solely cultivated, coffee and sugar, the latter is used mostly in the manufacture of rum, which is sold to the natives. The soil is rich in mineral deposits—iron, copper, and gold being found in all parts—but the mining "concessions are granted by the Portuguese on terms calculated to crush an infant industry, the price of the minerals extracted being fixed at Loanda."

The chief interest in the account of a journey round Siam, by J. S. Black, with which the *Geographical Journal* for November opens, lies in the contrast drawn between the regions opened respectively to French and British influence. The western basin of the Mekong, which, by the recent treaty with Siam, has become practically a French river, was found by the traveller to be an almost uninhabited wilderness swarming with wild animals. The few inhabitants remaining of the once dense population, witnessed to by the "extraordinary number of ruined cities," are stricken with fever, smallpox, and cholera. They have a custom of placing before their houses, when there is illness, as a supplication for mercy to the demon of the disease, an earthenware pot marked with blue or white bands; and "the number of these pots in some places," says Mr. Black, "was perfectly alarming." When the watershed between the Mekong and Menam basins was crossed, the change was very striking. In place of the flat, jungly plains in which marshes and brackish streams abound, were hills, sparkling brooks, fertile valleys, and an active, well-to-do people living in large and solidly built houses. The aggregate foreign trade of this part of Siam, both of imports and exports, the latter being chiefly teak and rice, is estimated at eighteen million dollars annually, while that of the Mekong basin is only one million. There is also a scholarly account of the Roman roads and defences of the upper Euphrates, in which Mr. Yorke gives as the most important result of the recent Hogarth expedition the discovery of the site of one of the four frontier stations, as well as an "important tributary of the Euphrates before unknown."

The last Bulletin of the *Société de Géographie* is wholly devoted to Africa. A description of a journey across Tripoli is followed by accounts of two exploring expeditions in the French Congo, and a sketch of the different attempts of the Franciscans to reach Abyssinia in the fifteenth century. The number closes with a vivacious account of a journey on the west coast of Madagascar, which is marked by great moral callousness. When the territory of a native chief was entered by the Frenchman, his present consisted mainly of rum and gin, with the inevitable consequence of an interview ending in a drunken orgy.

The State of New Jersey, which was the first to produce a topographical contour map of its territory, on the liberal scale of an inch to the mile, has used this work of its Geological Survey as the foundation of what is probably the best relief map ever constructed in this country. From this in turn has just been published by the Survey at Trenton a beautifully executed lithographic sheet of the State on the scale of an inch to four miles, which is incontestably the most important contribution to the teaching of geography yet made in New Jersey, and a useful instrument in such instruction anywhere. The strongly marked difference in conformation between the glacial and subglacial portions of the peninsula conveys a lesson almost without the need of a text. Within a range of elevation from tidewater to 1,800 feet, the river systems, whose singular courses have a singular history, are readily grasped by the eye, and afford the beginning of a real topographical knowledge of the State. The ordinary geologic and the as yet incomplete surface-geologic maps issued by the Survey leave nothing to be desired by the student of this relief map, which some of the New England States have materials for imitating.

A preliminary geological map of New York State has lately been issued after years of special study. It has been constructed under the direction of Prof James Hall, State Geologist, by W. J. McGee, printed by the United States Geological Survey, and published by authority of the State Legislature under date of 1894. It is in six large sheets, on a scale of 1:316,800. The base-map has no indication of topographic relief, but represents villages and cities, roads and railroads, etc. Twenty-nine colors represent as many subdivisions of the geological scale; glacial deposits not being included, and no indication being given of the southern limit of the drift. Certain areas are left blank, where information is still wanting, as, around the rim of the Adirondacks, the Hudson valley east of the river from about Chatham to Poughkeepsie, and Long Island. Otherwise, the map is a great improvement on anything hitherto published.

—A curious inquiry, engagingly set forth, and relating to "The Colonel and his Command," has fitly the place of honor in the *American Historical Review* for October. The writer, Mr. Julian Corbett, essays a destructive criticism of the explanations heretofore given of the origin of the title of colonel, and certainly leaves them discredited. His own surmise, that that officer of the Renaissance period once bore a baton in the semblance of a classic column, he offers for what it is worth; neither military work nor portrait can he cite in its support. Solution must come, if ever, from some Italian 'Oxford Dictionary' of the future. Entertaining also in its way is Prof. James D. Butler's article on "British Convicts Shipped to American Colonies," the result of research in contemporary periodicals, with many a shrewd and diligent resort to other sources beyond the histories. He bids those—"the Japhets who seek for their fathers"—who would go deeper and discover the names of the transported, consult the 110 MS. volumes of Old Bailey proceedings; but with a necessary caution in regard to aliases that will discourage the most ardent and insensitive genealogist. Prof. Butler lets it be seen what qualification of the term convict should be made in our conception of the "transports." Thus, in 1773, one John Lowe, who was to have been executed at Tyburn for returning from transportation, was reprieved because the original offence had been "receiving a shilling for the carriage of a goose that had been stolen, of which theft he declared that he was ignorant." Quite a different kind of transportation is the theme of Bernard C. Steiner in his article on "Rev. Thomas Bray and his American Libraries," a useful addition to recent revelations of the bookishness of our Southern gentry. Bray, an Oxford graduate, was bent on equipping with learned apparatus the first Anglican clergy sent over to Maryland, and to that end devised and carried out a general scheme of lending and parochial libraries for the British colonies. In connection with this he founded the Society for Promoting Christian Knowledge, which will soon celebrate its 200th anniversary, and later the Society for Propagating the Gospel in Foreign Parts. Fragments of these libraries still exist in several States of the Union. Their contents were varied, and by no means wholly theological. Bray's apparent reliance on the support and extension of his libraries by the people of the colonies was doomed to disappointment. We have space to mention further only Charles H. Haskins's lucid account of the Vatican Archives as now accessible to scholars, and Dr. Charles Gross's list of town records of Great Britain.

—With the assistance of Prof. Jesse Macy of Iowa College, Mr. James Bryce has prepared an abridged edition, in one volume, of his 'American Commonwealth' (Macmillan), for the use of colleges and high schools. Of the first volume of the larger work, all but two chapters and the appendix are here retained, but shortened by skilful omission of many sentences and paragraphs unsuited to a text-book, and of many of the comparisons drawn from English political usage. The selections from the second volume seem to us less adequate. We have the chapters on political parties and their history, on nominating conventions, and on public opinion, but we miss the keen accounts of "machine" politics, rings and bosses, spoils and corruption, and electoral methods, which helped to make Mr. Bryce's book such a revelation to most Americans, and which no teacher or student can afford to neglect. The same method of condensation that has been applied to the first volume would have allowed the inclusion of most of these chapters in the present abridgment without increasing unduly either the size or the cost; for the volume as it stands contains about 175 pages less than the original vol. i., but sells at the same price. Notwithstanding these omissions, however, the book in its present form is a real boon to students and teachers, and will doubtless be read and pondered by many who have been deterred by the size and cost of the larger work. Where the lecture system of instruction prevails, there is no better book than this to put into the hands of college students. To say, as one must, that it is not a very perfect example of what a text-book should be, is not to detract in the least from its merits, for the original work was never designed for such a purpose, and has been adopted extensively as a class-room manual only because of its commanding excellence in other directions. From the pedagogic standpoint, the volume before us not only is lacking in orderly arrangement, concise statement, and didactic discrimination, but fails, like the larger work, to include many details which, if not very interesting to read, are extremely important to know. This comes, of course, from dwelling more upon the political than upon the administrative side of American government, and is a defect only when an attempt is made to turn a philosophical treatise into a text-book. It is rather surprising that American history and American government are about the only departments of high-school and college study in which we have not, as yet, a single text-book to which serious exceptions must not be taken. In the latter field, this abridgment of Mr. Bryce's great

work is superior in many ways to anything yet offered, as it is certainly the most readable; but we do not think that Prof. Hart need be deterred by it from publishing his promised contribution to the American Citizen Series, on "Actual Government, as Applied under American Conditions."

—Mr. Moorfield Storey's interesting address on "A Year's Legislation," delivered last summer before the American Bar Association, has been reprinted (Philadelphia: Dando Printing and Publishing Co.), and makes a pamphlet of some seventy-four pages. It is a review of the "most noteworthy changes in statute law on points of general interest made in the several States and by Congress" during a year, and, notwithstanding the dryness of the subject, is entertaining as well as interesting, owing to the shrewd originality and point of Mr. Storey's style and the skill with which he presents his facts. Most of what he says is of more than professional interest. For instance, the first fact brought out in his review is exactly that emphasized by the recent election—that the interests affected by legislation throughout the country are homogeneous, and the essential feature of the country its unity. "The same problems confront us all alike, and are dealt with in the same way by Louisiana and Massachusetts, by Maryland and Utah." In the legislation of the year there is no indication that any social or political questions or antagonisms or passions or interests have created sectional lines, or made possible sectional legislation, such as slavery once produced. One State, for example, making arrangements for a constitutional convention, provides that it shall have no power to impair the obligation of the State debt. It is the State of Louisiana which does this. The State of South Carolina has passed the most enlightened statute abrogating charter jobbery. Civil-service reform has been adopted by Utah. Labor legislation is governed by the same principles, whether we examine the statute-book of New Jersey, Maryland, or Mississippi. The feeling against Trusts and corporations finds expression in all sorts of queer statutes, and they are sometimes queerer in one State than in another, but they all spring from the same economic misapprehensions. Massachusetts undertakes to fix the price of gas, while Mississippi allows any producer or owner of anything the cost or price of which is "affected" by any "unlawful Trust or combine," to recover $500 and all actual damages in a suit against any party to the "combine" or any of its attorneys, officers, or agents, whether they combined in Mississippi or elsewhere. So it goes on through the various heads examined by Mr. Storey, until we come to the subject of Railway Reorganization, in which case we find that Kentucky turns out to be the first State which has attempted to correct the notorious abuses from which the security-holders of railroads in the hands of reorganization committees and receivers suffer.

—The next point made by Mr. Storey is negative, but important. If it were true that any class, like the farmers or laborers, had been systematically oppressed in any part of the country for the last twenty years by anybody, the fact would certainly make itself apparent in the statute-books of the States affected. But there is no evidence of a local or class sense of wrong anywhere. Even the labor and anti monopoly statutes, he might have added, are not the result of any "uprising." They are always passed cheerfully anywhere the moment they are demanded. And this brings us to the final point - that there is a rapid increase all over the country of statutes of a socialistic tendency, sometimes by means of the use of the power of taxation, sometimes through the "police power." The pamphlet is really a valuable picture of American society in movement drawn by an exceptionally skilful hand.

—At this season's first meeting of the Hellenic Society in London, Mr. Arthur Evans read a paper on "Further Discoveries of the Early Cretan Script," the most striking of which he had related at Liverpool in his presidential address before the Anthropological Section of the British Association. In recent visits to Crete he had gathered additional evidence corroborating the evidence submitted in his paper read before the Hellenic Society two years ago. The new discoveries made still more certain the existence in prehistoric Crete of two interrelated systems of writing—one pictographic, the other linear. That the latter, which belongs to the Mycenæan era, and shows points of resemblance to Hittite script, was evolved out of the former, became still more clear from a fresh series of seals which was described. Examples of an earlier and pre-Mycenæan linear script on Cretan seals, which had curious points of resemblance to Greek and Phœnician letters, were also discussed. This part of Mr. Evans's paper consisted in the presentation of evidence not differing materially from the great mass of examples discussed in his previous paper, published in the *Journal of Hellenic Studies* for 1894 (vol. xiv., part ii.), which were chiefly engraved seals and *graffiti* on vases.

—A new piece of evidence, however, differing in character from anything previously discovered, was now presented. Mr. Evans described in detail the unearthing of a part of a libation-table of steatite (soapstone), imitated from a XIIth Dynasty Egyptian model, and bearing the remaining half of what seemed to be a dedication in Cretan linear characters. The inscription consisted of nine letters with two punctuations, and was of the highest importance, as showing that this pre-Phœnician script was applied to monumental as well as personal objects. The Egyptian affinities of this libation-table itself fitted in with other signs of intimate connection between Crete and the Egypt of the XIIth Dynasty supplied by the decorative designs of sealstones and steatite vases. The place of its discovery, on the other hand, had its bearings in another connection, since the table was found in the cave of Psychzo, the "Dictæan Cave" of the Cretan legend of Zeus's birth. As to Cretan relations with Egypt, this Cretan imitation of an object of Egyptian *cultus* indicated more than mere commercial intercourse, and pointed to continuous land contact, suggesting, indeed, that the old empire of Egypt influenced Crete through Libyan settlements in the island. Upon this hypothesis the beginnings of the earliest and pre-Mycenæan Cretan linear script, which also showed Egyptian affinities, might ultimately be discovered in Tripoli. A remarkable parallelism existed, in fact, between Cretan signs and the early Libyan alphabets. Converging lines of evidence showed that the inscribed libation-table (found, as it was, under a votive and sacrificial stratum of Mycenæan date) could not be brought down later than about 2000 B.C.

—Few scientific societies have been founded more securely or operated more successfully than the American Ornithologists' Union, which has just held its fourteenth annual congress in Cambridge. Its membership includes every ornithologist of special note in the world, its financial status is sound, the *Auk* does not suffer in comparison with the English *Ibis*, and the yearly reunions have always proved enjoyable occasions, whose scientific aspects are mitigated by social amenities, with a touch of missionary enterprise in warming up public interest in bird-life. On the last occasion the Union was received with an address of welcome by Prof. Goodale on behalf of Harvard University, which placed two lecture-rooms at its disposition; the resident ornithologists of the Nuttall Club entertained their visiting members handsomely at the Colonial Club, and President Brewster gave a series of receptions at his house and in his private museum, finishing a lavish hospitality with an excursion to his hunting-lodge near Concord. One of the two most marked features of the scientific sessions was the exhibition of some of the original manuscript journals of Audubon, made by Dr. Coues on behalf of Miss M. R. Audubon, who was present in person. The other was Mr. A. H. Thayer's out-door demonstration of some remarkable facts in the protective coloration of birds. The public programme occupied three days, besides two others devoted to routine business and to setting the fashion in bird-nomenclature for the current year. The officers of last year were reëlected, and the policy of the Union continues unchanged in its rigid exclusiveness regarding the Active, Honorary, and Foreign memberships, offset by its liberality in respect of its Associates and Correspondents. The fifteenth Congress will be held in New York about this time next year.

RAE'S SHERIDAN.

Sheridan: A Biography. By W. Fraser Rae. With an introduction by Sheridan's great-grandson, the Marquis of Dufferin and Ava. With portraits. 2 vols. Henry Holt & Co. 1896.

AFTER a period of prosperity, Richard Brinsley Sheridan, like his father and his grandfather, fell upon evil times. His triumphs were numerous and so were his misfortunes. One of them was that he failed to get a good contemporary biographer. We can hardly explain the circumstance by Gray's dictum that "a favourite has no friend." Sheridan had friends among men of literary taste as well as among politicians. The trouble was that most of his intimates were too brilliant to assume the humble rôle of biographer. Moore knew him well and was an Irishman to boot. He ought to have produced a much better 'Life' than he did do. He failed from sheer ennui. He became tired of the subject before he had fairly started it. The following passage from his diary explains why his performance is so poor: "I often wish Sheridan, Miss Linley, and Major Mathews at the Devil."

Mr. Fraser Rae comes into the field to supplant Moore, Dr. Watkins, and Prof. Smyth. He has, of course, the great disadvantage of writing eighty years after his subject's death. Sheridan's genius was of the sparkling variety. We open a fresh volume about him with fear and trembling lest the champagne should be decanted. Fortunately we find that, in the present case, we have to do with a serious historian, and not with a belated retailer of Sheridania. Mr. Rae's opportunities for collecting material have been excellent. Lord

Dufferin, the most distinguished of Sheridan's descendants, is his sponsor, and the family archives have been opened to him without reserve. The Duke of Devonshire has furnished papers, and Mr. Gladstone recollections of recollections. Mr. Bancroft has described for him the modern presentation of Sheridan's dramas, and Sir Henry Irving has contributed a criticism of Sheridan as a playwright. The portraits and facsimiles are in the best style.

While an official biographer derives assistance from access to valuable sources, it is hard for him to be impartial. In the case of Mr. Rae, the difficulty is very considerable because he has always been a devoted admirer of Sheridan. It was his Memoir on 'Wilkes, Sheridan, Fox: The Opposition under George III.,' which first attracted the attention of Lord Dufferin and led him to suggest that Mr. Rae "should undertake a complete biography of Sheridan." Lord Dufferin is careful to explain that Mr. Rae's narrative must not "in any way be regarded as an Apologia. He possesses the confidence of Sheridan's descendants, because the family know from his other writings that he is studiously impartial and conscientiously accurate. Accuracy and impartiality are all that they bargained for, tempered by that benevolence of treatment of which the most blameless stand in need." We are not disposed to quarrel about terms, especially as apologia is ambiguous and often misapplied. But if Mr. Rae has succeeded in avoiding the strain of an apologia, he has not avoided the strain of a vindication. It will be remembered that Lord Macaulay, after his defeat in the Edinburgh election of 1847, sat down at once to the composition of some stanzas concerning his own career. He brings a number of fairies to his infant bedside and relates what they did and said. Mr. Rae uses the same imagery, although he keeps to prose. He brings the fairies to 12 Dorset Street, Dublin, shortly after Sheridan's birth, and makes their queen prophesy many desirable things. When she has ceased speaking, a wicked fairy predicts that the babe will have "all his grandfather's levity and thriftlessness, and all his father's ill-luck"; also that his second marriage will be unfortunate, and that his own countrymen will circulate untrue, dishonorable stories about him. "Having exhausted her power for working mischief, she shook her tiny fist at the sleeping infant and faded into the darkness. Thereafter the moon shone forth and brightened the bed-chamber. The Queen of the Fairies kissed the eyelids and mouth of the infant whom she had taken under her protection, and softly vanished amid the tinkling of silvery bells." This somewhat rhapsodical beginning shows the extent of Mr. Rae's sympathy for Sheridan. He is accurate in statement and exposes many calumnies, notably those regarding Sheridan's deathbed. His chief biographical fault is that he carries "benevolence of treatment" a little too far. He softens hard outlines; he supplies the mantle of charity which the reader, left to himself, would doubtless cast over the declining years of the brilliant Irishman.

In venturing this criticism we have said all that we have to say in depreciation of Mr. Rae's interesting volumes. Sheridan has delighted the world, and it is an ungrateful business to deny him any portion of praise. Let us turn to Mr. Rae's account of his happier years. Two women inseparably connected with Sheridan are here described with much fulness and with a new charm—his mother and his first wife. Each of them has an individual claim to remembrance on the score of accomplishments. Frances Chamberlaine wrote the 'Memoirs of Sidney Biddulph,' which Fox styled the best novel of the age, and which the Abbé Prévost translated into French. Elizabeth Linley was one of the most rapturous singers of her generation. In the ordinary sketch of Sheridan's life she drops out of sight after the Bath episode, or, at least, after her marriage. Mr. Rae never loses sight of her from 1770 till her interment in Wells Cathedral. The best thing in Sheridan's character was his devotion to her amid the storm of flattery which buffeted him during the heyday of success. Lord Dufferin calls her "the angelic woman to whom Sheridan was united under such romantic circumstances, who shared his earliest trials, whose sweetness and beauty shed an additional grace on his subsequent triumphs." By his just portrayal of the first Mrs. Sheridan, Mr. Rae has enriched biography with a new and charming character.

For thirty years Sheridan's life was overflowingly full of incident. He moved in at least four circles, literary, parliamentary, dramatic, fashionable, and was a star in them all. With so much material at hand, Mr. Rae must have found it difficult to keep his memoir within the reasonable limit of two short volumes. He secures conciseness by a topical treatment. Indeed, he comes nearer to the critic or essayist than to the annalist. Economizing space on the unimportant years, he is able to describe important incidents at length. Sheridan's life might well be made the subject of a five-act play, ending with the success of the "School for Scandal" or with the Warren Hastings trial. The first act of such a play would centre at Bath, and, of course, Miss Linley would be the heroine. Mr. Rae's account of Sheridan's intimacy with Halhed, of the elopement, and of the duel with Major Mathews in London, is by far the most authentic and the most graphic story of these events which has yet been printed. His extracts from the letters of the two ardent and venturesome lovers are enough to put the banal novelist of modern days to shame. Here is a picture of Miss Linley writing at midnight to her "dear Horatio" (vol. i., p. 192):

"Upon my knees, half-nacked, once more I am going to tire you with my nonsense. I could not bear to see this little blank without filling it up. Tho' I do not know with what, as I have almost exhausted the Budget of news which I had colected since our long absence. I do insist that you write to me, you lazy wretch; can't you take so small a trouble? I can receive your letter by the same method. My sister is very impatient that I don't come into bed, but I feel more happiness in this situation, tho' I am half froze, than in the warmest bed in England . . ."

Mr. Rae's narrative of Sheridan's years of prosperity in London is equally divided between Drury Lane and St. Stephen's. Considering his hero to be "the greatest dramatist since Shakspere, and the greatest orator who ever addressed the House of Commons," Mr. Rae is bound to do him justice in both capacities. As a contribution to biography, the dramatic part of the work is far more important than the political part. Mr. Rae establishes an important point in proving that Sheridan was without lust of office. On the other hand, his personal relations with "the first gentleman of Europe" are not very satisfactorily presented. When Mr. Rae gets Sheridan on the boards of the theatre, he has nothing to explain or defend, and he has new information to relate. One of his discoveries is a revision of the "School for Scandal," which Sheridan prepared for publication at the instance of Ridgway.

Mr. Rae says little in praise of the second Mrs. Sheridan, and it is clear that her memory is not warmly cherished by the first wife's descendants. Relations between husband and wife became strained in 1810, and Sheridan drew up a statement, "covering twenty-four closely written pages of quarto paper," in his own defence. The substance of it is expressed in two sentences (vol. ii., p. 218): "I have said before, you do not know me; in truth you do not in the least. You should judge of my conduct, character, and principles upon a larger scale of observation, and not from the defects of daily life which arise from the failings I acknowledge."

It is greatly to Mr. Rae's credit that he does not seek to make his book readable by repeating worn-out and apocryphal stories of Sheridan's wit. When he wishes to show what good things Sheridan could say, he selects gems from authentic plays and speeches. The first effect of his volumes will be to send readers post-haste to the "Duenna," the "Critic," the "Rivals," and the "School for Scandal."

Sheridan has a double claim upon his tomb in Westminster, and he still has a double claim upon our gratitude. We are far enough away from him now to judge his work and his genius fairly. He has suffered much from detraction, and no one will grudge him this competent and sympathetic biography.

THE ALEXANDER LEGEND.

The Life and Exploits of Alexander the Great; being a series of translations of the Ethiopic Histories of Alexander by the Pseudo-Callisthenes and other writers. With introduction, etc., by E. A. Wallis Budge, Litt.D., F.S.A. Cambridge (Eng.): University Press; New York: Macmillan. 1896.

Comment Alexandre devint Dieu en Égypte. Par G. Maspero. Annuaire de l'École Pratique des Hautes Études. 1897.

THE growth of the Alexander romance is a very curious and instructive example of the process of myth-making. It began during the lifetime of its subject. It was cultivated and disseminated by Greeks as well as Egyptians. It was easily accepted by the soldiery of the perpetually victorious army; it was probably more than half believed by the great general himself. He had not only the current beliefs of his epoch, but the superstition which has characterized many great leaders; he believed in his ancestry and his destiny. His soldiers might well accept with complete confidence a manifest deity who led them to unfailing victory, in preference to those remote dwellers in Olympus who "lay beside their nectar careless of mankind." His very tent was a sort of tabernacle, which brought security against their enemies; his body was a precious and divine relic fought over by his generals and successors, and conferring sanctity and protection on the great capital which bore his name. His miraculous presence in the Sema spread an ægis over the empire of the Ptolemies.

The Egyptians, as Dr. Budge shows, were naturally foremost in accepting his divine character, and it was in Egypt that the myth first sprang and flourished and assumed some characteristic aspects. The Pharaohs were all sons of Ra or of Ammon-Ra, either directly

or by descent. To maintain the blood of this solar line unmixed and untainted was devised that incestuous custom of intermarriage between brother and sister which the Ptolemies adopted as a matter of state policy, if for no other reasons. The issue of such marriages inherited the clearest title to the throne, and the undisputed right to approach the temples of his divine father and be saluted by the priest as son of Ra, according to a well-known formula and ceremonial. It was in accordance with this traditional ceremony that Alexander was hailed by the priests as a son of Ammon. The occasion, as M. Maspero has lately shown with great clearness, was not exceptional and political; it was part and parcel of the institutions of the country.

The priestly logic, which had worked out with such rigor the process for securing the purity of the solar line, had already proved capable of a flexible somersault when the necessities of the national fortunes required it. If a foreign invader proved successful in imposing his yoke, then the native deities must have adopted him and ordained his good fortune. The moment that Alexander made his appearance as a victorious Pharaoh *de facto*, the divinity of his origin and his descent from Ammon became established according to priestly tradition. It made no difference that Philip was his reputed father; they asserted that in this case, as in others known to their history, Ammon had condescended to assume the form of a mortal, Philip of Macedon. The conqueror of Egypt and of the world was, after all, an incarnation of the supreme Egyptian deity.

On this priestly and official fiction, which commended itself to the pious Egyptian, and which flattered and soothed his national pride, was built the legend of Nectanebus, and of the sorceries he practised on Olympias. The nidus of the story is Alexandria rather than Egypt at large, and a breath of Euhemerism has blown over it, as Maspero says, to adapt the details to the rationalizing spirit of the Alexandrian population. Nectanebus II. was the last native king of Egypt, and sober history records that he fled into Ethiopia before the victorious Persians, about 350–340 B. C. The inventors of the legend transport Nectanebus to Macedonia; they convert him into a magician who, in the absence of Philip, deceives Olympias and becomes the father of Alexander. It is true that Alexander was born anywhere from five to fifteen years earlier than the flight of Nectanebus; but this does not embarrass the myth-makers. He is made to practise certain black arts with wax figures, which were familiar to the Egyptians as early as 4000 B. C. He beguiles Olympias in the form of a two-horned serpent, the symbol of Ammon-Ra—a form which agrees at once with the Egyptian worship of the Agathodemon Pshai, prevalent at that period, and also with the current Greek rumors which reported the familiarity of Olympias with serpents, and her devotion to bacchic orgies. The transformation is therefore made plausible to the mind of that generation, and it bears some slight relation to historic facts. It is a fair sample of the other transformations and distortions which make up the history of the Pseudo-Callisthenes. This conglomerate is in the main not a popular growth, but the work of half-learned rhetoricians unscrupulously exercising their fancy on historical themes. Hence the astounding trash put in the mouths of Demosthenes and Demades in Book II., and the perpetual flow of letters to Darius, to Aristotle, to the Amazons, which issued from the copy-books of the epistolographers. The result of this *rifacimento* reflects the real facts of Alexander's career very much as a convex mirror distorts the objects before it.

This comparison will serve in a general way, but is of course not exact. In some cases the facts are more wildly distorted, in other cases the facts do not exist, the narration is pure fiction or folk-lore. The visit of Candace, the tokens exchanged with Darius, the descent to the bottom of the sea, and the flight on eagle's wings up to heaven, evidently belong to the category of folk-tales. Dr. Budge even shows that the latter story is told of a Babylonian hero called Etanna, and is recorded in an Assyrian fragment of the royal library of Assur-bani-pal.

Such as it is, however, the popular fame of Alexander is based much rather on this curious composition than on the biographies of Arrian, of Quintus Curtius, and Plutarch. It has travelled from one end of the world to the other; it has assumed the garb and language of all nations from Malay to the British Islands, from Sweden in the north to Abyssinia in the south. It has been translated into Armenian, Pehlevi, Syriac, Hebrew, Arabic, Persian, Coptic, Turkish, and all the principal European languages. No other book except the Bible has wandered so widely or met with so universal a reception. In fact, we meet with traces of the Alexander myth in the Book of Daniel and in the Koran. No wonder, indeed, that the career of this youthful hero, which outruns the invention of romance, should have captivated the imagination of mankind the world over; his very name, which was naturalized in so many languages, became a sort of magnet that attracted to itself the floating tales of the marvellous such as we hear from Herodotus, or Lucian, or Palladius, or Marco Polo.

The divergence of these translations from their original source in the Greek varies considerably. The Armenian, which has not yet, we believe, been translated, is said to follow very closely an early and authentic text of the Greek. The Syriac, which Dr. Budge printed with a translation in 1889, exhibits some departures in detail from the Greek texts known to us, but agrees substantially with Codex A of the Bibliothèque Nationale, and can be compared in the main, chapter and verse, with the original. It contains the ludicrously puerile correspondence between Philip and the tutors about Alexander's pocket-money, which does not occur in the Greek; and also a curious letter purporting to be written by Aristotle to dissuade Alexander from founding Alexandria, on the ground that the city would be too large to be managed and supplied with provisions. The translator was undoubtedly a Christian, as he occasionally foists in quotations from Jeremiah and the Gospels.

But the Ethiopic Histories which Dr. Budge here publishes present a much wider departure from the original, and have taken on a new color from the hand of the unknown translator. Working from the Arabic, he makes Alexander a Christian King of rather Judaic type, yet a believer in the Trinity, whose conversation is bestrewn with quotations from the Scriptures, and who omits no opportunity to address pious homilies to his subjects, his army, and to Darius himself. His single lapse from ascetic virtue is caused by the bewildering charms of Candace, a countrywoman of the patriotic translator; and, in his last will and testament, he bequeaths 10,000 dinanir to the churches of Egypt! Other characters and incidents suffer a sea-change to match this pious predilection. His master Aristotle appears as a Christian philosopher, quoting the Psalms, Deuteronomy, and Samuel. The Brahmins, whose ascetic simplicity and wisdom cut so striking a figure in all the biographies of Alexander, here announce themselves as "the children of Seth, and the remnant who had not bowed the knee to Baal-Peor." Dionysus is transformed into Enoch, Bucephalus is turned into a mare to agree with Arabian notions; and, as might be expected from such a quarter, the long narrative of the Olympic contest with Nicolaus has disappeared completely. The episode made no appeal to the Oriental mind.

It is an easy step from such vagaries and digressions to the absolute waywardness of the curious Christian romance, which is largely a rhapsody on the merit of chastity, supported by a cento of Scripture texts. In this history, which was found among the mass of MSS. accumulated by King Theodore at Magdala, Alexander is pictured as a very tedious Sir Galahad, who goes forth to conquer the savage and lustful nations of Gog and Magog, and to preach to a sinful and adulterous generation. Besides other extravagant and strictly Pagan adventures, he converses with Enoch and Elijah, and is instructed by the Holy Ghost, who assures him that his father Philip will be reckoned among the martyrs. The name of Alexander is here become a mere peg, as Dr. Budge remarks, on which to hang the author's homilies. The single shred by which it adheres to the traits of the original is the reputation for continence which the conqueror of the Persians won by his treatment of the wife and daughter of Darius.

Another turn of the kaleidoscope associates Alexander with Attila and the terrors of the Huns. In the Syriac version he goes forth to meet Tubarlak, the "King of the Persians, of the house of Xerxes," who leads against him sixty-two kings and the people of Gog and Magog. He defeats these with an army of several hundred thousand men, and, to restrain their inroads, he builds enormous gates of brass and iron "in the face of the north wind." The description of these people and of their leader exactly fits the Huns and the "Scourge of God"; the account of the battle is probably a reflection of the Roman defeat of Attila on the plains of Châlons, A. D. 450-453. The fullest form of the tale is in the Canticle of Jacob of Serug, who was born about this period. His poem begins with an invocation of Christ, throned among the cherubim and seraphim, and ends with a jeremiad largely quoted from Jeremiah, predicting the woes that shall befall the earth when Gog and Magog break forth again. The Ethiopic offers variations on the same theme.

Now what are the facts about which this fantasy is composed? There stood, or stands, in the pass of Derbend along the ridges of the Caucasus, an ancient wall furnished at intervals with iron gates, called Saddi-Iskander, the rampart of Alexander. In the third book of the Greek Pseudo-Callisthenes, Alexander, writing to his mother, tells how he lately chastised a cannibal people, and, to restrain their ravages, had built gates of brass, which he called the Caspian Gates. From this, and the recent invasion of the Huns, arises the vision of Jacob of Serug, like the dream of an opium-eater. Suppose all the facts to have vanished, and that, after a lapse of a thousand years, this fantasy were to be subjected to the microscope of the scientific historian; what grain of truth could be detected as to the life and exploits of Alexander the Great?

Dr. Budge's introduction and notes, drawn from many recondite sources, add great interest to this sumptuous work, for which the public is indebted to Lady Meux's munificence. Five hundred copies of the volume containing the notes and translations have been printed separately for the benefit of those who have no use for the Ethiopic text.

European Architecture: An Historical Study. By Russell Sturgis, A.M., Ph.D., F.A.I.A. Macmillan Co. 1896.

One notices quickly the difference between a book freely written from a mind that is full of its subject, and a composite of matter that is accumulated as it is used. The advantages which the first is apt to have in form and cohesion, as well as in freshness and animation, Mr. Sturgis's Study has over most architectural compendiums. It is not a handbook, nor even a history, but an historical essay, confined pretty closely to the main line of development in European architecture, hardly meddling with those aspects of it which are not significant of the manner of its evolution from classic through mediæval to modern. Thus, Byzantine architecture is but lightly touched, though obviously Mr. Sturgis is its admirer; Russia, Scandinavia, and other regions outside the area of main development are entirely passed by. Within its limits the book takes all the freedom of an essay, delaying here, hastening there; lingers in France and Italy, treats Germany, England, and Spain briefly. It dwells especially on the Gothic style, more lightly on the Renaissance, deals with the Romanesque a little like a stepfather, and dismisses the modern styles with scant attention. The logical evolution of the subject fails after the early Rennaissance, and the book from this point inevitably lapses a little into the method of a handbook; for analysis of the later styles, especially outside of Italy, is unrewarding, its only interest being in a minuteness of study that is impracticable in a work of this compass.

Gothic building invites Mr. Sturgis most; and indeed its development is the logical thread that for a thousand years or more holds together the growth of European architecture. The backbone of his essay is the study of its structural progress from early Romanesque to the classic revival. He holds firmly by the now accepted doctrine that the essence of Gothic is in its structure, and the essence of its structure in the development of its vaulting, in the subordination of the whole construction of a building to that feature, and of its whole design to its construction. The doctrine, however, is one that may be pushed to extremes, and often has been. Gothic architecture is exceedingly logical, but it is not all logic—no great art can be. Apart from the great types of plan that were developed before its system of vaulting, and gave the spur to that, although they were modified and in some degree constrained by it, many other things are to be considered: the upward aspiration, the preference for lines over surfaces and for horizontal lines over vertical, for polygonal forms over round, the actual fervor for the pointed arch that grew up (which is apt to be belittled in modern analysis), and the whole array of decorative features and sculpture of animal and vegetable forms, which might have been very different without interfering with the vaulting system. The untaught reader would be better off for some allusion to these things.

There are other omissions that we should not have looked for: in the discussion of Greek architecture, for example, buildings other than temples and theatres are hardly mentioned, and we miss an adequate account of the temple form itself, or of what constitutes an order, either Greek or Roman. The types of building in all styles get scant attention, including even the great types of mediæval churches, nor do we find any account of the influence of the monastic orders on architecture, or of the transition to Gothic forms at the end of the twelfth century. One wonders why we see St. Paul's Church in London carefully analyzed, and St. Peter's at Rome slighted, or why Raphael is made prominent as an architect, and Bramante's work in Rome, even on St. Peter's, overlooked.

But only a small part of so large a subject can be discussed in five hundred pages with freedom enough to give it interest, and one man's selection is not another's. Mr. Sturgis has his own convictions and an educated critical faculty. A large store of information and much animation of mind give freshness and interest to his writing, and will furnish the reader with more to think about than he will find in many books of twice the size of this. Among all its class, at least in English, this one, we think, is the most likely to be profitable and attractive to readers to whom the subject is unfamiliar.

A History of Elementary Mathematics. With Hints on Methods of Teaching. By Florian Cajori, Ph.D., Professor of Physics in Colorado College. Macmillan. 1896. 8vo, pp. 289.

The author, in his preface, admits having freely used the works of Cantor, Hankel, Unger, etc., some of them quite recent, on the history of mathematics. He seems to have followed his German authorities so slavishly that he spells Arabic words and names in the awkward German manner, with *dsch* where a simple *j* renders the sound much better, as in the title of Alkhwarizmi's work 'Aldschebr [aljebr] walmukabâla' (Restoration and Opposition), from which the very word "algebra" is taken; or *dschîba* (*jiba*) as the Arabic for our sine; it is in fact *jaib*. There are also annoying mistakes in mathematical notation, which we hope are slips of the pen or misprints. For instance, we find that in Briggs's tables, upon Napier's suggestion, 10^7 was made the logarithm of the whole sine, while Briggs had proposed 10^7 as the logarithm of 1-10. For 10^7 there should be 10 in one place and 1 in the other.

The introduction gives the number-systems of antiquity, based on the powers of ten, of twelve, of twenty, and at Babylon, in part, of sixty. The history proper begins with the Ahmes papyrus, written between 1700 and 2000 B. C., which shows that great progress had even then been made on the banks of the Nile in arithmetic, especially in fractions; but Egypt seems not to have gone much further. We are then introduced to the numerical notations of Babylon, Phœnicia, Greece, and Rome, and lastly to that of the Hindus, perfected about 500 A. D., borrowed from them by the Arabs, and by Europe from these. The use of the Roman abacus for adding numbers and certain fractions by balls on strings is well explained. This instrument became needless when Arabic figures were written in position, giving value to each, like the strings of the abacus; and the author shows clearly how greatly the art of calculation was aided by this mode of numeration, yet how slowly and painfully middle-age Europe groped about before division, especially before long division, took its present form. The Greeks, though backward in arithmetic, struck out boldly in geometry, which they kept wholly separate from it, and which in the hands of Euclid (to whom, of course, the largest space is given) belied its name (earth-measuring), as mensuration seems to have been beneath his notice. Thales, Pythagoras, and Plato before him, Archimedes, Eratosthenes, Claudius Ptolemæus, Theron and Hypatia after Euclid, are shortly referred to as geometers, and last, among the Greeks, their only algebraist, Diophantus. Very little is said or could be said about the Romans, who did nothing in mathematical research, and did not even appropriate the discoveries of Greece in this field. The author then turns to the Hindus and Arabs. Both, he thinks, learned much from Greece; both of them carried the science further. Trigonometry, plane and spherical, seems to have come from India to the Arabs; and, among the latter, Al Battânî is said to have found the fundamental equation for the oblique spherical triangle.

Christian Europe did little or nothing for mathematics till the time of the Renaissance in Italy. We find, starting with this period, the names of all the great masters in Italy, France, England, Scotland, and Germany; and besides them those of such arithmetic writers as Cocker in England and Adam Riese in Germany, together with their imitators in the American colonies. On coming to Napier and his logarithms, the author points out that these were not exactly "natural," that they run in the opposite direction from the *sinus totus* down, and belong to sines, not to current numbers; that Napier got at the idea of this function in a roundabout way, from the proposition which we write: $d \log x = \frac{dx}{x}$. But he fails to tell us how Napier worked out his table; which we supply. Napier felt somehow, that for an ω so small as to be written by 16 decimals of which the first 8 are zeros, he might consider $\log (1+\omega) = \omega$. He got his $1+\omega$ by drawing thirty times (or oftener) the square root of a given N, reaching thus the 1,073,741,824th root of N, and then $\log N = 1{,}073{,}741{,}824 \times \omega$. Whoever wishes to test the Scotchman's patience should try to find one logarithm by that road.

On page 265 we read of Gauss, when still a boy at the University, inscribing a polygon of 17 sides in the circle, and his discovery is referred to on page 74 as applicable to all polygons with $2^{2^n}+1$ sides, when that number is prime. But as the author tells us not a word about De Moivre's great theorem for expressing the sine and cosine by imaginary exponentials, and of the resulting mode of dividing the periphery into $2m+1$ parts by the equation $x^{2m} + x^{2m-1} + \ldots x + 1 = 0$, he does not in anywise indicate that Gauss found real roots, without passing through the imaginary symbol, when $2m = 2^{2^n}$. If De Moivre's theorem is not elementary enough for the scope of the work, neither is its application by Gauss.

In speaking of $\sqrt{-1}$, the author rebukes those text writers who still deny its reality, as holding an obsolete view, and he refers to scholars from H. Kühn in 1750 down to Hamilton and the elder Peirce, who gave to $\sqrt{-1}$ its geometric meaning. This meaning is simple enough: when (-1) represents the half-rotation, or direction turned back, $\sqrt{-1}$ is the quarter rotation or perpendicular; but Prof. Cajori does not tell us this, though it is one of the most momentous steps in the progress of mathematics. Towards the end of the volume Lobatchevsky, Bolyai, father and son, and

Riemann are named as creators of a non-Euclidean, or even an anti-Euclidean, geometry; but while there are short notices on the lives of the Russian and of the two Magyars, there is not one word to denote the standpoint of any one of them; and of Riemann we are told only in a foot note that he deems all our notions of space to be derived from sensation and experience.

Our author gives a great deal of space to the attempts of modern writers to prove the unsatisfactory axiom of Euclid on which he bases all his theorems about parallel lines; and, after displaying the weakness of some of these attempts, comes to the conclusion that parallels cannot be truly defined, and that the equality of the angles upon them cannot be proved. He does not name Prof. J. J. Littrow of Vienna, whose demonstration is yet worth notice. Littrow proves first that the three angles of a triangle are = 2 R. Thus: When a side a and angles B C are given, angle A is determined; it is = F (a B C); and as an angle may be viewed as an abstract number, it has no relation to one measure in space: angle A = F (A B) simply. Now divide a right-angled triangle by a perpendicular; the new angles are each in a new triangle which has two of the old angles, and must therefore be equal to them; hence in a right-angled triangle the sum of angles is =2 R, and by putting two of these figures together so as to run two right angles into one line, any triangle can be formed with its three angles =2 R. Now cross one line by two others, meeting on one side, at any distance at A; then the two other angles sum up 2 R—A, or are less than 2 R, which is Euclid's axiom, and parallels appear as lines drawn in the same plane which never meet. The difficulty remains how to teach the meaning of the words "in one plane" without going into solid geometry; but this pervades the whole of Euclidean, and perhaps of all other, plane geometry.

The promised "Hints as to Methods of Teaching" are hints only. A systematic work on the best mode of teaching mathematics, somewhat like Parker's method of teaching geography in the Educational Series, taking a broad independent stand, and cutting loose from Euclid and from all old prejudices, as to the order and selection of the material, would do a great deal towards diffusing a taste for and the knowledge of the purest of disciplines known to mankind.

Guide to the Study of American History. By Edward Channing, Ph.D., and Albert Bushnell Hart, Ph.D., Assistant Professors of History in Harvard University. Boston: Ginn & Co. 1896.

If Jared Sparks could cast an eye over his progeny in the fields of American history and biography, he would behold them numerous as the sands of the sea. They have toiled hard and have much to show for their toil. They have planted a forest which abounds in well-grown elms and maples, but which is encumbered in spots with a dense jungle of underbrush. One must attempt to cut a section through this maze before he can understand either its extent or its intricacy. Even if he boasts some knowledge of woodcraft, he will welcome the assistance of a local guide. The authors of the present volume are professional pathfinders of skill and endurance. Not content with blazing a trail, they haussmannize the wilderness, that their students may sip coffee on an ample boulevard.

Thirteen years' experience in teaching history at Harvard forms the basis of this "guide." It is familiarly known that the lectures of Prof. Channing deal with the colonial period, those of Prof. Hart with the history of the United States. By combining forces they cover the whole ground, and get the benefit of mutual advice and suggestion. Their plan of bringing out a joint bibliography was an excellent one, and it has been successfully put through. The production of work like Mr. Mason's study of the Veto Power and of Miss Follett's study of the Speaker has already shown that American history is soundly taught at Harvard. This impression will be confirmed by the diligence and learning now disclosed.

There is a vast difference between "a mine of learning" and "a dungeon of learning." The lucidity implied by the former phrase shows itself here in many practical hints, and in the arrangement of a large and intricate body of literature. The contents are classed under three parts, each with its series of clearly defined sections. Part i. deals with methods and materials; part ii. with topics and references in colonial history; and part iii. with topics and references in United States history. The sections are numbered consecutively and run up to 214, where the book closes with the abolition of slavery. A more logical division might perhaps have been effected by making two parts only, and putting what now constitutes parts ii. and iii. under part ii. as A and B. Parts ii. and iii. are really the same thing. The treatment of subjects is identical throughout both, and they are merely divided by the transformation of the colonies into the Union. At the same time part i. has a character of its own and occupies more space than the other two parts. A neater tabulation, then, would be: Part i., methods and materials; Part ii., topics and references—A, Colonial, B, United States.

But this may very well be called a matter of taste. The book deserves unqualified praise for its clearness and precision. Designed for the aid of teachers, students, and librarians, it makes useful suggestions to them all. The treatment is rigidly categorical, and every word has been weighed. We have seldom seen such careful compression, such painstaking elimination of what is ornamental and unnecessary. In this respect the guide is not second to Stubbs's 'Select Charters.' Part i., which consists largely of disquisition, contains the highest quality of work, although parts ii. and iii., with their concise bibliographies, will probably be most used by the student-with-a-purpose. The tone of part i. is didactic, but not dogmatic, and under its seventy-six sections almost every matter connected with the private reading or the class study of American history is discussed. The standing and extent of American history, general methods, special bibliographies, working libraries, class exercises, reading, written work, and tests are its main divisions. Each division has its own sub-sections, ranging in number from three to twenty-one. The book is so concentrated that analysis of its main points would involve almost exact reproduction. Hence we are driven to describe its contents by the use of statistical formulas.

The authors safeguard themselves against a charge which might be brought against many professors of American history, namely, that of encouraging students to undertake special research before they are properly equipped for it. Just as Sir Henry Maine insists that democracy is a form of government, Prof. Channing and Prof. Hart insist that American history is a part of history. "Every student, teacher, and writer of American history must from the beginning keep in mind the fact that the development of this country is only a part of a general movement, and that in the relations of foreign Powers with the nations of the New World is often to be found the key to the actual direction of American history." And again, in another connection: "No one can be fitted to be a specialist in American history who has not also a good, all-round training in the general subject, and thus is able to compare intelligently the history of other countries with that of his own." We doubt, however, whether a large proportion of the students who hand in the "special reports" described under section 70 are best served by that ingenious system. A scrutiny of the life of Robert C. Grier is all very well in its place, and so is an investigation of the receipts derived by the United States from the tariff on quinine; but we say about them what Horace says about misplaced purple patches, "*Sed nunc non erat his locus.*" We assume that the undergraduates engaged in drawing up these reports are not on terms of close intimacy with Thucydides, Tacitus, and Gibbon. Until they have learned from the masters what historical writing really is, they had best leave the "intensive" study of American history alone. The time allotted to history by the ordinary curriculum will barely suffice for the laying of a broad foundation. Of course one expects thoroughness everywhere, but the methods of historical specialization, in so far as they tend to be professional, should be relegated to the graduate school. We applaud the zeal which Prof. Channing and Prof. Hart have shown in emphasizing the necessity of thoroughness, observation, and reflection. Their manual proves that the authors themselves are the happy possessors of these three high qualities. And so, if we criticise the special-report system, it is only because we think that it may conflict with the attainment of that firm grasp of general history which, in common with them, we hold to be indispensable.

We regret that we are unable to devote any space to the purely bibliographical aspects of the book. We should attempt such an examination if it could be kept within reasonable limits. As it is, we recommend every lover of the national history to buy this guide and to keep it at his elbow. The literary style of part i. is on the whole good, though at times it is not immaculate. Parts ii. and iii. make no literary pretensions. The main considerations suggested by each topic which they embrace are grouped under a summary. The summary is followed by an analysis of the material under the heads general, special, sources, and bibliography. The authors do not pretend that the bibliography of any given topic has been exhausted. Leaving the antiquarian and the genealogist out of account, they have sought to bring together what is "likely to be most immediately useful to the searcher into political, social, constitutional, and economic history." Within the limits thus defined they have succeeded admirably.

My Long Life: An Autobiographical Sketch. By Mary Cowden-Clarke, Author of the 'Concordance of Shakspeare,' etc., etc. Dodd, Mead & Co. 1896.

For so long a life as Mrs. Cowden-Clarke has very literally enjoyed, her story of it is extremely short, and the 270 openly printed pages are as cheerful to the eye as is her brief

recital to the mind. That she is a gleaner after her own reaping in her 'Recollections of Literary People' is probably the reason why she dwells so little on even the more distinguished figures on her crowded stage, and makes her narrative but little more than a journal of meetings and partings, the seeing of famous actors and the hearing of famous singers and other musical performers. For those who are much interested in the history of music and the drama, her book will have a special interest. But it does not make its principal appeal to any favored class. It is delightful because of its infectious cheerfulness. In front of her Italian house there is a sun-dial with the familiar motto, "I mark only the sunny hours," and her sister tells her that this might well have been the motto of her book. It was the motto of her life. Particularly beautiful was her married happiness with Charles Cowden Clarke, who was nearly twenty years her senior, but who was always young of heart. He died in 1877, "the spring sun shining on his bed," and left behind him a memory as cheerful as his living presence. Together they made full proof of Theodore Parker's saying, "A happy marriage is a long falling in love."

Born in 1809, Mrs. Cowden Clarke enjoyed a glimpse of Shelley and had a golden vision of John Keats listening to her father's music. In her husband's memory he lived a second life as vivid as became the author of an Epistle to Charles Cowden Clarke. Leigh Hunt she knew long and intimately and Charles Lamb very well. It was no ordinary honeymoon that had for its consummation a week with Lamb at Enfield, which was enlivened by some of his most humorous escapades. It was on a little visit celebrating her first wedding anniversary that she resolved to undertake the Shakspere Concordance, some one at table having regretted that there was none. Sallying out after breakfast, she took a volume of Shakspere, with pencil and paper, jotted down her plan, and wrote the first line of her intended book, which, although diligently followed up, was sixteen years in the making. Coleridge she saw but once, when, incited by her father's musical reputation, he plunged into an eloquent exposition "of an idea he had that the creation of the universe must have been accompanied by a grand prevailing harmony of spheral music"—probably an unconscious reminiscence, after his manner, of the singing of the morning stars. She would have us know that her literary tasks did not prevent her skill in cookery and needle-work. At one time she made all the clothes she wore, as well as her husband's dress waistcoats, one of which, "embroidered on black satin with a wreath of ivy-leaves and berries in their natural colors," must have been a spectacle for men and angels.

Mrs. Cowden Clarke has been a diligent traveller and visitor, and has seen much of interesting people, and few indeed are the contemporary celebrities that do not at least flit across her page. The music of the future pleases her equally with the music of the past. All is grist that comes to the mill of her enthusiastic disposition, or rather she is instinctively selective of the good and fair. All coarseness she has repelled, and she quotes with heartiest approval words of Sir John Lubbock, which may be commended to the editors of the *Daily Muckrake* as deserving their deliberate attention: "The soul is dyed by its thoughts; we cannot keep our minds pure if we allow them to be sullied by detailed accounts of crime and sin."

An Illustrated Flora of the Northern United States, Canada and the British Possessions, from Newfoundland to the Parallel of the Southern Boundary of Virginia, and from the Atlantic Ocean westward to the 102d meridian. By N. L. Britton, Ph.D., Emeritus Professor of Botany in Columbia University, and Director-in-Chief of the New York Botanical Garden, and Hon. Addison Brown, President of the Torrey Botanical Club. In three volumes. Vol. I. Ophioglossaceæ to Aizoaceæ, Ferns to Carpetweed. Charles Scribner's Sons. 1896.

THAT there is a real demand for an illustrated account of the plants of our country is apparent from the eagerness with which every honest attempt in this direction has been received. One need go no farther than to note the welcome which has been accorded to the two charming handbooks by Mr. Schuyler Mathews. These two works, although very limited in their range, have been recognized as important aids to the understanding of our native plants. The time, therefore, seems ripe for the production of an exhaustive illustrated flora of the most easily accessible parts of our continent.

In the work before us we have a partial realization of this plan. As far as the present volume enables us to judge, we have here a treatise which will exert a wide influence in inducing large numbers of persons to make botany within these limits a pleasant recreative study, and which will, at the same time, afford to those who are fond of systematic botany a convenient work of reference. As we shall see later, the authors have followed a hint from German systematists, and have reversed the sequence of orders. May we not be permitted likewise to reverse the ordinary sequence in criticism, and mention first what seem to us to be serious defects in the treatise, and then proceed to the more agreeable task of speaking of the many excellences? These defects appear to us to be chiefly three.

First, the *differentiæ*, or the characters by which genera are separated from contiguous genera, and species from allied species, are not always sharply put. Of course we recognize the fact that in some instances these lines are very obscure, and contrasted characters are not readily found, but such as do exist should be brought into prominence. An ingenious typographical device which is the common property of all sciences of the classificatory type, namely, the use of italics to denote the more important differential characters, so that the eye of the reader is aided considerably in his search, is here unfortunately wanting. The fact that such a difference of type is employed in another work covering much the same range could not have influenced the authors of this, but we regret that the good judgment which moved them to choose such admirable type for the body of the treatise did not lead them to go still farther and make it much more helpful.

Secondly, while expressing admiration for the prodigal use throughout of figures in outline, we must qualify our expression by calling attention to the unequal quality of the drawing, considered from a botanical point of view. A large proportion of the drawings are excellent in all respects; others will hardly prove of any assistance to the student. In some notable instances the artists have with true feeling caught the essential and differential features, and have given these with skill. What is needed in a botanical drawing may be illustrated by what everybody knows about caricature. A skilful draughtsman can catch from the human face a few lines which will bear a trifling exaggeration, and these lines become ever after associated with the face in question. Even such slight emphasis or exaggeration gives to some drawings of plants a character which aids very greatly in their employment in identification. Those who are familiar with the occasional look of despair which comes over the face of a botanist who, in Europe, tries for the first time to discriminate between polymorphous species by the help of some of the popular illustrated floras, will share our apprehension that a similar look of disappointment will be observable when some of the more sketchy figures in this work are employed.

Third, the nomenclature. This embodies an application of the rules against which a good many conservative botanists have been compelled to protest, in the hope that by and by there might be a general consensus looking towards reform in the matter. Now, however, we have Pandora's box wide open and the cover gone. The most grotesque even of Rafinesque's names are here, and now can never be recalled. It is not unlikely that in the not very distant future these same generic names will be a source of deep mortification to those who have dragged them from merited obscurity. Those who had hoped that better counsels might prevail must wait a little longer for order to come out of the chaos of names. Our readers remember how deeply many botanists regretted that the sumptuous work, 'The Silva of North America,' was handicapped by its nomenclature; to the confusion ushered in by this innovation is now added a new element in the present treatise. We trust that the more conservative botanists will not entirely give up the old idea that possibly hope may be lingering around Pandora's box, but it seems rather a discouraging way of getting at it to have to meet so many unnecessary troubles first.

Now, having said our say, but we trust with no spirit of petulance tinging our expression of regret, we proceed to the enumeration of some of the many merits of this work. In the first place, it wisely adopts the plan of arrangement by which one goes from the simpler to the more complex forms of vegetation. Such a course takes its way from the ferns to the gymnosperms, which were formerly sandwiched between two great groups, instead of standing as an interesting link between the so-called flowerless and the flowering plants. From the gymnosperms we pass in succession to the monocotyledons, and finally to the dicotyledons, the volume coming to a close with certain allies of our common four-o'clock. This adoption of the Engler, or, as it is generally known, the Eichler method we regard as a substantial step in advance.

Secondly, the artificial keys are excellent throughout. All of them appear, so far as our examination has gone, to be carefully prepared. They are characterized by much of the same quality which rendered the keys in Wood's Botany popular, and will serve a good purpose through not being deterrent to the beginner.

Thirdly, the appearance of the whole work is extremely attractive, and every feature of its mechanical execution will bear strict scrutiny as regards both workmanship and sound taste. The authors are to be heartily congratulated on their genuine success in securing earnest coöperation from all their coadjutors, and thus making a worthy contribution to the advancement of interest in our native flora. No matter how many changes may be sug-

gested in the range of plants here described, no matter how great the temporary confusion resulting from a transitory change of names, the fact remains that in this treatise we have an admirable addition to the working appliances of all lovers of North American plants.

Hand-book of Courses Open to Women in British, Continental, and Canadian Universities. Compiled for the Graduate Club of Bryn Mawr College by Isabel Maddison; assisted by Helen W. Thomas and Emma S. Wines. Macmillan Co. 1896.

It seems quite unlikely that the course of woman's education ever will run smooth; and those who have experienced the restrictions under which women study abroad will understand that a hand-book of courses open to women in foreign universities is useful rather than agreeable reading. The volume entitled 'Graduate Courses,' published at first by Harvard University and later by the Federation of Graduate Clubs, was compiled to meet needs arising from the rapid increase of graduate work in American universities and colleges. The present work, published under the auspices of the Bryn Mawr Graduate Club, implies by its title that it is the woman's side of the subject that has been mainly considered. But, since *Minerva*, the "Jahrbuch der Gelehrten Welt," the German *locus classicus* on the subject, cannot be supposed to have a wide circulation in America or England, it is probable that the mass of information about the lecturers and regulations in foreign universities here presented, in English, for the first time, will be useful to men as well as women students—and it is interesting even to the general reader.

Those who measure a nation's refinement by the position of its women may be reminded that the universities of France, Italy, and Spain lay no restrictions on women—in the two latter countries no distinction has ever been drawn—whereas England and Germany give grudgingly what little they give, their motto being "no rights and few privileges," and Russia is uncompromisingly intolerant. Norway, the Netherlands, Denmark, and Belgium are liberal in their attitude; Austria is a shade more conservative than Germany. In cases where the editors have been unable to obtain information, the silence of the authorities does not augur friendliness.

In Great Britain we find Scotland boldly offering to women equal chances with men, whereas in Ireland, whose national characteristics are not usually supposed to include timidity, Trinity College, Dublin, has just entered on the first year of a cautious policy whereby women, separately trained, may take the examinations for the senior freshmen's certificate. This is to be regarded as an experiment, and the privilege holds good only until 1898. After giving such a sign of life, the venerable foundation of Trinity College may reasonably demand these three years in which to take breath. At this rate, no doubt, women will ultimately be admitted to the Dublin degree; but, to paraphrase Mrs. Garth, they are not asking for degrees "ultimately"—they are asking for them now.

At Oxford, women are excluded from the Medical School only—we forbear to point the moral for Johns Hopkins—and the names of the Medical Faculty are accordingly omitted (p. 93); since they are given for Cambridge (p. 79), the implication is that women may pass through the medical courses there, though, as is well known, Cambridge does not, as yet, grant the actual degree to women; it would be well, however, to state more precisely on p. 78 what privileges Cambridge gives to women medical students.

The Collège de France has admitted women since the sixteenth century. We note (p. 26) that attention is drawn to "the advantages of less crowded classes and more individual attention from the professors offered by the faculties of the provinces compared with those of Paris"; it seems improbable that students who set out to hear the classical lectures of Martha, or Boissier, or Croiset, or Poincaré in mathematics at the Sorbonne, would regard individual attention in the provinces as an equivalent. In fact, if that were indispensable, it could be had in Paris itself at the École Nationale des Chartes, where there are eight lecturers teaching eight subjects to twenty students. A concession to masculine interests is made on p. 32, where particulars are given of the École Libre des Sciences Politiques, "for the training of diplomatists, consuls, and ambassadors." On p. 28 we are informed that "students from American universities going to study in France are allowed a reduction of thirty per cent. on the rates of the steamers of the Compagnie Générale Transatlantique." We take this opportunity of warning intending passengers to follow literally the instructions to apply for this reduction to M. Paul Melon at the Sorbonne; the New York office of the line denies all knowledge of such an arrangement, and one member at any rate of the American committee, having himself received no information on the subject, is unable to impart any.

We would say, in conclusion, that the Handbook is admirably got up, and is open to criticism only on minor points. On p. 86, left column, for Sellars read Sellers; p. 79, right column, Sir G. M. Humphry's name is misspelt Humphrey; p. 78, right column, is the typographical error "Head, lam" for Headlam.

Parakites: A Treatise on the Making and Flying of Tailless Kites for Scientific Purposes and for Recreation. By Gilbert Totten Woglom. Illustrated. G. P. Putnam's Sons. 1896.

This treatise is exceedingly uneven in quality. In parts it merits high praise; but its defects and its apparent lack of frankness regarding the work of other experimenters afford ground for censure. The essential features of the Woglom parakite (more than a kite) seem to be precisely the same as those of the Malay kite which Mr. Eddy has been flying and describing for four or five years. It is true that Mr. Woglom's Libby is a "dream in pale blue China silk," and that the Bride is "a spruce creation robed in virgin-white silk conventionally cut and plaited," and that Mr. Eddy has not aspired higher than cambric or silesia; but whether spruce, or bamboo, or silk, cotton, or paper, the parakite is the Malay kite, and nothing else, in form, figure, and proportions. In the scientific journals Mr. Eddy has frequently given directions for constructing the kites he was using, and in a number of places he has told how he came to evolve this particular form, so that the appearance of the very same tailless kite as the idea of Mr. Woglom, with his name tacked to it, is, to say the least, surprising. Mr. Woglom ought to have explained this. Further, the omission of any word in the book about Mr. Eddy or his work (unless, indeed, the sneer at the aerial photography of others is a mention of Mr. Eddy) is significant, as is also the utter neglect to speak of Blue Hill Observatory, where so much work has been done in a scientific way, and mostly with kites of the Eddy pattern. Scientific men who have kept the run of reliable publications have come to know Mr. Eddy as the man through whose apparatus, energy, and example kite-flying has become the important adjunct to investigation that it is, and thus far in no one of these publications has his right to this reputation been even questioned. Mr. Woglom made a mistake in ignoring these facts which everybody conversant with kites is informed about, for no one can be permitted to appropriate that which belongs to another without some kind of justification.

His book, however, as a guide to the construction of tailless kites, is admirable. The author is a man of ingenuity and has mechanical instincts. He adopts proper ways of constructing things and shows how to do them well. He has ability to follow up certain lines of investigation, and has done this with care and precision. He has developed the minutiæ of kite-building in a remarkable way; he has studied with care the possible materials, and has noted the problems which occur during flight. All this he explains in language so clear that, with his book in hand, any one could make a tailless kite, and with a little experience could make it fly. Thus far the book is a model. But when Mr. Woglom tries to write a chapter about meteorology he fails. He seems to have acquired some of the elementary principles of the science, but in developing them he plainly gets beyond his depth—so much so that even the professional meteorologist finds himself puzzled to know what it is all about. The mathematics, too, are a little queer. One cannot say that they are wrong, but Mr. Woglom assumes that the reader has a knowledge of sines, secants, and logarithms, and then tries to simplify the elementary formulas for the solution of the right-angled triangle. The method of triangulation he advises for getting the heights of kites is not to be recommended. It requires an assistant who must place himself vertically under the kite and determine the exact spot by sighting up a plumbline, and then must measure the exact distance back to the flyer. Of course in a city, or in a country that is not perfectly level, these measurements are out of the question. If, however, this is the way in which Mr. Woglom has determined the flight of his kites, it perhaps explains his evident exaggeration in estimating the heights from which those pictures were taken with his camera which appear as illustrations in his book.

The volume is well illustrated, but one who desires to look up some particular item in the text will usually find it more easily by turning the pages than by consulting the index.

Myths and Legends of Our Own Land. By Charles M. Skinner. 2 vols. Philadelphia: J. B. Lippincott Co. 1896.

A scientific treatment of American myths and legends would divide them into two great classes: the myths and folk-lore of the aborigines and those of the white colonists and their descendants. These latter again subdivide into variations on old themes common to all Europe (such as headless horsemen, buried treasure, and the like) and those which seem to have sprung up indigenously on American soil. Besides these there are numerous floating stories which are not properly folk-lore, but inventions of ingenious story-tellers of the literary class, such as William

Austin's 'Peter Rugg.' If there is a dangerous reef, somebody is sure to fit it with a pathetic shipwreck; if there is a precipice or cataract, we are certain to have the fugitive lovers who leap or are drifted over it. Of the ætiological myth, or story made up to account for the facts, we have here a good example in the rather grim tradition of "The Deformed of Zoar." If there ever were such strangely malformed people, it is clear that the story of the peddler's mutilation and murder has been made up to account for their occurrence.

It has not, however, been Mr. Skinner's purpose to undertake any scientific treatment or classification of American traditions, but simply to make a collection of those that are current, and to tell them as concisely as possible. He groups them geographically: legends of the Hudson and the Dutch colonists; those of the New England States, those of the South, of the Central States and Great Lakes, of the Rocky Range, and of the Pacific Slope. And he certainly has made a remarkable collection of nearly three hundred myths, traditions, and curious stories, out of which novelists, poets, and dramatists might draw excellent material. His treatment is perhaps a little jejune; but if he had not told his stories very briefly, he could not have condensed so much into these small volumes. The book is handsomely printed and tastefully illustrated from photographs.

BOOKS OF THE WEEK.

Alexander, Mrs. A Golden Autumn. Philadelphia: J. B. Lippincott Co. $1 25.
Alger, Horatio, jr. The Young Salesman. Philadelphia: H. T. Coates & Co.
Allen, Grant. The Desire of the Eyes. R. F. Fenno & Co. $1 25.
Amicis, Edmondo de. Constantinople. 2 vols. Philadelphia: H. T. Coates & Co. $3.
Anderson, Mrs. Finley. A Woman with a Record. G. W. Dillingham Co.
A Record of the Buddhist Religion as Practised in India and the Malay Archipelago (671-695). Oxford: Clarendon Press; New York: Macmillan.
Armstrong, Walter. The Art of Velazquez. [Portfolio Monographs.] Macmillan.
Aubrey, W. H. S. Rise and Growth of the English Nation. 3 vols. Appletons. $4 50.
Balzac, H. de. Juana. Boston: Roberts Bros. $1.50.
Barnes, James. Midshipman Farragut. Appletons. $1.
Barnes, James. Naval Actions of the War of 1812. Harpers. $4.50.
Beal, Mrs. Mary B. The Boys of Clovernook. Boston: Lothrop Publishing Co. $1.50.
Beal, Prof. W. J. Grasses of North America. Vol. II. Henry Holt & Co. $5.
Beard, D. C. The American Boy's Book of Sport, Scribners. $2.50.
Beck, Friedrich. Dante's Vita Nuova. Kritischer Text. München: Piloty & Loehle.
Behrends, A. J. F. The World for Christ. New York: Eaton & Mains. 90c.
Biddle, A. J. D. The Froggy Fairy Book. Philadelphia: Drexel-Biddle & Bradley Publishing Co.
Biedermann, Prof. W. Electro-Physiology. Macmillan. $5.50.
Bigelow, John. The Mystery of Sleep. Harpers. $1.50.
Bill Nye's History of England. Philadelphia: J. B. Lippincott Co. $1.25.
Biré, Edmond. The Diary of a Citizen of Paris during "The Terror" 2 vols. London: Chatto & Windus; New York: Dodd, Mead & Co. $7.50.
Birrell, Augustine. Boswell's Life of Johnson. 6 vols. Macmillan. $6.
Bolles, A. S. The Elements of Commercial Law. Henry Holt & Co. $1.
Bolmer, W. B. The Church and the Bible. E. & J. B. Young & Co. $1.
Bourg, Princess de. The American Duchess. G. W. Dillingham Co.
Bowen, H. W. International Law: A Simple Statement of its Principles. Putnams. $1.25.
Brögger, W. C., and Rolfsen, Nordahl. Fridtiof Nansen, 1861-1893. Longmans, Green & Co. $4.
Brown, Alice. Mercy Warren. [Women of Colonial and Revolutionary Times.] Scribners. $1.25.
Bullock, Shan F. Ring o' Rushes. Stone & Kimball. $1 25.
Bunner, H. C. Poems. Scribners. $1.75.
Burnet, Prof. John. Greek Rudiments. Longmans, Green & Co. $1.50.
Burroughs, John. Whitman: A Study. Boston: Houghton, Mifflin & Co. $1 25.
Butterworth, Hezekiah. The Wampum Belt; or, "The Fairest Page of History." Appletons. $1.50.
Cameos from English History. Eight Series. Macmillan. $1.25.
Carry, Rosa N. The Mistress of Brae Farm. Philadelphia: J. B. Lippincott Co. $1.25.
Castlemon, Harry. The Young Game-Warden. Philadelphia: H. T. Coates & Co.
Chatfield-Taylor, H. C. The Land of the Castanet. Chicago: H. S. Stone & Co. $1.25.
Cherbuliez, Victor. With Fortune Made. Appletons. $1.
Child, F. S. The Colonial Parson of New England. Baker & Taylor Co. $1.25.
Clarke, Jennie T. Songs of the South. Philadelphia: J. B. Lippincott Co. $1 50.
Collins, Mabel. The Star Sapphire. Boston: Roberts Bros. $1.50.
Corelli, Marie. Jane: A Social Incident. Philadelphia: J. B Lippincott Co. 75c.
Corelli, Marie. The Murder of Delicia. Philadelphia: J. B. Lipoincott Co. $1.25.
Costello, F. H. Master Ardick, Buccaneer. Appletons. $1.
Coursen, Frances B What the Dragon-Fly Told the Children. Boston: Lothrop Publishing Co. $1.50
Cow-Boy. Paris: Lévy; New York: Brentano's. 75c.
Coyle, Rev. R. F. Workingmen and the Church. Boston: *Arena* Publishing Co. 75c.
Crane, Stephen. The Little Regiment, and Other Episodes of the Civil War. Appletons.
Croquet, C. P. du. An Elementary French Grammar. W. R. Jenkins. 90c.
Curry, S. S. Imagination and Dramatic Instinct. Boston: School of Expression. $1.50.
Curtis, W. E. The Yankees of the East. 2 vols. Stone & Kimball. $4.
D'Annunzio, Gabriele. The Triumph of Death. G. H. Richmond & Co. $1.50.
Darmsteter, James. English Studies. London: Unwin; New York: Putnams.
Davis, M. E. M. An Elephant's Track, and Other Stories. Harpers. $1 25.
Dawson, Rev. W. J. The Story of Hannah. Dodd, Mead & Co. $1.50.
Deland, Ellen D. Malvern: A Neighborhood Story. Boston: W. A. Wilde & Co. $1.50
Dennie, John. Rome of To day and Yesterday. 3d ed. Putnams. $4.
Dobson, Austin. Eighteenth-Century Vignettes. Third Series. Dodd, Mead & Co. $2.
Dodge, Mrs. Mary M. Hans Brinker; or, The Silver Skates. New Amsterdam Edition. Scribners $2 50.
Donaldson, Thomas. Walt Whitman, the Man. New York: F. P. Harper. $1.75.
Dörpfeld, W., and Reisch, E Das Griechische Theater. Leipzig: Fleischer; New York: Lemcke & Buechner.
Doyle, A. C. Rodney Stone. Appletons. $1.50.
Earle, Mrs. Alice M Curious Punishments of Bygone Days. Chicago: H. S. Stone & Co. $1.50.
Egan, Maurice F. The Vocation of Edward Conway. Benziger Bros. $1.25.
Eggleston, E. The Beginners of a Nation. Appletons.
Everett-Green, E. The Sign of the Red Cross: A Tale of Old London T. Nelson & Sons.
Fernald, C. B. The Cat and the Cherub, and Other Stories. Century Co. $1.50.
Field, Eugene. Songs of Childhood. Music by Reginald De Koven and Others. Scribners. $2.
Fireside Stories, Old and New. 3 vols. Philadelphia: H. T. Coates & Co.
Ford, P. L. The True George Washington. Philadelphia: Lippincott Co. $2.
Fuller, Anna. A Literary Courtship. A Venetian June. 2 vols. Putnams.
Furman, Lucy S. Stories of a Sanctified Town. Century Co. $1 25.
Goold, Prof. C. B. Tales from Hauff. Boston: Ginn & Co.
Gould, E. S. A Primer of the Calculus. D. Van Nostrand Co. 50c.
Greenidge, A. H. J. A Handbook of Greek Constitutional History. Macmillan. $1.25.
Grier, S. C. An Uncrowned King: A Romance of High Politics. Putnams. $1 50.
Grimm's Household Stories. Illustrated. T. Y. Crowell & Co. 75c.
Haigh, A. E. The Tragic Drama of the Greeks. Oxford: Clarendon Press; New York; Macmillan.
Hamerton, P. G. An Autobiography (1834-1858) and a Memoir by his Wife (1858-1894). Boston: Roberts Bros. $3.
Hare, Augustus J. C. The Story of My Life. 2 vols. Dodd, Mead & Co. $7.50.
Harris, J. C. Sister Jane, her Friends and Acquaintances Boston: Houghton, Mifflin & Co. $1.50.
Hawthorne, Nathaniel. A Wonder-Book for Girls and Boys. T. Y. Crowell & Co. 75c.

The Nation.

NEW YORK, THURSDAY, DECEMBER 3, 1896.

The Week.

THE Republican politicians generally are opposed to doing anything in reference to the tariff before McKinley comes in. They do not want to risk the fruits of the recent victory by reopening that question immediately. If they continue in this frame of mind, the Dingley bill will not pass. To defeat it in a short session, when there is hardly time to pass the appropriation bills, is easy enough. It will defeat itself unless it has some very powerful backing. Still, there is a good deal of money in it for private interests, and we see signs that these interests are stirring. They do not want to wait for a general overhauling of the tariff, which may not come. In their view a bird in the hand is worth two in the bush. The Boston Home Market Club evidently shares these views. On the other hand, there is a growing opinion in Boston that there ought to be a permanent Tariff Commission. A resolution to this effect was offered to the Massachusetts Board of Trade at its last meeting by Mr. Edwin L. Sprague, which will come up at the next monthly meeting. Tariff Commissions have not been very successful heretofore, but Mr. Sprague's proposal may serve a useful purpose by furnishing a forum for Republican debate. The Tariff Commission of 1882 served that purpose, if no other.

If we turn to the South and West, we find other opinions about the bill. The wool-commission men of Philadelphia want it because it will throw back into their hands some profits which they have lost since foreign wools were put on the free list. The Ohio wool-growers want it if the duties on wool are increased to meet their views, but they do not want it in its present shape. Senator Morgan of Alabama wants it because it will punish the New England manufacturers and compel the people of the North to use more cotton to keep themselves warm. His interesting views are communicated in a letter to the Selma *Times*, in which he says that "a very high tax on wool would raise the price as compared with cotton, and give us a great market for our thick fleecy cotton goods, which can be made a quarter of an inch thick, as soft as silk, and very light." Although his heart is moved with pity for the poorer classes of the North, a tax on wool has never been alarming to him as a Southern man. Thus he and Judge Lawrence stand on the same platform at last, although for somewhat different reasons. Senator Dubois of Idaho, on the other hand, agrees with Senator Teller. He sees no reason for changing his position as an obstructionist of tariff legislation until something is done for silver.

As soon as the news of McKinley's election reached the Hawaiian Islands the cry was raised by the *Hawaiian Gazette* that the Republican victory was "the signal for opening the annexation campaign." Bryan's election would, of course, have given the same signal to the *Gazette*, as its preëlection comments showed. But the intention to make a dead set for annexation is unmistakable. Ex-Secretary Foster, who drew the Harrison snap-shot treaty of annexation four years ago, is just back from Hawaii, and is strong for annexation, though his arguments, as reported from Chicago, are neither coherent nor convincing. "The islands were never in a more prosperous condition," he says, which would seem to be a good reason for continuing, instead of extinguishing, their present government. But Mr. Foster meets this by saying that though the islanders have governed themselves so successfully for four years, they will not be able to do so "for any great length of time." That does not mean that the Queen could be restored, Mr. Foster hastens to add; she will "never rule again," and the people are all sound republicans, only, somehow, they will not be able to make the republic work. They can make it work just long enough to secure annexation, but not a moment longer. If this is a little intricate, Mr. Foster has one conclusive argument in reserve. If the islands are not annexed by the United States, they will be by "some other of the great Powers." But this appeal to jealousy, when self-interest is not clear, was so overworked four years ago, and has become so ludicrous by lapse of time, that we do not look to see it have much effect on a country and a Congress that show signs of being decidedly weary of Hawaii.

The signs are that Congress is not going to be quite so hilarious and precipitate about Cuba as it was last winter. A Presidential election just past instead of just to come usually cools off the unselfish ardor of professional patriots. Yet the subject will no doubt be much discussed and action of various sorts urged. We do not say that some kind of action will not be necessary soon, but we do say that the matter should be approached in a much more sober spirit than we see manifested anywhere. It is not a question of going to war "with a light heart," like Ollivier in 1870. There is small chance of a serious war with Spain. But the thing that should give us pause and make us grave is the prospect that our interference in Cuba will bring us speedily face to face with the enormously difficult problem of ourselves undertaking the government of that island. What provision for colonial administration have we anywhere in our system? How are we to assimilate vast new masses of illiteracy? What will the addition of six Cubans to our Senate do to exalt the character of a body now counting a Tillman, a Butler, a Quay, a Hill among its ornaments? These are some of the questions which ought to be filling the minds of our great authorities on how to do it in Cuba; but all their givings forth are of the way our ships could make the Spanish navy look silly, and so on.

"The atrocity of the war in Cuba," says a morning paper, "forces on this country the question whether there is such a thing as international morality." The filibustering newspapers generally seem to favor a war which does not hurt anybody except, perhaps, the combatants, and them not much. They seem to have forgotten some of the lessons of our own war and some of the sayings of our own most beloved and revered commanders. When Sherman was at Atlanta, he said, in reply to somebody's complaint, "War is cruelty. You cannot refine it." At a later period, long after the close of the war, he said in his abrupt way on some public occasion, "War is hell." Nobody need question Sherman's authority on that subject. There is a great outcry among those who advocate the use of rose water for suppressing rebellions, against Gen. Weyler's plan of denuding the province of Pinar del Rio of food supplies in order to starve out Maceo. Was it Gen. Grant or Gen. Sheridan who gave orders to strip the Valley of Virginia "so that a crow flying over it would have to carry his own provisions"? That is about what Gen. Weyler proposes for Pinar del Rio, yet we of the North thought at the time when Gen. Early made his raid upon Washington that that was the right way to prevent a repetition of it. It makes a great deal of difference whose ox is gored.

The most striking passage in Mr. Morgan's report as Treasurer of the United States relates to greenback redemption. During the fifteen months ending with September, he informs us, no less a sum than $192,972,205 in gold was paid out on presentation of greenbacks. That is to say, considerably more than one-half of all the greenbacks in existence were redeemed in those fifteen months. But will they stay "redeemed"? Oh, no. A wise Congress has ordered the Treasurer to put them all out again, and "redeem" them all over again as often as they are thrust in his face. For a nation that boasts of being "smart," and piques

itself on its Yankee 'cuteness, this position is one of the most astonishing ever known. We practically advertise to all the world that if gold is needed anywhere, all that is necessary is to walk up to Uncle Sam's counter and get it. We furiously curse all who accept the invitation, and call them unpatriotic, yet we just as furiously curse those who propose to avert the continuance of the folly by cancelling the greenbacks as fast as redeemed. A great democracy taking a turn at finance must now and then excite laughter in Olympus.

A paragraph is going the rounds of the newspapers, for which nobody in particular seems to be responsible, to the effect that Russia has it in mind to call an international conference for the purpose of establishing a fixed price for wheat. The idea is that if the leading commercial and wheat-growing nations of the world would join, they could fix a price for wheat, to be maintained uniformly through various seasons of over-production and unsatisfactory crops, caused by drought or continual rain, and thus make the principal grain staple upon which the millions of consumers depend for food as unchangeable in value as gold. This is really a scheme to fix a ratio between wheat and gold, say 15,500 to 1. It so closely resembles the scheme of the international bimetallists that we strongly suspect that it was put out as a kind of international joke on Dr. Arendt, Mr. Balfour, and our friend Gen. Walker. The idea of a fixed ratio between wheat and gold is not intrinsically more absurd than one between silver and gold. The difference is one of degree, not of kind. Of course it is capable of indefinite extension. A ratio between corn and gold would be equally desirable and feasible, and, if preceded by a wheat-gold ratio, would *ipso facto* establish a ratio between wheat and corn. As this plan, once carried into effect, would put an end to "corners" in wheat, the speculators would oppose it, and they would cunningly begin by asking its advocates what particular ratio they proposed to establish. The latter would be justified by precedent in replying that they do not intend to be drawn into any such trap, and that there is no use in discussing that question until we know whether a sufficient number of nations will join to make the plan a success.

There are suggestions in nearly all States using the new ballot system for amendments in the law, but from no quarter does there come a call for a reversion to the old system. We have thus succeeded in getting rid of some of the worst influences surrounding our elections. The bulldozers and "heelers" have been driven from the polls for ever. Every man can cast an absolutely secret ballot now in all but a few Southern States, and can do it in a thoroughly civilized manner. But while the "heeler" and his work have been abolished, the politicians go on collecting money for the non-existing expense, much the same as if there had been no change. The candidates of the Republican party for office in this State at the last election paid in contributions to the State committee nearly $34,000; the Republican candidates for Presidential electors, an office which ought to entail no expense whatever, expended nearly $15,000, much of it through the State committee. Yet no real campaign was made and no large expense incurred. Our laws should be made more rigorous in regard to contributions and expenditures, and our reformers should devote themselves to this work now.

It is clearly the purpose of the Platt machine to give the new Governor, Mr. Black, no chance of following a doubtful course in regard to his relations to it. All its most notorious members are pushing themselves forward for places. If they receive what they are seeking, it will be as plain as a pikestaff that the new Governor is Platt's personal property. Such an appointment as that of Lou Payn for Insurance Commissioner could be interpreted in no other way than this. No Governor who was free to follow his own inclinations, with even the most superficial regard for his oath of office, would consent to give any kind of responsible office to Payn. He might just as well make Abe Gruber a Civil-Service Commissioner or Lauterbach a Judge of the Court of Appeals. It remains to be seen whether the new Governor is so indifferent to decent public sentiment as the Platt machine leaders think he is. They, of course, utterly despise that sentiment, but as he is a young man at the threshold of what may be a great career, he may be able to see the advantages of paying some respect to it.

The jubilee banquet in which Mr. Platt's election to the Senate is to be celebrated is already arranged for at Albany. A hall with a capacity of 3,000 persons has been engaged, and will be "floored over" for the occasion, and a great assemblage is promised. It is taken for granted that Mr. Platt's election is as good as accomplished, and the date for it is fixed at January 19. No discussion of his merits seems to be in progress anywhere, and none seems to be thought necessary. The fact is universally recognized that he has the "thing fixed," that the Republican members of the Legislature are in no danger whatever of voting for any one else, and that it is a waste of time to pretend that any such question as qualification for the place has anything to do with the matter. It is interesting to observe that not only is Platt virtually elected to the Senate this year, but Mr. Hackett, his chairman of the State committee, is booked for the next vacancy in that body, which will occur when Senator Murphy's term expires in 1899. Platt and Hackett would well fill the places held by Hill and Murphy.

A ray of hope dawns on us in the shape of the news that Mr. Joseph H. Choate is willing to stand for the senatorship, and that the reforming Republicans are ready to support him. It makes no difference whether Mr. Choate be elected or not. Every decent and intelligent man and woman in the State owes it to the American name to see that this great community, distinguished as it is in all the arts of civilization, does not allow its highest honors to be bestowed by a base and corrupt Legislature on one of its most contemptible members, without at least a protest. It will not do to have it set down in history that, after several years of experience of Hill and Murphy, the people of New York put Platt in the place of one of them when it got a chance. There has not been a better year since the Revolution than this to reaffirm the old principles on which the Government was founded. We were called on in 1861 to show the force of the republic and its capacity for material sacrifices. We are called on to-day to show its wisdom and its honor and its capacity for self-government. The Senate was intended by its founders to be composed of eminent men, famous for their "ability and integrity." For a long period New York sent such men to it. Since the war it has apparently been inclining more and more to the belief that the Senate was meant to be an assemblage of criminals and speculators. We cannot render better service to the country, therefore, than to show our children this year what the fathers of the republic had in their minds. When they founded the Senate, they meant that it should be filled by men like Mr. Choate. He is to-day our foremost man for political purposes, and it will be the greatest shame of this century, not if the Platt Legislature sends Platt in his stead, but if this old trickster be allowed to disgrace a great historic assemblage by his presence, without a word of protest from those of us who live in the hope of a better day.

The latest announcement by Mr. Croker is that he has decided, after looking the field over, not to remain with us for the next municipal campaign, but to return to Europe to look out for his racing interests. This would seem to imply a doubt as to the outlook for Tammany success next year. It was well understood in Tammany circles that the boss had returned because he began to realize the necessity of replenishing his private fortune; the large expenses of living, combined with unfortunate ventures on the race-track, having made heavy inroads upon his savings. Then, too, opportuni-

ties for "speculating in real estate" are less plentiful abroad than they are here, and, as everybody knows, it was in "real estate" that Mr. Croker made his fortune. His conclusion seems to imply that the real-estate outlook is not more cheering in his opinion than the political outlook. We trust that this will not have a depressing effect upon the real-estate market, for it is not a fair test of the situation. It must be borne in mind that the real-estate conditions which enabled Mr. Croker to become enormously rich within four or five years were not ordinary ones. No ordinary ventures in houses and lots yield such sudden and fabulous profits as his did. Of course he is looking for like conditions again now, and the fact that he does not find them should not be regarded as foreshadowing a decline in values. It is barely possible, also, that the very large Republican majority in both branches of the Legislature, and the presence of a Republican Governor at Albany for two years longer, have had some effect in clouding the clearness of Mr. Croker's real-estate judgment.

The change of faith which has come over Mr. Nissen, a Civil-Service Commissioner of Brooklyn, is much like that which Gen. Collis, our Commissioner of Public Works, has experienced. Mr. Nissen entered upon his duties last January, and was not thought at that time to be friendly to the reform. He says frankly now that he had misgivings about his ability to "make a strict performance of duty consistent with his views on civil-service matters," that he had "believed, with many other people who have not fairly looked into the question, that there was considerable humbug about civil-service reform, and that the system was being extensively used for the protection and promotion of political favorites." He now says:

> "I have got bravely over my misgivings, and I will frankly say that, in my opinion, no honest man can make a study of the subject in all its various bearings upon public and political morals without the result of making him a conscientious and sincere advocate of true and practical civil-service reform."

He predicts that the proposed raid on the law will fail, because there is a popular sentiment in favor of strengthening rather than weakening the law, and that the public official who takes his stand in favor of the raid is doomed to political destruction. Our new Governor is likely to have this view of the matter pressed home to him in case the raid ever gets so far as to require his action to complete it.

Nearly two years and a half have passed since the Chicago riots took place which led to something like a riot on the part of Gov. Altgeld against the authority of the federal Government. It will be remembered that "President" Debs, the organizer of the strike and boycott out of which the riots grew, and which paralyzed industry all the way to the Pacific Coast, declared in a written manifesto that Pullman was engaged in "the devilish work of starving his employees to death." The fact was, however, that the Pullman Company was at that time manufacturing cars at less than cost in order to keep its men employed, and that the dispute between the company and Debs was whether the loss per car should be increased by an increase of wages at that juncture or not. One of the odd features of the affair was that the company closed its Detroit shops altogether, in order to keep the larger works at the town of Pullman going, but the closing at Detroit was never mentioned by President Debs as a grievance. The only thing worth rioting about was the question whether more money should be paid for wages and materials for car-building at Pullman than the buyers of cars would pay for the completed product, and whether Mr. Pullman should submit this question to arbitration. He took the view that a man who submits a business question to arbitration is bound by the decision of the arbitrators; and since he could not possibly pay the wages demanded under the existing circumstances of the market, there was nothing that he could submit to the decision of arbitrators. Then Debs issued his orders to railroad companies to stop hauling Pullman cars, and the riots began.

When Debs had been landed in jail for contempt of court, work was resumed at the town of Pullman, and the results of the fiscal year ending July 31, 1896, are now before us, in the last report of the Pullman Palace Car Co. Although it was a bad year for general business, the whole number of the company's employees was increased from 10,318 to 11,515, and the total amount of wages paid rose from $5,011,565 to $5,669,121. There was also a small increase of average wages during the year, *i. e.*, from $2.24 to $2.28 per day for journeymen mechanics. There was an increase of deposits in the savings bank of the town of Pullman of $133,042 as compared with the previous year, and the number of individual depositors increased from 1,683 to 2,222. These gains on the part of the workmen were made possible by an increase in the manufactured product of the car-works from $4,986.128 to $7,704,938. The low product of the fiscal year ending July 31, 1895, was due mainly to the strike itself, which began the last of June, 1894. These results ought to impair the future influence of Debs.

"I do not believe in adopting foreign rates of wages or foreign hours of labor" (cheers). This is not, as the shrewd reader infers, an extract from a Canton campaign speech. It is taken, rather, from an address recently made by the English Secretary for the Colonies before the Birmingham Chamber of Commerce. Mr. Chamberlain was discussing the question of German competition—that bogey which has been terrifying so many timid bimetallic and fair-trading minds in England. The Colonial Secretary had little difficulty in showing that the inroads of German on British commerce had been enormously exaggerated, and then went on to show that German success in foreign trade had come simply from applying the highest intelligence to it. It seemed to be a theory with many British manufacturers that consumers were sent into the world to take the goods which they (the manufacturers) made, and that there was no obligation upon the manufacturers to make the things the consumers wanted. The Germans had shown an underhanded willingness to consult the wishes, even the prejudices, of their customers. All this scarcely proved, as the Howard Vincent school asserted, that England could never make head against German competition except by going for protection and bimetallism.

The London County Council has been made the victim of an extraordinary fraud, which the London *Spectator* compares to Tammany's best efforts, but by which nobody appears to have profited. It seems to consist in the "cooking" of accounts by the employees, and the desire seems to have been simply to save the Council from charges of mismanagement and extravagance. To carry this design out they have transferred charges from one account to another, and charged for materials never used, so as to put a good face on the whole situation. But why they expected this never to be found out and exposed, does not appear. The trouble arose from what we call "bi-partisanship"—that is, the attempt to carry on work needing decision, energy, and administrative experience and ability, by a committee instead of a single head. Committees and bi-partisan commissions always differ, are generally at loggerheads, and are easily hoodwinked by subordinates. Subordinates get around some of them and "pull their legs," and the man whose leg is pulled feels flattered and stands by the man who pulls it, and feels bound to protect him against his colleagues, and his colleagues do not wish to quarrel about him, and so abuses go on until they become intolerable. This affair is extremely unfortunate for the County Council, for it has a host of enemies, and some very powerful ones, and its relations with laborers and contractors have long been a subject of indignant criticism from one party of taxpayers. It will probably result in some concentration of authority, for the leading feature of the scandal seems to be the impossibility of fixing responsibility for it on any one.

NO FEDERAL ELECTION LAW.

THE Chicago *Times-Herald*, through its Washington correspondent, makes an announcement as to the probable policy of the new Administration, which contains the following passage:

"Men who hold confidential relations with the President-elect believe the coming Administration will mark the enactment of a new election law—not a 'force bill,' but a comprehensive statute designed to prevent a recurrence of such election frauds as those which have cursed a number of Southern and border States during past national campaigns."

There is only one thing to be said of such a policy as is here suggested—it would be an exhibition of political madness. Six years ago, as "leader of the House," Mr. McKinley helped to put the force bill of 1890 through that body, and if he could have had his way, it would have become a law. Happily it failed to pass the Senate, through an alliance between the Southern Democrats and free-silver Republicans of the West—the one good thing, by the way, that the nation has ever got out of the free-coinage agitation. The force-bill policy was an important element in producing the popular revolution of 1890 and 1892, which gave the Democrats the House of Representatives during the last half of the Harrison Administration, and then entire control of both branches of Congress. They signalized their supremacy by repealing all the federal election laws. This action was hailed by sensible Republicans everywhere, and particularly in the South. The force bill of 1890 had been opposed by more than one Southern Republican in the House.

The election laws were repealed in the early part of 1894. In the following November the Republicans carried Missouri, Tennessee, and West Virginia, and, through a fusion with the Populists, defeated the Democrats in North Carolina—these being in each case the first Republican victories since the end of the reconstruction era. In 1895 the Republicans carried Maryland and Kentucky. In all six of these States Republicans claimed and Democrats conceded that the change was largely due to the repeal of the election laws by the Democratic Congress and the abandonment of the force-bill policy by the Republican party, which rendered it impossible for the Democrats to solidify the whites, as of old, by an appeal to the race issue.

The Republicans, in their national convention last June, ignored the whole sectional question, and Mr. McKinley, in his letter of acceptance, gave what was universally understood to be a pledge that he would never again lend any favor to a policy looking in the direction of federal election laws. This pledge was accepted at its face value by the sound-money Democrats of the South. Without it, McKinley would surely have lost Kentucky, and he owed to it a large share of his majorities in Maryland and West Virginia, as well as the unusually large Republican vote in Tennessee, North Carolina, and other Southern States. Since the election Gov. Oates of Alabama, a representative Southern Democrat, has urged the Legislature to abolish the system of separate State elections in August, and consolidate those elections with the elections for federal officials in November, on the ground that "the federal election laws were repealed by Congress three years ago, and now no reasonable person apprehends their re-enactment, or the passage by Congress of a 'force bill.'"

For the McKinley Administration to push a federal election law—any kind of a federal election law—would be as gross a breach of faith as was ever committed by a victorious party. It would be as shameless a violation of a pledge as would be a movement by that Administration to promote the free coinage of silver. Every honest man who supported Mr. McKinley in the belief that he and the Republican party meant what they said they meant about this whole force-bill issue would feel outraged. The solid South has been visibly dissolving before our eyes during the past two years. The bringing forward of a new force bill—and any sort of a federal election law would be regarded at the South as a force bill—would drive the whites together again, and inject the hateful sectional issue into our national politics once more. Such a scheme would be nothing short of a crime.

The one thing that the South needs is to be let alone. "You will tell me," said Mr. Ewart of North Carolina to his Northern Republican colleagues in the House, six years ago, "that I am suggesting no remedy for the political state of affairs in the South. Yes, there is a remedy, and that is to mind your own affairs and treat the colored man of the South with 'wise and salutary neglect.'" This remedy has now been applied for some years. The beneficent effects are apparent. The recent national election was the fairest held since the war in many Southern States. Public sentiment in most States has already made great headway towards compelling honest returns of the ballots cast. In Tennessee and Virginia, where the worst frauds were committed, the decent elements in the community are becoming aroused to the necessity of a radical reform, and they will bring it about if only left to themselves.

If the Republicans live up to their platform and pledges, they can hope to carry several Southern States in 1898 and 1900. If they should be so mad as to attempt any sort of congressional legislation regarding elections, they would put the South and the nation back a dozen years. In a private letter, a prominent Palmer and Buckner Democrat in a Southern State, who has accepted the force-bill issue as dead, thus describes the situation in his State caused by its disappearance:

"The Solid South has vanished. The whites are at last divided. In my judgment, if the McKinley Administration shall live up to its promise not to attempt any federal election legislation, no political scheme will ever bring our people together again. Freedom of opinion is in the air."

BANKING REFORM.

THE *Evening Post* published on November 25 a thoughtful communication from Mr. Henry J. Ford of Sewickley, Pa., on the subject of banking methods and the need of a reform which will satisfy the people of the South and Southwest. It is quite true, as Mr. Ford says, that the people of those States and districts cannot understand why money should be scarce and impossible to get hold of in their communities when it is piled up in large and almost unusable amounts in the cities of the North. It is probably true that they will continue to vote for free silver, or free greenbacks, or anything else that is considered wild and heretical in the North, until some change in the banking system of the country is effected which they will consider a measure of relief.

Most of them look upon the 10 per cent. tax on the notes of State banks as the chief cause of their trouble. It is not "the crime of 1873" that makes them angry, but an earlier one, dating back to the war period. They have an indistinct recollection of the banks immediately before the war, which were fairly good in the South, although they had been preceded by an atrocious litter of wildcats in all those States, almost coeval with the federal Union. Anybody who will take the trouble to read Prof. Sumner's historical review of those institutions will justly consider all present evils of a financial kind as Elysian fields by comparison. Yet it is probably true that a repeal of the 10 per cent. tax on the notes of State banks would kill the silver heresy stone dead in every Southern State. It would cure all other financial heresies for the time being, in the same way that John Phoenix proposed to cure mosquito bites, by plunging the bitten part into boiling water. As soon as free banking under all sorts of State laws should have reached its full development, there would be a much worse condition of things than there is now, and the cry for bank reform would be much louder than before.

None the less is it necessary to undertake bank reform. The greenbacks must be got rid of. The Government must go out of the banking business. The gold reserve must be allowed to regulate itself under commercial, not political, influences. Yet Mr. Ford is right in saying that retirement of the greenbacks cannot be effected without putting something in place of them. Even though gold would flow into the vacuum, the process would be unobserved, its existence would be

doubted, and hence it would be politically impossible. The people who need to be conciliated, and without whose co-operation no reform is possible, would say that the retirement of the greenbacks was another step on the part of the grasping national banks; that, having defeated Bryan, they were now trying to control the currency and "corner gold" again, and thus to collect back from the people the money they had paid to carry the election. This view is present to the mind of every member of Congress, Republican, Democrat, or Populist. There is no man with a livelier sense of the politics that lies in this question than Bryan himself. Nobody knows better how much is to be gained by fanning discontent with our present banking arrangements, and how much is to be lost by any measures which would quiet it.

It is certain that the country is in no mood for a return to the old miscellaneous sort of banknote issues which prevailed before the war, however pleasing that might be to the States south of the Potomac. If the evils surely attendant upon that system, or lack of system, could be confined to the States which believe in it and want it, the question would be very different. So, too, the proposed free coinage of silver would present a very different aspect if it could be restricted in its operation and effects to Kansas, Colorado, and other States that want it very much. Unfortunately, it is not possible to restrict the effects to any particular State or section. Silver dollars legal tender in one State must be legal tender in all. Any banking law passed by Congress must be valid in all the States. A repeal of the tax on State bank issues would open the door in New York as well as in Mississippi. Some States prohibit banknote issues other than national by their constitutions, but those provisions would not prevent the notes of other States from gaining entrance among their people. If Louisiana, for example, were allowed to issue banknotes under State laws, the notes would circulate in Texas, although the latter prohibits State-bank issues of her own. What serves for one must serve for all.

The practical question, therefore, is whether an amendment of the national banking law can be secured which shall keep the safeguards necessary to protect the people against wildcatting and yet make banking and banknote issuing profitable in those Southern communities where the silver craze, and the greenback craze, and the sub-treasury craze now predominate and threaten at every national election all that we hold dear. Mr. Ford mentioned in his communication the Scotch system of branch banks by which every nook and glen of the country is provided with banking facilities of the very best kind. While there is no fundamental objection to branch banks in this country, and while we have had some very successful examples in the past in the State banks of Indiana, Ohio, and Missouri, we must bear in mind that the Scotch system is the growth of more than two centuries, and that it cannot be transplanted to this country in time for the next election. Still, there is wisdom in the suggestion. National banks ought to be allowed to have branches in this country under certain conditions as to capital and public supervision.

The great thing to be done is to make banknote issuing profitable enough to induce capitalists to go to these bankless sections of the Union and supply them with the facilities now lacking. The present national banking law does not afford this profit. The public mind, the Granger mind, the Populist mind, is all wrong on this subject. The men who have money would be as glad to make money, say in Alabama, as anywhere if anybody would show them how. They would avail themselves of any facilities for issuing demand notes and giving "cash credits" according to the Scotch system if they could see a profit in it, but there is none (or none worth mention) if it is necessary to deposit $110 of bonds for every $90 of circulation obtained. The question now coming up is whether this feature of our banking system can be amended without giving the field to wildcats. Our Canadian neighbors seem to have solved this problem, in part, by borrowing the old safety-fund system of the State of New York. May we not do the same?

PLATT AND THE CIVIL SERVICE.

It has been evident to all persons interested in the reform of the civil service in this State, ever since the interpretation of the amendment to the Constitution by the Court of Appeals, that something would be done soon by the Platt politicians to get around, or, as they call it, "beat," the law. For it is one of the most extraordinary features of our present situation that the men who are actively engaged in managing our affairs, pass most of their time in trying to frustrate or defeat measures called for or forced upon them by public opinion. In fact, the complete separation between the class called "politicians" and the mass of the people in political ideals is one of the most interesting phenomena of the day. We were present in a small company of lawyers, immediately after the decision of the court, when the question of what Platt would do now came up for discussion, and one present immediately predicted the plan of making every department its own examiner, and giving the appointing officer full control of the eligible list. But it was not till six months afterwards that his prophecy was fulfilled by the appearance of an article in the *Sun* showing that there would be nothing unconstitutional in such a scheme, which revealed the fact that the Plattite brains were already at work on it.

We need hardly say that the scheme is an old one. The first demand for civil-service reform in Washington was met by an exactly similar arrangement. Each department was directed to examine its own candidates, and did so, but the result was, of course, laughable. No one presented himself except those the appointing officer called for, and the examination naturally allowed the men he wanted to pass without difficulty. Nobody who would be of much value would submit to such a farcical test, knowing he would not be appointed without "a pull." In fact, nobody would ever come to such examinations here except the Mikes, Jakes, and Barneys, for whom the Plattite appointing officers are now sighing. The steady growth since that period of the competitive system managed by independent boards, shows that the public speedily understood the Platt system and would have none of it. The extension of the competitive system by every President since President Arthur, and the unanimous testimony of departmental officers in its favor, prove that its success is assured. No more remarkable sign of its hold on the popular mind could be given than its submission to the popular vote in Chicago, of all places in the world, in April, 1895, when it was adopted by a majority of 45,000. No departmental officer in Chicago, Gen. O'Beirne will be sorry to hear, can now get "the men he wants." He must take the men provided for him by law.

Another very amusing episode in the earlier days of the civil-service reform agitation is recalled by the recent Platt movement. What is disturbing the Platt politicians, it appears, is that the examinations are not "practical" enough, and that, owing to their very literary and abstruse character, they are carried off by "college men." In the early seventies there used to be a vigorous stand made every now and then by the political class against examinations, sometimes because there were also examinations in China, but generally because the examinations were not "practical"—that is, did not let in more of the ignorant, shiftless "workers." One of their favorite illustrations of this thesis was that candidates for clerical places used to be examined about "the depth of the Polar Sea and the height of the walls of Timbuctoo." We were greatly amused, therefore, on Saturday by hearing from Chairman Hackett that

> "if a man is a candidate for a place on the police force or in the excise office, he doesn't think he should be asked to bound Timbuctoo or tell all about the government of Zanzibar. A man who has never heard of Timbuctoo or Zanzibar may make an excellent policeman or excise inspector. I think a man should be examined strictly on the duties he is expected to perform."

The last time we heard about Timbuctoo and Zanzibar was from the learned and vivacious Howard Carroll on the stump about 1882—"God be wid the good ould times," as Tom Brennan would say. The only answer needed to stuff of

this sort was, of course, the publication of the rules and of the examination papers, which was often done, and disposed of both Timbuctoo, Zanzibar, and the Polar Sea. The utmost pains is and has always been taken by all Civil-Service Commissions to make the examinations strictly practical, and to make them bear directly on the duties of the place to be filled, as any one may satisfy himself by looking at the papers of any examination. It is hardly worth while to apply this remedy now. Our advice to Hackett or any politician who is troubled about want of "practicalness" in the civil-service system, is not to go to the Legislature, but to go to a physician. If he finds his mind wandering about Timbuctoo, Zanzibar, or China, the best thing to do is to take an anodyne, and get a good sleep with a wet towel round his head.

Another old friend, over which in years long gone we spent many a merry day, was the fondness of politicians for civil-service reform in the abstract, but dislike of "this particular measure." "Real civil-service reform," they all, like our eminent friend Abe Gruber, desired, but "this particular measure"—faugh! The reappearance of this trouble thirty years later is one of the drollest incidents of the present agitation. Civil-service reform, "the men we want," but no Zanzibar or Polar Sea.

And then the college men—what are we to do about these "college men"? The practical examination is "to give other than college-bred folks a chance." Well, in the last ten years, the applicants for admission to all the departments in the federal service in Washington were 169,522. Of these, alas! 140,017 came from the public schools, 10,980 from business, but the college rascals numbered 18,525; an appalling fact, which makes the future of the republic look dark indeed. Of these, 84,051 of the candidates from the public schools passed, 7,440 of the business candidates, and 12,764 of the college men. It will be seen that the college contingent was small after all, but think of our universities extending their pestiferous influence into the public service even in this degree. And there are men among us who are glad that our colleges are multiplying!

We have not by us at this moment the figures about the candidates in this State, but we believe the percentage of college men among the candidates is still lower here than in Washington. In fact, the agitation which has been started is so plainly the concoction of beaten men who see their doom approaching, that, even if they get their bill passed, the end is near. We warrant that Gen. O'Beirne will be sick of "the men he wants" before we get done with him.

THE STUDY OF GOVERNMENT.

THE academic study of government and administration, as subjects distinct from history and political philosophy, has only within a very few years begun to receive particular attention in this country. Here and there, to be sure, one could find a college whose curriculum accorded to the Constitution of the United States a certain amount of respectful attention: the formal phrases of the instrument had to be learned by rote, while its provisions were illustrated by comparison with the Articles of Confederation, and reference to striking events in our national history. But, however fruitful its results, this was, after all, essentially a study of government in theory rather than in practice. Whether the actual workings of the various departments of government were such as the text of the Constitution seemed to indicate, and whether there were not other factors of which that document said nothing, were questions seldom raised. Of study of European systems of government there was none, save the little that was inseparable from courses in so-called "constitutional" history. Some colleges still require a memorizing of the Constitution; others have sought to "enrich" the course of study by the adoption of a text-book on "civil government," in which comment on the sections of the Constitution *seriatim* is judiciously mixed with the history of the United States, and supplemented by meagre accounts of State and local administration. How largely these dry and lifeless methods have been discredited, and how broad a field is being opened to scientific investigation, a very brief examination of typical courses of instruction in government, now offered by leading universities in this country, will serve to show.

In addition to American constitutional law, most of our universities of the first rank now provide for the extended study of government and administration in the United States, national, State, and local, with emphasis upon practical operation as well as upon the legal or theoretical basis. As is the case with other courses in this department, the method of instruction is usually by lectures, supplemented by reading, special research, and personal investigation. The University of Chicago offers a course in the government of American States, and Johns Hopkins a course dealing generally with systems of local government. Elsewhere, local government seems to be included in the general courses, although separate courses are allotted to municipal government at the Universities of Michigan, Pennsylvania, Chicago, Columbia, and Yale. The government and administration of European countries is studied comparatively under a variety of titles, and, apparently, with somewhat different estimates of its importance. Columbia, for example, presents courses in the comparative constitutional law and comparative administrative law of the principal European States, with seminaria in administrative law and comparative legislation. Pennsylvania devotes separate courses to the constitutions of leading foreign countries, the text of the German Constitution being compared with the constitutions of the United States and Switzerland; public administration in leading foreign countries, especially in Germany; and a study of the existing governments of France and England. Johns Hopkins has a year's course in systems of administration in England, France, Prussia, Italy, and the United States. The courses at Chicago include the comparative constitutional law of France, Germany, Switzerland, Great Britain, and the United States, and federal government in the United States, Germany, and Switzerland; while Harvard provides an elementary half-course in constitutional government and a half-course in federal government, historical and comparative. Columbia, Pennsylvania, Michigan, and Yale have courses for the comparative study of municipal institutions.

This enumeration of representative courses will suffice to show the field of inquiry contemplated and the classification usually adopted. It does not, obviously, indicate all the work in government done by the institutions named. In some cases, further, the work is merged in that of other departments, particularly law and history, or in research in various fields. At Harvard, for example, where extended facilities in this department are not yet provided, seminary work in government is announced as included under seminary work in history, while the history of government in the leading countries is treated in the historical courses. It is probable, however, that everywhere such combination courses are much more historical than descriptive. But, however variously entitled, it is clear that progress in this new department has been rapid, and that the facilities now offered in this country for the study of actual political methods, both at home and abroad, are very considerable, comparing favorably, as far as they go, with those available in European universities.

That more extensive work is not carried on is due in part, no doubt, to the newness of the subject, and uncertainty as to its proper place in the university curriculum. There are numerous indications, also, that the broad and thorough study of government and administration is not yet widely cared for in the United States. The different extent to which the various universities have taken up the work is noticeable. At present only two institutions of the first rank—Pennsylvania and Chicago—attempt to cover systematically a large field; the others follow at irregular distances, while two or three offer so little as to suggest either limited resources or a depreciatory estimate of the importance of the subject. As a rule, the largest share of time is given to American government—a fact partially attributable, doubtless, to laudable patriotic interest, yet somewhat surprising when we remember that, in these same institutions, courses in European history greatly outnumber those in American history. The most obvious lack is that of courses dealing exclusively and in detail with the political institutions of any one foreign country. As for the comparative study of European government, it is limited, for the most part, to the constitutional and administrative law of Great Britain, Germany, and France, with the occasional inclusion of Switzerland, Belgium, and Italy. It does not appear that the political organization of Russia, the Netherlands, Austria-Hungary, Norway and Sweden, or Spain is anywhere particularly studied in systematic courses; nor have we noted a reference to detailed study of the Dominion of Canada, although its federal organization is, presumably, considered in connection with the comparative study of federal government. In general, we may say that the study of government in American universities is still, in most cases, general rather than specific, extensive rather than intensive, and not quite comparable, in either extent or thoroughness, to our work in the kindred field of history.

The literature of a subject is sometimes a very good indication of the kind and amount of popular concern about it. Up to the pre-

sent time, it must be confessed, there is in English hardly more than the beginning of a literature descriptive of the political life of countries other than Great Britain and the United States. Discussion of any phase of the subject in the general periodicals is infrequent. Even in regard to the two countries just named, there is a real scarcity of accurate, scholarly, and usable publications. Next to American history, the history of England is probably most widely studied in this country; yet we do not possess a single book, treating of English political institutions, at all to be compared with Bryce's 'American Commonwealth,' or so well adapted to class-room use as Hinsdale's 'American Government.' On the other hand, the government of the United States has nowhere been treated so usefully as has that of Great Britain in the "English Citizen Series," or as that of France seems likely to be in the series now in course of publication under the title of "La Vie Nationale." For the comparative study of government, the well known treatises of Burgess, Goodnow, and Wilson, reënforced now by Mr. A. Lawrence Lowell's recent work on 'Governments and Parties of Continental Europe,' stand almost alone. As far as the universities are concerned, the lack of books available for use as text-books may not, of course, be very serious, since with them the basis of instruction is usually the lecture with collateral reading. It may, however, serve as a partial explanation of the non-participation of the colleges in the study of government and administration. At present, few colleges in the United States offer in this department anything beyond a brief course in American government, and most do not do even that. Whether constitutional and administrative law are suitable subjects to be included in the college curriculum, admits no doubt of argument; but it is clear that the absence of a sufficient literature would act as a decided limitation on the work, even if the colleges were disposed to undertake it.

GEN. TROCHU'S MEMOIRS.—II.

PARIS, November 18, 1896.

WHEN Trochu returned to Paris, after the death of Marshal Bugeaud, to whom he seems to have been attached by the strongest ties of gratitude and of admiration, the first visit he received in his small apartment was, as I have said, from an aide-de-camp of Prince Louis Napoleon. The Prince, who was President, offered him a place on his military staff, in memory of Marshal Bugeaud. Trochu at once put on his uniform and went to the Élysée, where he was introduced to the Prince. He thanked him for the proffered honor, but asked permission not to accept. He owed his advancement, his position in the army to two men, General Lamoricière and Marshal Bugeaud. At the deathbed of Bugeaud he had taken the resolution never again to accept any position on the staff; he wished to take his place in the ranks of the army. He desired to be no longer in evidence.

Lamoricière had, in fact, been the first protector of Trochu; it was an act of courage to pronounce his name before Louis Napoleon. Lamoricière was among those who were arrested on the night of the Coup d'État of December 2, with Gen. Bedeau, Gen. Le Flô, and others, and sent into exile. Trochu never concealed his indignation and his profound sorrow at what he calls the "great military captation which preceded the Coup d'État," and which has recently been related, in all its details, with a sort of cynical sincerity, in the Memoirs of Gen. Fleury, a part of which has appeared in the *Revue de Paris*.

"Let those," writes Trochu, speaking of the Coup d'État, "who knew me in my youth, ask themselves what I would have done if, as aide-de-camp of Prince Napoleon, I had become an instrument, an accomplice, or merely a subordinate actor in those great political saturnalia!"

In saying to the Prince-President that he wished to return to the ranks, Trochu did not say all; in the election for the Presidency, he had cast his vote for General Cavaignac, for whom he had always felt the greatest respect. He could not enter into daily relations with his too fortunate competitor. The Prince received Trochu's refusal in his usual kind way; he did not seem ruffled, asked him to reflect, and left him entire liberty of reflection and of action. Trochu did not reflect long; an hour afterwards he was at the War Department, asking for letters of service. The Minister was very angry at his decision, and showed much temper. Trochu heard him in perfect silence; he felt himself free. "Never," he says, "did Providence serve me better than on this occasion."

Those who lived through that period cannot but feel much sympathy and admiration for a man, accustomed to military obedience, yet led by a virtuous instinct to refuse honors which he felt to be full of dangers.

"Victrix causa diis placuit, sed victa Catoni."

Trochu was not on the side of Louis Napoleon; he was on the side of Cavaignac, which was, at the time, the side of law and legality. After the Coup d'État, the Minister of War, Marshal Saint-Arnaud, who had known Trochu in Algeria and knew his worth, invited him to occupy an important post in the Ministry of War. Trochu refused. The invitation was replaced by a written order, and he had to enter upon functions which were very complex, as they comprised the services of the infantry, the cavalry, the gendarmerie, the staff, the military schools, the recruiting, military justice. He spent a whole year in mastering all these organizations; he had soon an occasion to show his independence of character. The Emperor had decided to place the gendarmerie in the Department of the Interior instead of the Department of War. The gendarmes, in this system, ceased to be soldiers, and belonged in reality to the police. Trochu would not admit such a change; the French gendarmerie is very much respected in the provinces, and it enjoys this reputation, which has survived all our revolutions, from the fact that the gendarmes are all recruited from the army by a very careful selection; the gendarmerie is, in reality, the élite of the army. Trochu felt that if it became merely a corps of police, it would lose its prestige. The Minister of War withdrew his project (he was still Saint-Arnaud, who was a thorough soldier); he felt the force of Trochu's arguments, and the gendarmerie preserved its ancient organization.

Napoleon, on arriving at power, pronounced at Bordeaux the famous formula, "L'Empire, c'est la paix"; but everybody in Europe felt that the new empire needed the baptism of war. The occasion was furnished by the eternal Eastern question. In 1852 some misunderstanding arose between the Porte and the Emperor Nicholas; the year after, diplomatic relations were interrupted between Constantinople and St. Petersburg, a Russian army entered the Principalities, and the Turkish fleet was annihilated at Sinope. A general war became imminent.

"The Emperor Napoleon," says Trochu, "was penetrated with the belief that the appearance of the imperial eagle on our flags was, for the French army, the permanent consecration of victory in the eventual wars of the future. This sort of Napoleonic fetishism explained itself in theory—in sentiment, if you like—by the splendid victories of a past of which the Emperor was the heir and the representative among us. Practically it was unjustifiable, full of dangers; and I affirm (contenting myself with viewing in its broad aspects the destiny of the Second Empire) that this fetishism was to be and became the most efficient cause of its downfall and of our ruin. This incurable and fatal blindness had overtaken the Emperor, the court, the military entourage, the ministers, everybody to a certain extent, sometimes through conviction, more often by imitation and by fashion."

Two formulas were in many mouths: the first was, "We have the first army in the world"; the second was, on the eve of a war, "We are ready." To do justice to Trochu, he did not wait for the time of our disasters to protest against this dangerous optimism. Nobody knew better, at the beginning of the Eastern difficulties, that we were not ready. "At the end," he says, "of January, 1854, two months after the catastrophe at Sinope, no question had been put to us as to the state of military matters." Trochu, with some other directors of the War Department, had to take the initiative, and they prepared among themselves, unofficially, so to speak, plans for the formation of an army destined for the East. Every detail of the plan was well studied, and thus it was that in a very short time the nucleus of the corps which was to operate in the East was prepared, and that afterwards this nucleus was increased into a real army, composed of three divisions of infantry, one division of cavalry, with the necessary artillery and the administrative services.

Saint-Arnaud, who was the commander of the French army, took Trochu for his first aide-de-camp.

"My dear Colonel," said he to him, with a sort of solemnity, "I know where I am going. I have a malady [angina pectoris] which is still intermittent, and which allows me a little more life; but I have it from a doctor who had the courage to tell me the truth, that it does not pardon. If the thing is to get worse, I would rather die among my soldiers than in my bed. . . . But my health may fail, and I need near me an auxiliary on whom I can count. You will be this auxiliary."

Trochu had often judged with severity the adventurous life of Saint-Arnaud, but he could not be insensible to such an appeal. "Providence," he says, "recompensed Saint-Arnaud by allowing him to end his life, as he had wished, among his soldiers." Saint-Arnaud, by a miracle of will, was able to superintend the landing of the army in the Crimea and to witness the battle of the Alma. The Marshal died a fortnight afterwards.

The Italian war was even less carefully prepared than the Crimean war. In 1859 Trochu, who had become brigadier, was discharging at the ministry the function of member of the committee of the general staff. "None of us," he says, "believed in a war"; but a few words spoken on New Year's day by Napoleon to Baron Hübner, the Austrian Ambassador, convinced everybody that a war was imminent. Without entering into details, it is enough to say that Trochu shows clearly that there was no preparation for a great campaign, that everything had to be improvised. The Emperor counted upon his "star." He gained much easier victories in Italy than in the Cri-

mea, and he became even more confirmed in an optimism which had in the end such disastrous results.

The first volume of the Memoirs of Trochu is devoted to an account of his military career up to the year 1870, and the exposition of his views on "The State, Society, the Army." The second volume is consecrated entirely to the war of 1870, and particularly to the siege of Paris. As such, it will remain among the most valuable documents on the war. It was no easy task for Trochu to preserve order in a city which was exasperated by a long siege; to maintain his authority over the National Guard, which was all but worthless as a military force, but which was very dangerous as a revolutionary force. He had only two regiments of regulars, and the sailors placed in the forts, on whom he could really depend; also a few battalions of Breton mobiles, who were faithful to him as a Breton. His only hope lay in the arrival of Bazaine's army, and after the surrender of Metz this hope was gone; he never believed much in the arrival of a second army, knowing well that the organization of it required more time than he had at his disposal. He tried, however, to the end to foster in the Parisian population a confidence which had nearly forsaken him. He does ample justice to the courage and the resignation of the Parisians, when, at the end of the third month of the siege, the bombardment of Paris began. During this bombardment he visited periodically the forts and the quarters on the left bank of the river, which suffered particularly.

"Going at my horse's pace through the groups of poor emigrants who, leaving the outskirts immediately bombarded, took refuge in the centre of the city, amidst terrible cold, I acquired proof that the besiegers completely failed in their plan of destroying the morale of the besieged. They were irritated, but not cast down. As I was following the Chaussée du Maine towards the ramparts, a tall woman, with gray hair, who seemed to have some authority there, screamed to me loudly: 'C'est toi, Trochu? Eh bien, va toujours!' And I was moved. This woman of the people gave me everything in a word — consolation, encouragement, recompense. She had in her unconsciously a force which I believe is now disappearing—patriotism devoid of any personal interest, any political interest."

Trochu modestly adds: "I feel authorized to say that if I have not done great things, I have seen great things."

After the war Trochu was elected Deputy to the Constituent Assembly by ten departments. He had not put himself forward as a candidate; he had resolved to retire into private life, but he was induced by his friends to take his place in the Assembly, which was obliged at once to set about the reorganization of the French army. When he reached Bordeaux, where the Assembly first met, Jules Favre, Minister of Foreign Affairs in M. Thiers's first cabinet, offered him, in the name of the head of the executive power, the rank of Marshal of France. Trochu declined an honor which, in his opinion, should be the reward of victory alone. He declined afterwards the command of an army corps. He did not remain long in the Assembly, where he took his seat among the monarchists, and he retired to Tours, where he spent the last years of his life.

Correspondence.

WASHINGTON'S LIBRARY.

To the Editor of The Nation:

Sir: The Boston Athenæum possesses an interesting collection of over 300 volumes from the library of George Washington. These were acquired in 1848 from Henry Stevens for $3,800, subscribed by about seventy gentlemen in Boston, Cambridge, and Salem. A careful catalogue of these books has recently been compiled by Mr. A. P. C. Griffin, formerly of the Boston Public Library and now of the Lenox Library in New York. He has examined all of Washington's letters in the State Department at Washington, in Philadelphia, Boston, and elsewhere, and made notes of all passages in them relating to his books and the conditions under which they were obtained. The catalogue, which will shortly be published, includes, in addition to the books which were owned by Washington, a number of others formerly belonging to Judge Bushrod Washington and other members of the family, and the large collection of Washingtoniana which the Athenæum has gradually collected.

It is intended to add, in an appendix, the list of Washington's books as given in the appraiser's inventory filed in the Orphans' Court of Fairfax Co., Virginia. This list shows about a thousand volumes, and most of the books in the Athenæum collection can be identified on it in spite of the brief and imperfect titles given. I am anxious to trace the whereabouts of any of the other volumes, many of which have been sold at auction within the last ten years, and I shall be extremely obliged to any one who will kindly communicate any facts in his possession in regard to the present ownership of any of these books.—Very truly yours,

Wm. C. Lane, Librarian.

Boston, Mass., November 30, 1896.

THE CAMEL IN AFRICA.

To the Editor of The Nation:

Sir: The learned reviewer of Sayce's 'Egypt' asks (p. 350) what naturalists have "shown that the camel was not introduced into the northern coast of Africa until after the beginning of the Christian era." Whoever those "naturalists" may be, they are little acquainted with the facts. Cæsar took twenty-two camels from Juba half a century before the Christian era (*Bell. Afric.*, 68). The Louvre possesses a terracotta statuette, representing a camel, which was found in Cyrenaica, and belongs to the *second* century B. C. The real question is, whether or not the camel was of common use in the Barbary States (Tunis, Algeria, Morocco) before the *Byzantine* period. I have collected much evidence on the subject, both literary and monumental, in a paper entitled "Africain sur son chameau: terre cuite trouvée à Hadrumète," which I published in the "Collections du Musée Alaoui" (Paris, 1890, p. 33). Allow me to refer your reviewer to that exposé of the problem, to which I have nothing essential to add.—Truly yours, Salomon Reinach.

St. Germain-en-Laye, November 17, 1896.

SLAVIC STUDIES AT HARVARD.

To the Editor of The Nation:

Sir: Through the efforts of the lamented Prof. F. J. Child and Dr. A.C. Coolidge, provision has been made for the study of Slavic languages at Harvard University. Probably no better proof can be given of the necessity for such a chair than is furnished by the fact that it was found advisable the very first year to offer three courses, in Russian, Polish, and Old Church-Slavic, all of which are now actually taught. There have also come assurances that advanced courses will be asked for next year. In reply to the several inquiries as to the facilities offered here for the study of Russian, etc., a short statement of what is to be found in the University Library will, therefore, not be out of place.

Prof. Child created for the Library a folk-lore collection such as exists, probably, nowhere else in the world. This collection contains about seven hundred volumes of popular songs in every language and dialect of the Slavic family. These offer an inexhaustible source for linguistic and literary studies. The publications of the Historical and Archæographical Societies of Russia, Poland, Servia, Bohemia, of which the Library has complete sets, subserve the same purpose. Similar matter will be found in the publications of the Academies of St. Petersburg, Vienna, Cracow, Agram.

For philological purposes there are complete sets of the leading philological Slavic journals published in Germany, Russia, Poland, as well as the large collections of acta and monumenta of the several Slavic universities and academies. Through the munificent gift of Dr. A. C. Coolidge of nearly 3 000 Slavic volumes, we now possess all the most important philological and historical publications of all Slavic countries. This collection is especially rich in Polish literature. In all, not less than 6,000 volumes, which are now being placed compactly together as a Slavic collection, are available for historical, philological, and literary studies. The Russian literary material is rather weak, but we expect this year an addition of 300 volumes, and further gifts will not fail to come with the growing interest for Slavic studies at Harvard. The Boston Public Library has lately added 300 Croatian works to its Slavic books, and the trustees have passed an order for the purchase of some 600 volumes of Russian and Polish classics. It is a noteworthy fact that a former Harvard student sent last year to the Harvard Library a rich collection of Nihilistic literature; this will shortly be made complete by another gift of all such works as are not contained in the first, so that we shall have here a unique source for the study of Nihilism in Russia.

Leo Wiener,
Instructor in the Slavic Languages.

Harvard University, November 28, 1896.

HIGH SCHOOL AND GRAMMAR SCHOOL

To the Editor of The Nation:

Sir: As a schoolman I have been deeply interested in the whole subject of Elementary English in the Schools, both as presented in your paper and as discussed in the community at large. Personally I am one of those who acknowledge that there is fault in our teaching, and I also believe that the fault in this particular line of work is due to our colleges.

Prof. Dillard's charge, throwing the responsibility back upon the grammar schools, might be answered by teachers, as indeed it is answered by many, by pushing the responsibility back still farther, and placing it upon the primary schools, and yet again upon the homes. In truth, much of the fault does lie at the parents' door; but that by no means relieves the teacher, for his work is to overcome bad home training in this matter as in many others. My own observation (corroborated by others competent to judge) is that the language work in the grammar schools

is of a higher character and the results relatively more satisfactory than in the high schools. The number of subjects, of which he complains, does not interfere with the language work, or good work in any subject, provided the school has a good teacher. In fact, it is well known that those schools that neglect the so-called enrichment branches are doing the poorest work all along the line.

The reasons why this is so are simple. The lower schools can correlate their studies as the high schools cannot. The lower schools do not have the "college requirements" standing before them as a bar to good, honest teaching; and consequently they direct their efforts to child development rather than to stuff so much of this, that, and the other into the pupil in a given time that he may *pass an absurd examination*, that seldom reveals power and not always acquirements. The lower schools are looking for teachers who not only possess scholarship, but who also have a *special training* for their work; while the high schools have in the past certainly looked for scholarship only. The lower schools have responded to the needs of the time, and have adapted themselves to the social and economic changes, while the high schools are still under the bondage of an educational system centuries old—a system, by the way, that the colleges perpetuate and force upon all schools sending pupils to them.

ELMER L. CURTISS,
Superintendent of Schools.

HINGHAM, MASS., November 23, 1896.

CITIZENSHIP IN THE GRAMMAR SCHOOLS.

TO THE EDITOR OF THE NATION:

SIR: Your columns have of late teemed with complaints about the inability of the American youth to write good English in his examination papers in applying for admission to college. The complaint is doubtless just, and the root of the evil lies probably in the inefficient teaching of English in the high and grammar schools. But, bad as this is, there is a still greater crime that must be laid at the doors of our elementary schools, and that is the utterly inefficient teaching of citizenship for American youth.

Speaking for the Middle West, it may be said without fear of contradiction that the average citizen, the ordinary voter, the "plain man," never enters a high school, and he gets all his training from the grammar school. In his youthful, plastic period he learns reading, writing, spelling, grammar, some geography, a little history, and much (useless) arithmetic. We are of late perhaps getting away from the old style of learning in geography the names of capes and mountains and bays and rivers exclusively, but there is much to be learnt in the way of routes of commerce and the achievements of man on the face of the earth. In history there is a visible tendency to break away from date-memorizing, campaign-following, and statistics of battles, but in many quarters there is a grievous tendency to teach only American history—and Jingo history at that. It is not, perhaps, too much to say that probably there is not one school in fifty where the true history of the war of 1812 or the Mexican war is honestly taught. In some of our schools an attempt is made to teach English history in the last year of the grammar school, but in too many cases the most stress and energy is devoted to the mediæval and mythical periods of English history. That leaves almost no time for the great democratizing movements of later years. However, any history of England at all is better than none to awaken in the American youth's consciousness the idea that there are other nations on earth besides ours. A better course would undoubtedly be to take in something of the recent movements in Germany, France, and Italy. The history of Europe for the last hundred years would be extremely fruitful to the average child in counteracting the narrow, exclusive ideas of Americanism indigenous in a community so isolated and so far removed from the centres of culture as is the West of America.

Still, on the whole, there is a manifest improvement in the common schools in the line of history and geography teaching, and one ought to be thankful for half a loaf under certain conditions. But the one thing needful, the *sine qua non* of American citizenship, without which a republic constituted as is ours is hopeless, is not taught at all; and that is political science, science of government, or political economy, or whatever you choose to call it. What I mean is our understanding of the purpose, functions, and duties existing reciprocally between the citizen and his government, and between his government and other governments, together with a knowledge of the elementary laws of the production, exchange, and distribution of commodities among men. It is true that, in a scientifically arranged course of study for a candidate for the degree of bachelor of arts, such topics could be more adequately discussed in college; but I must repeat that the average man with us, the man who shapes our nation's policy, does not go to the high school even, and it is a question again of half a loaf or no bread; and, while a youth of fifteen might not discuss so broadly as he could at twenty the following topics (which, at the risk of seeming schoolmasterish, I will suggest), I cannot but believe that the habit of thought, once formed, would make him a less willing prey to the wily demagogue that he is sure to meet later in life:

"Why do we delegate part of our rights and powers as citizens to men whom we select for that purpose? Why must we have a government, and what is the purpose of that government? If we were stockholders in a street railway, for instance, on what principle should we select officers? Why not attend to all their duties ourselves? In choosing a board of directors what qualifications should we insist on? If we knew a 'real good fellow,' who was, say, a fairly good oiler in the engine-room, who could take a drink with the boys, tell a good story and belonged to our neighborhood, why not put him in charge of the entire electric plant because he was such a good-natured man and a friend of ours? Or if we had in our employ a motorman who attended strictly to business, never ran over people, was always on time, was exemplary in conduct, did our work faithfully, and never cost us money for careless accidents—if he had held the job for a couple of years, why not lay him off and put in a new, untried man off the farm, because the job was a well paying one and he needed work, and the other fellow ought not to keep a good thing all the time?

"Or, again, if our railway stock was quoted on the market at 95, could our board of directors vote it worth 150? If they did, what effect would such a proceeding have on the market value of that stock? Or suppose that, being in financial straits, our company should pay their bills with written promises to pay, and suppose that, in course of time, their creditors and the men's creditors should refuse to accept these promises at their face value—would the fact that our board of directors voted never so solemnly that the promises were worth a hundred cents on the dollar make them so in the markets of trade? If not, why not?

"Now, then, institute a comparison between a small corporation (explaining what a corporation is), like a street railway, and a large corporation, like the United States."

Similar questions could be asked and answers discussed on such subjects as money, currency, the doctrine of demand and supply of wheat, for instance, and the elementary principles of international law, even in the grammar school. The elementary principles of these large-sounding subjects are, as Langdell said of the common law, few and simple. Once mastered, only common sense and common honesty are required to put them in operation. It is perhaps hopeless to expect to do anything with the adult population of the Southern and extreme Western States that voted for national repudiation and dishonor in the last election, but there is hope for the rising generation if the common schools do their duty. Kansas, with its large percentage of voters who have attended American schools and do attend American churches, is probably not vicious at heart, not more dishonest than other parts of the country. The unfortunate political condition of Kansas is the direct result of the kind of teaching that the adult generation of Americans got from the public school twenty years ago. Jingoish ideas of America's past and future, ignorance of the experience and possibilities of foreign countries, ignorance of modern methods of commerce and finance, combined with isolation from the centres of culture and aloofness from the large affairs of life, will produce in any community the bad preëminence which at present distinguishes Kansas.

E. L. C. M.

CHICAGO, November 25, 1896.

Notes.

A. C. McCLURG & Co., Chicago, will speedily publish 'Eating and Drinking,' by Dr. Albert H. Hoyt.

Additional announcements by D. Appleton & Co. are 'Prehistoric Man and Beast,' by the Rev. H. N. Hutchinson; 'The Struggle of the Nations: Egypt, Syria and Assyria,' by Prof. G. Maspero; 'The Story of Extinct Civilizations in the East,' by Robert E. Anderson; 'Ancient Greek Literature,' by Prof. Gilbert G. A. Murray; 'The Aurora Borealis,' by Alfred Angot; and 'Some Masters of Lithography,' by Atherton Curtis, illustrated by twenty-two photogravures.

Lemcke & Buechner will shortly publish a new novel, 'Barbara Blomberg,' by Georg Ebers.

R. H. Russell & Son send us two collections of drawings, republished from *Life* and other periodicals, 'In Vanity Fair,' by A. B. Wenzell, and 'Pictures of People,' by Charles Dana Gibson. Both sets are very familiar to us all, but the cleverness of the one artist with the brush and the other with pen-and-ink is often made more conspicuous by the increased size of the present reproductions, which must closely approach that of the originals. Sometimes, indeed, there is an apparent loss of delicacy from the same source,

the drawings being too large and seemingly coarse for the near inspection their place in a book invites. Seen upon a wall, as pictures, there would be nothing but gain.

The same firm publish 'Posters in Miniature,' a book with almost as little text as those just mentioned, having only a very brief "Introduction" by Edward Penfield, the well-known designer of posters for Harper & Brothers. It has the advantage, for Americans, of containing a larger selection of American examples than any book on the subject we have seen, but not all these are of very high class, while the reproductions are, as a whole, rather indifferent. Only the pure black and-white pieces come out really well.

Macmillan Co. publish two books on artistic anatomy, 'Anatomy [Human] for Art Students,' by Prof. Arthur Thomson, and 'Studies in the Art Anatomy of Animals,' by Ernest E. Thompson. The latter is rather an atlas of plates than a book in the ordinary sense, the text being confined to a minimum of comment and explanation. The plates should prove valuable, especially to sculptors of animal life. A new feature, so far as we know, and an interesting one, is the introduction of plans of hair growth. The dog, the wolf, the fox, the cats (great and small), the horse, the ox and buffalo, the sheep, the dromedary and camel, and several types of bird, are fully treated, most space being given to the dog and horse, while several other animals are briefly treated of in the text, but without plates.

Prof. Thomson's book is, on the contrary, though profusely illustrated, an elaborate treatise on human anatomy as it affects external form. Prof. Thomson is lecturer on Anatomy at South Kensington, and his experience has taught him to understand the requirements of art students. We have been able to give the volume only a cursory examination, but that has convinced us that his method is, in the main, the right one. There is perhaps too much of detail for the average art student, but the point of view is constantly that of the student of form, not that of the student of function. Until the ideal book for students of drawing shall be written (when it is, it will be written by a painter), this may be recommended as an approximation to it. The illustrations from photographs from nature are perhaps better than anything could be but expressly prepared drawings by a master of the human figure. One wonders, however, if the greatest works of painting and sculpture might not be drawn upon with advantage for this purpose.

A welcome should be sure for 'Jean François Millet, his Life and Letters,' by Julia Cartwright (Mrs. Henry Ady), of which the London publishers are Swan Sonnenschein & Co., and the New York publishers the Macmillan Co. Mrs. Ady has thoroughly assimilated all the material at her disposal, and has produced a sound and painstaking piece of work, which corrects in some particulars the impression given by Sensier. Her own critical remarks are fairly good, but the criticism given in extracts from Millet's own letters is all that is essential, and is of the grave and splendid kind we know so well. The nine illustrations are beautifully rendered in photogravure, and paper and print leave little to be desired. The book is emphatically one to be desired by admirers (and who is not one?) of the great peasant-painter of Barbizon.

Mr. Cecil Torr's recent volume, 'Memphis and Mycenæ' (Cambridge [Eng.] University Press; New York: Macmillan), is addressed to the refutation of the assertion that "the Mycenæan age in Greece can definitely be fixed at 1500 B. C., or thereabouts, on the strength of evidence from Egyptian sources." An examination of this evidence leads to the discovery that the proof consists of two propositions: one, that the Mycenæan age was contemporary with a portion of the eighteenth Egyptian dynasty, and the other, that the date of certain kings of the dynasty approximated 1500 B. C. The discussions that follow are highly detailed and quite technical, so that they are of particular interest only to specialists, but the off-hand judgment of any one acquainted with the uncertainties of Egyptian chronology will be that, if the second proposition is an essential part of the proof of the view here sought to be controverted, the view has small chance of ultimate acceptance. The author's contribution to "an examination of Egyptian chronology and its application to the early history of Greece" would be more valuable if he had examined with care the sources whence his material was derived; but just this he admits that he has not done.

It is a great pity that Augustus Le Plongeon, M.D., who enjoyed great advantages for the exploration of the Maya country of Yucatan, did not confine himself to the task of adding to the world's stock of real knowledge when he sat down to write 'Queen Móo and the Egyptian Sphinx.' He starts with the assertion, "In this book I offer no theory," but his statements of fact with regard to the Mayas are so mixed up with fanciful and absurd assertions with regard to things Egyptian, not to mention China, India, Babylonia, and the four quarters of the earth, that one can with difficulty extract from them any real contribution to Maya history or archæology. His pictures are good, valuable as far as they go, and no doubt there is more or less of sound material to be found in the book if one had the time to search for it, but life is short, and the book is an octavo of nearly three hundred and fifty pages. We have stumbled upon some delicious bits of information about Egyptian archæology, and may be permitted to mention two of them. The claim is put forward, apparently with all seriousness, that the Egyptians learned the use of determinatives in their pictorial writing from the Mayas. The real fact is, that in this particular we are able to follow, more clearly than in any other, the internal development of the hieroglyphic system. At another place we are told that the Maya word "*Canob* signifies the 'Four,' the 'strong,' the 'mighty,'" and are then soberly informed that "From the Maya *Canob* the Egyptians no doubt called *Canopi* the four vases in which were deposited the entrails of the dead." The author does not seem to be aware that the word was not so used till the opening of the present century, and then only as the result of a misunderstanding. Even if this were not the case, the absurdity of the "theory" would not have to be pointed out to any one with even a rudimentary knowledge of Greek mythology or Egyptian antiquities. The list of the authorities cited by the author is a veritable curiosity. It ranges from the Book of Genesis, the Acts of the Apostles, and the 'Rig-Veda,' to "Dr." Paley and Ralph Waldo Emerson. But the names of Maspero and Petrie, not to mention a host of others, are conspicuous by their absence. The book is published in this city by the author.

Zittel's well-known 'Handbuch der Palaeontologie' is now appearing in English from the Macmillan press (Vol. I., Part 1, 352 pages, 593 woodcuts). Dr. Charles R. Eastman, of the Museum of Comparative Zcölogy, Cambridge, a former pupil of Professor von Zittel, is the editor and translator. He is assisted by a number of American specialists, as well as by the author himself, who is thoroughly revising the original. The work, which fills five large volumes, is one of the invaluable monuments of German intelligence and industry, and to say that the English translation is worthy of the original text is in itself high praise. It is a labor of love upon the part of the translator, both towards an old teacher and towards this great subject. This revised text will undoubtedly reach a still wider circle of readers than the original German edition, and probably its chief service will be to coördinate, and thus render more effective, researches which are going on independently in widely scattered centres of palæontological and geological study.

'The Earth and Its Story,' a first book of geology, by Angelo Heilprin, Professor of Geology in the Academy of Natural Sciences of Philadelphia (Boston: Silver, Burdett & Co.), is an excellent book of its kind—that is, it presents well-selected examples of appropriate facts, generally well illustrated, in pleasant and effective form for school use, and thus is sure to attract and interest the scholar; but the disciplinary element of instruction is not a prominent feature—perhaps intentionally so. A reference to the sections on water-gaps and terraces will illustrate our meaning. A praiseworthy quality of the book, for a beginning in geology, is the strict subordination of historical to dynamical geology, as illustrated in the forms and processes of to-day, namely, in physical geography; but in the thirty-odd pages devoted more or less directly to historical geology, the young student will be left with little idea of the real nature of the geological problems there touched upon. Fact, rather than principle and method of reaching the principle, is here presented to him.

The 'Allgemeine Erdkunde' of Hann, Hochstetter, and Pokorny is now appearing in a fifth much enlarged edition. Part i., by Hann, is just issued (Vienna: Tempsky), and treats of the earth as a whole, its atmosphere and hydrosphere. Part ii., by Brückner, on the earth's crust and its forms, and part iii., by Kirchhoff, on the distribution of animals and plants, are to be issued shortly. The first part is a thorough treatise from a competent hand. Its important chapters are: The earth as "Weltkörper"; terrestrial magnetism, with full discussion of the aurora borealis; the temperature, pressure, winds, rain, etc., of the atmosphere; the oceans, with an elaborate account of temperatures, and a good discussion of currents and tides. We know of no general work that is so complete and generally satisfactory as this; but, from its very fulness of detail, the relation of the parts to the whole is hardly impressed on the student with sufficient emphasis. The discussion of rainfall before the section on cyclones is an inverted order, inherited from a time when the importance of cyclones as a cause of rainfall was not understood; and among the few non-explanatory statements we have noticed is one concerning the diurnal inequality of the tides, from which the reader is not led to perceive an inequality in low as well as high water.

In spite of the reputation enjoyed by H. Habenicht as a cartographer in Perthes's geographical establishment at Gotha, his collection of essays entitled 'Grundriss einer exacten Schöpfungsgeschichte' (Vienna: Hartleben)

can be recommended only to the collectors of paradoxical literature. It is a fantastically gratuitous series of assumptions concerning the origin of continents, ocean basins, and everything else, by the explosive outbursting of gases contained within the earth, and the collapsing of the great craters of eruption, followed by a whole series of changes to order. The devastating outbursts destroy all life; hence Darwinism is declared to be out of the question. The alternate shrinking and expansion of the oceans, as the continents slide about, control the succession of glacial periods. The plates are nicely prepared, but they are highly imaginative, to say the least.

The thirty-seventh and latest number of the 'Geographische Charakter-Bilder' (Vienna: Hölzel) is an admirable view of the Gorge of the Rhine, looking south past the Lorelei from the upland back of St. Goarshausen. It is a reproduction in colors of a painting by Fischer, showing the broad fields and quiet villages of the uplands, above which the ridge of the Bingenwald rises faintly in the distance and beneath which the deep, steep-sided gorge is sharply incised—the gorge, an international highway, full of life and movement; the uplands, a region of rural byways, unseen by the thousands who pass beneath. A descriptive and explanatory text by Penck adds greatly to the educational value of the view, which, like the rest of the series, is intended "for school and home."

Calendars for 1897 begin to make their appearance, and we have before us (*place aux dames*) "A very seasonable Kalendar . . . designed to bee vsed by y^e manie louers of . . . Master William Shakespeare" (Boston: Louella C. Poole & Andrèa Jonsson, 457 Shawmut Ave.). The illustrations are by Maria Danforth Page, and the arabesque title-page is the fancy of Josephine Wright Chapman. This is altogether a very pretty and well-reasoned performance. Each sheet is rubricated, has its illustration—always sufficient and often pleasingly decorative—and is linked to its fellows by a hinge of silk cord. Drollery furnishes the motive of "A California Bear Calendar," illustrated by James Swinnerton and published in San Francisco by the Dodge Book and Stationery Co.; but we fear the Eastern mind will discover as little humor in it as art. "The Pursuit of Happiness Calendar, selected from the writings of Dr. Daniel G. Brinton, by Martha Allston Potts, with drawings by Wm. Sherman Potts" (Philadelphia: Geo. W. Jacobs & Co.) tells its own story. Dr. Brinton's genial face shows through the oval opening of the cover, as if in sympathy with the sentiment set down for January 6: "Sunshine within more than compensates for its absence without." The scheme and the ornamentation of this calendar are well contrived.

The German fashion is something solider and more instructive. "Meyer's Historisch-Geographischer Kalender" (Lemcke & Buechner), for example, is in effect an octavo book of 365 pages, printed on as many leaves. One can read it through with interest before tearing off the daily leaf. One or more historical events associated with the date, the festivals, a proverb or two, a bit of sentiment or of humor, fill out the sheet, which is headed with a picture. The majority of these are views of German cities after Merian's precious series of etchings (1645), with now and again a recent cut after a photograph of the same place, as in the case of Graz, Prag, and Lindau; and one could wish that this comparison had been more extensively carried out. Other pictures are portraits, old and new, or represent notable buildings, or scenery, or curious geologic formations. The scope, both historical and geographical and pictorial, is German in the broad sense. This calendar is, we conclude, too good to be destroyed by peeling from the pad.

We extract two items of interest from the November Bulletin of the Providence Public Library: (1.) Hereafter this publication will include all the accessions to the Providence Athenæum (a subscription library) and to the Brown University Library. (2.) The Boston Public Library maintains a public stenographer and typewriter, who is prepared to make investigations into material in that collection in behalf of persons or institutions at a distance. There is also a photograph-room for the copying of MSS., plates, etc.

The Quarterly Statement of the Palestine Exploration Fund for October contains a report of Dr. Bliss on his recent excavations at Jerusalem. In it he announces the discovery of a flight of thirty-four steps, with alternate wide and narrow treads, in the Tyropœon Valley, of what age it is now impossible to decide. A street was also uncovered in this same valley, with paving-stones of great size laid on a concrete bed made of chips and lime. These excavations, it should be added, are prosecuted with great difficulty, on account of the depth of the rubbish, which at places exceeds one hundred feet. It is very remarkable that no architectural or archæological remains of importance dating from Jewish times have yet been found. The veteran explorer Herr von Schick contributes an elaborate account, with ground plans, of the Church of the Ascension and the neighboring buildings.

The figure of Heinrich von Treitschke, as drawn by Paul Bailleu in the pages of the *Rundschau* for October and November, is impressive in its unstudied dramatic effect. Treitschke's ideas took early in life a turn sharply at variance with the traditions of his family and his native Saxony. Like Lessing, he was German to the core, and particularism and patriotism were to both of them mutually exclusive ideas. Germany's unity and greatness, through the influence and power of Prussia, was the single aim to which Treitschke devoted his life-work, whether as publicist or academical teacher, as historian, statesman, or representative in the Reichstag. An attack of the measles in his childhood left him partially deaf. His father was an officer of high rank in the Saxon army, and his brother fought against Prussia at Königgrätz; but neither physical infirmity nor the deeper affliction caused by strained family relations could make him swerve from his course. His character, his stalwartness and sincerity, also remind us of Lessing; but he had not, like the latter, a dislike for professorial chairs, and, great though the effect of his many publications has been, his influence upon the academic youth at Leipzig, Freiburg, Kiel, Heidelberg, and Berlin was ever felt by him as a powerful stimulus to patriotic activity. Between thirty and forty letters of Treitschke to Gustav Freytag, to Bismarck, and others are also published in this connection. Several of them are of historical interest, and recall vividly the political events of the periods to which they belong.

Volume i., No. 8 of the *Far East* (the monthly English edition of the Japanese *Kokumin-no-tomo*, or The Nation's Friend) contains articles on the downfall of the Ito cabinet, with pictures of the new Minister-President of State, Count Matsukata, and of Okuma, Minister of Foreign Affairs. Japan is now reaping the evil aftermath of a successful war, in the shape of deficits in revenue, increased taxation to support the swollen military and naval establishments, and the payment in gold for foreign war material. She finds a sea of troubles, too, in the form of a depressed silk market and enormous losses of life and property from destructive natural elements. Very few critics of either party expect the new cabinet to continue very long, or to be able to face with full success the new and complex problems entailed by the war. In "A Word to Americans," Mr. Shimada Saburo, scholar, historian, and vice-president of the lower house of the Diet, protests against those obstacles to trade between Japan and the United States which an American high tariff will set up. He turns upon us the text which Perry and Harris preached so loudly with warships and diplomacy forty years ago, "To maintain communication between the races is the will of God." Dr. W. F. Eastlake, resident in Japan for more than fifteen years, who has just finished his 'Heroic Japan,' a history of the Chino-Japanese war of 1894–'5, in an acute paper on the Europeanization of Japan, declares that "European nations will never admit as their equal a land in which Buddhism is the national or favorite creed." With news and notes there is a detailed account of the chanoyu (hot water tea) ceremony.

—To the expert eye the London *Academy* had for a long time been showing signs of financial pinch and loosening hold on existence when it was bruited that a change of management was impending. This change took place with the issue for November 14 (No. 1280). Mr. Lewis Hind succeeds Mr. James S. Cotton as editor, being the fourth in descent from the founder, Dr. Charles Edward Appleton. What most marks the new broom is not the improved paper and typography, nor the rearrangement of parts, nor the "portrait supplement," but the explicit abandonment of the signed review. The open proclamation of the critic was the chief excuse for a rival to the *Athenæum* in the year 1869, so far as the reading public was concerned. At the same time, the creation of the *Academy* was a satisfaction to those who smarted under the elder journal's anonymous criticism, or regarded the *Athenæum* as dominated by a clique, or for other reasons found themselves out with it and its editorial control; and of course the more critical reviews, the more chances for budding reviewers. Experience has fully justified those who held to the conservative ground which has made English criticism of books the best in the world. At no period did the *Academy* reach the level of the *Athenæum*, or deliver its message with the same independence and directness and with equal weight. This is not, of course, to deny its scholarly direction and support, and its essential utility as an organ of learning. The change will dishearten those who, in this country, occasionally lift up their voices against anonymity, in the face of some very striking examples of literary reputations lowered by signed criticism. It ought not to be overlooked that a large body of minor criticism, none the less conclusive or possibly offensive for being brief—much of it in the nature of hack-work, and therefore superficial and careless—regularly went unsigned in the *Academy*.

—Two books just published by John Wiley & Sons, 'American Theatres,' by William H. Birkmire, and 'Theatre Fires and Panics,' by

William Paul Gerhard, C.E., contain much information concerning modern play-houses and their construction, most of which, however, is too technical to be of interest to the general reader. The former is devoted chiefly to detailed descriptions, with abundant photographic illustrations, of the many fine theatres erected during the last few years in New York, Boston, and Chicago. All of them are highly decorated, more or less commodious, and nominally, if not actually, fireproof. The latter discusses fires and panics and the various precautions which ought to be taken against them. It appears that, since 1751, nearly 750 theatres have been burned in different parts of the world (there is some little discrepancy in the figures quoted from different authorities), with a loss of nearly 7,000 lives. This proves the importance of the subject. Mr. Gerhard, evidently, has studied it carefully, and his conclusions, so far as they go, are perfectly sound. All that he says about the necessity of fireproof materials in building, abundant and easy modes of exit, open spaces around the theatre, a copious water supply, frequent inspection, disciplined attendants, etc., is indisputably true, but in no sense original or novel. The list which he furnishes of patent appliances of all kinds for the prompt extinction of flames once started seems to be very complete, and many of them, no doubt, are essential, but the vital question is not how to put a fire out, but how to prevent the possibility of its occurrence. On this point he is not so clear and definite as he might be. As a matter of fact, there is no excuse for having the present amount of combustible material in a theatre, or, practically, any combustible material at all. Everything on or about the stage, including scenery, ropes, draperies, even the lightest costumes of the players, can be made absolutely fire-proof. Moreover, with separate structures for lighting and heating apparatus, it is not necessary to have flame of any sort within the building. So much assurance of precaution would do away with the chief provoking cause of a theatrical panic, more dangerous to life than fire itself.

—Volume iv. of the Grimm Library (London: David Nutt), entitled 'The Voyage of Bran, edited with translation, by Kuno Meyer, with an Essay upon the Irish Vision of the Happy Otherworld, etc.,' by Alfred Nutt, is a valuable gift both to the philologist and to the folklorist. The Voyage of Bran has been much discussed of late, notably by Zimmer. The significance of the text for Irish grammar may best be learned from Meyer's words, p. xvi: "The Voyage of Bran was originally written down in the *seventh century*. From this original, some time in the tenth century, a copy was made, in which the language of the *poetry*, protected by the laws of metre and assonance, was *left almost intact*, while the prose was subjected to a process of partial modernization, which most affected the verbal forms. From this tenth-century copy all our MSS. are derived." We have italicized the significant words. They imply that pratically we have a poetical text in Irish as that language existed in the seventh century. The quatrains in the Voyage of Bran, then, take rank with, if they do not antedate, our earliest literature in Anglo-Saxon and German, and are contemporary with the celebrated Würzburg Gloss to the Pauline Epistles (see Zimmer, 'Glossæ Hibernicæ,' and Whitley Stokes, 'The Old-Irish Glosses'). These quatrains (60 in number, or 240 lines in the present edition), accordingly, may be used to complement the phonology and lexicography of the Würzburg gloss. Of Professor Meyer's part as editor and commentator we can speak only in terms of the highest praise; evidently he has spared no pains to make his work both lucid and exhaustive. The same praise should be extended to Mr. Nutt's disquisitions upon the general conceptions underlying the Irish story. Though still incomplete (the present volume contains only Part I.), the Essay proves the author to be a master of his complicated theme. He indicates the relations and interdependence of Irish, Classical, Jewish, and Early Christian conceptions of an Other-World and a Happy Land. As a specimen we may refer to chapter x., which treats of the Phœnix story, familiar to students of Anglo-Saxon, of the Apocryphal Apocalypses (especially of Peter), the Visio Pauli, the Second Sibylline Oracle, etc. Under Mr. Nutt's cautious guidance one cannot help becoming initiated in the marvellous complexity of mediæval literature.

—From the Clarendon Press we have the first part of a 'Compendious Syriac Dictionary,' by J. Payne Smith, a daughter of the late R. Payne Smith, D.D. The work is substantially an abridgment of her father's 'Thesaurus Syriacus.' Proper names and a multitude of the foreign words with which Syriac writers embellished their style are omitted, as well as all references to authors and native lexicons. The arrangement is alphabetical instead of etymological, even *Afel's* of verbs with a weak initial consonant being entered under A, with a reference to the verbs from which they are formed. Derivative and cognate words are registered under the roots to which they belong. In various ways considerable space is given to matters for which it would have been better simply to refer to a grammar, as, for example, in the article on the letter Âlaf. So it is surely superfluous to give—as is done throughout—the plural of nouns and the feminine of adjectives which are entirely regular; those who use such a dictionary must be presumed to have at least learned their paradigms. On the other hand, the distinction between the explosive and spirant sounds of the mutes in words like *abhâ*, 'father,' *ebâ* or *ebbâ*, 'fruit,' which can be learned only from the dictionary, is neglected. The definitions, in English, are concise and clear. The author has generally followed the 'Thesaurus' closely, even where criticism or subsequent research has proved it wrong; the name of the month Adar, for example, is still said to be derived from the Persian, though it is now certainly known to be of Babylonian origin. In some cases the work of abridgment seems to have been rather hastily done. Thus, the 'Thesaurus' tells us that *aubâurâun* (the pronunciation is dubious) is interpreted by some 'wild chicory,' by others 'dandelion'; the 'Dictionary' sets these down, under *a* and *b*, as the two meanings of the word. Löw's discussion of the word is not noticed, and the true form of the name is entirely omitted. In the rare instances in which the author departs in any way from the larger work she has not always improved upon it. The reintroduction (from Castell) of "a mason's trowel" as one of the meanings of *abhâthâ* is certainly a mistake. In general, however, the work seems to have been well done, and the Dictionary will doubtless be warmly welcomed by English and American students. When completed it will, as we estimate, fill not far from 600 pages in quarto, and thus be considerably longer than the recent Lexicon of Brockelmann. The typography is fully up to the standard of the Clarendon Press; higher praise cannot be given.

—With the exception of our cities, local government in the United States has not of late years been the subject of many experiments, though time has brought about some changes in administrative detail. More than ordinary importance, therefore, attaches to the proposed remodelling of its form of government which the town of Melrose, Mass., had for some months under consideration, even cast into definite form for submission to the Legislature, and then, unfortunately for the curious, rejected. The plan provides for a representative body of fifty members, to be known as the Town Council, and exercising the powers vested by law in the town as a municipal corporation, but heretofore exercised by the town meeting. The duties now performed by the selectmen, water, sewer, and road commissioners, surveyors of highways, and overseers of the poor are to devolve upon an executive board of nine members, to be known as the Board of Public Works. For election purposes the town is to be divided into five precincts, each of which is to elect eight members of the Town Council, the remaining ten to be chosen at large. The members of the Board of Public Works will regularly be elected for three years, three retiring annually. The Board will have the appointment and removal of a number of town officials, but the town will continue to elect annually its Clerk, Assessors, School Committee, Treasurer, Auditor, and Board of Health. The Board is to meet as often as occasion requires; the Town Council is to meet in January, March, and October of each year, and at other times on the request of ten or more legal voters, or as they themselves may deem necessary. It will be seen that by this plan the Town Council will be legislative in its character, with control, apparently, of taxation and finance, while the Board of Public Works is intended to be purely executive. The town meeting disappears. The outcome of such an experiment would be awaited with widespread interest.

—Since the meeting of the International Woman's Congress at Berlin, in September last, the tone of the German public press has undergone a complete change as far as discussions of questions pertaining to the woman movement are concerned. While these were formerly quite generally characterized by flippancy or lack of sympathy, they are now marked by a serious and friendly spirit. If the recent event itself attracted the attention of thoughtful men and women in the country, the calmness and dignity with which all the meetings of the congress were conducted seem to have won universal respect for its members. Even the exchange of views between the *Socialdemokratinnen* and the more conservative majority of the participants in the congress did not lead to intemperance of language or exhibitions of violent antagonism—a circumstance with which foreign delegates have been favorably impressed. English and French delegates have expressed their surprise at the remarkable self control and matter-of-fact ways of the German women. The latter, in their turn, are deriving from occurrences at the congress encouragement for the future reconciliation of the classes through the mediation of woman. One of their special objects of agitation just now is the revision, by the new Reichstag two years hence, of certain sec-

tions of the new civil code of the Empire which will not take effect till the year 1900.

LANG'S LOCKHART.

The Life and Letters of John Gibson Lockhart. By Andrew Lang. From Abbotsford and Milton Lockhart MSS. and other original sources. With fifteen illustrations. 2 vols. London: John C. Nimmo; New York: Charles Scribner's Sons. 1896.

THESE two showy and costly volumes deserve a wider circulation than it is to be feared their size and price will allow. It was eminently right that the Life of Lockhart should be written; and perhaps, all things considered, Mr. Andrew Lang was the best person to write it. He is a Scotchman; he is a man of fine taste and a practised writer; and he honestly and heartily admires Sir Walter in these days which affect to call Scott's poems "verse" and his novels antiquated. Perhaps no one else could have been found combining these three necessary qualifications; and certainly his book is one not laid down in a hurry after it is once taken up. Yet there is, all through, an effort in reading it which is never experienced by those who love its subject. Mr. Lang's constant writing in modern periodicals has given him something of their smart, jerky style, not wholly out of tune, perhaps, with Lockhart's own earlier production, but one which he would have assuredly made to feel his correcting pen if offered to the *Quarterly*.

John Gibson Lockhart, whose life extended from 1794 to 1854, was a man of exceptional attractiveness in person, talents, and character. His means were small enough to stimulate him to hard work; his education at Oxford and his social position in Scotland were perfectly adapted to introduce him to the circles where his talents could be turned to the best account. Yet, as we read his life, we get the impression of ill-success, and there is an air of sadness over it which does not surround others of his contemporaries—Southey, for instance—who worked harder and scarcely achieved more. Two causes contributed to make Lockhart get less out of life than he might have hoped. First was his intense love of satire, even to the extent in his youth of making mischief; his keen, trained mind detected the follies and weaknesses of his contemporaries instantly, and when the ludicrous vision once arose, an almost irresistible propensity led him to make them the subject of provoking, too often of absolutely insulting, fun. He carried this so far in his early literary life that when, by the advice of Scott, and probably by his own advice to himself, he was ready to drop it, and did do so, the reputation of a merciless satirist was gained and was not to be shaken off. The place where this evil temper found vent was in *Blackwood's Magazine*, where, in conjunction with John Wilson, who really behaved sometimes more like a malicious schoolboy than a grown man, and deserved the like punishment, he filled number after number with jests on all and sundry which no possible coolness or good nature could laugh at or forgive. Mr. Lang endeavors to throw off the blame of this wanton abuse on Blackwood the editor, whom he makes out to have been as fond of a "slashing article" as the immortal Bungay. But it does not appear that Lockhart or Wilson ever objected to write the "slashing articles," and, considering that they really were "Maga," the idea that she was a kind of siren who seduced them into reckless bad manners is fanciful.

In all his account of Lockhart's connection with *Blackwood*, with the *Quarterly*, and with John Wilson Croker, Mr. Lang admits that he had not full access to original documents and was obliged in many parts of his subject to feel his way. Certain it is that he writes rather as defending Lockhart against charges which everybody knows than as telling the story which every one does not know, and letting us form our own opinion. In discussing the terrible duel between Christie and John Scott, which is of itself enough to stamp the whole breed of duels as wicked and absurd, he is determined to clear Lockhart from any imputation against his honor. Technically, according to the wretched code of the duello, he succeeds, by the simple process of throwing much of the blame on Horace Smith, who was Scott's second—and certainly no duellist ever had worse seconds than poor Scott; but the fact remains that if Lockhart had not sought to maintain his honor by the formal absurdity of "posting" Scott, there need never have been any duel at all. The idea, however, that mischief, and quarrels, and duels, and deaths might come of his fighting temper does not seem to have troubled Lockhart much.

The second obstacle to Lockhart's success, which superficial people might fancy was a blessing, was his being Sir Walter's son-in-law. It overshadowed him, it hampered him, and one might almost say it crushed him. It enabled him to write one of the most delightful books ever written; but the position he was in during Scott's life, and the cares in which this relation involved him after his death, were altogether too much for his shy, sensitive, sad nature. Contact with the cheery, robust, insouciant character of Sir Walter seemed the very thing to correct his faults, especially when we consider how tenderly and delicately the task was taken in hand; but the constant comparison of two such characters by the world inevitably drove the younger and secondary soul in upon itself and aggravated its melancholy. The world criticised him for not being like his great connection, as it would have criticised him still worse for trying to imitate him.

The whole story of this alliance, this marriage with a child of the immortals which was almost as fatal as those of Tithonus and Anchises, is most of it very well told by Mr. Lang, who has had unreserved access to the Abbotsford papers; but there is one serious exception. Scott's Life, as written by Lockhart, gave great offence to the representatives of the Ballantynes, his printer and publisher. A war of pamphlets took place, in which the Ballantynes had the last word, and in which Lockhart's contribution, whether correct or not in facts, is certainly, as Mr. Lang has to admit, sufficiently flippant in tone. In fact, Lockhart appears so one-sided in the correspondence that his biographer is obliged to speak of him as holding a brief, and to throw all blame for misrepresentation of facts, if blame there be, upon Cadell, the last of Scott's publishers. But any one who has read all three pamphlets—not, perhaps, easy to collect now—and Mr. Lang's apology, will be almost forced into the belief that Sir Walter, in following the will-of-the-wisp of a baronial estate, with its castle, not only ruined himself, but ruined the printing-house which, without his insane purchases and constructions, might have given both him and his printers a noble income; and that the failure was by his fault and not that of the Ballantynes. In this, as in so many cases, the old tale recurs: Lockhart may be acquitted of sober malignity, but he could hardly tell even an honest story without resorting to reckless satire against any antagonist, high or low; and such hornet's stings hurt worse than deadlier poison.

In fact, as has been already noticed by some English reviewers, Mr. Lang injures his hero by the very ardor of his defence. He is so anxious to defend Lockhart against charges of being a fiend that he hardly recognizes how much suffering Lockhart caused by a boyish love of mischief. He has brought out, with loving care, the genius, the industry, the truly tender heart, and the sorrow which seemed almost to pursue Lockhart like an avenging deity; and for this labor of love he deserves warm thanks. He deserves, perhaps, even greater thanks for adding another brilliant and polished gem to the cairn of Lockhart's illustrious friend and connection, whose fame is beginning again to assert itself against a series of attacks as deficient in artistic sense as they are in generous emotion, and which in due time will all be consigned to the same limbo with Jeffrey's original review of 'Marmion'—worth studying only to see to what absurdities a critic can come who writes from a valley and not from a hill.

PINE FORESTRY.

The Timber Pines of the Southern States. By Charles Mohr, Ph.D. Together with a Discussion of the Structure of their Wood, by Fillibert Roth. Washington: Government Printing-Office. 1896.

The White Pine. With Tables of Volume and Yield. By Gifford Pinchot and H. S. Graves. The Century Company. 1896.

FEW subjects are considered of greater practical importance by thoughtful people than the proper treatment of forests; there are few subjects more neglected. In a half-hearted way we delegate to State and national commissions on forestry such powers as we think will not conflict with the prejudices of our voting lumbermen; we encourage frantic newspaper appeals to the wood-pulp manufacturer and to the owners of the lumber railroads; and then, having done our duty, we calmly suffer the work of forest destruction to proceed. We treat the whole matter as if it were some sort of charity, readily transferable to a set of officers, instead of needing constant and earnest consideration at home and at our own doors. In truth, the whole matter presents a very discouraging side. For instance, if a practical lumberman in New Hampshire should be told that leaving the rubbishy tops and large branches of his trees in the woods where his logs are cut increases immensely the terrible risk of his greatest peril, fire, he would tell you truly that he admits what you say, but that he cannot apply foreign rules to his operations. In Europe, the poor would gather gladly the smallest of the twigs for faggots, but here nobody in his senses would take as a gift even the large branches for fuel. The lumberman would rightly say that whoever wants the waste for fuel or for wood-pulp is welcome to it, but that he himself will not use up his narrow margin of profit by removing the hazardous tangle of fallen limbs. Moreover, he will be very likely to add, also, some expression of his views as to making clean work of trees, large and small, instead of cutting only the larger and leaving the smaller to grow and be cut in their turn. He may go even so far as to show that he dares not incur the risk of keeping the smaller trees standing in the midst of his rubbish, for he may lose them by

fire. And when you come to the question of replanting as you go along, as is the custom in some of the forest operations abroad, he shows its impracticability or absurdity under conditions which prevail in our Northeast. Admitting everything you claim, confessing that he is pursuing a destructive policy, he goes right ahead, and leaves behind him a mass of timber and scrub through which, from lightning or huntsman's match, wildfire will run, and this in turn will leave the hillsides to be robbed of soil at all seasons of the year.

Perhaps the lumberman is right; perhaps he cannot afford to aid in protecting his own property and that of his neighbors down in the valleys. If so, the question of keeping our mountains and hill tops covered with forest will have to be taken in hand, not by sagacious lumbermen skilled in forestry, and treating the woodland as a permanent investment, but by the manufacturers on the rivers which come from the strength of the hills. In these days of steam the perils from scanty supply of water are by no means so great as the dangers from sudden freshets. These twin but unequal dangers are now assuming their proper magnitude in the reports of directors of manufacturing companies. All recognize the importance of the matter, and all feel helpless. It is generally recognized that, in order to effect adequate protection, large districts must be held under single management. Hence follows the conclusion that the State should promptly do something, even if it be rather arbitrary and in invasion of private rights. In other parts of the country there is likewise a feeling that our imperilled forests must somehow or other be taken in hand by Government and held for the good of all. Our Government has taken the consideration, but not the forests, in hand.

The Division of Forestry in the Department of Agriculture (like its predecessors under other names) has been for many years engaged in the collection and diffusion of information regarding sound methods of procedure in forest operations, but it has not felt called upon to propose extreme measures. It has rather endeavored to apply established principles of European forestry to our conditions, and in this it has not always commanded a respectful hearing. When, however, it has attempted to describe exhaustively our forests or their constituent parts, it has generally succeeded in a happy manner. This is well illustrated by the admirable monographs by Dr. Mohr and Mr. Roth, published under the auspices of the Division. To Dr. Mohr was intrusted the task of describing the four principal pines of the Southern States, which have economic interest, namely, *Pinus palustris*, Long-leaf Pine, *Pinus echinata*, Short-leaf Pine, *Pinus Tæda*, Loblolly Pine, and *Pinus heterophylla*, Cuban Pine. The first two are generally known as Southern or Yellow Pine, the two latter are frequently called Slash Pine. The botanical characters of the species, their rate of growth, and their products are dealt with in a systematic and thorough manner. The structure of the wood has been well worked out, and the results are embodied in the same report. The whole treatise is designed to "enable the owners of the Southern pineries, who are now engaged in exploiting them, so to modify their treatment of the same as to insure continued reproduction instead of complete exhaustion, which is threatened under present methods." It is a scientific and honest attempt to present sound advice on the subject.

If, now, we try to place ourselves in the position of the small owners of timber lots within the limits mentioned in the monographs, we should simply despair of accomplishing anything in a practical way. It would be out of the question to manage our little wood-lots after the methods here suggested; and we should give up discouraged, and with bitter feelings towards the unpractical doctrinaires who had tried to make us work after their theoretical fashion. But, on the other hand, suppose we were in charge of a territory belonging to a syndicate willing to make fair trial of promising methods, we should unhesitatingly welcome the present monographs as of high value in our practical work. And this is just what the chief of the Division of Foresty has here aimed at. He says:

"The owners of timber land and the operators of mills are the only people who can improve these conditions, and this by a more rational treatment of their property. If they can be made to realize now that what they own and hold as a temporary speculation will, in a short time, when supplies have visibly decreased, become a first class investment, and, by its revenues, become a greater source of wealth under competent management with a view to reproduction than that which they have derived from it by the mere robbing of the old timber, they might take steps at least against the unnecessary damage done to it by fire and cattle. Permanency and continuity of ownership appear to be the first condition to insure such results, and therefore corporations which are not of an ephemeral character and men of large wealth are most desirable forest owners."

It appears as if, under existing conditions, the best way to secure the advantages of forestry, both North and South, is to secure the formation of corporations made up of people interested in the development of forest culture and willing to take small profits on their investments. Such corporations can find intelligent superintendents trained in practical forestry, under whose judicious management forestry, especially at the South, would become safe and reasonably profitable.

Where the question is one of protection against freshets, and not a matter of profit from lumber, it would be perhaps possible for our larger manufacturing establishments on our Eastern rivers to secure large tracts of timber on our more exposed elevated lands, which could be managed solely with the design of preserving the integrity of the watershed. All such problems of tree preservation at the North and East could be safely left to our foresters. But we should not look with confidence to them for any profitable logging. All profits would be solely the indirect ones arising from governing water-supply and water-release. In the South, however, as we have intimated, the case is different. Here we should expect safe albeit small profits in the direct way. The monographs by Dr. Mohr are a valuable contribution looking towards this end.

As indicating the drift of scientific forestry, we commend to the attention of our readers the little book by Mr. Pinchot and Dr. Graves, on the White Pine. It shows how the study of trees differs nowadays from the study of even a quarter of a century ago, and gives substantial ground for the belief that better times are in store. With Prof. Sargent's 'Silva' and its remarkable illustrations by Mr. Faxon, those who are interested in our forest trees possess all requisite appliances for the recognition and comparison of the species. The excellent works referred to in this notice prove that the study of the species from a botanical point of view can be satisfactorily supplemented in all their economic aspects. Hence it is an auspicious time to convert some of the neglect which we deplore into active enterprise in conservative forestry. In our opinion Prof. Fernow of the Division at Washington deserves a great deal of credit for his services in enlisting in the cause of sound forestry the many who are now coöperating with him throughout the country.

Chapters from a Life. By Elizabeth Stuart Phelps. Illustrated. Boston: Houghton, Mifflin & Co. 1896.

MRS. WARD begins the story of her life in the high-pitched voice with which all those who have read her much are too painfully familiar, and this note recurs at times throughout the book, especially in the didactic, or rather hortatory, parts. The narrative parts are written more quietly, yet with an excess of animal spirits, and a proneness to that kind of humor which consists in using sesquipedalian words to express simple ideas. Even where no humor is intended, we have such laborious clumsiness of phrase as suggests the local editorial rather than good literature. For example, speaking of Emerson's behavior among the Andover theologians, she says:

"His clear-cut, sarcastic lips sought to assume the well-bred curves of conformity to the environment of entertainers who valued him so highly as to demand a series of his own lectures; but the cynic [cynicism?] of his temperamental revolt from us, or, to be exact, from the thing which he supposed us to be, lurked in every line of his memorable face."

Few of those who knew Emerson much better than Mrs. Ward ever knew him will recognize him in her school-girl picture, which evidently has been a good deal "restored" by her maturer hand.

As Benedick, when he said he would die single, did not think he should live till he was married, so Mrs. Ward, when she fancied that autobiography was of all things most objectionable to her, little imagined that she would live to write her own. She gives no reasons for so radical a change of mind. She is very modest in crediting all her literary ability to her ancestors, but apparently less just. If heredity counts for anything, one would certainly expect ability from the granddaughter of Moses Stuart, but not of Mrs. Ward's particular kind. The face of Moses Stuart contrasts violently with that of her paternal grandfather, whose great distinction was long acquaintance with a haunted house. Mrs. Ward has in her possession his MS. record of this experience, but has solemnly bound herself to defraud the societies for psychical research of their right and title to examine it. Of her father she says little, having dealt with him elsewhere. Her mother had a distinct literary gift, and her 'Sunnyside,' a picture of a New England minister's domestic life, reached a circulation of 100,000 copies before her early death. If we remember rightly, it was written very quietly, but she had a passion for high colors in dress goods, and this seems to have passed over into the daughter's style of writing, which has many passages corresponding to the red broadcloth and the canary yellow in which the mother arrayed her little boy and girl.

"Andover Life and People" is the most delightful chapter in the book. There are airs from Cranford blowing through it—these more in the provincial traits suggested than in the author's habitually restless manner of depicting the amenities and humors of the

frugal academic town. As a mere girl Miss Phelps got $2.50 for a story, but her literary ambition seemed to catch with its success surcease. The war came home to the Andover Academy and Theological School very seriously, and from its emotional quickening came Miss Phelps's real start on her literary career, a war story for *Harper's Magazine*. She is quite confident that, had this story been rejected, or the next, or the next, she would have written no more; but we permit ourselves to entertain a doubt of this. She has good advice for young writers, telling them how little "influence" can do for them; that the editors and publishers are much more anxious to get really good things than the young authors are to sell their wares. But they do not always know a good thing when they see it. The catalogue is long of admirable things which have been rejected by distinguished editors and publishers. A big story is told of her substantially rewriting a child's book of 350 pp. that came back to her, between suppertime and the next morning, but in general Mrs. Ward professes to have been a very careful writer, surprising us with the fact that her 'Gates Ajar,' which yields such an impression of spontaneity, was some years in the making, and hung fire in the publisher's office for two more. This book was her great success, so far as wide popular admiration is concerned. It was a strong emotional cry for immortality, contending that the cry was the sufficient evidence of the thing so much desired. It was much translated, much answered, much supplemented, travestied, economized. There were "Gates Ajar" tippets, collars, funeral-pieces, songs, cigars, and patent medicines. A Westerner in Boston inquired furtively of a bartender if there was a new drink called "Gates Ajar." One must remember the average quality of the preaching of a future life in the early sixties in order to appreciate the appeal which the book made to persons of emotional temperament and hungry heart.

Mrs. Ward's reminiscences of Mrs. Stowe, James T. Fields, Celia Thaxter, Whittier, Lucy Larcom, Phillips Brooks, and others are not elaborate, but they are interesting contributions to a fund which cannot be too large. "Andover was a heavy, masculine place," and for this reason Mrs. Stowe was regarded with suspicion, rumors of certain Episcopalian leanings coöperating with her undeniable sex. 'The Minister's Wooing' was written there, the outcome of a bitter personal experience. There are pleasing stories of Mr. Fields's kindness to unfortunate authors and lecture agents. One of Miss Phelps's best titles, 'Men, Women, and Ghosts,' was of his devising. Longfellow she had the honor of introducing in his old age to the reef of Norman's Woe on which he had wrecked the *Hesperus* in his youth. We find Whittier half repenting his scorching "Ichabod," but his impulses were always wiser than his calculations. One of the best stories brackets him and Lucy Larcom in the happiest manner. They were driving together, the hill was steep, the horse lively and threatening to break. Miss Larcom's subject was presumably the life to come. "Lucy," cried the poet, "if thee doesn't stop talking till I get this horse in hand, thee will be in heaven before thee wants to."

A chapter on Mrs. Ward's life at Gloucester is braided of many colors, light and dark; the darkest the misery entailed by the drinking habit on the fishermen and their families, out of which came her terrible story of 'Jack the Fisherman,' and more recently 'A Singular Life,' which has so deeply stirred a multitude of the most earnest people. Another cloud upon the Gloucester life was sickness with insomnia, and Mrs. Ward is passionate in her advice against the use of anodynes to conjure sleep. Upon the other side of the account was her happy marriage with Mr. Ward. Something of the personal equation lurks in her estimate of the books they wrote together, 'The Master of the Magicians' and 'Come Forth.' Of her short stories she tells us that her favorites are 'The Madonna of the Tubs,' 'Jack the Fisherman,' 'The Supply at Saint Agatha's,' and 'The Bell of Saint Basil's.' She argues earnestly for "art for truth's sake" as a wiser motto than "art for art's sake." "In a word," she says, "the province of the artist is to portray life as it is; and life *is* moral reponsibility." If her own art has suffered from her moral insistence, the fault is one than which there is no greener leaf among the laurels she has fairly won.

Lectures on Justice, Police, Revenue, and Arms delivered in the University of Glasgow by Adam Smith, reported by a student in 1763, and edited, with introduction and notes, by Edwin Cannan. Oxford: Clarendon Press; New York: Macmillan. 1896. xxxix, 293 pp.

A MOOT question in the history of economic thought has long been the degree of originality possessed by its great classic, Adam Smith's 'Wealth of Nations.' Opinion has varied from Dupont de Nemours's dictum, "Everything that is true in this respectable but tedious work in two fat quarto volumes is to be found in Turgot's 'Reflections on the Formation and Distribution of Riches'; everything added by Adam Smith is inaccurate, not to say incorrect"—to McCulloch's familiar estimate, "The 'Wealth of Nations' was the first work in which the science was treated to its fullest extent," and "gives Adam Smith an undoubted claim to be regarded as the founder of the modern system of political economy." French writers have in general inclined to the first opinion; English economists have as naturally pinned their faith to the second.

The facts of the case are these: Adam Smith occupied the chair of Moral Philosophy in the University of Glasgow from 1752 to 1764. In this capacity he delivered regular courses of lectures on jurisprudence and politics, some part of which had indeed been given at Edinburgh as early as 1750. The concluding paragraph of 'The Theory of Moral Sentiments,' published in 1759, explicitly promised a comprehensive treatise by the same author upon the general principles of law and government. Smith resigned his professorship in 1764 to accept a travelling tutorship to the young Duke of Buccleugh, and began the actual composition of the 'Wealth of Nations' in the same year. The greater part of 1766 was spent in Paris, in intimate association with the brilliant coterie of French economists of which Quesnay was the recognized leader, and of which Turgot, Dupont de Nemours, Mercier de la Rivière and Mirabeau were distinguished disciples. Smith returned to England in the latter part of 1766, and remained in retirement, steadily engaged upon the 'Wealth of Nations,' until its publication in March, 1776.

The issue is then clear. Is the 'Wealth of Nations' in the main an independent development of Smith's earlier thought as represented in the Glasgow lectures, or does it merely reflect in its essential doctrines the general influence of the physiocratic writers? The method of verification which naturally suggests itself—comparison of the treatise with the lecture-notes—is made impossible by Smith's zealous care to destroy all his manuscripts before his death. In lieu thereof, biographers and critics have had to content themselves with John Millar's brief outline of the lectures, obtained and inserted by Dugald Stewart in his memoir of Adam Smith, and containing the explicit statement that "what he [*i. e.*, Smith] delivered on these subjects contained the substance of the work he afterwards published under the title of 'An Inquiry into the Nature and Causes of the Wealth of Nations.'" This testimony of a person who actually heard the lectures has been supplemented by Mr. John Rae, in his recent admirable 'Life of Adam Smith,' with certain other details pointing in the same direction. Yet, as Mr. Cannan remarks, myths of this kind die hard, and under ordinary circumstances we must have been prepared for periodic repetition of Dupont de Nemours's assertion of a large physiocratic indebtedness.

The matter has now been definitively settled by a remarkable literary find. This consists in the accidental discovery of Adam Smith's Glasgow lectures on "Justice, Police, Revenue, and Arms," as reported by a student in 1763. Mr. Edwin Cannan, well known by his acute study of the doctrines of the English classical economists, has edited the MS. for the Clarendon Press, with a concise account of the history and value of the Report, a striking table of parallel passages in the Lectures and in the 'Wealth of Nations,' and with scholarly explanatory and historical notes.

The Report, while lacking, of course, the absolute certainty of Adam Smith's original lecture-notes, bears such incontestable evidence of authenticity and accuracy as to satisfy every ordinary doubt with respect to the questions heretofore in debate. Three categoric statements are warranted by an examination of the Report, and to these the economic world will doubtless give prompt assent: (1.) Adam Smith's Glasgow lectures contained not only the general principles but also the detailed expositions of the 'Wealth of Nations,' so that those whom Mr. Cannan calls "enthusiasts of plagiarism" must henceforth endeavor to convict Turgot instead of Smith of unacknowledged indebtedness. (2) The idea of the necessity of a theory of distribution in an economic treatise was derived by Adam Smith from the French economists; but, instead of adopting the intricate physiocratic theory, Smith simply "tacked his own scheme (very different from theirs) on to his already existing theory of prices." (3) Smith's projected work on jurisprudence, often referred to but never completed, dealt with the subjects included in Part I. ("Of Justice"), and possibly in Part V. ("Of the Law of Nations") of the Report, and constituted the third part of the lecture course on moral philosophy, as described by Millar; Parts II., III., and IV. ("Of Police, Revenue, and Arms") of the Report contain a well-rounded draft of the 'Wealth of Nations,' and correspond to the fourth part of Millar's outline.

This fortunately recovered memorial of Adam Smith's academic activity is thus not only of unique literary interest, but of vital importance to the historian of economic thought. It is here reproduced in worthy garb, and under editorial supervision that leaves nothing to be desired.

Modern Political Orations. Edited by Leopold Wagner. Henry Holt & Co. 1896. Pp. xv, 344.

THIS volume is, in the preface, declared to be a "modest attempt to collect some of the most notable examples of the political oratory of the present reign [of Victoria]." We are given twenty-four speeches by as many orators. The book is interesting and instructive, but in a certain sense wanting in balance. Some of the best speakers of the period named are omitted—we have neither Sir Robert Peel nor Lord Palmerston, Lord Stanley ("the Rupert of debate") nor Dr. Magee. A desire to forward the cause of home rule is perhaps the motive of the work Not only are seven of the speeches more or less concerned with that subject, but we have an appendix dealing with the *Times* on "Parnellism and Crime" and with the Pigott forgeries.

It is interesting to remark that most of the subjects treated of in the speeches have dropped out of sight or been finally laid at rest. The Don Pacifico case no longer troubles us. Fears regarding negro emancipation, the admission of Jews to Parliament, the extension of the franchise, the Disestablishment of the Irish Church, the adoption of the ballot, no longer disturb British statesmen. The Irish question remains unsettled. Much of O'Connell's speech at Tara, delivered fifty-three years ago, might have been taken *en bloc* from an Irish newspaper of the present day. We are struck by the absence in the speeches before us of wide generalization and of lofty, all-embracing thought. They are essentially businesslike and to the point, but wanting in fire. Bright and Bradlaugh perhaps reach the highest levels in this respect. We find much to illustrate doctrines concerning the vanity of human wishes, much to cause the cynic to smile—O'Connell in 1843 all but promising Repeal within a year, Lord Ellenborough in 1863 encouraging the Poles to persevere in insurrection, Joseph Cowen posing as a "life-long radical," Mr. Chamberlain still, so lately as 1885, expatiating on the necessity laid upon England "to conciliate the national sentiment of Ireland." Bulwer-Lytton on the Crimean War, Lord Beaconsfield on the Berlin Congress, Gladstone on the Beaconsfield Ministry are, in the light of present events, painful or suggestive reading. A speech by Cobden on free trade is opportune even fifty-four years after delivery. We must, if not regarding Great Britain, at least regarding the rest of the world, add the free-trade question to that of the Irish as still, after the lapse of half a century, unsettled. We trust Mr. Wagner's volume is not a clumsy effort by the Cobden Club to disseminate its opinions!

BOOKS OF THE WEEK.

A Round Table of the Representative American Catholic Novelists. Benziger Bros. $1.50.
Boutmy, Émile. Le Parthénon et le Génie Grec. Paris: A. Colin & Cie.
Carman, Bliss, and Hovey, Richard More Songs from Vagabondia. Boston: Copeland & Day. $1.
Duryea, Anna S. P. Sir Knight of the Golden Pathway. Putnams. $1.25.
Edwards, H. S. Sons and Fathers. Rand, McNally & Co.
Fletcher, J. S. Mistress Spitfire. London: J. M. Dent & Co; Chicago: A. C. McClurg & Co. $1.50.
Gréard, Vallery C. O. Meissonier: His Life and His Art. A. C. Armstrong & Son.
Hobbs, C. A. The Elements of Plane Geometry. A. Lovell & Co. 75c.
Jex-Blake, K. The Elder Pliny's Chapters on the History of Art. Macmillan. $3.50.
Keller, Prof. I. First Year in German. American Book Co. $1.
Lee, G. S. The Shadow Christ: An Introduction to Christ Himself. Century Co. $1.25.
Malosse, Louis. Impressions d'Egypte. Paris: A. Colin & Cie.
Ollivier, Émile. Marie-Madeleine: Récit de Jeunesse. Paris: Garnier Frères; New York: Lemcke & Buechner.
Peck, Prof. H. T. Harper's Dictionary of Classical Literature and Antiquities. Harpers.
Querdec, Yves le. Letters of a Country Vicar. Dodd, Mead & Co.
Reed, Edwin. Bacon vs. Shakspere. Brief for the Plaintiff. 7th ed. Boston: Joseph Knight Co. $2.50.
Richards, Mrs. Laura E. "Some Say." Neighbours in Cyrus. Boston: Estes & Lauriat. 50c.
Stuart, Mrs. Ruth McE. Sonny. Century Co. $1.

CONCLUSION OF THE TWELFTH VOLUME AND SIXTH YEAR.

DECEMBER

EDUCATIONAL REVIEW.

ARTICLES.—The University of Virginia, by William Baird; Attempted Improvements in the Course of Study, by Paul H. Hanus; Some Characteristics of Prussian Schools, by Edward J. Goodwin; The National Educational Association, by Aaron Gove; Should Preparatory and non-Preparatory Pupils Receive Identical Treatment in the High School? by W. R. Butler; History of English Grammar Teaching, by F. A. Barbour.
DISCUSSION.—The *Breviarium* of Eutropius, by J. W. Redway.
REVIEWS. EDITORIAL.

$3 a year (monthly, excepting July and August). 35 cents a number. Table of Contents, Vols. I.-XI., free.

HENRY HOLT & CO.,
29 WEST 23D STREET, NEW YORK.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 PICCADILLY, LONDON, W.

Tennyson's The Princess.

A critical edition, edited by ANDREW J. GEORGE, A.M. Cloth, 200 pages, 40 cents.

Dodd, Mead & Company

HAVE JUST PUBLISHED:

Lyrics of Lowly Life.

POEMS BY

PAUL LAWRENCE DUNBAR.

12mo, Cloth, with Portrait, $1.25.

Mr. William Dean Howells has written an introduction to this volume of Poems by Mr. Dunbar, the young negro poet. Mr. Howells is not alone in his generous appreciation and recognition of his work; indeed, he has made numerous conquests among our men of letters. The work is a most remarkable and hopeful production. There are three things illustrated in Mr. Dunbar's volume which will be of special interest to the scientific students of his race: the negro's gift in telling a story illustrated in the humorous and dialect pieces; the negro's serious revelation of his passion of love; and perhaps of far greater importance just at present, the negro's sense of verbal melody.

DODD, MEAD & COMPANY
5th Ave. and 21st St., New York.

WANTED.

FOR WORK IN PHILADELPHIA,

a college-bred man and student of English literature who can write well and correct proof, and is competent to conduct a class of cultivated adults in literary studies. The position to be filled is an agreeable one, and the salary about that of a college teacher. Address P. O. Box No. 2123, Station A, Philadelphia, Pa., stating qualifications, experience, and age.

LIBRARIAN.—Wanted, after Xmas, an engagement in a public or PRIVATE LIBRARY, by a librarian of experience, well read, and with good knowledge of languages. X., care *Nation.*

TWO ROMANCES OF HISTORY.

THE FINAL WAR.

An Historical Romance of the near future. By LOUIS TRACY. With 16 full-page illustrations. Large 12mo, $1.75.

"A capital story and full of action. . . . Such a vast topic as a great war in Europe the author has treated in the cleverest manner."—*N. Y. Times.*

"The volume will be read with genuine interest. . . . On the whole, it is a book that will attract considerable attention."—*Los Angeles Herald.*

"A remarkable volume. . . . The narrative is presented with considerable technical knowledge and with a variety and vivacity of imagination not unrelieved by humor, and that makes the narrative almost as interesting in its way as was the 'Battle of Dorking.' The book is worth considering as an indication of the present political tendencies of Great Britain, . . . and of her readiness to come into cordial relations with the United States."—*N. Y. Sun (Editorial).*

AN UNCROWNED KING.

A Romance of High Politics. By SYDNEY C. GRIER, author of "In Furthest Ind," "His Excellency's English Governess," etc. 12mo, $1.50.

"The adventures of Prince Alexander of Battenberg, at one time Prince of Bulgaria, have manifestly suggested to Mr. Grier the subject of his story. The author has, however, done his best to cover up carefully the tracks. . . . But no change of names or geographical features can alter the fact that the Marquis of Caerleon and Prince Alexander of Battenberg pass through almost identical adventures. Caerleon has Stambouloff, although he passes by another name; he has also the secret emissaries of Russia perpetually spying and plotting around him; and in the end loses his throne by a complex intrigue. . . . Mr. Grier manages his romance of high politics extremely well, and whether he is presenting to us Russian spies or Bulgarian patriots, he manifestly knows what he is doing. The chapters which tell us of the adventures of Caerleon after he accepts the throne of Thracia may be called thrilling. The indispensable love story is, moreover, ingenious and interesting, while the heroine is as fascinating as she is unconventional."—*London Speaker.*

YALE MIXTURE.

The choicest tobacco made, and pre-eminently a gentleman's smoke.

Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.

The Nation.

NEW YORK, THURSDAY, DECEMBER 10, 1896.

The Week.

ONE passage in the President's message practically extinguishes what little hope there was of tariff legislation this winter. It is the part in which he asserts, with truth, that the Wilson bill has not yet had a chance to show what it can do in the way of producing revenue, and intimates that he proposes to give it a chance. This is tantamount to a warning that he would veto the Dingley bill or any other patchwork tariff measure. At any rate, it will doubtless be so interpreted by the Republicans who do not want to fool with the tariff at all. There would not be much fun in racking all the party joints to pass a bill, only to see it vetoed. To do it just to put Mr. Cleveland "in a hole" is no longer a sufficient motive. He is nearly out of his last hole, and the turn of the Republicans to fall into the ones they have themselves dug is coming on apace. Speaker Reed perceives the President's drift, and knows that it means no tariff or revenue legislation this winter. The President's policy is very tame, but it is announced by a man who has full power to carry it out up to March 4. It is, in a word, Leave off extravagant appropriations, give the business world a rest from tariff agitation, and let the Wilson bill have a chance.

The Indianapolis movement presents the most hopeful solution of the problems brought up by the President's message; not that any specific solution has been evolved or even outlined as yet, but because it stirs the commercial classes to their duty. They have been heretofore torpid while less intelligent groups of the community have been stirring. We have had conventions of silver men and of workingmen, we have had Ocala platforms and Omaha platforms, we have had Debs and Bryan and A. J. Warner and "Coin" Harvey in the lecture field long before the Chicago convention met, but we have had no counteracting force from the real business interests of the nation. The latter have depended on the press to speak for them and do their fighting. Now, however, they seem moved to speak for themselves. It is time to do so. We agree with Congressman Walker; we are of the opinion that if another national contest takes place with this question unsettled, the Republican party will have to face the gravest danger in its history, the danger of disintegration. Therefore we adjure them and all others who coöperated with them in the recent election to help make the Indianapolis convention a success in point of numbers and intelligence, not only for its effect upon Congress, but still more for its effect upon those who make and unmake Congresses.

Speaker Reed repeats at Washington what he said in his speech at Duluth—that it is the duty of Congress in this session to provide more revenue for the Government by tariff legislation. This may cause the Dingley bill to lift up its drooping head for a time, though we still believe the influences which openly or secretly are against that measure will be too much for it. Chief among them, of course, is the lack of time in a crowded short session. We should be glad to hear Mr. Reed's voice on the subject of keeping down expenditures as well as of increasing the revenue. All politicians that we ever heard of are in favor of more revenue—the greater it is, the greater the spendings; the greater the spendings, the fatter their pickings. Chairman Cannon of the appropriations committee is out for severe economy; he is going to use the knife relentlessly. But so he was a year ago, with the result only of seeing himself ridden down again and again by the raiders and log-rollers, and the total outlay voted rising $52,000,000 above the Government estimates. The truth is, that centralized and responsible financial control is rapidly breaking down and disappearing in Congress. Yet no Speaker or party leader mentions this, or refers to the need of retrenchment except in a general and perfunctory way; all the talk is of getting more money, whether to spend wisely or to waste recklessly is nowhere said.

We presume that our protectionist friends will draw their usual moral from the November Treasury returns. During that month the Government's revenue fell $7,050,024 short of the expenditure, contrasting with a deficit of only $1,212,780 in November, 1895. What better proof could anybody ask of the immediate necessity for new tariff legislation, framed, of course, "with due regard for the protection of American industry"? But, as it happens, there are other striking comparisons than this in the November figures. The decrease in receipts, as compared with 1895, was wholly occasioned, it is true, by diminished customs revenue. The cause for this shrinkage in customs dues, however, is pretty plain in the minds of people who have watched this season's slackening import movement. The November importations were not increased in any enormous quantity over the record of October; even the execution of orders left conditional on results of the election has not yet restored our foreign import trade to normal volume. Had the November imports this year been as large as they were in 1895, the Treasury's revenue for the month would have exceeded last year's by nearly $800,000. It will probably surprise some people to learn that, whatever current deficits may be, the November Government receipts this year were above the average of the last six years—a period covering both the McKinley and the Wilson tariffs.

But a glance at the record of expenditure tells a very different story. In November, 1891, the Government's total disbursements under appropriation bills were $26,156,000; last month they had advanced to $33,260,720—in other words, there has been a pretty steady increase in expenditures, even during the period of hard times. In the face of such comparisons as this, the talk of curing all the evils of our situation by an increased revenue is simple rubbish. If our current Government expenses were as light as they were ten years ago, the Treasury would be paying its way, and leaving a surplus over, even with the temporarily decreased customs revenue. Suppose the revenue were to be suddenly and heavily increased; does any one suppose that the log-rollers of Congress would rest idle? Despatches from Washington last week represented the committee on appropriations as getting already into consultation to discuss how they can possibly mete out justice to the horde of applicants for special Government expenditure. And who can be sure that revenue will be adjusted cleverly to meet such new demands?

A sudden shyness has fallen upon Mr. Platt in regard to the senatorship, due primarily to the appearance of Mr. Choate as an alternative candidate. He is not quite sure now whether he will consent to be a candidate, and he has had the valuable information made public through his State committee, that he has not authorized anybody to say that he would accept the place if it were offered to him. It is also announced that the great banquet at Albany, which enthusiastic Platt men have been arranging for him when he shall be elected Senator, is really not a Platt banquet, but a Senatorial banquet, and that the man who is chosen Senator will be the guest of honor, no matter who he is. All the Platt men wink at one another when they say this, and the committee of arrangements go on "flooring over" the hall as if nothing had happened to disturb the prospect. The possibility that they may be arranging a feast in honor of Mr. Choate does not seem to them to be alarming. They know the "old man" too well to have any doubts about his intentions and his methods. What he is seeking to avoid now is too sharp an examination into his record and qualifications, and, if possible, all publication of his political operations either in

the somewhat remote or the recent past. A quiet entry upon the scene as United States Senator is what he, like the truly modest man he is, desires above all things. Invidious comparisons and impertinent discussion of qualifications give him such pain that he would almost rather forego public office than submit to them.

The Baltimore *News* advocates the election of the Senators by the people as a remedy for Platt, but we must point out that, though it might be an improvement in some ways, it would not rid us of Platt. Platt's art lies in "getting the delegates" to the nominating conventions, and the conventions would still nominate men of the Platt, Hill, and Murphy sort, unless there were some change in the moral judgment of the electors. We cannot get rid of Plattism by any legal or constitutional process. Nothing will rid us of it but an improvement in the standards of voters and an increase of State pride. Platt committed, or caused to be committed, enormous frauds in "getting the delegates" last year. These frauds were exposed by a committee of twenty-five of the best class of Republicans, who pronounced his convention "rotten." But he "got the delegates" just the same. It was "the Presidential year," and one has to wink a little at crimes in the Presidential year.

It will occasion no surprise to learn from the interviews and talks with the members and leaders of the Hill machine in various parts of this State that most of them have no definite ideas about the future. They are determined to stand by free silver and the Chicago platform till they receive "orders" to abandon that policy. Like their boss, Senator Hill, they are "waiting for something to turn up, and in the meantime are keeping very quiet." That he or they should have any convictions or principles, or any other conception of party policy than to get possession of the offices at whatever cost, could not be expected by anybody who has followed their course during the past ten years. The National Democrats, who are talking about forming an organization for future work, will make a great mistake if they count at all upon any coöperation from or any change for the better in the old Hill machine. It was suggested at their meeting in this city a few evenings ago that many of the members of that machine did not seriously believe in the principles of the Chicago platform, and would be glad to get away from them into an organization which stood for better things. This view is a delusion. They are a hopeless lot, and until the National Democrats adopt this view of them and act upon it, they will make no progress towards the restoration of their party in New York to public confidence. Mr. Wheeler H. Peckham remarked, the other evening, that "there is not a great deal for a political party to do now, but there is a lot for one to oppose"; and that is the best line for the anti-Hill Democrats to work on.

Senator Peffer is naturally both puzzled and pained at the efforts to defeat his reelection by the Populist Legislature of Kansas. He has sent out a circular letter to all the members whom he regards as his "logical supporters," in which he sets forth the arguments for his reëlection with a lucidity and force which we do not see how any supporter with a grain of logic in him can withstand. He takes his stand, to begin with, on the impregnable position that "a Senator, just like a man in any other calling, must learn his business, and that takes time." Peffer has been "studious and diligent," and has learned the business. Why turn him off just as he is ready to "attain the highest standard of usefulness"? Nor will his modesty prevent him from pointing out his solid achievements even while learning the business. Just look at this condensed but eloquent account of his efforts, as compiled from the *Congressional Record:*

Whole number petitions presented	306
Bills and joint resolutions introduced	202
Reports submitted	87
Senate and concurrent motions and resolutions	62
Amendments proposed	94
Speeches, long and short	437

There is, from the Kansas point of view, a certain logical weakness in Senator Peffer's position. He has not lived up to the prophecies made on his behalf six years ago. Then there was no talk about his requiring time to learn the Senatorial business. He was prepared at once to make the money power quake. Laws to enable every borrower in Kansas to get money out of the sub-treasury at 2 per cent., and no questions asked about security, were to be written by him in the statute-books without delay. Thus he is in the unlucky situation of having deferred a promised millennium. If it had to go six years overdue, who knows but it may still be delayed another of Peffer's terms? On the other hand, any one of his rivals before the Legislature would, we have no manner of doubt, engage to begin the chaining of the devil the very day after taking his seat. If Peffer is beaten, it will be due to the overpowering desire of Kansas to get her millennium red-hot.

In both the Georgia and the Alabama Legislatures, bills have been introduced forbidding gold contracts. The Alabama proposition was that "it shall be unlawful to make any note, bond, bill of exchange, mortgage, or any other contract or agreement of any description, payable specifically in either gold, silver, or any other particular money, other than the general legal-tender money of the United States"; and that all contracts or agreements of any description hereafter made in violation of this prohibition shall be absolutely void. In each State it has been necessary to make opposition to this scheme, intelligent people recognizing that there was danger of its endorsement if it should be voted on without discussion. The Montgomery *Advertiser*, for example, has felt constrained to argue the matter seriously, and to show why, if such a bill were to become a law, "men with means would flee from the State as a family would flee from smallpox or yellow fever." The Georgia bill was defeated in the Senate on Thursday, and the Alabama proposition promptly met the same fate.

Happily for the sound-money men in Alabama, the effect of the proposed policy was clearly illustrated while the measure was pending in the Legislature. Negotiations for the purchase of the Montgomery, Tuscaloosa and Memphis Railroad by the Mobile and Ohio have been under way for some time, and were on the point of conclusion when the bill prohibiting gold contracts was introduced. Proceedings were suspended until action should be taken on the measure, for the reason that, to secure this property, the Mobile and Ohio Company would have to endorse the bonds of the Montgomery Company, which specify in what kind of legal-tender money of the United States they are payable, while it was proposed by the Populists that the State should declare such a contract illegal. The Mobile *Register* estimated that the consummation of this purchase would result in the permanent investment of some $7,000,000 of outside capital in the State, which would give employment to many people and create values to be the subject of State taxation. The really surprising thing about such schemes as these is that the Alabama bill should have been supported by as many as nine out of twenty-nine Senators, and that in Georgia the division was so close as twenty-one for sustaining the adverse report of the judiciary committee and sixteen against.

Gov. Morton has an opportunity to do this city a service of incalculable value in selecting a successor to Col. Fellows. The District Attorney's office is the key to the machinery of justice in New York. It has been used as often to protect criminals as to prosecute them, provided there were political reasons for so doing. An honest, able, fearless man at the head of it, who used it in the interest, not of Democratic justice, or Republican justice, or Tammany justice, or liquor justice, but of plain, simple justice, could accomplish even in a single year veritable wonders for the cause of good government in the city. Such a District Attorney during the next few months would help us enormously in keeping the city from falling back into Tammany clutches next year, for he would be the most powerful ally possible for all the forces which make for good government,

and which have so often had their efforts blocked and defeated by the passive or active opposition encountered in the District Attorney's office. Gov. Morton can break up all the combinations, some of them of many years' standing, which have been responsible for these defeats, by appointing a man who is not a political "dealer," but is simply honest and capable. It is all the more important that he should do this because it is so evident now that we have nothing to hope for in this direction from the new Governor, who is apparently willing to allow Platt to dictate all his acts. A Platt man in the District Attorney's office would be merely a Tammany man under another name. The old alliance between the two machines, which was disclosed when Col. Fellows made Lauterbach's son one of his assistants, would be continued, and the old methods of administering justice would be continued, with the difference only of a diversion of most of the patronage and other perquisites to the Platt machine.

The *Sun* thinks that "the appointing authorities as a rule would endeavor in good faith to do their duty under the civil-service clauses of the Constitution" if the work of examining candidates were turned over to them, as is proposed. The answer to this is that the plan is not new, that the system of examination by the appointing officer has been tried at Washington and failed miserably, and that the whole system of competitive examinations was originally devised in order to protect the public offices against the weakness or dishonesty of appointing officers. In fact, it is this weakness and dishonesty of appointing officers which caused the agitation for civil-service reform and led to its success. The system of examinations was instituted because it was found, after fifty years' experience, that appointing officers seldom or never appointed for fitness, or through a regard for the public service. They appointed for political reasons, either to oblige an "influoence" or to reward for political services. If they had ever done what the *Sun* says they would do now, no constitutional amendment providing for examinations would have been necessary, nor would legal examinations have been necessary at all. The officers would have held them on their own account. Their unwillingness to do anything of the sort constituted what is called the "spoils system"—that is, the system under which offices were treated as booty won at the polls.

It is not surprising that Michael Kelly, representing District Assembly 49 of the Knights of Labor, should the other day have sent a petition to the Commissioners of Grand Jurors, setting forth that "it is well understood and clearly contemplated that the grand jury should be a representative body," and that if it is not "it lacks the requirements and expectations of the body politic," and that the panel of the grand jurors, as formed for many years past, "is not of the representative character within the meaning of the law of that term." The law is simply that persons selected for the grand-jury panel shall be "intelligent citizens of good character," and possessed of the qualifications required of petty jurors. A petty juror has to be twenty-one years of age, a citizen of the United States, a resident of the county, the owner of $250 worth of property, in possession of his faculties, neither infirm nor decrepit, intelligent, of good character, and able to read and write. That is all; so who it is who "well understood and clearly comtemplated" that it must be a representative body, "within the meaning of the law of that term," unless it be Michael Kelly himself, we cannot guess. Nor can we imagine anybody but Kelly himself being "the body politic" whose "requirements and expectations" the present panel "lacks." He wants it to be of a "broadly representative character," and to contain "a due proportion of mechanics, artisans, laborers, and clerks and small store-keepers." Were it legally a representative body, Kelly would be within his right, but the duties of the grand jury are distinctly executive and judicial. They have to shield people from vexatious and improper persecution, and to present criminals and nuisances and malfeasance in office. To discharge such duties requires a considerable degree of intelligence and education and acquaintance with business, and if the Commissioners were to select people for the grand jury for any other reasons, they would be false to their oaths and inflict a great wrong on the community.

We comment on this case because it furnishes an excellent illustration of the shape in which false ideas about government, originated and nursed by the more intelligent classes, work down among the more ignorant; the discontent they spread, and the revolutionary hopes which they nourish when men like the Knights of Labor get hold of them. The conversion of executive into representative officers began among politicians for their own purposes—that is, in order to make places, from the cabinet down, created for the public interest, rewards of electioneering work, so that at last we have the most ignorant classes of the population claiming judicial functions as "representatives." The silver craze followed nearly the same course. It was started by wily men of the upper order of intelligence, in order to help the sale of their commodities, and in ten or fifteen years became a new religion, which was to secure the happiness of mankind by universal poverty and humbug.

Mr. Arthur Balfour is rapidly getting rid of the financial authority which our bimetallists used to ascribe to him (no one ever knew why) as a "brainy man." The odd position he holds as the bimetallic First Lord of the Treasury in a monometallic government has long excited jeering remark. But he every now and then makes speeches which render his position all the odder. At Sheffield in England the other day, he apparently tried to discredit English free trade by calling attention to the fact that no other nation except Turkey had adopted it, which was rather an astonishing remark for the author of the 'Foundations of Belief,' let alone a Lord of the Treasury, to make. The logical way to criticise free trade is to ask, Has England prospered under it? If she has, the failure of other nations to adopt it simply tends to prove that other nations are foolish. As an argument it resembles the failure of a number of drunkards to imitate a man who had taken the pledge. "You see," they might say, "nobody but you has done it. What do you think of your temperance now?" That Mr. Balfour had but slight comprehension of his subject soon appeared when he calmly went to work to show that you cannot export without importing, that all imports are paid for, not in money, but in exports; which is the free-traders' capital argument, the very foundation of their system. So that if Mr. Balfour was right, the nations which had not followed England's example had failed to understand the essential facts of the case. Things like these make the Tory need of Mr. Chamberlain more and more manifest. He never attacks things he does not understand. He simply propounds a grand plan. He develops the colonies, or crushes the Irish, or pensions the old. If people do not like his proposal, they need not adopt it.

The judgment against Great Britain in the Egyptian Court of Appeals, by which she is compelled to refund the cost of the Sudan campaign to the Egyptian treasury, has all the air of being "a put-up job," though, of course, such a thing is not to be suspected. It really makes idle the French opposition to the continuance of the British occupation, for it allows England, at her own expense, to extend her frontier and to deliver Egypt from the most serious of all her difficulties, the presence of the Dervishes on her borders, where they constituted a standing menace to her government. England may, in fact, now be said to hold Egypt by purchase, and the French rejoicings over the judgment become somewhat ludicrous. This is the one success of Lord Salisbury's foreign policy, and it will be very useful in covering up his Turkish failure. He has, by the by, repudiated as "superstitious" the opposition to Russia, which he encouraged in 1877 under Disraeli; and this with much cheerfulness, as if he had not served under that amusing adventurer in the Berlin Conference.

THE MESSAGE.

PRESIDENT CLEVELAND'S message, after a few introductory sentences, begins with a reference to the Armenian massacres and the attitude of our Government with reference to them. He says that no Americans have been killed or wounded in these disturbances, although often in the midst of dangers. Claims have been made on the Turkish Government for missionary property pillaged or destroyed at Harput and Marash during uprisings at those places, and they will be insisted upon, although the Turkish Government does not acknowledge responsibility. The President deprecates the demand for impossible things on the part of those who sympathize with the Armenians, believing that any step taken by us in the way of intervention in the domestic concerns of Turkey not only would be ineffectual, but would increase the fury and fanaticism of the Turks and offend those European nations which have the exclusive right to interfere.

The war in Cuba fills a considerable space in the message, as was expected. The President says that there has not been much change in the situation since his last message on the subject. The Spanish authorities occupy Havana and all the large towns, while the insurgents hold two-thirds of the rural districts. The former have not succeeded in suppressing the rebellion, but, on the other hand, the rebels "have not made good their title to be regarded as an independent state." A government exists in the towns, but anarchy exists everywhere else. In fact, "the putative Cuban Government has now given up all attempt to exercise its functions, leaving that Government confessedly (what there is the best reason for supposing it always to have been in fact) a government merely on paper."

This is a very important statement as affecting the matter of belligerent rights, and it seems to settle the question so far as this Government is concerned, for if there is no rebel Government, but only roving bands, there is nothing to recognize and nobody to communicate with. Meanwhile the country itself is going to ruin. Both sides are destroying property lest it fall into the hands of the other, and the outlook is most gloomy. Natives of Cuba residing in the United States are doing all in their power to bring about intervention by the United States, and many of our own citizens, excited by the spectacle of people striving after better and freer government, are urging steps which would lead to such a policy even at the cost of a war with Spain, which they think would not amount to much anyway. Upon this point the President's remarks are most admirable. He says that whether a war with Spain would be long or short, easy or difficult, the United States has its own character to maintain and its own duties to perform in the family of nations. Although peace is not a necessity to us, it is always a desideratum. Our own territory is sufficient to satisfy all of our longings, to preclude all thought of conquest, and to stifle all desire for seizing what belongs to others. Our uniform policy in former insurrections has been that of non-intervention, and, so far as can be now seen, it should so continue. At the same time he suggests that by the autonomy of Cuba, voluntarily granted by Spain, and consistent with her sovereignty, the pacification of the island might still be effected. Such a course, he thinks, would stop the conflict and save some measure of prosperity for the island.

After giving his reasons for thinking that peace might be restored in this w y, the President comes to the most weighty and interesting part of his reference to Cuban affairs, which is this:

"It was intimated by this Government to the Government of Spain some months ago that if a satisfactory measure of home rule were tendered the Cuban insurgents, and would be accepted by them upon a guarantee of its execution, the United States would endeavor to find a way not objectionable to Spain of furnishing such guarantee. While no definite response to this intimation has yet been received from the Spanish Government, it is believed to be not altogether unwelcome, while, as already suggested, no reason is perceived why it should not be approved by the insurgents. Neither party can fail to see the importance of early action, and both must realize that to prolong the present state of things for even a short period will add enormously to the time and labor and expenditure necessary to bring about the industrial recuperation of the island. It is therefore fervently hoped on all grounds that earnest efforts for healing the breach between Spain and the insurgent Cubans, upon the lines above indicated, may be at once inaugurated and pushed to an immediate and successful issue. The friendly offices of the United States, either in the manner above outlined or in any other way consistent with our Constitution and laws, will always be at the disposal of either party."

At the same time the President says that we can neither allow interference with or the control of Cuba by any other Power, nor can we wait for ever for Spain to reëstablish her own control. Without attempting to pass judgment upon future events, he thinks that a time may come when we can no longer remain mere spectators of a scene of desolation; but "until we face the contingencies suggested, or the situation is by other incidents imperatively changed, we should continue in the line of conduct heretofore pursued, thus in all circumstances exhibiting our obedience to the requirements of public law, and our regard for the duty enjoined upon us by the position we occupy in the family of nations."

It is most gratifying to find the Venezuelan boundary question dispatched in a paragraph of ten lines, which tells us that all differences between this country and Great Britain on that subject have vanished, and that the assent of Venezuela to the arbitration agreed upon between the two countries may be confidently anticipated. Still more gratifying is the assurance which the message conveys on the wider subject of general arbitration with Great Britain. Negotiations for such a treaty, it says, "are far advanced, and promise to reach a successful consummation at an early date."

The President's recommendations touching financial reform embrace nothing new, nothing which he has not presented to Congress with equal force in former communications, special and general, yet they will receive more respectful attention now than they did one year ago. The change of attitude on the part of the Republicans is due, of course, to the fact that Mr. Cleveland is the head of the sound-money Democrats, without whose coöperation in the recent campaign Mr. McKinley could not have been elected. What he says, therefore, on any subject will receive very respectful consideration from them, and especially on the subject which constituted the chief issue of the campaign. They may not adopt any specific legislation at the present session, but the minds of members will be open to suggestions coming from that quarter, and this receptiveness will extend to their constituents also. This is at least an important aid to future action.

The President refers first to the greenback as an incident of the war period to be classed among other evils of a temporary kind, such as the wounds of soldiers and the bereavement of families—evils which wisdom will tolerate no longer than necessary. The wounds have been healed so far as possible, the bereavement has been soothed as much as possible, but the greenback remains "a disturbing menace to business security and an ever-present agent of monetary distress." Then he adds: "Because we are enjoying a temporary relief from its depressing influence, this should not lull us into a false security, nor lead us to forget the suddenness of past visitations." These past visitations are so recent that it is hardly necessary to recount them. There have been four different occasions in three years when an issue of bonds was absolutely necessary to save the Government from bankruptcy. The last one was when the President sent the Venezuelan message to Congress. What happened then is sufficient warning of what might happen at any time if any serious foreign complication should arise. We should not like to underwrite the Treasury, for example, in the event of a war with Spain, for although that might not be much of a war in itself, it would begin, as all wars do, by the hoarding of gold by those who have the means and the power to command gold. Such persons always "take time by the forelock," and put themselves in a condition for every emergency. Foreign complications are likely to rise at any time. They generally come when they are not expected, as the Chilian complication came in Harrison's time and the Venezuelan one last year. And let not the grim spectre of Bryanism be forgotten.

Mr. Cleveland's recommendations are the same that he has advanced before. They include the retirement of the greenbacks and such changes of the national

banking-law as will give us an elastic as well as a safe currency. These suggestions may be called stereotyped. They are certainly familiar, but they have become so by their ever-pressing and increasing necessity. As the chairman of the Indianapolis conference said the other day: "The time has now arrived when the Government must either discontinue the banking business or go into it on a broader, better defined, and more comprehensive scale." There is no way to pursue the latter course except by making the Treasury a bank of discount as well as a bank of issue; and when it becomes a bank of discount, it will end with the sub-treasury system of the Populists and general chaos.

ACCOUNTABILITY.

As has been recognized by all thoughtful men both here and in England, one of the great scandals and shames of our democracies is the large sums of money spent in various forms of corruption at elections. Successful efforts have been made in England to put a check on it by specifying the amounts which may be lawfully spent, and the ways in which they may be spent, and compelling the candidates and their committees to declare how much they have spent and on what. There are a few States in the Union which have begun to copy this legislation, including New York, but we have copied it only very partially. We in this State oblige every candidate to say how much he has spent on his election, but he gets rid of all trouble in the matter by saying how much he has given to the committee, and from the committee we get no account whatever. When a judge, for instance, purchases his nomination from the committee for $10,000, say, the committee never tells what it does with the money.

On the political evils of this we do not propose to comment to-day. They are patent enough. The thing to which we wish to call attention is the very demoralizing effect on the whole community, and especially on the young men, of this public practice of handling large sums of money belonging to other people without rendering any account. This has in "politics" been carried to an astounding extent. The sum Mr. Hanna and his committee have passed through their hands in the last election is said to amount to millions; no one outside the committee knows how much it was, or what was done with it. In this State the two bosses Croker and Platt have collected hundreds of thousands of dollars during the last ten years, and no one knows what became of it. But the necessity of accounting to some one for all money given to you by other people except as a gift to yourself personally, lies at the very foundation of social morality. Ever since the establishment of the right of property, of the recognition of a difference between *meum* and *tuum*, and ever since the invention of writing and arithmetic, accounting for what you have done with things belonging to others, and especially with money, has been held to be one of the first duties of men. Failure to keep accounts raises in law a presumption of dishonesty, no matter in whom. The destruction of books of account raises a presumption that there was something to conceal. All executors, and administrators, and guardians, and trustees, and agents are bound to account in writing by the courts. So are all treasurers of corporations of every kind, charitable as well as others. Every one to whom a friend gives money for any purpose considers himself bound in honor to say what disposition he has made of it down to the last cent. In fact, accounting forms the larger part of the business of mankind every day. The duty of accounting is among the very foremost of social duties, and the one which needs most earnestly to be impressed on every child from his infancy.

Well, we have, in spite of all this, established among us the practice of giving large sums of money to an individual, or a small knot of individuals, nominally to assist in carrying on our government, without ever asking them either how much they have received or what they do with it. A committee, however, furnishes a slight guarantee of honesty, because the members are possibly a check on each other; but in this State we substitute for a committee a single man, called a "boss," and we hand over to him all the funds he asks for, without inquiry, without accounts, vouchers, or any description of bookkeeping. The lower the opinion we have of his character, the more money we give him. No charity, or college, or hospital, or library, or museum could in this city get one-hundredth part of the money given to Croker and Platt in a single year by men fully persuaded of the bad character of both, yet given without receipt, or examination, or account. Neither of these ever says what he does with the money.

In the case of Croker the presumption is raised that he appropriated a large part of it to his own use by the fact that he became suddenly rich, acquired large possessions, and took to horse-racing in England. But Platt lives plainly, manages an express business, resides in a hotel, and has a pew in church. This leads many people to say they feel sure that he keeps none of the money himself, that it all goes in paying election expenses, subsidizing editors, and generally "supporting the party." But they have no right to exempt Platt from the ancient presumption, justified by ten thousand years of human experience, and adopted in all our law and business, that the man who does not account is dishonest, and does use for his own profit the money he receives as a trustee. As long as Platt refuses to say what he did with the money, the theory that he keeps some of it for himself is too strong to be upset by any feeling or opinion of people who confess they know no more about the matter than any one else. Under these circumstances the plainness of his house or dress, or his pew in church, or his own declaration counts for nothing. He may not care for gaudy attire or a sumptuous abode. He may be putting his gains into investments for his children. He may have a pew in church, as hundreds have it, as a means of helping his business. The one question to put to him is a question which in every age has made the guilty tremble —"Where are the books?" Nothing can meet this but the books—no surmises, no old clothes, no cheap board, no sanctimonious expression of countenance, no length of hair, no pew in church, no readiness to go to war with England.

MR. RAINES AND HIS LAW.

It required only three days of inquiry to convince Senator Raines that the responsibility for the unsatisfactory operation of his liquor law rests, not with the police of this or any other city, but in the defective provisions of the law itself. This might have been inferred from the authorship of the statute. Mr. Raines has been active in the politics of this State for nearly or quite twenty years, and during that time has done nothing which gave evidence that he was interested in anything except political trickery. Nobody has ever accused him of taking "theoretical" views of public questions, and he has seldom been found on the side of a genuine reform measure. Taken as a whole, his political reputation is as well rounded as that of any thoroughly practical politician in the State. When he took hold of the liquor question, and bent his mind to the preparation of a general law for the State, everybody who knew him knew that the law would be stuffed as full as it could hold with "politics" of the Platt machine variety.

His investigation proves that this was the case. All the evils which it has caused—and they are very great and very demoralizing—are shown to be the outcome of those provisions of the law which Raines put in for the purpose of making the law useful to politics. He would not accept the Ohio law as it stood, because that does not provide for the building up of a huge political machine. He would not accept the principle of a tax on liquor, and leave the business of collecting it, as the Ohio law does, to the regular tax-collecting machinery of the State. That would put the liquor-traffic outside of politics, as the Ohio statute has done, and Raines was not seeking any such end as that. His object was to take the traffic out of Democratic politics and put it into Republican politics. Accordingly, he created a State bureau for the collection of the tax and the enforcement of the law, with about 200 employees and a salary list aggregating fully $250,000 a

year. He gave so much thought to this part of the statute that the other parts got little attention, and were thrown in with small regard to their meaning or scope.

When the law failed to work with entire satisfaction in this city, Raines declared that the fault lay with the police, and he came down here for the special purpose of proving his charge. A great mass of cumulative testimony poured upon him to the effect that what he charged as violations of the law, committed because of police incompetence or dishonesty, was really vile public nuisances made possible and actually protected by his law. These so-called "fake" or "Raines" hotels are pronounced by the most competent authorities to be far worse dens of iniquity and drunkenness on Sundays than the old liquor-saloons were when they were all "wide open." The police are powerless to close them because of the provisions of Raines's law, which are so vague and lax as to make any intelligent interpretation of them difficult, and to make the most reasonable interpretation of them favorable to the dens.

When he could no longer refuse to confess that the law itself was responsible for these evils, Raines is quoted as declaring with virtuous fury: "We will close these fake hotels and clubs on Sunday, even if we have to close every hotel and club in the city to do it. It would be a hardship for the bona-fide places to close, but it would result in the greatest good to the greatest number. Public opinion will not permit the fake establishments to remain open, and the newspapers are paving the way to closing them by their outcry." By "we" Raines of course means himself and the other rural statesmen who regulate our municipal affairs for us each winter. He does not intend to allow the people of this city to have any voice as to the way in which the Sunday-selling question shall be solved. The newspapers which call attention to the abominable effects of his law are making an "outcry," and are warned that they are in danger of bringing about the complete closing of all hotels and clubs on Sunday if they do not stop. This is the regulation Raines method of solving a great public question.

Raines closed his inquiry in very bad humor, and the chances are that the city will suffer for it when he gets down to "work" in the Senate this winter. The net result of his week of investigation was a unanimous condemnation of his liquor law as a loosely drawn measure, which has greatly stimulated drunkenness and added perceptibly to the vice and crime of the city. Not only the witnesses whom Raines examined agreed in this view, but the grand jury added to his wrath and misery presently by saying, in an entirely unexpected and gratuitous manner, that, in their opinion, the law was so drawn "as to invite evasion and make its strict enforcement impossible," thereby bringing the "administration of criminal justice into disrepute and contempt." Raines had hardly become calm under this assault when he received a letter from Dr. Parkhurst which was so extremely disagreeable to himself as a statesman and lawmaker that he refused to give it out to the press, and declared that if anybody else gave it out, he would "compel Dr. Parkhurst to come to Albany and back up his statements there." As he might have expected, after this threat, the Doctor gave out the letter at once. It simply stated, in the Doctor's forcible style, the main facts about the law which Raines himself had established at his inquiry, and which the grand jury has emphasized.

We must be meek and take what Raines and his associates will give us. As Mr. Roosevelt said in his testimony the other day, there are some admirable provisions of the law which go far to offset its defects. One of these is the requirement that all shades and shutters shall be open or raised on Sundays, and another is the higher tax. Still another is the abolition of the local Boards of Excise. These changes give us a condition of affairs which is a great improvement upon the old. Whatever defects exist are due entirely to the "politics" and ignorance which flow inevitably from lawmakers of the Raines variety. They are not making laws for the public good, but for the benefit of the political machine; and so long as the people of the State are content to leave this most important business to them, just so long must we expect results which make our claim to civilization a huge joke, and government in our cities so often little less than legalized crime.

CODFISH AND CURRENCY.

How did we get our dollar—our recent apple of discord? The measures which American colonists brought from England we for the most part still retain. Our terms for length and area—as foot, acre, and all through the scale—are English. So are our words for capacity, from least to greatest. Our weights, too, from grains to tons, are English. Neither the old French arpent nor the new French metre has prevailed among us. We remain English in regard to all measures except those of value. Cleaving to English heirlooms of weight and bulk, why have we discarded English monetary measures—ignoring the pound sterling while abiding by the pound troy and the pound avoirdupois? "Thanks to codfish!" is the shortest answer, and it is not far from the exact truth. No colonies save our own are known to have rejected the monetary standards of their mother countries. But for colonial fisheries, there is small reason to think that we should not to this day reckon in English pounds of value as we do in English pounds of weight.

The genesis, however, of the federal currency in fisheries, and its growth out of them, form a by way of history which has been seldom explored. The truth is, that, from the earliest settlement of New England, fish exported elsewhere than to the mother country brought home to us the bulk of the specie in colonial circulation. This money was for the most part dollars, a coin long known as pieces-of-eight, having the value of eight reals. Wherever dollars became the predominant coin in circulation, they naturally became the real unit of value, while the word pound sterling, hardly entering into actual transactions, was retained in keeping accounts. Dollar as a coin came into the American colonies, directly or indirectly, chiefly from Spaniards. The name dollar, unknown in Spanish even now, was derived from the German tongue, and probably came into American use from the Dutch founders of New York.

The word dollar has a curious history. Ten miles from Carlsbad, so well known to American invalids, there was a mediæval Bohemian mine rich in silver. The place was called Joachimsthal, or the dale of Joachim. In the year 1518 the richness of the mine led to a coinage, with little alloy, which thus gained high repute and wide circulation. The name Joachimsthaler, contracted, as all long words must be if much used, became *thaler—i. e.*, valley-piece—and a synonym of good money. Hence its good name was given to many similar coins. As Joachimsthal was in the German Empire, or *Reich*, the pieces minted there were called *Reichsthäler*—that is, in English, Rix or Rigs dollars. One of the earliest appearances of the word in English was in 1606. Shakspere, in "Macbeth" (i., 2, 62), then spoke of slain Norsemen denied burial till their king had disbursed ten thousand dollars. But the word was doubtless already known. It occurs often in the travels of Sandys, begun in 1610, and shows the thing to have already gone up and down in three continents. Sandys hired a boat in Egypt for twelve dollars (p. 117). He tells us that Dutch dollers (*sic*) throughout Jewry and Phœnicia were "equivalent with royals of eight—elsewhere less by ten aspers" (p. 205). He adds that Constantinople was "well stored with pieces of eight, which in no place lose [aught] of their value." He found the monastery on Mount Sinai to be "receiving an annual revenue of 60,000 dollars from Christian princes" (p. 124).

On the Western continent the name came into use not much more slowly than the coin. In 1642 it was ordained by Massachusetts authorities, "considering the often occasions we have of trading with the Hollanders of the Dutch plantation and otherwise, that the Holland ducatour [*sic*] shall be current at six shillings, and the Rix dollar and Royall-of-eight shall be five shillings" (Mass. Col. Rec., ii., p. 29). The next year a similar enactment in Connecticut said that "good Ryalls-of-eight and Rix dollars should pass at five shillings." From the tendency of words to contraction, and because the syllable Rix, though significant of empire to Germans, means nothing to foreign ears, that prefix was dropped in common parlance, while the word dollar survived.

The name dollar, however derived by our colonists, could not fail to be extended to the Spanish *peso*, or pound, a word from the same root with *pois*, the final syllable in avoirdupois. The alternative Spanish name, piece-of-eight, was a circumlocution which could not fail to be supplanted by the single word dollar. Pieces-of-eight flowed into New England from southern Europe and the West Indies, partly in return for fish and partly from half-piratical buccaneers who made booty on Spanish commerce. In Plymouth, Gov. Bradford describes one Capt. Cromwell, who, in 1646, having made prizes, "scattered a great deal of silver among the pilgrims, and, as was feared, a great deal more sin than silver." In 1740 Capt. Hull of Newport made such a

capture that the share of every man on his ship was proclaimed in the Boston *News-Letter* to amount to more than a thousand pieces-of-eight. In 1687 the Yankee skipper Phips, with his divers, brought up a million and a half of such pieces from the sunken wreck of a single Spanish galleon. But these spasmodic windfalls were trifles compared with the steady stream which gushed forth from the perennial fishery fountains.

The connection of cod and currency was close. Money was never so scarce in New England as during its early decades. That colony had been planted by the aid of English capital. The exports from the new country were needed for paying debts in the old, or for procuring new supplies. No import of money from England could be hoped for, nor could the colonists keep the pittance they had brought with them. Within ten years after his arrival, Winthrop writes sadly, "Our money was now [1640] gone" (Journal, ii., p. 24). In this emergency attempts were made to keep money in the country by a law which forbade carrying it out on pain of forfeiture, and by a fiat money act for coining ninepences and ordaining that they should pass current as shillings. Hence originated the pine-tree shillings of the Old Bay State, now prized so highly by numismatists. Puritans eschewed Shakspere, but they knew as well as his *Jack Cade* to order that "seven ha'penny loaves should be sold for a penny."

Necessity fortunately soon invented a more excellent way to make money plenty in every man's pocket. A new and better fish market than the English was discovered and utilized to the utmost. The Navigation Act, indeed, forced all vessels to steer for England, but, once there, they could push on to Spain and further. This act, however, laid on American necks a yoke too heavy to be borne. It was thrown off at every opportunity, without any twinge of Puritan conscience, especially as to the carriage of fish to the West Indies. It was soon relaxed so as to permit voyages direct to all points south of the most northern cape in Spain. Thanks to fasts, which had been abolished in England, fish in rigidly Catholic countries was indispensable. The demand was great and unceasing, prices high, and paid in pieces-of-eight. No wonder the fish trade, mainly in cod, expanded and was differentiated. Refuse culls, or poor John, became in sugar islands the only luxury of Sambo; the medium grades contented his creole master, while the selectest variety, the duncod, enabled European grandees of the straitest sect to keep the most rigorous fasts without much mortification of the flesh.

It is safe to say that none of these varieties of cod tasted so sweet to hunger-bitten fasters as the profits from them tasted to the Yankees when they had secured free course through Southern markets. Their ciphering was of this sort: A vessel of 100 tons with twenty men fishing on the Banks and voyaging to Portugal, Spain, or Italy, perhaps selling half her cargo in the West Indies, will expend £1,000. At the year's end her receipts may be expected to show a gain of 200 per cent. It is no wonder that as early as 1709 the fishing navy was chronicled as already amounting to 30,000 tons. In 1741 the total export trade to southern islands equalled that to England itself; each was reckoned at £100,000. The birth of a codfish aristocracy could not be long deferred.

The codfish dollar as a coin could not fail to become early the real unit of value, though the pound so continued in name till near the close of the eighteenth century. The Spanish fractions of the dollar, as well as the dollar itself, predominated in American circulation, while English names were given to the pieces. Thus, the ryall (rial, real, royal) was called a nine-pence, and its half a four pence-ha'penny. These Spanish subdivisions formed most of the change-current in the United States during the first half of the present century. This fact appears in the rates of postage, which were fixed in conformity to the size of those bits. We see on old letters postage marked 6¼ cents, because the smallest Spanish silverling passed at that value. But for this coin, postage could never be fully paid, as no quarter of a cent was ever minted. Economical men used to pay in copper, and thus saved four per cent. on their outlays. For twenty-three years previous to 1828, not one half dime was stamped in the United States mint, and the total number which had been before stamped was little over a quarter of a million (265,543). Other American coins were struck off on a similarly scanty scale.

We thus owe the federal currency formally adopted by Congress in 1786, but used in business long before, to codfish. It brought us the dollar as our monetary unit—the dollar both name and thing, with all early subdivisions and some that still survive—as really as though every codfish had been caught with a silverling in his mouth, like the fish in which St. Peter found the stater for paying his tribute and his master's.

Correspondence.

THE COLLEGE MAN IN THE CIVIL SERVICE.

To the Editor of The Nation:

Sir: In support of your statements and statistics in this week's *Nation*, illustrating the chance of monopoly of the public service by college graduates under civil-service rules, I beg to contribute the following figures, just compiled by me from the records of the Massachusetts Civil-Service Commission, showing the number of college men applying or examined since the organization of this commission in 1884. In this table I have included as college men all applicants claiming to have attended college, without regard to the length of time, or whether they received a degree:

PERSONS EXAMINED.

Year	School education.	College education
1885	1,267	25
1886	1,016	19
1887	919	19
1888	1,008	6
1889	989	27
1890	1,031	13
1891	1,055	29
1892	883	20
1893	1,854	19
1894	1,568	14
1895	2,578	35
1896	2,767	37
Total	16,935	263

Percentage of college men, 1.53.

It is probable that there are in Massachusetts more college graduates in proportion to the male population than in any other State. I add that the average age of applicants for the classified civil service in Massachusetts is a little over thirty-five years. It has varied but little from year to year. The lowest average age was in the year 1890, 33.47; the highest in 1891, 37.28.

Chas. Theo. Russell, Chairman.

Massachusetts Civil-Service Commission,
Boston, December 4, 1896.

THE PROVIDENCE ELECTION.

To the Editor of The Nation:

Sir: The Providence municipal election, which this year was held for the first time on the same day as the Presidential election, presented some very instructive features. In the voting for the Presidential ticket, the Republican candidate evidently received nearly the entire sound-money vote, giving a Republican plurality of 7,211; while in the voting for the municipal ticket the plurality was a Democratic one of 9,366. In other words, the Democratic candidate for Mayor, who one year ago received only 7,904 votes, was this year re-elected by a vote of 14,506. To obtain this, he apparently must have received more Republican votes than the Republican candidate of this year, who had only 5,140 votes.

If the comparison be made with the total vote cast this year in the municipal and Presidential ballotings respectively, the result is almost equally interesting. Out of a total of 20,056 votes cast for the Presidential tickets, the McKinley ticket received 13,124. Out of a total of 21,889 votes cast for the municipal tickets, the Democratic ticket received 14,506. In each case the successful candidates received more than two-thirds of the whole, and outnumbered their opponents more than two to one.

While it is true that the reëlected Mayor of Providence is emphatically worthy of the non-partisan support which he received, there is yet another feature of interest to be taken into account. In the face of every principle of local self-government, and in the face of the direct remonstrances of the municipalities concerned, the Republican majority in the last State Legislature succeeded in enacting the law whereby, in each of the five cities of the State, the municipal election should this year fall on the day of the Presidential election. The obvious expectation was that a successful Republican ticket in national matters would perforce sweep along with it the Republican candidates on the local municipal tickets. It is at once ludicrous and reassuring to notice that in only one of these five cities (Woonsocket) was a Republican mayor elected, while every one of them (and, in fact, every one of the thirty-seven towns and cities in the State) voted against the Bryan ticket.

We are sometimes inclined to ask despairingly whether voters can be induced to think for themselves. On this occasion it is very evident that they did think for themselves.

F.

Providence, R. I., December 5, 1896.

DUELLING IN THE BRITISH ARMY.

To the Editor of The Nation:

Sir: The *Nation* of November 26, in a paragraph relating to duelling in the German Army, says that duelling in the British Army was abolished about fifty years ago. This is not correct. Duelling has in fact been discountenanced in the British Army since much earlier times. Our articles of war against duelling were copied from the British articles in 1775, and the prohibition of the practice may be traced back through different British codes to the beginning of the seventeenth century. In James the Second's articles (1686) and Prince Rupert's (1673), the articles relating to duelling are almost in the language of the American articles now in force. In the ordinances published by the Earl of Northumberland in 1640 it was prescribed that "whosoever shall receive an injurie, and shall

take his own satisfaction, shall be punished by imprisonment, and as it shall be thought fit by the marshall court." In the ordinances put forth by the Earl of Essex in 1639 the corresponding article was:

"No man shall challenge or defye another, in campe or garrison, nor shall accept of the challenge, upon paine of imprisonment and publike disarming before his companie; nor shall any, by words or injuries, provoke another to the fight or duell, or shall revenge his own injuries or provocations, upon the like penalties."

In the Articles of War of Gustavus Adolphus the article relating to duelling is in language which seems to indicate that it was followed in the British codes:

"No Duell or Combat shall be permitted to bee fought either in the Leaguer or place of Strength; if any offereth to wrong others, it shall bee decided by the Officers of the Regiment; he that challengeth the field of another shall answer it before the Marshal's Court. If any Captain, Lieutenant, Ancient, or other inferiour officer, shall either give leave or permission unto any under their command, to enter combat, and doth not rather hinder them, shall be presently cashiered from their charges, and serve afterwards as a Reformado or common souldier; but if any harm be done he shall answer it as deeply as he that did it."

And even in the military code of Henry VIII. it was prescribed "that noe man make debate, striffe, or contention for anie hatred or malice of tyme passed, ne for tyme to come, whereby anie man bee slayne, upon payne of him or them that be causers, or partners of ye murder, to be hanged therefore."

G. Norman Lieber.

Washington, December 2, 1896.

[We did not say "discountenanced"; we said "abolished," which is correct. Duels were fought by army officers in England down to 1843. The late Lord Cardigan fought one with another officer in 1840, and the last duel in England was in 1843 between Lieutenant Monro and Colonel Fawcett, his brother-in-law, when Colonel Fawcett was killed. This led, in 1844, to an amendment to the Articles of War, which visited failure to try to prevent a duel even, let alone "to fight or promote a duel," with cashiering, and made the reception or offer of an apology suitable to the character of honorable men. Before this, duelling was not punished unless it had fatal results, and to refuse a challenge led to retirement from the regiment. Consequently, while Mr. Lieber is correct in saying that duelling in England was "discountenanced" centuries ago, he is incorrect in saying that we are "not correct" in saying that it was abolished only fifty years ago. The exact number is fifty-two.—Ed. Nation.]

INJUNCTION AND ANARCHY.

To the Editor of The Nation:

Sir: In your issue of November 5 you denounce Senate Bill No. 2984 authorizing trial by jury in contempt cases in the federal courts, under the heading "The Bill to Authorize Anarchy." Permit me to inquire how you reconcile your views therein with those of date September 13, 1894, entitled "The Debs Case," wherein you condemn the action of the federal court at Chicago in trying without a jury the contempt charges against Debs and others for violating an "omnibus" injunction theretofore issued. When a journal so independent and generally sane on public questions changes front so completely as the *Nation* has done in this instance, it is due to its readers that the reasons therefor be given.

Very truly yours, Henry Z. Johnson.

Boisé, Idaho, November 18, 1896.

[We do not seem to have been inconsistent. In the editorial of 1894 we conceded that "there is no doubt of the power of a court to punish summarily those who disobey its orders; . . . the person charged with contempt . . . cannot demand a jury"; and our theme was, "It may be doubted whether the injunctions [in the Debs case] were not wholly superfluous"; and we contended that it was improper to resort to the civil injunction, with its possibilities of contempt proceedings, when the situation really involved a crime, and therefore should have been left, for preventive purposes, to the federal troops as peace officers. Since that time popular feeling, aroused by the impropriety noted by us, has come to confound in its haste the injunction itself with the casual abuse of it; and our aim in the editorial of November 5 was to warn against this terrible error, which, if carried into effect by Senate Bill No. 2984, would wholly destroy the very vitality of the injunction in all cases, however legitimately used—a consequence disastrous to civil rights. In short, it is one thing to criticise the propriety of using the injunction in a given case (which we did in 1894), but it is a wholly different thing to wish to abolish it as a civil remedy (which we now and ever shall oppose).—Ed. Nation.]

MARY LYON AND OBERLIN.

To the Editor of The Nation:

Sir: The recent gift of $450 by the professors and students at Oberlin to Mt. Holyoke College, in return for a similar sum sent to Oberlin by Miss Lyon and her pupils (then at Ipswich, Mass.), furnishes a proper occasion to fix in the public mind some facts concerning the movement for the higher education of women which are not generally known. This large gift (for the time) of Miss Lyon and her associates was sent to Oberlin in 1834 in token of their interest in the determination of Oberlin's founders to open all departments of the College to women on equal terms with men. It was three or four years after this that Miss Lyon established the Seminary at Mt. Holyoke, which has only lately become a college with a full curriculum.

The interest in the higher education of women was, at that time, also manifested by the number of young women who flocked to Oberlin for the advantages there offered to them, entering the very first classes, and in due time finishing the classical course (then on a par with that of the New England colleges), and receiving the bachelor's degree twelve or fifteen years before it was granted to women by any other college. This is a fact to be remembered by the presidents of some of our women's colleges, who seem to be under the impression that the movement for the higher education of women began with them.

G. Frederick Wright.

Notes.

The Caxton Club of Chicago has nearly ready Joutel's 'Journal of La Salle's Last Voyage,' a page-for-page and line-for-line reprint of the first English translation (1714), with a facsimile of the folding-map of the first French edition (1713), and numerous notes by Melville B. Anderson. Two hundred and three copies will be printed from type on American handmade paper and three on Japanese vellum. Subscriptions at six dollars to the paper set will not be received after December 16. The treasurer of the club is Charles L. Hutchinson.

The Southern History Association will begin with the new year to issue its publications in the form of a quarterly, subscription to which is included in the annual membership fee of three dollars. The Secretary is Colyer Meriwether, 325 East Capitol Street, Washington.

Miss Alice C. Baker of Cambridge and Deerfield, Mass., has made it a pious duty to trace the fortunes of New England's captives carried to Canada during the French and Indian wars. She has done this, not alone in books, but by laborious travels in the St. Lawrence Valley, and her 'Stories of the Captives,' embracing thirteen narratives, will be published during the present season.

Fresh announcements by the Macmillan Company are 'A First Book in Writing English,' by Edwin Herbert Lewis, Ph.D., of Chicago University; 'Bird Life for Beginners,' by Mrs. Mabel Osgood Wright and Dr. Elliott Coues; 'The National Movement in the Reign of Henry III.,' by Prof. Oliver H. Richardson of Drury College; and 'Faith the Beginning, Self-Surrender the Fulfilment, of the Spiritual Life,' by Dr. James Martineau.

Copeland & Day, Boston, who have transferred their list of works issued in connection with John Lane of London to his New York house, The Bodley Head, 140 Fifth Avenue, announce 'In Childhood's Country,' by Louise Chandler Moulton, pictured by Ethel Reed; 'Martins,' poems by Francis Sherman, and 'Gold Stories of '49,' by a Californian.

Ginn & Co. will bring out this winter 'Method in History,' by Prof. Wm. H. Mace of Syracuse University.

'Pennsylvania Colony and Commonwealth,' by Sidney George Fisher, is in the press of Henry T. Coates & Co.

We reserve for future notice the long-expected work by Dr. Dörpfeld on the Greek Theatre, which has at last appeared and is for sale by Lemcke & Buechner, New York. The title is 'Das Griechische Theater; Beiträge zur Geschichte des Dionysos-Theaters in Athen, und anderer Griechischer Theater, von Wilhelm Dörpfeld und Emil Reisch' (Leipzig: Carl Fr. Fleischer).

The pains bestowed by Dodd, Mead & Co. on their holiday edition of Lord Lytton's 'Richelieu' have met with least success in what was presumably the main motive for the edition—we mean the illustrations. They are the work of one hand, but untastefully (and untypographically) contrasted in the medium of expression; part being in pen-and-ink line, part in wash, and all feeble and anything but dramatic.

There is little to say of 'My Village' (Scribners). Life in a French village is described in

it with pen and pencil by E. Boyd Smith, and text and illustrations are much on a level of pretty slightness. The little book may serve to pass a pleasant hour if one is content not to ask too much of it.

The 'Jane Eyre' just issued in London by Service & Paton and in New York by the Putnams deserves consideration by admirers of that work. The letter-press is distinct and tasteful, the binding in corresponding taste. Mr. F. H. Townsend's illustrations are clever and individual, if slight.

Henry T. Coates & Co., Philadelphia, have provided a companion to Amicis's 'Constantinople' in Charles Yriarte's 'Venice,' similarly adorned with excellent and pertinent photogravures, a good map, and an index. Colleoni's statue does duty a second time upon the cover, and gives distinction to the binding. Yriarte is more historical and artistic than his Italian brother man of letters, but he has his moments of tourist description and impression, and is anything but heavy reading.

"A Selection of Songs of Good Courage" is the sub-title, and perhaps the better title, of 'Through Love to Light,' made by John White Chadwick and Annie Hathaway Chadwick—a pretty volume in white and gold (Boston: Joseph Knight Co.). It must not, however, as the compilers give warning, be too rigidly interpreted, as witness Alfred Lyall's 'Theology in Extremis' and (considering how large a part the hereafter plays in keeping up our spirits) Matthew Arnold's "Is it so small a thing?" Arnold has, by the way, been more largely drawn upon than any other poet, with nine pieces; Emerson with eight; Lowell and Tennyson with seven; Browning, Clough, Symonds, and E. R. Sill with six, etc. Lowell is ingeniously made to furnish an antistrophe to Shakspere. Whittier lends but two, and Wordsworth but four, pieces. Mr. Chadwick contributes liberally of his own store, and there is otherwise a fair representation of the Unitarian connection, especially of the younger men. The names of Carman, Roberts, Tabb, Riley, Arlo Bates, and W. R. Thayer show that our newest singers have not been overlooked. Many of the titles are supplied, for fragments, by the compilers. One of these, "Cosmic Emotion," is as exact as it is un-Tennysonian. The collection cannot fail to find acceptance.

Mr. Clifton Johnson has made New England his province in one or more works which he has used his camera to adorn and illustrate to the life. He returns to the subject in 'A Book of Country Clouds and Sunshine' (Boston: Lee & Shepard), with chapters on winter life, town-meeting, financiering on a small farm, a hill-town Sabbath, the minister, deserted homes, etc. Mr. Johnson does not rank with the more practised, graphic, or philosophic writers who have preceded him, but his matter is interesting and based on knowledge. His pictures are well-chosen for character and scenic effect, and, if they do not always fit the adjacent text, they harmonize with the atmosphere of the book. The volume is handsomely manufactured.

The latest of the Scribners' musical publications is 'Songs of Childhood: Verses by Eugene Field, Music by Reginald de Koven and Others.' It contains musical settings of twenty of Field's poems, the composers represented besides De Koven being Arthur Foote, G. W. Chadwick, W. W. Gilchrist, Clayton Johns, Gerrit Smith, C. B. Hawley, Hubbard T. Smith, and Edgar S. Kelley. Mr. De Koven contributes nine of the songs, and one of them is marked opus 117 No. 2—a rather startling number for a composer of his age (thirty-seven). The collection as a whole may be commended, the music being usually on a level with the verse.

'Small Songs for Small Singers,' by W. H. Neidlinger (Schirmer), is a collection of unpretentious ditties, with marginal colored pictures that will probably interest the little ones more than the music.

The '"Thumb" Pilgrim's Progress,' contrived for the vest-pocket by Henry Frowde, is singularly legible. The inch-and-a-half-square page amasses 418 without producing a thickness of more than half an inch, including the morocco binding. There are illustrations to boot. This is the sort of vade-mecum which would admirably befit a poetic anthology of shorter poems.

Some years ago the 'Journal of Emily Shore' was noticed in our columns. She died in 1839. We have now a volume of the poems of a sister, Louisa, who survived her fifty-six years (London and New York: John Lane). To the Memoir by her sister Arabella Mr. Frederic Harrison adds an appreciation. Miss Louisa Shore was a lady who lived a secluded life, taking, however, a deep and intelligent interest in the outer world—a type of the best class of English Liberal, Nonconforming womanhood. It is to be regretted that her self-appreciation was so low that she cared to finish but few of her more ambitious attempts. The fragments here given cause us to wish for more. Mr. Harrison's estimate of her is high. (Some of her elegies have been much used in Positivist services.) He says of her that of all the men and women with whom in his literary life he had been thrown, "she, I think, lived the most continuously alone with her own creations." Upon the whole, this little book of high and tender memories is more likely to take its place upon the book-shelves of friends among privately printed memoirs than with the general public. Though a record of advanced achievement and of a matured and finished life, it has not the same general interest as the 'Journal' of the sister Emily.

The editors of the *Philosophical Review* reprint as a supplement the translation of Dr. Adickes's Bibliography of German writings by and on Kant. It is a work of immense size and learning, which, we suppose, no self-respecting philosophical library can afford to be without. Its usefulness is greatly increased by the fact that it contains not merely a list of the various books in their chronological order, but also a brief account and estimate of their contents, which becomes fuller and very serviceable in the case of the most important writings. To give an idea of the magnitude of this monument of German industry, it suffices to state that it extends over 623 closely printed pages (including the index), and mentions 2,832 publications, whose subjects range from the sublime to the ridiculous, from the application of Kantian principles to the Deity to their application to cookery. And yet the bibliography extends at present only to 1804, the year of Kant's death, and the accumulations of another century's pondering on the sage of Königsberg remain to be recorded!

Two youthful, hitherto unpublished poems of Emerson's are the most curious feature of Duprat & Co.'s *Booklover's Almanac* for 1897. Mr. S. P. Avery contributes in facsimile an autograph letter of Disraeli's complaining to his binder that his books would not lie open; together with a sketch of the late William Matthews, our foremost New York binder, whose work is shown in two colored specimens.

In the *New England Magazine* for December Mr. F. B. Sanborn discourses of the various portraits of Emerson. Accompanying his paper is a large number of examples, of the best and of the poorest. The editor desires to return to the subject, and begs to be favored with fresh material for copying.

An entertaining account, by George Kolb, of two hunting trips made by him in 1894–96 in British East Africa is contained in the last number of *Petermann's Mitteilungen*. Large game was found in abundance on the eastern slope of Mt. Kenia, where he killed forty-four rhinoceroses in nineteen days, and a companion shot twelve elephants in one morning. A lake was discovered, at an elevation of six thousand feet, in which were numerous hippopotamuses. There are many interesting sketches of the natives, whose confidence Mr. Kolb was singularly successful in winning. He has a good word even for the Masai, the North American Indian of Africa, out of whom the British officials are making efficient soldiers. Among some of the tribes a custom prevails of permitting only the circumcised males to marry. But before a youth can be circumcised he must have killed a man; hence there is constant warfare between tribes, and an overplus of women. A considerable part of the region traversed is very fertile, and the climate is no more dangerous to the health and life of the European than that of Germany—provided that he avoid the use of alcohol.

The latest report of the Missouri Geological Survey contains an essay by C. F. Marbut on the physical features of that State, in which due importance is at last attached to the escarpments by which the lowlands and uplands are separated in various districts. The escarpments are formed by the retreating edges of the more resistant strata, all of which stand at a very gentle inclination. Their front bluff or escarpment is very ragged and uneven, under the long weathering of the atmosphere; beneath the bluffs, weaker underlying strata are worn down to relatively even lower lands; back of the bluffs, the surface of the upland gradually descends with the dip of the controlling stratum to another lowland in the rear. A map illustrates the distribution of these important features, of which the chief are the Bethany escarpment, crossing the northwest corner of the State; the Burlington escarpment, in the southwest corner; and several others near the middle of the eastern border. Special attention is given also to the peculiarly irregular or meandering courses of a number of rivers, concerning which, especially the Osage, there has been some discussion in recent years. The report is well illustrated with photographs and maps.

The Dutch missionary settlement in Formosa in the seventeenth century (1624-1661) was the first enterprise of Protestant missions on a large scale. Within a few years past the English Presbyterians have begun operations in the same region. In addition, they have recovered, both from libraries in the Netherlands and the natives in Formosa, not a few literary relics of the good work which was, in 1661, swept away by the Chino-Japanese pirate, Koxinga. To his handsome publication of Gravius's version of St. Matthew in the Sinkang dialect, with parallel versions in Dutch and English, the Rev. William Campbell now adds a companion volume in like excellent typography, proceeding from the press of Kegan Paul, Trench, Trübner & Co., London. It has an introduction of xix

and text of 199 pages. Mr. Campbell seems to look hopefully upon the Japanese possession of this populous island, while making a plea also for Gospel work among the mountain savages who are likewise head-hunters. The work contains the "Articles of Christian Instruction" with which people in the Reformed Dutch church in America and on other continents are familiar. The text is in the Favorlang dialect, with Dutch and English parallel versions. There are also five sermons, questions on the Creed and the Lord's Prayer, a catechism for those to receive baptism, and a specimen of the dialect of the aborigines at Toa-sia. In reproducing George Psalmanazar's "Dialogue between a Japanese and a Formosan," Mr. Campbell takes occasion to show that the late Professor de Lacouperie's surmise that there existed a native Formosan script of neither Chinese nor European origin is baseless. Psalmanazar's reputation is not improved, though the interest in reading this rare tract is heightened as we see the Japanese of 1896 face to face with these mountain tribes, finding it no easy task to tame them. The vocabulary of the Favorlang dialect is very rich, and, unless we greatly mistake, is of great value not only to intending missionaries but to students of pre-Buddhistic Japanese.

The General Theological Library whose home is at 53 Mt. Vernon Street, Boston, seeks a further endowment of $400,000 for its undenominational collection, now more than thirty years in the gathering, and amounting to 14,000 volumes. Perpetual membership by a church enables the pastors for ever to use the library and to draw books without charge. The present rate for this is $100, and there are various rates for founders, associate founders, patrons, etc. The Secretary is L. Farnham.

The death is announced from Copenhagen of Prof. Karl Adolph Verner, the discoverer of the so-called Verner's Law. Prof. Verner was born in Aarhus, Denmark, March 7, 1846. After graduating from the Latin school of his native place, he began the study of the Slavic languages, visiting at different times Germany and Russia. In July, 1875, he made the discovery that was destined to give him an international reputation on its publication two years later in Kuhn's *Zeitschrift*. By this he showed that the apparently exceptional change of Indo-European k, t, p to g, d, b respectively was the result of the position of the accent in the original forms. In recognition of the value of this discovery the Berlin Academy granted him the Bopp prize, and the University of Heidelberg gave him the degree of Ph.D. *honoris causa*. For a number of years he was custodian of the University Library at Halle. In 1883 he was appointed Docent in the Slavic Languages at the University of Copenhagen, and five years later he was made Professor Extraordinarius. During the last years of his life Prof. Verner published practically nothing, but devoted himself to his university duties and to the construction of an original apparatus for registering speech sounds with greater accuracy than has hitherto been possible. This instrument is said to be so nearly completed as already to be of great value to investigators.

The two articles on Australasian Government Populistic land experiments in Nos. 1628, 1629 of the *Nation*, based on M. Pierre Leroy-Beaulieu's exposition of the subject in the *Revue des Deux Mondes*, evoked some criticism and denials which we forwarded to M. Leroy-Beaulieu. In his reply, just received, he adheres to the correctness of his own statements, and to our own abstract of them, with one unfortunate exception, where we substituted "New Zealand" for "South Australia" in the leading illustration in the first of the above articles.

—"Light in Dark Places" is the title of Jacob A. Riis's contribution to the December *Century*. Only the varied bands of workers in Tenement House Commission, Health Department, or Associated Charity, who through weary years have wrestled with landlord and legislator to clear out New York's human rookeries, clean its streets, and bring within sight the day when, among other reforms, "every child who asks shall find a seat provided for him in the public school, and when that scandal of the age, the mixing of truants and thieves in a jail, shall have finally ceased," can read between the lines of this noble showing of results. But it bears on its face a contradiction of the disgraceful arguments which the negligent citizen is not ashamed to employ, in his own defence, that public work must always be in incompetent or corrupt hands, or that it is of no use to struggle with the politicians. And since, for good or ill, women have determined to have a hand in the vitally important work Mr. Riis describes, it is necessary to reckon with the point of view ably set forth in the "Open Letter" department by Mrs. Christine Ladd Franklin, who avers that "there can be no doubt that that nation which first adds the well-trained mental powers of its women to the sum total of its intelligence, will add vastly to its power for dealing with all those difficult questions which are pressing for solution." On the literary side of this number Thomas A. Janvier's gracefully written Christmas "Kalends of Provence" is supported by two carols, translated from the Provençal of Roumanille by Mrs. Janvier, and turned again into verse by Edith Thomas and by Margaret Vandegrift.

—Besides E. L. Godkin's "Social Classes in the Republic," the December *Atlantic* contains several papers upon which time may be profitably spent. "Josiah Flynt," in particular, while describing his personal experience of a week in one of the German colonies for the unemployed (started in 1882), touches upon two of the most pregnant sources of perplexity to those who have to deal, from any point of view, with the problems of the unemployed. One is the passion for town life, exemplified by the swarms of Germans who will neither ask for work in the villages they pass through on their tramp from city to city, nor take it from the farmers, who "often bid high for laborers." The other is the total absence of any sense of personal responsibility in men of the class who frequent the colonies, though they know exactly what ails the world and what is needed for its regeneration, repeating in this respect the trait common to tramps, who will "talk for hours at the hang-out camp fire about what ought to be done to make the world better, and at times with a clearness of perception and earnestness of argument that are unexcelled; but let a little personal introspection or criticism be suggested, and a silence comes over them like that of the graveyard." In the latter observation lies the gist of the ultimate question which the philanthropist who endeavors to work on scientific lines is forced to put to himself: "What shall be done with the man in whom no sense of personal responsibility can be aroused?" Spasmodic and sentimental charity insists upon putting off any reasonable answer; but its finding will be hastened by plain statement of facts such as "Josiah Flynt" hits upon in his voyages of discovery among the human dregs. It is refreshing to find side by side with a study like this last a paper so charming in style and genially ripe in scholarship as Prof. Gildersleeve's "Classical Studies in America," which passes on to the reader part of the pleasure of the writer's recent visit to Greece.

—There is cause for congratulation that in the round half-dozen short stories in *Scribner's* this month not more than a single one has its pages disfigured by the debased jargon which is made to do duty as dialect in so much of the current story-telling, and by means of which the magazines add their quota to the advancing demoralization of the mother-tongue. *Scribner's*, moreover, introduces to its readers, or to such as have not already made his acquaintance through the "Yellow Book" or otherwise, a writer new to magazines on this side of the water, Kenneth Grahame. Mr. Grahame's English, undefiled by New-World associations, forms always part of the charm of his writing, and this sketch of childhood, "The Magic Ring," like those in a former volume, "The Golden Age," is quite subtle and suggestive enough to engage the undivided mind of the adult reader, who will discover under the more academic guise of Miss Repplier's essay, "Little Pharisees in Fiction," a kindred spirit of revolt against accepted methods of bending the twig. Unwholesome Sunday-school literature fares hardly here, and deservedly so, at Miss Repplier's hands. Cosmo Monkhouse's account of the late Sir John Millais suffices, with its excellent illustrations, to give an agreeable all-round view of the work of a very agreeable painter, the best achievement of whose pre-Raphaelite period, the "Lorenzo and Isabella," invites, as here reproduced from the original in the Liverpool Art Gallery, a close study.

—The Texas Ranger, arms and the man, is the subject, in *Harper's*, of Frederic Remington's "How the Law got into the Chaparral." A territory where, in the thirties, Texans, Comanches, and Mexicans "chased one another over the plains, and shot and stabbed to find who should inherit the land," afforded a fair field for the stirring escapades which have found here, in one and the same hand, a wide-awake chronicler and spirited illustrator. Mr. Howells, in his turn, proves, as might have been expected, an attractive chronicler of some of the personal traits of Oliver Wendell Holmes. But just which those "fences" were that this genial celebrity, accessible to both friend and stranger, might with advantage have dispensed with, "because God has made enough differences between men" and "we need not trouble ourselves to multiply them," curiosity is piqued to understand. Some of his visitors were unfortunately left unprovided with a capacity to perceive any "fences" whatsoever, so that Dr. Holmes was forced to adopt, when "now and then an insensitive began to trespass," a sliding-scale of dismissal that, as Mr. Howells appreciatively notices, "never failed of its work, and that really saved the author from the effect of intrusion." An illustrated Christmas feature of the number is an abstract, by John Corbin, under the title of "A Middle-English Nativity," of the verse of a Yorkshire mystery-play, with interesting introduction and explanatory notes.

—The Joint Committee of Congress on the Library have been sitting during the recess, with a view to the adoption of well-settled plans for the removal of the library to its magnificent new building, and its proper development and administration in the new era upon which it will now enter. Last week the committee invited several prominent librarians to appear before them and give expert advice on these matters. Messrs. Brett of Cleveland (President of the American Library Association), Dewey of the New York State Library, Putnam of Boston, Baker of Columbia University, Hayes of Columbus, Ohio (son of the late ex-President Hayes), and Fletcher of Amherst College were examined at length. With some diversities of opinion on minor points, they appear by the reports in the Washington papers to have been in substantial agreement as to the main issues. They urged the importance and necessity of a great enlargement of the official staff of the library, of new and accurate classification and catalogue systems, and of a policy of coöperation with other libraries both in Washington and elsewhere. One point especially dwelt upon was that this library, which must henceforth be rather a great national library than merely the Library of Congress, should be a great bibliographic centre, where inquirers, either in person or by letter, can learn what literature exists on a given subject, and, so far as possible, where the works indicated can be found. It was also urged that every facility should be furnished for the copying, at the expense of inquirers at a distance, of desired chapters or portions from books not easily obtained in the local libraries, and that, under proper restrictions, books from the National Library should be loaned to libraries throughout the country for the use of special students. The committee showed themselves very hospitable to the suggestions of the librarians, and their report, which will be presented to Congress early in the present session, cannot fail to exhibit a more intelligent grasp of the situation, present and future, for this consultation with practical and experienced librarians.

—The country was very fortunate in the appointment of Mr. Crandall to the new office of Superintendent of Documents in the Government Printing-office. He organized his bureau skilfully, he has conducted it usefully, so far as the law allows him to be useful, and he has drafted an act which will very much increase the chance of the country receiving from public documents a return of service somewhat commensurate with their great cost. But perhaps nothing that he has done is so important in its consequences as his commencing in the right form the comprehensive index to the documents which Congress ordered to be issued at the close of each regular session. There are so many ways in which it ought not to be made and in which it was very likely to be made, and the chances were so great that, from the inertia prevalent in public offices, it would, when once started wrong, have gone on wrong for ever, causing us a fresh regret and a fresh sensation of disgust with every new volume, that his choice of the dictionary form and of this particular style of dictionary might well have been mentioned on our late holiday as one of the fit causes of thanksgiving. Mr. Crandall's decision was made, not by chance, but as the result of inquiry and a conviction which shows clearly in his preface. "Any man," he says, "who knows his alphabet and has intelligence enough to find words in a dictionary, can find what he looks for in this book. No table of contents, no index, no side columns, no classification, no chronological or numerical order, no attempts to originate some new and unfamiliar form of catalogue, will here be found to add to the confusion in which the public documents are already enveloped in the public mind."

—The entries are under author and subject, occasionally under title. Special attention appears to have been paid to making the needful cross-references. Mr. Crandall prefers to call this a catalogue rather than a "comprehensive index," as it was termed in the act ordering its publication, because it is a catalogue—that is, a list of papers, not a collection of references to parts of papers. But it is an analytical catalogue—that is, each separate paper in collections like the Proceedings of the National Museum, the Bulletin of the Geological Survey, the Report of the Smithsonian Institution, is duly entered. We hope the superintendent will consider the possibility of employing the linotype, or the monotype, or some similar machine, to make a cumulative index on the plan so successfully inaugurated this year at the Cleveland Public Library, so that the monthly list of documents shall always embrace under subjects as well as authors references to all that has been published up to date from the beginning of the session, and so that when the sessional catalogues become too numerous for ready consultation, they can be combined into one single-alphabet quinquesessional list. It would be a bulky volume. The amount of printing done by our Government is now so enormous that the present catalogue of the issues from March 3, 1893, to June 30, 1895, only two years and a third, has 630 large octavo double-columned pages. It is another instance of woman's advance in the library world that it was compiled under the direction of Miss Edith E. Clarke, to whose energy, skill, and executive ability, says Mr. Crandall, the credit for any favor it may gain will largely be due. It certainly will gain favor, for it is a most creditable piece of work.

—This country does not stand alone in its generally unfortunate attitude toward the destruction of forests. According to the Scandinavian specialist G. Wilhjelm, who published an article on this subject in a recent number of the *Tidsskrift for Skovvæsen*, all the Scandinavian countries except Denmark are confronted with very serious problems in forestry that call for immediate solution. Especially is this true of Norway, which, at the present rate of consumption, will be practically denuded of its forests in sixty or seventy years. The chief causes that threaten a tree famine in Norway are the enormous exports and the domestic use in mills, etc., combined with the lack of definite rules for preserving the old forests and providing for new ones. The Norwegians seem to be almost as extravagant in their use of wood for building and fuel as our own frontiersmen. Norway is one of the few European countries in which wood is largely used for building, in marked contrast to Denmark, where brick and stone are used almost exclusively for this purpose. Wooden fences, too, are frequent in the country districts. But far more serious than the use of wood is its waste. In Denmark even the twigs are gathered for fuel, while in Norway only the best parts of the tree are valued, the discarded parts being left to litter the ground and to interfere with new growth. The young shoots, furthermore, that do succeed in pushing their way through the earth, are too frequently left to the fastidious appetite of horses and sheep. Just as in our northwestern woods, great damage is caused in Norway by forest fires. In 1888 in one district of Norway alone the loss from this cause was estimated at 650,000 kroner ($180,000). Although many laws have been passed by the Norwegian Althing to protect the forests, but little improvement can be noted. These laws are unpopular, because, like so many protective measures passed by legislative bodies all the world over, they lack clearness and definiteness. More successful is the rather Populistic royal resolution authorizing the Norwegian Bank to issue loans on forest lands up to three-tenths of their assessed value. In all three of the northern Scandinavian countries there are regularly appointed forest engineers who give advice on scientific forestry to communes and landowners. Tree-planting by school-children is also encouraged, and, it is thought, with considerable educational results.

PHILIP GILBERT HAMERTON.

Philip Gilbert Hamerton: An Autobiography, 1834-1858, and a Memoir by his wife, 1858-1894. With a Portrait. Boston: Roberts Brothers. 1896.

DISRAELI'S celebrated definition of the critics as "the failures in literature and art" was certainly intended to be ill-natured, but it is, perhaps, worth considering whether these "failures" are not, on the whole, the best possible material of which critics can be made. The first thing required of a critic is surely that he shall have an interest in and a knowledge of the art he is to criticise; and in proportion as his interest is deep will be the likelihood that he will have attempted the practice of this art, while the practice itself will vastly have increased his knowledge of the aims and methods and difficulties of it. If, however, he have the true critical breadth of mind and variety of interests, these very qualities may tend to prevent the concentration of aim and effort necessary to success in the practice of any art. Also, success, if attained, keeps the successful artist too busy to allow of his devoting much time to criticism, even if he were thoroughly fitted for it by nature. The ideal critic would possibly be a thoroughly successful artist who should have mastered his craft without narrowing his mind, and who should then give up its practice for the sake of formulating its theory; but such men are not to be found. The criticism of successful artists is often of the greatest value, but it is generally fragmentary. The best of all critics of painting, Fromentin, was greater as a writer than as a painter, though he cannot be called a failure in his art. He is almost a unique example, and in general the "failures" in art are the only persons possessing at once the necessary knowledge and the necessary leisure to write well and at length of it.

Such a man was Philip Gilbert Hamerton. It is true that he protests against such a classification, saying:

"I have been sometimes represented as an unsuccessful painter who took to writing because he had failed as an artist. It is, of course, easy to state the matter so, but the exact truth is that a very moderate success in either literature or art would have been equally acceptable to me, so that there has been no other failure in my life than the usual one of not being able to catch two hares at the

same time. Very few dogs have ever been able to do that."

The difference is, however, merely one of statement. His literary ambition was of equal date with his artistic, but the literature he then contemplated was not criticism, but poetry. The failure of his volume of poems turned him toward painting, and it was, avowedly, as a painter that he began to write art criticism—witness his essay, "That Certain Artists Should Write on Art." What was the exact measure of his failure in painting we have no means of judging. He published a few etchings, which are feeble and amateurish; but his pictures were uniformly refused at exhibitions, and are unknown and inaccessible. From the time he wrote 'A Painter's Camp' his books were almost uniformly successful, and literature became more and more the business of his life. He wrote two or three novels and some books of a literary and semi-philosophical nature; but his interest in painting and his struggles to master its technical difficulties made the criticism of art his natural field, and his permanent place in the literature of the world, as far as his place may be permanent, will be that of an art critic.

As a critic of painting and the other graphic arts his influence was great and undoubtedly salutary. He would have been the last man in the world to assume that the function of the critic is the instruction of the artist, and he never fell into the vein of Mr. Ruskin, who was fond of telling young painters what they should do. Neither had he Ruskin's dangerous eloquence, which often persuaded young artists, Mr. Hamerton himself among the number, to do as he told them. Hamerton confined himself to the critic's true rôle of interpreter of the artist to the public, and for this office he had many qualifications besides the essential one of considerable practical knowledge of art. Even his limitations and defects were in a manner part of his effectiveness. Take, for instance, his style. It is a model of simplicity and lucidity, and has a certain elegance and charm. So clear is it that its possessor complains somewhere that it prevented his having any reputation in England for profundity, it being an English idea that a clear writer is a shallow one. It is without passion, or warmth of coloring, or brilliancy of fancy, as cold as it is clear—the style of a well-educated, gentlemanly person, not that of a poet or a rhapsodist. It can hardly be doubted that this is the style best calculated to carry conviction to the people for whom he wrote. Its air of cool reasonableness and well-bred abstention from extremes was for the cultivated Englishman or American a guarantee that here was the utterance of a sensible person like himself, not of an æsthete or a crank; and such a reader was prepared to accept doctrines entirely new to him which, if given in a more colored manner, he might have taken for pernicious nonsense.

The style was a true reflection of the mind. It was the mind of a cultivated man, broadened by a deep interest in art and by long residence abroad and the study of foreign languages and customs, yet, in many respects, essentially the mind of an English country gentleman. The English love of the open air and wild country, and of some of the forms of sport, and the English love of antiquity and respectability and comfort, always remained with him. Indeed, the love of wild nature was much stronger in him than the love of art, and was the dominating factor in his choice of landscape-painting as a profession. He resented being told that he was not a genius, saying that he never pretended to be one. He was not a specially profound or original thinker, and had no horror of the commonplace, being willing to say over and over again those simple and true things which it is essential that people should know, but which it is very tiresome to teach them. He felt profoundly that two and two do make four, and was willing to reiterate the truth without bothering himself or his readers with supersubtle doubts as to the nature of two and of four. He had that great love for detail and processes and apparatus which is generally one of the marks of the amateur, but which was most useful in enabling him to estimate the effect of technical considerations on the substance of art. In a word, he was just enough of an artist to understand the artist's point of view, and just enough of an outsider to know what the outsider wants and needs to be told, and how to tell it him with the least shock to his feelings or trouble to his understanding. To the artist his placidly flowing prose seems often irritating in its abundance of platitude and truism; but the truism of the artist is for the Philistine sometimes a startling paradox, and it is fortunate for the popular comprehension of art in England and America that an interpreter should have been found with just that combination of qualities and limitations which Hamerton possessed. He probably did more than any other man to counteract the teaching of Ruskin, and to spread abroad that "knowledge of what art is" that Goethe considered a fortunate possession for youth; and this distinction he would have considered amply sufficient.

Mr. Hamerton believed that no one could so properly write his Life as he himself, as no one else could so well know the facts of it. This is certainly true of the earlier part of it, the account of his childhood and youth. He had carried the work only to the time of his marriage when he laid down the pen for ever, and it was taken up by his wife, who furnishes a memoir which completes the volume. The truth of his life from that time on is, naturally, almost as well known to her as to himself, and we have the advantage of a point of view a little removed from his own. By slight things vividly remembered — things which he would hardly have thought worthy of mention—we are given an insight into the habits and nature of the man. The combination produces as nearly as may be an ideal form of biography, though, of course, it excludes any critical estimate of the work and influence of the man commemorated.

The earliest chapters of the book are somewhat depressing. Philip Gilbert Hamerton was born on the 10th of September, 1834, at Laneside, near Shaw, in Lancashire. His family was a very old one, a fact which he never forgot, but his father was a lawyer of somewhat dissipated habits, who married, without the consent of her mother, a young woman who died a few weeks after the birth of their son. This calamity threw the father back upon the bad habits he had abandoned, and he slowly drank himself to death after rendering his son's life miserable for some years. For most of the time during his father's life, and altogether after his death, young Hamerton was under the tutelage of a maiden aunt, who seems to have been a most estimable and lovable person, but was perhaps not always the best guide for a boy. He led, however, much the life of other English boys of his class, and his school experiences furnished him with some of the material for 'Harry Blount'—a book, by the way, the writing of which is, singularly enough, nowhere mentioned. He had a passion for poetry and for outdoor life, and a decent property which was afterwards lost. His father had expressly forbidden his becoming a lawyer, and he was at first expected to go through Oxford and become a clergyman; but conscientious scruples, aided by reaction from the teaching of a narrow and bigoted clerical "coach," forbade this course. He had not, at this time, to consider the necessity of earning a living, and so drifted naturally into landscape-painting and literature. In 1855 he published, at his own expense, 'The Isles of Loch Awe, and Other Poems,' and the failure of this volume discouraged him so completely that for some time he deserted literature and devoted himself entirely to art. Even when he returned to literature again, in 'A Painter's Camp,' it was, at first, with the idea of contributing to his reputation as a painter.

It has often been said that every young painter should have a competence of his own, and it often seems that the poor man who attempts the career of art loses much valuable time in the mere struggle for existence. Yet it may be doubted if Hamerton's little fortune was an unmixed benefit to him as a painter, though it may have helped to make him a critic. In the first place, it prevented his being taken seriously by those to whom he applied for advice, and so prevented his having the right instruction at the right time. No artist who saw him "riding a good horse" would believe that he wanted more than the kind of lessons given to the usual wealthy amateur. In the second place, it enabled him to satisfy all his whims and to live without work, so that he spent endless time contriving camping outfits and boats and apparatus and systems of note-taking, when the practical work of scene-painting and book-illustrating of the young Turner would have been infinitely more to the purpose; and to live away from cities, which he hated, but which are the only places where the trade of painting can be learned.

Even more fatal to his hopes was the influence of John Ruskin, then at its height. Ruskin convinced him that the observation and strict imitation of nature in all its detail was the one thing needful, and that all artistic tradition was hurtful and wrong. No one told him that the study of the figure was the one initiation to all art; no one taught him to see or to paint. His master, an obscure but conscientious artist, only taught him to copy his own works and to draw contours with rigid truth to measurement. With no training but that of a topographical draughtsman, he went off and set himself face to face with the most difficult country in the world, the highlands of Scotland, and spent years trying to paint from nature where the effect is not constant for two minutes, and to combine pre-Raphaelite detail and literalness with a rendering of nature's most splendid and most fleeting moments. The effort was bound to end in failure. He confesses that his wife, a French lady whom he had met in Paris in 1855, and whom he married and brought to Scotland in 1858, had more real sympathy with and knowledge of art at that time than he, and she reports how he used to bring her the most painfully minute and labored studies, only to be met with the remark that, "if it were true, it did not look so to me, since it produced none of the sensations of the natural scene. 'You would like me to exaggerate, then?' he asked. 'Yes,' I answered, 'if that is the way to make it *look* true.'"

The labor of these years made the 'Painter's Camp' a successful book, but, as training in art, the only result was to convince him that Ruskin was wrong, and to teach him the difference between art and nature. As a critic the lesson was invaluable to him, but it came too late to make him a painter. He lost his property, and had to work for his support and that of his family. His book had made him a name as a writer, while his pictures would not sell, and a professional writer he became and remained, though he never gave up trying to paint. It was because he had first failed as an artist that he became a good critic.

Having dwelt on that part of Hamerton's life which had the greatest share in making him what he was, the rest may be passed in review more rapidly. In 1861 he went to reside in France, first at Sens and afterward near Autun. It will prove a surprise to many that his eminently sane and wholesome books were produced with such mental strain as to occasion a painful nervous disorder, which, until near the end of his life, was always brought on by railway travel, so that he was forced to live in partial seclusion and far from books and galleries—a great handicap in his work. In his last years he was able to stand travel and the life of cities better, and he removed to the outskirts of Paris. He died suddenly of heart disease on the 4th of November, 1894.

The book is well printed and contains a well-executed photogravure portrait, which shows a far stronger and finer head than the engraved portrait published with Hamerton's 'Portfolio Papers.'

RECENT POETRY.

Pierre Ronsard, whom Mary Queen of Scots crowned as Apollo, and whom the French critics of his day ranked as the third poet of the universe, said that poetry, being the language of the gods, should not be lightly attempted by men, and that only the inspired should venture on it at all. This opinion is doubtless shared by all poets, and they vary mainly in their classification of the inspired; as when Southey ranked himself above all his contemporaries, and Matthew Arnold placed himself before Browning and Tennyson. Unfortunately this same variation extends to the judgment of critics; and all the effort of what is called scientific criticism has yet gone no farther than to lay down a few very simple rules, all of which, according to Thoreau, the poet straightway proceeds to violate with impunity. There are grades in poets, but what contemporary shall do the grading? Where, for instance, shall we class Rudyard Kipling? In taking up his new volume, 'The Seven Seas' (Appleton), the reader feels at first a thrill from the sonorous title; then recognizes that there is here a stronger claimant than Sir Edwin Arnold to the name once bestowed on the latter by an admirer, "The Poet of the Drum-beat of Empire." Never equalling Arnold in the felicity of some of his Indian ballads, Kipling incomparably surpasses him in vigor, in resonance, and (though this is harder) in the honest brag which is inseparable from the theme, and which Americans do not grudge to their elder brothers. Then, as a singer of sea marvels and mysteries, Kipling stands alone; and this is a more real power than lay in the questionable Anglo-Orientalism in which his muse had birth. He has also shown his power, as in "Danny Deever," to touch the universal human heart. It is of this last, however, that one feels the want in this volume, with all its superb quality. Kipling is always, of course, "virile," but there is no word of cant in the criticism of the day more perilous than this. We need to remind ourselves every day that mere strength is not enough; it is not the supreme quality to be virile alone—every hod-carrier is that, and is indeed very likely to surpass in brute force the architect whose plans he carries out. There are moments in reading the first half of this volume, and a great many more in turning over the second half, when we seem to be listening to a voice originally fine, but beginning to be broken and hoarsened by too much singing on board ship, for the delight of the forecastle, through wind and fog. We are tempted to ask ourselves whether Lablache can ship as a boatswain without spoiling his organ.

Then the book is half filled with the old barrack-room material, with odds and ends from Tommy Atkins's haversack. Even Mr. Atkins's dialect grows tiresome; one can have enough of "Gawd" and "bloomin'" and "poor beggars." We remember, too, that we are taking on trust the whole of this Anglo-Indian soldier-slang; and is it all quite genuine? It is well known that old Californians never admitted Bret Harte's local coloring to be authentic, and that Mr. Harte himself used to express a lively contempt for all that sort of thing as offered by Joaquin Miller. Mr. Kipling, it must be remembered, is now venturing perilously near us, and we cannot help testing his native dialect by his handling of our own. When we find him putting a Babel of mixed Americanisms into the mouth of Cape Ann fishermen, in his new story 'Captains Courageous'; when we find him making them say "a heap better" and "plumb distracted" and "twist round a piece"—phrases as unsuited to his heroes as would be palms and pomegranates on the East Gloucester downs—one is led to ask whether his Hindustani vernacular is any better. We have the testimony to the contrary of that exceedingly keen and cool Oriental, the Swami Vivekananda, who habitually shrugged his shoulders at the mention of Mr. Kipling's name. He pointed out that the very title of his spirited poem, "Gunga Din," was an utter misnomer, being, indeed, an impossible combination, the one word being Hindu and the other Mohammedan; and, moreover, that no Hindu would serve as a water-carrier to Christians. Mr. Kipling, at any rate, must be judged at last not merely by his vast vocabulary, but by his staying power, and of this he has given us as yet no final proof. For immediate and startling effects he stands unrivalled.

A similar question of grading arises in the case of another sea-loving poet, quite unlike Mr. Kipling, namely, Celia Thaxter, whose collected poems (Appledore Edition—Houghton, Mifflin & Co.) have the attraction which will always belong to the work of a person of rare and gifted nature, limited in both temperament and experience, and beset by the double disadvantage of alternate repression and flattery. It shows an innate strength of character that she rose above both of these, and extracted a really generous and beautiful life out of such drawbacks. Her poetry is like the flowers of the island she loved—a scanty yield, yet taking richer tints and deeper fragrance from the tonic neighborhood of the salt air. She knew all the New England literati of her time, yet it is not apparent that she was much influenced by any; certainly not by Lowell, whom she knew best. She showed rather more of the religious atmosphere of Whittier, whom she copied in the simple ballad measure which they both liked, and also in the strong inclination for a superfluous final verse conveying the moral. There is, indeed, in many of these verses a degree of dilution which brings them perilously near to the commonplace; and it is a curious fact that her first published poem, "Landlocked," printed by Lowell in the *Atlantic Monthly*, and here placed at the head of the volume, is incomparably the most artistic thing she ever achieved, and, as such, though no longer a novelty, is always worth quoting.

The poetical part of 'W. V., Her Book and Various Verses,' by William Canton (Stone & Kimball), is not, perhaps, so very much better than other people's poetry; or, if it is, it is so distinctly outshone by the prose part that it has no chance. The title, too, is enigmatical, but the delineation of the actual child known by the unexplained initials is simply the most charming portrayal of a child's life since 'Pet Marjorie.' Such a warm, delicious, original little bit of unspoiled existence would reach many hearts, were it but known; and her unflinching blunders cheer the heart of man. "Of course she wanted a story; I might have anticipated as much. Well, there was King Robert the Bruce, who was saved by a spider from his enemies when they were seeking his life. 'And if they had found him, would they have sworded off his head? Really, father? Like Oliver Crumball did Charles King's?' Her grammar was defective, but her surmises were beyond dispute: They would" (p. 7). Thus W. V. is followed through "Her Birthday," "Her Book," "Her Friend Littlejohn," and "Her Bedtime"; and though her loving papa is not without a touch of poetic fire, especially in his seaside ballads, yet he has chosen to celebrate a daughter who outshines him, and he must take the consequences.

It is a far cry from 'W. V.' to Mr. Riley, but the latter's 'Child-World' (Indianapolis: Bowen-Merrill) is another venture in that direction where he has been so successful, having really struck out a path as new and fresh as was marked in Whittier's 'Snow Bound,' than which it is indeed much more daring. Whittier gives a prose idyl of old-time New England life; but Mr. Riley gives Hoosier child-life, and this in dialect—a series of what it is now the fashion to call "human documents"; the tales told by the children themselves, the stories narrated to them, and the varying personality of the narrators. The dialect is sometimes as puzzling to the uninitiated as that of Uncle Remus, but Mr. Riley gives us, like Uncle Remus, a perfectly delineated group with its surroundings; and the respective characters, such as Bud and Lauretty and the Hired Man, are as real as if we had seen them.

The issue of two volumes of 'Elizabethan Sonnet-cycles,' by Martha Foote Crowe (Chicago: McClurg), is a well-meant enterprise, and is, moreover, on its own plan, well executed, the accuracy of proof-reading being especially commendable. The trouble is, that the plan adopted is neither the one thing nor the other. Any such reprint of an old author must be either scholarly or popular. This series cannot be called scholarly, because all the spelling is modernized, a thing not now approved of by scholarship. Nor is it popularized, because for this there would be needed a whole apparatus of notes and elucidations, whereas the editor gives only one or two, thus conceding the necessity, but not answering the demand. This omission is the more noticeable as the material was in most cases ready for the editor's use in previous critical editions.

The four series of poems selected are Samuel Daniel's "Delia," Henry Constable's "Diana," Thomas Lodge's "Phillis," and Giles Fletcher's "Licia." Let us take the last for example. The work had been previously edited by the Rev. Alexander B. Grosart in his "Miscellanies of the Fuller Worthies Library" (vol. iii., 1871), a book doubtless easily accessible in the great Chicago libraries, though not cited by the editor. Grosart reproduces the original spelling, and adds notes to the peculiar or obsolete words. Now there happens to occur in "Licia" one of the most singular verbal whims to be found in an Elizabethan writer, and one which, glaring as it is, has been ignored by all the great lexicographers until Murray, and is left unexplained even by him. The poet twice uses the word "ebon" with reversed meaning, to signify white instead of black. In praising a beautiful woman he speaks of her "ebon hands" (p. 122) and her "ebon thighs" (p. 112). Neither the Century Dictionary nor Stormont's alludes to this strange usage, still less any of their predecessors; it is only in the latest volume of Murray that we find the fact even noted, and he offers no explanation. Nor has any been offered except by Prof. G. L. Kittredge of Harvard University, who suggests that the word may have been originally written "eburn" from *ebur*, ivory, as in Ovid's *eburnea brachia*. Now here was an instance of a required and even indispensable footnote. Grosart gives a note saying "ebon, ivory, not ebony (black): a noticeable occurrence of the word" (iii, 109), after which plain fingerpost any following editor should at least have pointed out the strange usage; yet the present editor does not even mention it. For the sonnet-series themselves, they will always be interesting to students, were it only from their extreme irregularities of form, making it only the more remarkable that Shakspere and Milton should have achieved the standards of regularity they had. To recur to the spelling, it is true that Arber, in his 'English Garner,' reprints with modernized spelling some of these very sequences as well as others, such as "Drilla," "Cœlia," and "Idea"; but the example is a poor one, and it is much better to follow that of Grosart and also of Pollard in his edition of Sidney's "Astrophel and Stella," the forerunner and exemplar of all this whimsical race of books.

'English Epithalamies,' edited by Robert H. Case (London: Lane; Chicago: McClurg), is a book which does in an extremely careful and scholarly manner a task which was perhaps hardly worth doing, the collecting of English marriage poems, largely Elizabethan. Most of these are simply Catullus hammered out into rhyme and a little coarsened; while some of them, as those of Spenser, Jonson, Chapman, and Donne, give us finer and more poetic touches. Many, however, are hardly more than the old time fescennine verses; and the thorough and discriminating historical preface of the editor is perhaps the best part of the book.

Another of the Bodley Head anthologies is 'Musa Piscatrix,' by John Buchan, including many well-known poems and others hardly worth knowing, with illustrations by E. Philip Pimlott; these last adding but little to the attractions—we might say the professional attractions—of the volume. A newer and fresher outdoor book is 'Haunts of Wild Game,' by Isaac McLellan (New York: C. B Bradford), a little collection of poems by that fine old veteran sportsman whose 'Poems of the Rod and Gun' has been heretofore reviewed in these columns, and who now, at the age of ninety, sends forth another volume of the same kind. He is a native of Portland, Me., a townsman and lifelong friend of Prof. Longfellow and N. P. Willis, and now resides at Greenport, Long Island. He is a cousin of the late James Freeman Clarke, and pictures of Mr. McLellan at sixty and at ninety show that he is a worthy compeer of that excellent man in the vigor of his old age. The outdoor quality of his poems is fresh and simple, while their poetic execution is fair.

Another well-edited English anthology is 'Book-Verse: An Anthology of Poems of Books and Bookmen, from the Earliest Times to Recent Years,' prepared by W. Roberts for the "Bookhunters' Library" (Armstrong). The introduction and notes are excellent. The crowning and admirable bit of work in this direction, however, must be sought in 'The Treasury of American Sacred Song,' with notes explanatory and biographical, selected and edited by W. Garrett Holder, and published in the beautiful typography of the Oxford University Press (London and New York: Frowde). American authors have grown so accustomed to "a younger brother's portion" in the way of English criticism that it must give them at once a sense of honor to receive such careful and appreciative recognition, and a sense of shame that the same thing has never been done nearly so well in this country. With a corps of friendly advisers and assistants on both sides of the ocean, and with the British Museum at his elbow, Mr. Holder has achieved a book not only of exquisite execution, but almost absolutely free from error. In all the details given, we note but two or three points of fact needing correction. Mr. Holder mentions with approval, on his very first page, "the remark of Colonel Higginson to Matthew Arnold," namely, the phrase which the latter disapproved, about the "one drop more of nervous fluid" in the American. This was not, however, a remark made to Mr. Arnold, but one which occurred in Col Higginson's essay called "The Murder of the Innocents" ('Out-Door Papers,' p. 101), where it appeared, curiously enough, as the basis of a physiological warning, though Mr. Arnold interpreted it as a piece of boasting. Again, it is not correctly stated (p. 354) that Emily Dickinson's manuscript poems were "written in continuous lines, like prose"; this having rarely, though occasionally, happened. The mistake perhaps grew out of the fact that she frequently, in her letters, passed abruptly from prose to verse, but always marking the distinction in the lines. Again, it is rather a pity to perpetuate (as on p. 355) the phrase "Helen Hunt Jackson," as no woman would have less liked to bear simultaneously the names of two husbands. Nor can we always agree with the editor's criticism, as where he speaks of the "Psalm of Life" as one of the "least worthy" poems of Longfellow. It was an early poem, of course, and one of the least ambitious, intellectually speaking; but its high moral purpose, its simplicity, and its wide influence must surely take it out of the category to which Mr. Holder assigns it. The criticism is more unexpected from the fact that more pages of this volume are naturally given to Whittier than to any one else. The editor's general tone is, however, modest and courteous. The book has the further merit of interpreting its title very widely, and recalls sometimes the liberal theory of those who hold that we should hear only sacred music on Sunday, but that all good music is sacred.

Another valuable book from England is the second volume of Mr. Arthur S. Way's translation of Euripides (Macmillan). We ventured, some time since, to criticise the first volume for what seemed a somewhat jaunty attempt to render the stately choruses into vivacious English verse, thus often suggesting a comparison with Swinburne's 'Atalanta in Calydon,' than which few things are really less Greek. We find the same fault now, but greatly diminished in degree, perhaps designedly, perhaps because we have grown used to it; and we still observe an occasional use of unusual Scotch and other unfamiliar words, as (on p. 41) "a scaur to ascend," whereas only those who remember their "Young Lochinvar" will know what a scaur is. But in all else the translation is really admirable; and better still is the preface on "Euripides and his Work," which for the first time vindicates the great man, of whom Professor Moulton has said that he has been "next to Shakspere the best abused poet in literature." Mr. Way shows that Euripides, instead of being inferior to his great rivals Æschylus and Sophocles, was really their superior in what most touches modern humanity, in uttering the sentiment of sympathy from man to man, and in assigning true dignity and worth to woman. It is strange, indeed, that because of phrases he has put into the mouths of cynics, he should pass for a misogynist, when he introduced into the dramatic literature of the world four such noble feminine types as Alcestis, Iphigeneia, Makaria, and Polyxena. Goethe always maintained that Aristophanes, with his wicked wit, had permanently impaired the fame of Euripides; but Mr. Way has done all that one man can do to reclaim it.

A less satisfactory book of English translations is one which looks at first glance most attractive, and which wins American regard by its dedication to that friend of scholars Professor Norton. It is entitled 'Dante, Petrarch, Camoens, CXXIV Sonnets, translated by Richard Garnett, LL.D.' (Copeland & Day). The translator has earned the gratitude of many of our students as librarian of the British Museum, and he has also published a volume of his own poems; so that this set of versions plainly represents the solace and amusement of his life. That is well; but all experience shows that a translator must be born rather than made, and in dealing with sonnets by the picked sonnetteers of the world there is needed a rare combination of gifts. Of these, especially in the case of Petrarch, the sense of beauty in execution must rank almost first; nothing since the gems of Greek literature has required it more. It is in this sense that Mr. Garnett does not seem to us sufficiently strong; nor do his versions keep closely enough to the literal to vindicate in that way—if that can be a vindication—the æsthetic defect. This criticism can be vindicated only by taking some well-known instance, and considering it rather in detail. The following sonnet, describing an imaginary interview with Laura in heaven, is among the most celebrated. It is a defect in Mr. Garnett's arrangement that he does not give, as is usual, the first line of the original, which is in this case *Levommi il mio pensier in parte ov' era*. This is his translation (p. 83):

Exalted by my thought to regions where
I found whom earthly quest hath never shown,
Where Love hath rule 'twixt fourth and second zone;
More beautiful I found her, less austere.
Clasping my hand, she said, "Behold the sphere
Where we shall dwell, if Wish hath truly known.
I am who wrung from thee such bitter moan;
Whose sun went down ere Evening did appear.
My bliss, too high for man to understand,
Yet needs thee, and the veil that so did please,
Now unto dust for briefest season given."
Why ceased she speaking? Why withdrew her hand?
For rapt to ecstasy by words like these,
Little I wanted to have stayed in Heaven.

Comparing this with the Italian, we note at once a cumbrous and mechanical substitution of "'twixt fourth and second zone" for the simple *terzo cerchio* of the original. The image "whose sun went down" and the phrase "rapt to ecstasy" are both additions, and trite ones. The participle "clasping" is far less simple and vigorous than the preterite *Per man mi prese*, as is the plural "we shall dwell" than the direct appeal, *Sarai ancor meco*, while the similar appeal *Te solo aspetto* would be far better left in the first person than linked to another subject: it is not merely her bliss which lacks him, but she who looks for him. "Wish hath truly known" is an awkward phrase; and "wish" really renders *desir* with no nearer accuracy than the word "hope" would have attained. We have taken this sonnet quite at random, but it illustrates the point with which we began, that Mr. Garnett is an honest and laborious but by no means heaven-born translator.

'Songs of Exile,' by Herbert Bates (Copeland & Day), is another of the pretty little "Oaten Stop" series, and speaks the longing for the shore and the seaside of one banished to the prairies; Mr. Bates being now, as we understand, a resident of Nebraska, but a Harvard graduate of 1890. There is a good deal of salt air in the poems, the best of which is perhaps this (p. 34):

SEA GULLS.

Whence come the white gulls that sail,
That flutter, and sink, and sail?
Their red beaks flash and glitter,
Their wide wings droop and trail.

They follow the sea-tide's call,
They troop, at the sea-tide's call,
Over the wide sea-spaces
And along the dark sea-wall.

Along the dark sea steep,
By the black cliffs, bare and steep,
They flutter, and fall, and scream,
They drift slow-winged in sleep.

They wander and brighten and gleam
As the wind-clouds shift and gleam—
Souls of sea-winds that wander
In a mist-encircled dream.

'Songs of the South' (Philadelphia: Lippincott) is a collection of Southern (United States) poets, from the colonial times until now, edited by Jennie Thornley Clarke of the Georgia Normal and Industrial College, and prefaced with a few judicious words by Joel Chandler Harris. There is not much of critical spirit in the selection, and the best of the poems are well known; Lanier's "Marshes of Glynn" and Ticknor's "Little Giffen" standing easily at the head. The net is thrown widely, as is usually the case in all local collections—including, for instance, Poe, who was born in Boston, was educated in Virginia, and resided everywhere; Pike and Prentice, who were born at the North, but spent their lives at the South; and Allston, who was born in Charleston, S. C. The editor's account of him is the only instance we notice that looks like straining the point for a favorable showing. Miss Clarke merely says that he was "educated at the North on account of his health, and spent much time abroad" (page 317). That he left South Carolina in early boyhood; that he dwelt most of his life in Massachusetts, being there twice a husband and twice a widower; that his studio was in Cambridgeport, and that he was buried by torchlight in Old Cambridge—these are rather important facts to overlook. Out of his sixty-four years of life Allston spent in all but fifteen in Europe. The general fairness of the book, however, indicates that this partial misrepresentation of the facts was unintentional.

There is a steady supply, from what may be called the Bryan region of the country, of poetic volumes which have a certain promise and a certain pathos. There is in them a genuine love of nature, with a fair amount of local coloring in that respect. There is a good deal of the romance of domestic antiquity; of The Old Farm, and The Clock that Father Used to Wind. There is also a good deal of James Whitcomb Riley. There is much of encouragement in them, however, to the patriotic and patient spirit, which is checked only when they occasionally strike a false note and indulge in rhapsodies about "dead Guénivere" and "a glove of mauve." One of the best of these books is 'Showers and Sunshine,' by Will T. Hale (Memphis, Tenn.: Gayoso; but printed and bound in Boston). Not so good, though more pretentious, is the latest work of the inexhaustible Mr. Cawein, 'The Garden of Dreams' (Louisville, Ky.: Morton). Mr. Cawein is a shade less imitative than in his earlier volumes, but neither time nor criticism has done much to prune down such amazing turgidity as this (pp. 80–81):

How good to kiss her throat and hair,
And say no word! Her throat was bare
As some moon-fungus white and fair.
. . . . . .

Had God or Fiend assigned this hour
That bloomed—where love had all of power—
The senses' aphrodisiac flower?

The dawn was far away. Nude night
Hung savage stars of sultry white
Around her bosom's Ethiop light;

and so on indefinitely. As a rule, the Atlantic States do not produce this sort of thing; their weak point is in an affectation of the boulevards, with French phrases and opera-box flirtations. 'Beaux and Belles,' by Arthur Griscom (Putnams), and 'Love and Laughter,' by the late James G. Burnett (Putnams)—the latter with a preface by William Winter—are favorable examples, but the 'Poems' of the late H. C. Bunner (Scribners) of course stand at the head, though the best in this kind are but shadows. A single poem, "Shriven" (p. 240), remains as a solitary instance of what this last author might, perhaps, have accomplished had his career not come to a climax as editor of *Puck*. It is the meditations of a mediæval knight after he has been shriven and is left to die in peace; his vain efforts to lift his mind from the well-trodden paths of exceedingly secular memories, culminating at last with a sigh of regret that his dog is not with him for companionship. In terseness, vigor, and dramatic quality it could scarcely have been bettered by Browning.

'A Quiet Road,' by Lizette Woodworth Reese (Houghton, Mifflin & Co.), has that calm, lily-scented atmosphere which always belongs to this lady's poems; she knows how to make the most of what we have that is colonial and picturesque; and this is done without straining or affectation. She even takes pains to explain in a footnote that the "Dorset levels" in the poem which follows are not transatlantic, but are only on the Eastern Shore of Maryland, and that she has therefore a full right to dwell on them and theirs (p. 57):

THE LAVENDER WOMAN—A MARKET SONG.

Crooked, like the bough the March wind bends wall-
ward across the sleet,
Stands she at her blackened stall in the loud market
street;
All about her in the sun, full-topped, exceeding sweet,
Lie bundles of gray lavender, a-shrivel in the heat.

What the Vision that is mine, coming over and o'er?
'Tis the Dorset levels, aye, behind me and before:
Creeks that slip without a sound from flaggy shore to
shore;
Orchards gnarled with springtimes and as gust-bound
as of yore.

Oh, the panes at sunset burning rich-red as the rose!
Oh, colonial chimneys that the punctual swallow
knows!
Land where like a memory the salt scent stays or
goes,
Where wealthy is the reaper and right glad is he that
sows

Drips and drips the last June rain, but toward the even-
fall
Copper gleam the little pools behind the pear-trees
tall:
In a whirl of violet, and the fairest thing of all,
The lavender, the lavender sways by the sagging wall.
. . . . . .
Oh, my heart, why should you break at any thoughts
like these?
So sooth are they of the old time that they should
bring you ease;
Of Hester in the lavender and out among the bees,
Clipping the long stalks one by one under the Dorset
trees.

'Heart Songs,' by Rachel B. McMullen (Worcester: The Author), is a modest little book, plaintive and affectionate rather than inspired. 'Bohemian Legends, and Other Poems,' by F. P. Kopta (Jenkins), has a grim and patriotic rather than a poetic and pleasurable interest; and that it should have reached a second edition within two years shows how varied our national ingredients are becoming. In the same way the translated 'Poems of Johanna Ambrosius' (Boston: Roberts Bros.) have an astonishing personal interest as the work of a German peasant woman, but are not in themselves eminently attractive. 'Ballads of New Jersey in the Revolution,' by Charles D. Platt (Morristown: The Jerseyman Print) belong in the historical rather than the poetic alcove. In the way of new charade-books there are 'A New Book of Charades,' by Katharine I. Sanford (White), and '96 Charades,' by Norman Gray (Lamson). These, like all the rest, travel in the path of Mr. Bellamy's well-known 'Century of Charades,' of which a second series also appears (Houghton); but, after all, it is one of those cases where Eclipse is first and the rest nowhere. 'Notes and Half-Notes,' by Frank E. Sawyer (Putnams), are largely poems of music, and not without merit as such. 'Echoes from the Mountains,' by C. E. D. Phelps (Putnams), has some good outdoor description, yet is at its best in the following (p. 45):

EPITHALAMIUM.

Here ends all art, all artificers end:
Come ye, look thro' our little golden loop;
Here is the best that heaven to earth did send,
Here is the bond of love, and joy, and hope;
The soldier's laurel, poet's bay, down fling,
Take up this tiny wreath, the marriage ring.

The double bow, which heralds sunny weather,
The shining halo of the rising day,
Th' equator smooth, which binds the world together,
The chaplet fair, that rounds the brow of May,
A diadem by meanest mortals owned,
Who rightly wears thee, sits a king enthroned.

Let but a slender finger swift pass thro' thee,
And all delights shall follow in its train.
Hold fast by this, and woe may not undo thee,
That brave ring-armor blunts the edge of pain.
Gentles, but hearken to the minstrel's voice,
And ye shall ne'er repent, but aye rejoice.

'A Book of Old English Ballads,' with an accompaniment of decorative drawing by George Wharton Edwards and an introduction by Hamilton W. Mabie (Macmillan), is a really charming gift-book of the very best of the old English and Scotch ballads, unaccountably omitting, however, the most tender and touching among them all, "Annie Lochroyan." The selection and introduction have the average excellence of Mr. Mabie's literary work; but the drawings, though always decorative and sometimes ingenious, exhibit in all the faces an indescribable modernness of expression which removes them by centuries from the period whose costumes they wear. Mr. John Todhunter, on the other side, transfers us to the domain of Irish legend, which he uses very effectively in 'Three Irish Bardic Tales,' being metrical versions of the tales known as the Three Sorrows of Story-Telling (London: Dent; Chicago: Way & Williams). Were it not that Aubrey de Vere had preceded him with "The Swans of Lir" and Dr. Joyce with "Deidré," these myths would be distinct additions to the poetic treasury of

the world; nor are they without merits and charms, even as it is.

'Under Quicken Boughs,' by Nora Hopper (New York: The Bodley Head), gives us another example of that Celtic strain which is adding so pure and delightful a freshness to recent English poetry; and the author constantly recalls Mr. Yeats—the prince of all this class of rhymers—in the utter freedom with which she handles all the picturesque properties and enigmatical names of Irish fairy mythology. The Shee and the Fomorah and Miscann Many and the Ceol-Sidhe are as familiar to this writer as if she had been cradled among them, as very likely she was; and the mystic dancers come and go through the air and call the living to join them as in Yeats's bewildering lays. So attractive does she make it all that the latter half of the book, with its Greek and Norse legends, seems comparatively remote and unattractive, and we wish to get back to the society of Fiachra and the Dinny Math. It is all very much like O'Brien's 'Diamond Lens,' or Goethe's 'Melusina,' where you peep through a keyhole and discern a semi-human world.

If one wishes to turn from the robust—one might perhaps use *Hamlet's* word "robustious"—muse of Kipling to a more profoundly imaginative and thoughtful strain, he will find it in Victor Plarr, whose 'In the Dorian Mood' (New York: The Bodley Head) is also before us. Mr. Plarr is well-known as one of the more thoughtful among the Rhymers' Club; he is apparently not English by descent, but essentially so in his handling, and more than English in his breadth. It would be hard to put before us a better example of the way in which a thoroughly poetic mind can use the materials that lie directly around him than in the fine feeling and shaping imagination of this London poem (p. 102):

THE DEER IN GREENWICH PARK.

Pathetic in their rags, from far and near,
The children of the slums o'erswarm the grass;
Pathetic in their grace the kinglike deer
Leap up to let them pass.

Where riot scares the gloom and fevers burn,
These wizened babes were pent till morning light;
Slim shadows moving 'mong the moonlit fern,
These shy deer strayed all night.

In the hot hours London's poor wastrels find
Their paradise in this brown London park;
The lordlier brutes, in the scant shade reclined,
Pant for the hours of dark

When some dim instinct of primeval years
Thrills on a sudden through each dappled breast,
And with untamable mysterious fears
The herd is repossessed.

Then the branched horns are toss'd; the nostrils fine
Respire the sleepy breath from London's heart,
And bucks, and does, and fawns, in spectral line,
Forth from their bracken start.

An antlered watchman stamps a shapely hoof—
Is that a tartaned Gael within the brake?
Did Luath bay below the heath-clad roof—
Doth Fingal's son awake?

. . . . . .

Who knows what stirs them? Nay, can any guess
That which their beautiful clear eyes import
When, at high noon, about the hand they press,
Begging in timid sort,

Save haply the exile's doom, which is the same
Whether 'tis buried in the tragic eyes
Of king discrowned, or wanderer without name,
Bondman, or brute that dies?

CHILDREN'S BOOKS.—II.

THE two-volume 'Historical Tales, Greek and Roman' (Lippincott) is a useful plan of Mr. Charles Morris's, judiciously, if not ideally, carried out. There is real need for such a book, and the stories are given in short flights, well adapted to youngsters who are just fledging their wings for the reading-book. The best of them follow closely Herodotus, Livy, and Plutarch—the closer the better, as a matter of course. Mr. Morris shows a praiseworthy desire to be careful in matters of history, but he has it on his conscience besides to set up sign-posts against the legends; yet we believe "the noble lies" of Livy and Herodotus are more precious to the childish soul than many a vulgar matter of fact. In these sceptical days, the infant scientist may be trusted to part with his faith quite early enough for his intellectual health; nor can we quite approve the principle which warns the innocent mind against the ring of Polycrates and the nursing wolf of Romulus and Remus, and on the next page endorses a false etymology of the word *celer*. But the selection is, in general, good and inspiring, the style is clear and simple, very rarely striking a false note or deviating into a slipshod sentence.

'The Long Walls' (G. P. Putnam's Sons) is a handsome volume which describes a boy's adventures in Greece and his exploration of a ruined town near Missolonghi. What with Wallachian shepherds and earthquakes and thrilling discoveries, there is a high spice of legitimate excitement mingled with the lessons of archæology. Uncle Ned, who administers these, is a gentleman who may be trusted with children and is a safe and scholarly guide. "Van's" slang is probably not overdrawn, but is certainly overdone. Boys talk slang, it is true, but that is no reason why they should read it constantly. However, with this exception, the style is in good taste, and is always vivacious; the illustrations are excellent; the local color, and even the Greek quotations, are accurate. The story is just as attractive as if it contained no information, and yet it gives very correct impressions about art and antiquities as well as about modern Greek life and manners.

The late Col. Thomas W. Knox's 'The Land of the Kangaroo' (Boston: W. A. Wilde & Co.) is marked by the excellences as well as the defects of his previous works of the same character. Considerable information is given in this, his last volume, about the cities of Adelaide, Melbourne, and Sydney and the adjacent country, but in a manner not calculated to interest the young reader. Unnecessary stress also is laid upon the horror of convict life in the penal settlements and on the hulks in the early days of the colonies. The book is attractively provided with illustrations, but a map showing the boy travellers' route would have increased its value.

'The Boy Tramps,' by J. Macdonald Oxley (T. Y. Crowell & Co.), is a spirited and entertaining description of a journey across Canada. The account of life and scenery in the cities, on the plains, and in the mountains is enlivened by a series of blood-stirring adventures, in all of which the boy travellers play a prominent part. They are of the most varied kind, from encounters with highwaymen to shooting a timber slide and riding a half-wild buffalo. The two heroes are very attractive lads, and both amusement and instruction will be gained by accompanying them in their tramp from Quebec to Ottawa and through the passes of the Rocky Mountains on the track of the Canadian Pacific. The illustrations are very good.

'The Green Mountain Boys' is the title rather boldly appropriated by Eliza F. Pollard for a book published by Dodd, Mead & Co. No mention whatever is made of Thompson's well-known work bearing this title, although it is clear that it has furnished much of the material for the present volume. Some of the early incidents and battles of the Revolutionary period are woven together with a love story, the scene changing from Vermont to Massachusetts and back again. From the point of view of an adult there seems little to commend in the book; but we are obliged to testify that some youthful readers find it fascinating.

The new edition of Mrs. Mary Mapes Dodge's well-approved and standard children's story, 'Hans Brinker' (Scribners), is furnished with an unusually full and harmonious set of illustrations and vignettes, which really illustrate, at once adorning the book and instructing the reader. The artist, Mr. Allen B. Doggett, made an especial trip to Holland for the purpose of having his work sound and consistent; and he has reason to be satisfied, for his pictures not only are correct and full of local spirit, but have an illuminating relation to the text too often wholly wanting in books of like character.

'What the Dragon-Fly Told the Children,' by Frances Bell Coursen (Boston: Lothrop Publishing Co.), he quoted from our best poets, repeating simple melodious poems by Shakspere, Wordsworth, Tennyson, and others—even venturing one from Chaucer. Why these selections should be supposed to gain by a dragon-fly's recitation remains a puzzle, especially as the preface admits that "the poetry itself is the bait by which we hope to catch the children." We think in fairness the dragon-fly should have told the children that he was not quoting Kingsley verbatim when he repeated,

"Be good, dear children, let who will be clever."

It would be a pity to fix in a child's retentive mind even trifling inaccuracies.

This little verse, by the way, holds in a nutshell the kernel of 'Christine's Career,' by Pauline King (Appletons). Christine lived to outgrow her discontent that she lacked the brilliant talents of her father and mother, and to accept willingly as her "career" the work of making a home for her father. The soundness of this doctrine few will dispute, since most of us must do without a career and be content, as Clough once said, with "mere subsistence." Such errors in quotation as "wreathing and writhing" for "reeling and writhing," and "For James Fitz-James was Scotland's King," and such grammar as "she gave he and Teddy," can hardly be laid upon the compositor's burdened shoulders. But it was probably the bookbinder's perverse notion to turn upside down the pretty narcissus decoration of the cover.

Another girls' book, called 'A Genuine Girl,' is by Jeanie Gould Lincoln (Houghton, Mifflin & Co.). The heroine is a pretty girl and behaves in a pleasant way, but to any one who has ever known one specimen of the kind it will be superfluous to read the book, since Phylis, the "sweet P," is as like all the rest as if they had grown in the same pod. Perhaps the glimpses of Washington society, and the intimacy with Senators, judges, and other people of consideration, may be some compensation for the lack of artistic quality in the book.

This lack is even more strongly felt in Julia P. Dabney's 'Little Daughter of the Sun' (Roberts Bros.). If to make a commonplace story acceptable it is needful only to carry it into a foreign climate, and dress it up with a fantastic name, the business of story-writing has become too easy. In this case that method conspicuously fails. Even with the advantage of living in the island of Teneriffe, the little daughter of the sun is still a "dreadful ordinary" girl. We are left doubting whether she owes her fanciful designation to her tropi-

cal home or to her yellow hair. One is prejudiced against this story by the first glance at its illustrations, which are extremely bad. Altogether the book is one which any child's library can afford to be without.

In the same category we may class 'The Scrape that Jack Built,' by Ottilie A. Liljencrantz (Chicago: A. C. McClurg & Co.). The name of the book is hardly more offensive to one's sense of literary propriety than its contents. Jack is so weak and stupid, in addition to his naughtiness, that it is hard to take any interest in him, and impossible to believe that his final repentance is likely to last beyond the next temptation to mischief.

In refreshing contrast is 'Walter Gibbs, the Young Boss,' by E. W. Thompson (T. Y. Crowell & Co.). While taking up a work beyond his years to save an invalid father from ruinous loss, the young boss has a becoming sense of his own inexperience, and knows the important distinction between a self-reliant and a headstrong spirit. Canada is the scene of both this and the other stories in the volume, and the small amount of local color that they show is ingrained. "Tom's Fearful Adventure"—of almost drowning in a washbowl, by getting his head caught under the faucets—and one or two more of the shorter tales, are really better than the title story. The absence of slang throughout is a pleasant feature.

This year Mr. Andrew Lang adds to his long list of books for children a collection of "more or less true stories" about animals which he calls 'The Animal Story Book' (Longmans, Green & Co.). Many different creatures figure here, from bears, lions, and monkeys down to tortoises, frogs, and ants. Some of the stories date from classic times, like that of Androcles and his lion, but most are modern. This book will prove as welcome a feast as former ones of Mr. Lang's providing.

'The Dwarf's Tailor, and Other Fairy Tales' (Harpers) have been collected by Zoe Dana Underhill from widely scattered sources. Germany contributes most, but Sweden, Norway, Denmark, Russia, and Hungary are represented, too. Most of the stories resemble closely the familiar old tales that no child grows up without knowing, but there is sufficient novelty in handling to make them seem fresh and welcome. The English is good and direct, an agreeable change from the corrupt and feeble language in which many children's books are written.

A group of fantastic stories by Harry Jones is called 'Prince Boo Hoo and Little Smuts' (London: Gardner, Darton & Co.). The stories will please young children, fond of violent exercise for their imagination. They have more than usual of genuine gayety and good humor, and less of the galvanic antics so often and so vainly offered to amuse. The necessary grown-up reader, moreover, will find an occasional *mot* to cheer him on, like this: "It isn't right, and, what is more, it does not look well." The pictures are clear and amusing; one, in particular, showing how "the engine was smashed and all the passengers killed," cannot fail to please.

'Fairy Starlight and the Dolls,' by Elizabeth S. Blakeley (A. C. McClurg & Co.), is a book for small girls. Little Bianca, the mistress of four interesting dolls, makes the fairy's acquaintance one fine night and is allowed to join her dolls, incognita, and play with them during their wakeful midnight hours, when they indulge in various active amusements and present an aspect very different from their daytime stolidity. Together they make trips into Doll land, and have some exciting adventures. Bianca finally betrays her identity, and the dolls stiffen at once.

A book in which the children and animals mix on fairly equal terms, and seem to understand each other remarkably well, in spite of their difference in dialect, is 'Jerry the Blunderer,' by Lily F. Wesselhoeft (Roberts Bros.). Jerry is a well meaning, often ill-doing, Irish terrier, whose warm heart more than makes up to his friends for his clumsy manners. It is a safe guess that the children in this book were studies from life, so natural and convincing do their most erratic performances appear. The picture of little Rachel and Harry standing at the open window and "hollering up to God" is both funny and touching. "You see," they explain to their mother, "we have prayed and prayed to God to find a home for that poor little baby who hasn't got any mamma, and God hasn't taken any notice of it at all; so we thought that perhaps if we hollered loud he would be more likely to hear us."

In his 'American Boy's Book of Sports' (New York: Charles Scribner's Sons), the author, Daniel C. Beard, shows plainly that he believes in doing well what he undertakes to do. A surprise, therefore, awaits the reader, for it is not customary to expect excellence in books of games addressed to children. This book is praiseworthy from end to end, and will find favor even with those who have long since passed to man's estate. In his chapter about kites Mr. Beard gives a better history of the evolution of the tailless kite than any one of the kite experts has been able to produce, although his story, it should be remembered, is merely incidental to his main purpose, that of teaching boys how to make and fly kites. A brief history of the game accompanies the principal descriptions, and these must have taken time and pains. The careful work of the author impresses one who looks the volume over, and in those matters which, like the building of a boat or a Man-Friday sailing-raft, would involve risk were the directions in the least unpractical, one is led to have confidence in it and deem it safe to place in the hands of children.

Quotations for Occasions. Compiled by Katharine B. Wood. The Century Co. 1896.

WHETHER the ancient Greeks or Romans had anything corresponding to our menu-cards is a question to which the present reviewer has devoted time which perhaps might have been better spent; and the only conclusion he has reached is that of Miss Peecher on the question whether there were any Lizzies in the early Christian church, that "it must be considered very doubtful." The fact is, the Romans (for we must leave out of the question the Greeks, who never got beyond the crudest idea of a dinner) would have considered it the worst possible form to let the guests know what they were going to have. The Roman host's aim was to keep his guests alternating between expectation and surprise; witness the famous banquet of Trimalchio, where every course was a new astonishment.

With the menu-card would go, of course, the menu-mottoes. And yet in the banquet just mentioned there was a feature which seems a dim foreshadowing of them, or rather a turning of the mind in a direction leading to them. An immense platter, or *repositorium*, was brought in, divided into twelve compartments whereon the twelve signs of the zodiac were portrayed, and the ingenuity of the chef had fitted each of these with a congruent dish; on Taurus, a beefsteak; on Pisces a pair of mullets, and so on. Then, as representing the motto-feature, there were the *apophoreta*, or gifts distributed among the guests at Roman dinners, each accompanied with a distich, playfully or wittily allusive.

Domitian employed the poet Martial to write verses for his *apophoreta*, and the modern hostess usually lays the burden of finding mottoes for menu-cards or other entertainments upon some bookworm of her acquaintance. To lighten this burden, the present volume has been prepared; and we do it but justice to say that it not only admirably answers that purpose, but may almost claim a place in literature in virtue of its extensive range of research and ingenuity of application. In proof of the former quality, not only has the author drawn upon those books which everybody turns to for quotations, but such out-of-the-way sources as Heywood, Cartwright, Shackerley Marmion, Guevara's 'Epistles,' the drama of "Sakuntala," and 'The Babees Book.' To illustrate the latter point, take an instance or two almost at random:

(For an actors' dinner.) "'Tis impossible! The Players gone to dinner!" [*Rehearsal.*]
(Mint juleps.) "The delighted spirit
To bathe in fiery floods, or to reside
In thrilling regions of thick-ribbed ice."
[*Measure for Measure.*]
(Bicycle meet.) "The wheel has come full circle: I am here." [*Lear.*]

BOOKS OF THE WEEK.

Adeane, J. H. The Girlhood of Maria Josepha Holroyd [Lady Stanley]. Recorded in Letters of a Hundred Years Ago. Longmans, Green & Co. $5.

The Nation.

NEW YORK, THURSDAY, DECEMBER 17, 1896.

The Week.

TEN days ago the news came from Spanish sources that Maceo, the insurgent leader in Cuba, had been killed in a skirmish in the province of Havana. The news was promptly denied by the Cuban Junta and their newspapers in the United States. It was said that this was the twentieth time that Maceo had been killed on paper, and that the last report was a lie like all the rest of them. If the Spaniards had won a victory as well as killed Maceo, why did they not produce his body? This was a fair question, and it led to reasonable doubts whether he had been killed or not. A day or two later additional news came. It was explained that Maceo had passed around the Spanish line of forts called the Trocha in boats, with the intention of transferring military operations to the eastern part of the island, and that he had accidentally encountered a detachment of the Spanish forces under Major Cirujeda; that he was killed in the skirmish, but that the fact was not immediately known because his presence there was not suspected; that some Spanish guerillas went over the field rifling the pockets of the slain, and found among other things Maceo's order-book, and a memorandum written by young Gomez saying that he would not abandon the dead body of Maceo. Meanwhile the body itself had disappeared. On Friday all denials ceased, and the admission was made at the Cuban headquarters in Philadelphia that Maceo had been killed at the time and place first mentioned. On Sunday morning a new story burst upon us in the form of posters in the Junta newspapers that Maceo had been murdered. The details were so overwrought and embellished with such alarming job type, and coupled with such appeals for intervention by Congress, as to impart an animus to the tale and cast doubt upon its veracity at once. If Maceo had been murdered, the murder was not done on our territory. He was not an American citizen. How did it concern us? What had Congress to say about it anyway? Apparently the whole story had been "cooked up" for hysterical effect upon American readers and embellished to sell newspapers.

The "war scare" that took possession of the public mind one year ago has not died out with the settlement of the Venezuelan dispute. It has merely taken another form. Evidence of its continued existence was observed on Monday, when the stock market declined heavily on the report that Maceo had been killed by treachery instead of in fair fight—as though that circumstance could make any difference to us. This tale was, naturally enough, made the pretext for a series of resolutions proposed by a Senator whose term of office is expiring, and who finds it necessary to whoop louder than usual for that reason. Yet Mr. Call's state of mind is not that of either the Senate or the House. His resolutions were referred to the committee on foreign relations without debate, and there, we are assured, they will sleep a considerable time, because Senator Sherman, its chairman, has recovered from the fit of Jingoism that afflicted him in common with so many of his fellows last spring. In the House it is affirmed that Chairman Hitt has come back clothed and in his right mind. In short, the Republican party is pretty well satisfied with things as they are, and has no wish to change the issue and start a crusade the end of which cannot be foreseen. The Popocrats, we are obliged to say, have at no time been a Jingo party. They still insist that we shall not submit to foreign dictation as to the kind of money we shall use, but that is a different thing from dictating to foreign countries what they shall do or not do about their own exclusive concerns.

The decline in the stock market was without reason, but it serves to show how extremely sensitive the public mind is to anything like foreign embroilment, and how everything of that nature tends to interrupt business and check the return of prosperity. The anti-British Jingoes, or the survivors of them, in their search for something to take the place of the Venezuelan dispute, have discovered that the Lesser Antilles are in a suffering state by reason of the low price of sugar, and that they want to be annexed to us in order to get an advantage in our market over the German beet-sugar growers. They have been making representations on this subject to the home Government for many years, urging that England shall adopt countervailing duties to the German sugar bounty. Hitherto Parliament has remained deaf to their entreaties. Latterly their prayer has been accompanied by something like a warning that they may be compelled to seek pecuniary salvation by joining the United States. How far this sentiment has found expression it is impossible to say, but it has served as a text for some of our Jingo newspapers. They assume at the outset that those islands are a desirable possession *per se*, whereas they are a source of expense to the country that is now responsible for them, without any corresponding gain or advantage. They are poverty-stricken to the last degree. The whites have mostly abandoned them long since after losing their money in them. Ninety-five per cent. of the population consists of negroes and mulattoes, whose wages are only 20 cents per day. It is their poverty, and not their will, that directs their thoughts towards us, so far as they are thinking about annexation. Do we want any more paupers?

The arrival of the ex-Queen of Hawaii at San Francisco has revived to some extent the flagging interest in the question of the annexation of those islands to the United States. Nearly four years have passed since President Harrison sent to the Senate his treaty to accomplish that object. The treaty was not acted upon by the Senate before Mr. Cleveland's inauguration, and shortly after his accession he withdrew it. There was a good deal of excitement about the matter then and for nearly a year afterwards. Gradually it passed away, so that most people now remember very little about it, except that the Queen's Government was overthrown and a republic set up in its place which has gone on with tranquillity, has paid its own way, and has not been disturbed by either foreign aggression or internal convulsions. All American interests have been as fully protected as they could have been if Hawaii had been a State in the Union and had voted for McKinley in the recent election. One of the current reports is that the ex-Queen has come hither for the purpose of advocating annexation, that the expenses of her journey are paid by the Hawaiian Government, and that she is to have a pension of $10,000 per year if she succeeds in her mission.

Although the Republicans set out to annex the islands in the beginning, and although they put a plank in their last national platform on the subject of Hawaii, they came short of demanding annexation. This is the more remarkable since the same platform did demand the acquisition by purchase of the Danish West Indies, which nobody now seems to want even as a free gift. The exact words of the Hawaiian clause in the platform are these:

> "The Hawaiian Islands should be controlled by the United States, and no foreign Power should be permitted to interfere with them."

The fact is that the islands have been controlled by us for twenty-one years, partly by moral influences, partly by the treaties of 1875 and 1887. The former, the so-called reciprocity treaty, provided that Hawaii should not make any grant or concession of ports or territory, or even of trade reciprocity, to any other country. The latter extended the duration of the former, and gave us the exclusive use of Pearl River harbor in addition, with the privilege of fortifying it if we should

choose to do so. These treaties are as binding on the present Government as they were on that of the Queen, and are in no danger of being abrogated. Nor has any foreign Power shown the smallest desire or intention to interfere with the islands. The control, which is all that the Republican platform demands, is absolute now. It could not be made more so by annexation. But the control of Hawaii over us would begin with annexation, because she would then have demands on our Treasury, and would, after no very long period, send one Representative and two Senators to our Congress. She would begin to enact, in our halls of legislation, the same part that is now enacted by Idaho, Nevada, and Utah, with a constituency composed largely of Japanese, Chinese, and Portuguese, who would of course participate in our Presidential elections at the same time. Moreover, who is to answer for the movements of these interesting types of citizens after they come in? Being already part and parcel of Hawaii, they will become part and parcel of us, not merely as voters, but as persons. They will have the same right to move about that we have. In other words, they will be Americans, and will have the privilege of entering the port of San Francisco when they choose, in such numbers as they choose. They cannot be subjected to restraints in the way of identification that other citizens are not subjected to. We commend this view of annexation to the "Coasters" and all others who are fearful of a Mongolian invasion.

At the Republican Senate caucus on Tuesday week, a resolution was introduced by Senator Wolcott of Colorado of the following tenor:

> "Resolved, That a special committee of five members of this caucus be appointed to recommend some plan whereby legislation may be had at this session of Congress looking to an international conference with leading commercial nations of the world for the promotion of bimetallism."

The newspapers say that the resolution was adopted without objection, and in a perfunctory manner, with no expectation that it would lead to any result. It is said to be a sop to Senators from the silver-mining States who did not bolt the St. Louis nominations and absent themselves from the caucus. Moreover, it was considered as in some sort a fulfilment of the clause of the St. Louis platform which says:

> "We are therefore opposed to the free coinage of silver except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote," etc.

Whatever the reasons may have been for adopting such a resolution, it must be looked upon as solemn fooling, if not worse. It will probably turn out to be worse, since it confirms to a certain extent what the Bryanites said all through the campaign, that the country and mankind are suffering for want of bimetallism. If that is the truth, of course they must keep up the fight to bring it about, and logically the Republicans ought to join them. If the requisite number of foreign nations will not join us, then it is equally incumbent on us to do something to bring in bimetallism at home, and the only subject of dispute is whether the ratio of 16 to 1 is the true one, or whether we should adopt one nearer to the market ratio.

The good old times of "tariff hearings" are with us again. How idyllic the programme is! A day for this interest, another for that; one schedule to be "heard" on Monday, another on Tuesday, and so on. All the manufacturers who will march on Washington Coxey-fashion are to be disinterested patriots, anxious only that the dear workingmen may have good wages. They will strain a point with the committee to make their demands for themselves very "moderate." They will gravely tell Chairman Dingley that the rates they ask for are just sufficient to send up wages but not prices, except for those who like to pay higher prices; while as for the manufacturers themselves, they are willing to go on with only two meals a day. Then, of course, there is the revenue—they are all concerned about that. If you come right down to it, all they want a protective tariff for is to bring in revenue. Imported goods are monstrous, to be sure, and no true American can look upon them without disgust; but what is meant is goods imported to be used. Everybody approves of goods imported simply to pay duties and swell the revenue, and which will then immediately disappear and not bother us. If goods are really to come in and be sold as well as pay customs taxes, why, of course, they must be in some other "schedule" than our own. You are scarcely so simple as to think we voted for McKinley merely to have foreign goods dumped on our devoted shores.

The "business men" of Philadelphia, with whom Quay has quarrelled, published on Thursday a letter sent out during the late campaign to a number of candidates for the Pennsylvania Senate and House. It was sent by State Chairman Elkins, and ran as follows: "By request of Senator Quay I take great pleasure in enclosing contribution to defray your campaign expenses." Each letter contained a check for either $500 or $250. This is valuable as an account, in the very words, how the "boss business" is carried on. Platt conducts it in precisely the same manner. He sends candidates checks for "campaign expenses" out of the money levied by him as blackmail on the corporations. The candidate gladly accepts, and if he is elected he is "owned" by the boss, and obeys his orders in the Legislature. Most of these candidates are country lawyers or farmers, or young adventurers, to whom $250 or $500 for any purpose is very welcome. This enables both Platt and Quay to sell legislation, to say what bill shall be passed and what not. Indirectly it enables them to say to the Governors what appointments they shall make. In fact, it operates as a sale of the States to men of bad character. It is a very open transaction, too. It goes on year after year under the eyes and noses of men who profess to have a great deal of patriotism when there is a prospect of a war with England, but none at any other time. It is now about to operate as the sale of a seat in the Senate to Platt, and he is allowed to make the purchase as a reward for a long career of baseness.

One of the alarming features of the New York Senatorial crisis is the silence of the press about it. There is apparently a prospect that a gross outrage on the State is about to be perpetrated by a venal Legislature; and under the new doctrine that when an outrage is likely to succeed, there is no use in saying anything about it, the press has nothing to say about the senatorship. The *Tribune* has very tardily and warily spoken out for Choate, but the others let one of the most important functions of the State as a State be performed with little more than a mention, while they lavish columns on the doings of two foreigners in another country, Weyler and Maceo. If the Union League Club had not spoken up, one of our greatest shames would probably have passed without notice. That is one natural result of boss government. The essentials of American government are publicity and discussion—the doing of public business openly, and the open statement of the reason why each thing is done. The essentials of boss government are silence and secrecy, or, as they have been called in Pennsylvania, "addition, division, and silence."

People who think that our Presidents ought to be chosen by popular vote should find food for reflection in the statement from Austin that, during the last week of November, the State Returning Board was counting the vote of Texas, and that even so long after the election as the 1st of December the figures had not been received at the capital from six counties. Fancy the condition of the country after an election like that of 1880, when Garfield received 214 electoral votes and Hancock 155, if the public had been obliged to wait a month or more for the full returns from Texas in order to learn which candidate had a plurality of the popular vote—the final count in that year showing 9,464 more for Garfield than for Hancock in the whole Union. Think,

too, of the temptation that the Democratic officials who always compose returning-boards in Texas would have had, to throw out 10,000 Republican votes in that State in order to leave Hancock ahead in the whole country—the recent count at Austin having been made behind closed doors by the Governor, Secretary of State, and Attorney-General, without the presence of a single representative of any other party.

The *Iowa State Register* is loath to drop the idea that the sound-money Democrats ought to receive some "recognition" in the way of federal offices from the McKinley Administration. Its latest suggestion is on behalf of Mr. George F. Parker, United States Consul at Birmingham, who is an Iowa man and a Democrat, but who opposed Bryanism and, during the campaign, wrote letters and contributed articles to the press that were "greatly helpful in convincing true Democrats of the United States that Bryanarchy is not Democracy." The *Register* speaks highly of Mr. Parker's official record, and expresses the hope that "civil service, or a proper appreciation of a good man in the right place, will be sufficient to retain Mr. Parker as Consul at Birmingham during the next Administration." As we have previously said in regard to other cases, we do not think that a Democrat ought to be retained in office simply because he opposed Bryanism. On the other hand, we not only believe that Mr. Parker ought to be retained on the ground of his efficiency in office, but we see no reason why every other efficient Consul should not also be retained. Does the *Register* see any?

Gov. Morton deserves the thanks of all friends of good government for his public-spirited action in approving the extension of the civil-service regulations. It is no secret that in doing this he has disregarded the appeals of the Platt machine leaders, who realized that the extension would make their proposed work of nullifying the law more odious and consequently more difficult. They hoped to induce the Governor to delay action till the expiration of his term, feeling sure that Gov. Black would be more easily controlled by them. They have had little Lexow of Nyack and other Platt errand-boys running about on this business for several weeks past, hoping in one way or another to prevent Gov. Morton from taking any action; but all their efforts have come to nothing through the Governor's firmness and sense of public duty. The rules have been extended precisely as the friends of reform wished them to be. Not only have 116 new places been brought under the competitive examinations, but all public officials are subjected to stricter regulations and can be held to greater accountability than ever before. In giving his approval, Gov. Morton takes occasion to say some truths about civil-service reform and the public sentiment of the State in regard to it which the assailants of the law will not relish. "The civil service principle," he says, "as applied to administrative offices, is doubtless here to stay, and its utility will be readily conceded by most persons who have had experience in public affairs. Now that the policy is firmly established in our Constitution and laws, is sustained by our highest courts and justified by experience, it is important that it be judiciously applied in the public service, under a careful but not too rigid classification, and with clear and simple rules, possessing sufficient flexibility to permit modifications which may be found necessary in practical administration."

It is one of the veriest commonplaces that nobody else has so much to hope for from the establishment of civil-service reform and the elimination of partisanship from the mass of the offices as the poor man. For this reason "organized labor" could not have had a more obvious combination of duty and profit than would have been found in a campaign for the merit system. Yet we do not recall any evidence of activity in this line of effort among the various associations of workingmen in this State or elsewhere. It is therefore a gratifying surprise to find that the Indiana State Federation of Trade and Labor Unions has adopted a resolution advocating the passage by the new Legislature of a measure that shall place the entire control of the penal, correctional, and charitable institutions in the hands of the State Board of Charities, in order to abolish the spoils system of control. In advocating this resolution the President claimed that by its passage the Federation would be simply adhering to the policy outlined in its first declaration of principles, and he said that the members of the organization believe that it has had much to do in cultivating public sentiment on this question. The real wonder is that Indiana is the only State where the leaders of "organized labor" have been awake to the importance of this subject to those whom they represent.

The Republican candidate for Congress in the Third Mississippi District last month was a negro who received only a few hundred votes, and it is announced that he will contest the seat of Representative Catchings, who was reëlected. Apparently his claim will rest upon the contention that the present system of qualification for the suffrage in that State is unjust and unconstitutional. Since the new Constitution went into effect, the negro vote has fallen off very greatly. This is due largely to the fact that, in order to be entitled to the suffrage, a man must now be able to read the Constitution or to understand it when read to him, and must also have paid a poll tax, as well as have resided in his election precinct for a year. Honestly enforced, these restrictions would probably bar out ten ignorant, penniless, and migratory blacks to one white. If honestly enforced, nobody who believes that some guards should be put around the ballot-box can object to them.

The mere fact that few negroes now vote in Mississippi does not of itself prove any unfairness in the administration of the constitutional tests for the suffrage. Only a comparatively small proportion of the race can meet the existing qualifications, although the number registered seems to be increasing in a normal manner with the coming of age of youth who have been educated in the public schools. There is another reason for a small colored vote, however, which is seldom thought of. This is the fact that the Southern negro has ceased to regard the ballot as the supreme good. There was a time when he thought that it made little difference whether he worked and saved and accumulated money and learned something, provided he could vote. He has learned that it is far more important for him to acquire some property than it is to cast a ballot for some white or black politician who cares nothing for him. The wisest leaders of the race—men like Booker Washington of Tuskegee, Ala., for example—are much more urgent that the negro shall make himself fit for the suffrage in the future, than that black men who are not fit to exercise it shall cast ballots now; and such leaders have many followers. This is one reason why the colored vote has fallen off in all parts of the South.

Mr. Curzon made an address at Manchester on December 1, in which he spoke forcibly of the way in which diplomacy is hampered in the modern world by the press. The foreign correspondents of all the large papers are continually giving the public startling information about secret treaties or alliances or pending negotiations. These gentlemen are very ingenious and versatile, but the public forgets that they are not usually called right into the interiors of Foreign Offices. They simply hang about outside, and pick up what of rumor or fiction they can, and telegraph it as authentic news. Then the Foreign Secretary goes down to the House and is at once questioned by excited members as to the truth of the alarming news. He has to reply that he has no information on the subject, and then there is much muttering about his "evasion," and about the Government being always behind the newspapers in information. In a day or two the whole yarn is exposed, but by that time another one is invented just as good, and so it goes on.

THE OUTLOOK IN CONGRESS.

THE first political bout in the Senate on the 9th instant furnished a discouraging outlook for the work ahead of the McKinley Administration; for, although the new President is not yet in office, the Congress that is to coöperate with him will be composed of substantially the same raw material as the present. It is possible, but not probable, that the Republicans may muster a majority of the Senate after the 4th of March, but even if they do, there will be untrustworthy elements in it. There will be members like Carter of Montana, who will want to "do something for silver," and who will be pushed on by their constituents to demand something for it as the price of any legislation either tariff-wise or currency-wise. So we may fairly judge of the next Congress by the present one, and the forecast is by no means hopeful.

The Republicans have been wrestling with the Dingley bill. That measure, whether good or bad in itself, is only a temporary makeshift. Even if passed now, it would expire by limitation about eighteen months hence. It cannot be passed now without a fierce debate, on account of the free-silver amendment fastened upon it in the Senate. As there is no rule for limiting talk in the Senate, the silverites could easily carry it along on the tide of debate till the expiration of the session. But if it were passed in its present shape, it would not preclude the necessity of another tariff bill very soon. There is a clamorous faction in the party demanding an extra session of Congress as soon as McKinley is inaugurated in order to pass an entirely new tariff bill. It would be very disturbing to business to pass the Dingley bill on the 3d of March and have an extraordinary session of Congress called on the 4th to pass another bill dealing with the same subject. There would be something ridiculous in such a proceeding also.

These embarrassing features of the situation are present to the minds of the Republican leaders. It was probably for these reasons that they gave the cold shoulder to the Dingley bill in the Senate caucus on Tuesday week. The opposition Senators, being not exactly fools, thought that it would be just as well to make them take their medicine. So Senator Allen of Nebraska moved to take up the Dingley bill as a serious measure of business. That this motion was quite unexpected on the Republican side of the chamber was made plain by the sequel. Senators Aldrich and Platt both objected, but presently withdrew their objections and voted with Allen to take up the bill. In the meantime there was some very pretty by-play, with a view to putting each other "in a hole." Allen had professed a desire to remove all obstructions to the passage of the bill. Chandler suggested that one obstruction to its passage was the free-silver amendment, and wanted to know if Allen would consent to remove that. He would not. He did not consider that an obstruction, but rather the chief lubricant and motor of the bill. Aldrich wanted to know whether Allen would allow the bill to come to a vote immediately. Allen replied that he would not. He wanted to have it carefully considered. He wanted to know, too, whether the Republicans would commit themselves to the Dingley bill for the next four years. This was the only reason why he had called it up. He wanted to put the Republicans "in a hole." They understood the game of holes also, and they declined to go into this one, although they had started for it very promptly when Allen first made his motion. The result is that the Dingley bill is up. How it will be disposed of, it is too early to say, but it is not likely to pass.

This is a discouraging outlook because it promises no beneficial legislation so far as the Senate is concerned, and, of course, there can be none without the cooperation of the Senate. Turning to the House, we find some evidence of a serious purpose to grapple with the chief problem of the day. The committee on banking and currency seems to have a clear perception of the needs of the hour, and has shown a purpose to meet them to the extent at least of acquiring information. On motion of Mr. Brosius, a resolution was adopted inviting definite plans from commercial, financial, and industrial organizations for the amendment of our currency system. On motion of Mr. Johnson of Indiana, another resolution was adopted requesting the Comptroller of the Currency to analyze all the bills now before the committee, and state the effect of the same if enacted into law, and also to formulate a measure of his own. The latter task the Comptroller may easily undertake, but the former he cannot be expected to do within the short limits of the present session.

The resolution of Mr. Brosius is evidently a signal to the coming Indianapolis convention. It ought to be so considered at all events. Congress will do nothing about the retirement of the greenbacks—it will do nothing about anything—unless pushed on by public opinion. It will run in its present rut for four years, and take the awful risk of another Presidential campaign like the last one unless the commercial bodies of the country prise it out. They can do so if they will. They caused the repeal of the Sherman act in 1893 by active and incessant work. They can accomplish a greater reform now by the same means, but they must go about it in a systematic and persistent way. If they have not the necessary public spirit, certainly Congress will not have it. Nor can the newspapers do very much without the active and visible support and cooperation of the business community. With such backing, the torpor of Congress can be overcome and the ground can be prepared both for future legislation and for future political campaigns. Business men should be mindful also that whatever they do or fail to do, the silverites and fiat-money men are going to be as busy as the arch-enemy of mankind during the whole of the coming four years.

THE NEXT SENATE AND SILVER.

THE overwhelming defeat of the Populistic candidate for President in the national contest last month, and the large majority which the Republicans secured in the elections for members of the House of Representatives, produced a false impression as to the strength of their party in the next Senate. Even the professional politicians appear to have shared the popular feeling that the gold standard would have the support of a majority in the upper as well as in the lower branch of Congress from 1897 to 1899. The revelation of Republican weakness in the present Senate made by the recent division on the Dingley bill, and the consequent discovery of the narrowness of the chance that the "straight-out" members of the party will number a majority of the body after the 4th of March, have consequently come with a shock.

In the Fifty-third Congress, after the admission of Utah, there were 44 Republicans, 39 Democrats, and 6 Populists, with one seat from Delaware vacant—counting Tillman among the Democrats, and allowing the Republicans all who had been elected by that party, except the two Senators from Nevada. The other four Populists were Peffer of Kansas, Allen of Nebraska, Kyle of South Dakota, and Butler of North Carolina. As the result of elections in either 1895 or 1896, the Republicans gain one seat from each of the six States of New York, Ohio, Illinois, Indiana, Wisconsin, and Maryland, while they have lost the Legislatures which elect successors to outgoing Republicans in Colorado, Idaho, Utah, and Washington. Kentucky's action is still in doubt. Here is a net gain of two, which would give the party 46 out of 90 members, or a bare majority if all the sitting Senators who were elected as Republicans, except Jones and Stewart of Nevada, could always be depended upon. The losses are all practical gains for the Populists, since the Senators to be chosen in Colorado, Idaho, Utah, and Washington, whether former Republicans or Democrats, will be Populists on the silver issue.

Unfortunately for the Republicans, besides losing these four seats, they have already lost also two men who formerly attended Republican caucuses, and who will be members in the next Congress—Mantle of Montana and Pettigrew of South Dakota. This reduces their assured strength in caucus to 44. The chances seem favorable to the election of a Republican Senator by the Kentucky Legislature; but that body is so close, and party dissensions are so bitter, that the final result may be the choice of a

sound-money Democrat. There is some talk about the possibility of a Republican Senator being chosen by the North Carolina Legislature, in which body the Republicans have the largest number of members, though much short of a majority. But such a man would have to be a silver man to secure the necessary Populist support, so that he could not properly be counted as a Republican. If both of these States should return men who would enter Republican caucuses, the party would have 46 members, or a bare majority. That is the most favorable result possible.

But this would be a very different thing from a majority for living up to the St. Louis platform as regards the gold standard. The recent Republican caucus was attended by four members of the next Senate who believe in free coinage, although they supported McKinley in the recent canvass — Wolcott of Colorado, Shoup of Idaho, Carter of Montana, and Clark of Wyoming; besides Mitchell of Oregon, Perkins of California, and Pritchard of North Carolina, whose terms are about expiring. If sound-money men should be chosen in these three cases (and this is impossible in North Carolina), the Republicans would be still several short of a majority for the gold standard. The situation, therefore, is simply this: At best the Republicans may hope to have a bare majority of the Senate who will be willing to enter a Republican caucus; they are not sure even of this. But such a bare majority of the body will not mean that enough votes can be depended upon to carry out a policy of legislation based on the St. Louis platform. On the contrary, it must be regarded as certain that there will not be a majority of Republicans who will vote for any measure in the interest of the gold standard. Moreover, there is the graver danger, not to say certainty, that no majority can be secured for the passage of a tariff measure except upon the concession of some legislation in the interest of silver.

If the question were simply one of the gold standard, the prospect would not be depressing. The support of several sound-money Democrats could be counted upon for a good financial measure standing by itself. But such Democrats of course will not support a Republican tariff measure. Unfortunately it is tariff legislation rather than financial legislation that the Republican managers are most bent upon. The danger is that they will make almost any sacrifice on the silver question to secure such legislation. In view of the probable assembling of the Fifty-fifth Congress in a few weeks, sound-money men throughout the country should at once begin to arouse and organize public sentiment against another repetition of those compromises with the silver men which have disgraced our legislation for twenty years.

CONGRESS AND FINANCIAL CONTROL.

The American system of public finance —meaning thereby the control by Congress of national revenue and expenditure—has long been an anomalous thing. Nothing like it is known to any other government in the world, civilized or uncivilized. Nowhere else is the power to spend made so independent of the obligation to tax in order to spend. In every other system there is either a single man, a Minister of Finance, or a single committee—on the budget—that gives with the right hand only what is taken in taxation by the left. But our plan is to let one set of men lay the taxes, and guess within $20,000,000 how much they will produce, while another and entirely distinct and irresponsible set of men make appropriations, and guess how much they will amount to.

This system has always been the astonishment of foreign observers, and the concern of not a few even of those who live under it and suffer from it. But its vices have been concealed from the public view, owing to certain favoring circumstances. The steady and enormous expansion of the country has generally driven up the revenue above the most wanton spending. "Just look at the surplus!" has been the sufficient answer to all critics; "we guess your Chancellors of the Exchequer would be glad enough if they had as much to the good." But the events of the past three years have stricken the scales from many eyes. The system has been exposed for just what it is—a happy-go-lucky, irresponsible system, without sense or safeguards, that is foolish and indefensible in good times, and in bad is imbecile and dangerous to the last degree.

What could be more brainless and alarming than the kind of financial control seen in the last session of Congress and to be repeated in this? The committee on income was caught in an *impasse*. It could not raise a single dollar by taxation, though the revenues were notoriously deficient. Yet, in the face of this fact, the committees on expenditure brought in and passed bills for sums greater than ever before, thus deliberately voting a deficit of $50,000,000. The same process is to be gone through with this winter. Chairman Dingley has abandoned hope of being able to lay a single new tax. He and all his party cry to Heaven that the revenue is not sufficient to run the government, yet they confess their inability to add a penny to the income. But does this make any difference with the spending committees? Perish the thought! They are all going busily ahead with their appropriations, which, on their own showing, in accordance with their own angry charges and partisan recriminations, will create another deficiency of $50,000,000. This is financial chaos. Such a spectacle at Washington, twice exhibited, should suggest to the most blundering and haphazard of democracies that something is wrong with its system of financial control.

Now, the one fixed fact in all this business is, that any representative body with power to spend money will spend it extravagantly unless held in check. It is not a matter of race or climate or institutions. Waste is the very law of being of all congresses, parliaments, cortes, committees, boards, with power to disburse public funds. Any or all of them unchecked would run riot with public finance, as our Congress does, unless some sort of hook were put in their jaws. London is just now having a scandal over the reckless extravagance of the County Council. It is because that body is subject to no efficient financial control. The London School Board is in trouble over the fact that its various committees are spending more money than they have to spend. Here again the evil is lack of centralized and responsible financial control. The House of Commons escapes only because it is firmly bitted. No private member can so much as bring in a money bill. The Treasury controls everything. Every grant of money goes hand in hand with its corresponding tax. The Chancellor of the Exchequor has absolute control both of income and outgo. Under his scrutiny and authority the estimates are rigidly cut down and kept down. The ambition of the Treasury is to show as large a surplus as possible with as light taxation as possible. Without such a bridle on its head, the Commons would be as spendthrift as our Congress.

But how have we got along so well in the past if our system is all wrong? Well, our system, always defective, has yet been better than it now is. It has distinctly changed for the worse in the last few years. That is the most alarming thing in the situation. Thirty years ago we had a semblance of financial control in Congress. Down to the close of the war the power to appropriate was harnessed, as it should be, with the power to tax. The ways and means committee had charge, not only of revenue, but of expenditure. But in 1865 the separate appropriations committee was formed, thus putting asunder what should be joined for ever. Little by little the power even of this committee has been undermined. It now has charge of but six of the thirteen general appropriation bills. The chairmen of other committees are all the while fighting to get control of a bill carrying the spending of money. Already there are seven separate and independent spending committees against one helpless taxing committee. Is it any wonder that we plunge from one deficit into another?

Remedies we do not discuss at present. The recognition of the dangerous nature of the disease is the main thing. It is idle to talk about finding relief in changing Presidents or Congresses or tariffs as long as our headless system of financial con-

trol (or grotesque lack of it) continues. We have scattered responsibility, and have inevitably scattered our resources also. We have dissipated power and funds at the same time. We have flown in the face of all legislative and governmental experience, and it is not surprising that we are just now a little the worse for the collision. The absurdity, the humiliating helplessness of the situation at Washington to-day ought surely to have some effect even upon this complacent nation in rousing it to the need of protection against a spendthrift Congress, now running wild without bit or bridle.

THE NEW YORK SENATORSHIP.

THE action of the Union League Club in unanimously approving the candidacy of Mr. Choate for the senatorship is a most welcome sign that the moral sense of the Republican party in this State is not so dead as it has seemed to be recently. There was nothing perfunctory or half-hearted in the proceedings. Mr. Guthrie's impressive speech put the issue in precisely the right way, and put it so clearly that there could be no doubt as to the spirit in which the club took its action. He defined the situation accurately when he said that there "never has been a time since the foundation of this government when the federal Senate stood in greater need of the highest order of ability, integrity, and patriotism"; and though he refrained from making any reference to the man who is proposing to elect himself to meet this emergency, there was no need of his doing so, for nobody has been so audacious as to claim that Mr. Platt possesses the qualities which Mr. Guthrie enumerates as essential. Mr. Platt himself does not do it, and does not desire his friends to do it for him. He shrinks from all discussion of his qualifications, and wishes to be chosen Senator with as little disturbance as possible.

In this respect Platt's present candidacy is very much like his first. Nobody considered him as a candidate in the Presidential campaign of 1880. He was then chairman of the Republican State Committee, and held the place merely as Senator Conkling's confidential agent. He had cut no figure in public affairs, being content to run about the State as Conkling's political errand-boy, and finding natural delight in the underground work of politics. When the Legislature came together in January, 1881, he emerged suddenly as a candidate for Senator, and the discovery was soon made that he had been using his power as the head of the Conkling machine to "fix" the Legislature in his own interest. A great army of workers, State office-holders of all grades, from high officials to their deputies, assistants, and clerks, suddenly swarmed about the State capitol in support of Platt. It was estimated at the time that there were at least 100 of these. They all gave the members to understand that Platt was the Conkling machine candidate. No other reason was given for his election. The *Tribune*, which was a stanch Republican organ then, said of him after his election: "If a distinctive representative of the machine was to be chosen, then doubtless this is the best result obtainable." He entered the Senate on March 4, 1881, and did absolutely nothing in it except say ditto to Conkling. When President Garfield came in, Conkling at once got into his famous quarrel with him over the distribution of New York patronage, and when he resigned from the Senate on May 16, because he had lost the collectorship of the port of New York, Platt resigned also, exciting by his servile conduct the derision of the whole country, and earning his name of "Conkling's Me Too." He went to Albany with Conkling to fight for a vindication by means of a reëlection, but, after struggling for this object for several weeks, abandoned it in the face of a personal scandal which was so vile in its details that even the most sensational and unscrupulous of our newspapers refrained from publishing them.

Platt is wise and prudent, therefore, in seeking a reëlection without discussion, and with as little publicity as possible. He has done nothing during the sixteen years since he stepped down and out that shows him to be any more fit for the senatorship now than he was when he held it before. There is no reason for believing that he will be any more equal to its duties now than he was then, or will have any other idea of the position than to use it as a basis for a war on President McKinley over the distribution of spoils. He depends now, as he did in 1881, upon the machine for his election. From no other quarter does there come a demand for his election. Newspapers that he owns, as he owns members of the Legislature, because he has bought them with the political blackmail that he collects from corporations, support him as a matter of course, but nobody else does. Not a single voice that is disinterested and intelligent is heard in his favor. From no man or body of men, representing the morals, intelligence, and character of the people of the State, does there come a word in advocacy of his candidacy.

It is said of Mr. Platt by his sole champion in the press of New York, the ex-Tammany *Sun*, that "he has never cared to walk in a fog of virtuous pretences"—as if that were a reason why he should be chosen Senator from the State of New York. This is a variation of the old claim, that he is no humbug or hypocrite, which has been made in behalf of every political rascal since the dawn of history. In saying it of Platt, his advocate is refuting a charge which has not been made. No one, so far as we have observed, has accused Platt of "virtuous pretences." There is no more doubt about his methods than there is about those of Croker and Matt Quay and all other bosses, past and present. There has been no hypocrisy or humbug or false pretence about any of them. They are openly in the business of corrupt politics, and they don't care who knows it. Every one of them is fond of saying, and his friends are fond of saying it for him, that, whatever else he is, he is no hypocrite; hypocrisy being considered a far more atrocious thing than the stealing of public money, or the corruption of politics, or the buying and selling of legislation for personal profit. Not one of the men whom Platt's present champion has defended and praised during the past quarter of a century, beginning with Tweed, Barnard, and Cardozo, and running steadily down without a break through Gorman of Maryland, McLaughlin of Brooklyn, Gen. Butler of Massachusetts, Ingalls of Kansas, Matt Quay, John Kelly, Croker, Paddy Divver, Tom Grady, Dave Hill, the Sheehans, Ham Fish, and even the ex-convict Callicott of Albany, whom Hill wished to make Superintendent of Insurance, has "walked in a fog of virtuous pretences." Platt is, therefore, classified properly when he is placed in this Valhalla by the venerable Tammany Odin who for so many years has distributed the meadhorns to incoming Valkyrs.

In selecting Mr. Choate as their candidate the anti-Platt Republicans have acted with great wisdom. He presents such a perfect contrast to Platt that argument as to the respective merits of the two is absurd. Mr. Choate's character and abilities are so well known that anything more than the mention of him as a candidate is unnecessary. To set forth his qualifications at length would be simply to tell every man of intelligence in the State what he knows already. It is universally admitted that Mr. Choate would make the ideal Senator for the first State in the Union. Then why can he not be elected? Why should not the representatives of the people, when they assemble at Albany in January, give expression to the popular wish and judgment of the State, and vote to send Mr. Choate to Washington? Could anything be done by these representatives which would bring more honor to the State or confer upon it a higher service? Could anything be done by them which would bring more honor upon the Republican party? Then why will they not do it? The only reason is that Platt owns them and wishes them to elect himself instead. Any other explanation is impossible, for it is as difficult to give a satisfactory reason for electing Platt as it is to give one for refusing to elect Mr. Choate. That is why Platt and his men contemplate the situation in silence, and why the presses which Platt is able, for reasons mysterious and other, to control, mostly do likewise. It is one of those cases in which the less said the better, but it is also one in which silence is a

powerful argument against the very persons who are maintaining it.

THE THEATRE IN LONDON.

LONDON, November 30, 1896.

IT is only a very few years since a great *renaissance* was fondly proclaimed, and we had Mr. Pinero playing the English Ibsen, and an Independent Theatre in full swing, while psychology as a dramatic motive was supreme. But already the dark days have come again. The Independent faction has virtually disappeared. One-half the London theatres are given over to what is called musical comedy, a cross really between the old far more clever burlesque and the new music-hall programme; the other half to genuine melodrama, historical, romantic, or sentimental, as it may be. True, Sir Henry Irving remains faithful to Shakspere, but then there are unfriendly critics who say that Shakspere at the Lyceum is nothing more than spectacular melodrama under a finer name; and it is because I am afraid the same criticism would hold good in the case of Mr. Alexander's revival of "As You Like It" that I have not had the courage to go and see it. Altogether, it is high time that some effort should be made by the few who believe the theatre is meant for better things; and this effort, this practical protest, has come in the shape of two distinct performances within the week.

It is a matter of course that one of these should be an Ibsen play, for, in London at least, the Norwegian dramatist is, as Mr. Henry James has ingeniously called him, "a barometer of the intellectual weather." The special play chosen was the last published, "Little Eyolf," acted already elsewhere, but never before put on the English stage. It is too late in the day to explain or analyze its plot, since its publication in book form has already been a challenge for the heated argument which the printing or performance of an Ibsen drama has always proved. The theme is characteristic; more human, less intellectual than usual, some of the London critics have been saying. However that may be, in the study of the relations between this special husband and wife Ibsen has set himself but another of the ethical problems which he, better than any man living, knows how to work out dramatically. Nor is "Little Eyolf," especially when seen on the stage, found to be free from the most irritating defects of its author, found to be without his indisputable power. It is essentially "suburban" (I think it was Mr. James who first applied to the Ibsen play this adjective, which has now become a byword with the critical authorities of the London press). The simplicity of the dialogue, so admirable at times, at others dwindles into the most futile commonplace; and the hero is the impossible, the pedantic, the unbearable Ibsen prig, silly and like a vain child in his pride of mental and spiritual emancipation, who repels all interest and sympathy from the start. Indeed, it seems to me almost fortunate that, at this very moment, there should be hanging in one of the London galleries M. Blanche's last Salon picture, the big, really brutal portrait of M. Thaulow, for it serves as a timely reminder that there are still left a few Norsemen made of flesh and blood; that all the descendants of the old Vikings are not the puny weaklings, the anæmic, neurotic pedants that Ibsen would have us believe. To me, *Allmers* cuts almost a more contemptible figure than *Solness*, or *Tesman*, or *Helmer*.

But, having said so much, one must still admit that the play is intensely dramatic, that it holds the interest of the audience to the very end, though there is little action, little incident after the first act. When Ibsen forgets the preacher that is strong within him, he is the incomparable dramatist; and this one feels and recognizes, despite the inevitable element of symbolism in his plays—an element distasteful to the Anglo-Saxon no longer on familiar terms with the supernatural as is the Norseman or the Teuton; and despite the actors. And here I come really to the all-important point, for in every one of these recent sporadic attempts to reform, or "elevate," as the slang phrase goes, the stage, attention has been turned entirely to the drama itself, none spared for its interpreters. "Little Eyolf" was undertaken by two actresses, Miss Janet Achurch and Miss Elizabeth Robins, who have made so great a success in playing Ibsen that lately they have been seldom seen in anything else. Miss Achurch was *Rita*, a part the difficulty of which is not to be exaggerated. But, every allowance made, her interpretation could not be accepted as anything but painfully inadequate. I say this with all due hesitation, for there are enthusiasts in London who declare Miss Achurch the greatest actress of the age. She has, but it is by chance, her fine moments, which makes one realize that a good actress has been lost simply from lack of training. For so far is she from having mastered the first principles of her profession that even her voice is beyond her control, and half the time one does not understand what she is saying. To compare her to a Duse, as has been done, is much as if one were to compare the Royal Academy portrait to a Velasquez. Miss Robins, who has triumphed as some of Ibsen's other heroines, only less emotional than *Rita*, as *Hedda Gabler*, as *Hilde Wangel*, was content to efface herself as the colorless, and to her, I fancy, not congenial *Asta*. I need say nothing of the *Ratwife;* her entrance on the scene was the signal for melodrama. The two actors but emphasized the unpleasant qualities of Ibsen's men, and brought to their perhaps thankless task no compensating charm, or trick, of personality. If the performance of "Little Eyolf" proved anything, it was that a good play is much easier to lay hands on than a company competent to present it.

I think this is the moral, if moral must be had, of the second dramatic event to which I have referred, and which was a very different affair, a history lesson rather than an intellectual exercise. The play was the "Two Gentlemen of Verona," and it was given by the Elizabethan Stage Society, whose aims are largely archæological and historic, the object being not merely to produce the old Elizabethan comedies and tragedies, but to produce them exactly as they were seen by the dramatist's contemporaries—that is, with scenery of the most primitive description, or else none whatever; and with the costumes of the period, since managers then did not spend their energy in studying those details of dress and furniture which have now become of paramount importance. When possible, other conditions are observed, and one of London's beautiful old halls made the scene of the performance.

The first two experiments were not without interest. One was "The Comedy of Errors," its background Grey's Inn Hall, where, what with the lovely old panelling and screen, what with the appropriate attendants holding aloft their flaming torches, it made so fine a spectacle that one forgave the too evident shortcomings of the actors. The other was Marlow's "Dr. Faustus," which had less picturesque surroundings, but was vastly amusing in its primitive stage machinery, its Devils and Deadly Sins, like so many forerunners of the Drury Lane Pantomime, and its hero, who, in his naïve pedantry and priggishness, seemed to have anticipated Ibsen's students and sceptics. But the revival of primitive methods is always a dangerous game. There is a time when one grows weary of the Kelmscott book, of the sham mediæval woodcut, of the Pre-Raphaelite Madonna. Unfortunately, it is only with the spectacular revival that the Society, in its enthusiasm, is concerned.

For the "Two Gentlemen of Verona," every essential detail was most conscientiously considered. The Merchant Taylors lent their hall in Threadneedle Street, perhaps the most stately and magnificent of the many halls the city companies have hidden away in the little labyrinth of business streets which is known as the City of London. There was no stage, no scenery, no effect, beyond that yielded by gorgeous panelling, by palatial doorways, by flamboyant coats of arms. Through these doorways, sometimes directly through the body of the hall, in the midst of the audience, exits and entrances were made. Nor was there any music, save that called for by Shakspere in the second scene of the fourth act, and then the song "Who is Silvia?" was accompanied by the correct virginals and viols. There were attendants with halberds. The dress worn by *Valentine* and *Proteus* was carefully reproduced from an old sixteenth-century fresco that decorates the Hall of the Carpenters' Company; the uniform of the Outlaws was copied from a design for a halberdier used in the Fishmongers' pageant in 1609. In a word, no pains were spared to insure accuracy. It is just probable Shakspere himself might have sat through the performance without too great a shock.

But the novelty of Elizabethan stage management had already been worn off by the first example offered a year since with the "Comedy of Errors." One looked to the actors to prove something more than mere historical dummies. It would have been pleasant—and I do not think the demand unreasonable—to hear the lines put into their mouths. But this was the one thing quite impossible: not a single man or woman of them all understood the secret of distinct, clear enunciation; and, as for their manner, I could imagine the lecture Shakspere would have read them on their mouthing and ranting! Of the fact that three-fourths of the audience could see as little as they could hear I shall not speak, since it was the result of a mistaken, though no doubt well-meant, arrangement of the seats. And besides, if the performance failed, it was because of no such trifle, but entirely because the actors were not qualified to play on any stage, whether fashioned after Shaksperian or Lyceum models.

There is no question that the Englishman—and it makes no difference if he calls himself Ibsenite or Elizabethan—who aspires to a more perfect theatre, has begun at the wrong end of the ladder. Just as the English painter hopes, by the bigness or holiness of his subject, to overcome his technical deficiencies, so the English actor trusts to the quality of the play to bring out his latent but untrained talent. There is really needed at the present crisis, not the great drama, but the great

actor, as accomplished in his art as a Duse or a Coquelin, as eager in his study of the right gesture, the right intonation, as a Flaubert in his search for the right word; and the two latest of so many attempts to break away from the restraints of the popular theatre do but confirm this truth.

BRANTÔME.

PARIS, December 2, 1896.

THE Société de l'Histoire de France was founded as late as 1834; its publications already form a very important series. I count in it twelve exhausted, seventy-four partly exhausted, and six in the press. There is a council which chooses the works to be published and the most capable editors. Some of the volumes are perhaps not of the highest interest; many others are very valuable historical documents. In 1862 M. de Montalembert, one of the founders, expressed a desire that the Society would issue an edition of the works of Brantôme, accompanied, as are all the Society's publications, with notes, summaries, and indexes. The task, not an easy one, was confided to M. Ludovic Lalanne; the first volume appeared in 1864, and volumes ii. to x. successively till 1871; volume xi., comprising the index, appeared in 1882; the notice of Brantôme, his life and his works, constituting the last volume of the series, appeared only a few days ago.

Brantôme is well known to those who have made a thorough study of French literature and history. As a littérateur he holds a very peculiar place. He is an admirable specimen of the writer of the sixteenth century; his language has an archaism, an ease, a freedom, a sort of looseness and fluidity which does not recur in the classics of the seventeenth century. It is difficult to call him an historian, as he never attempted to write the systematic history of any period; but his works contain an abundance of anecdotes on all the people of his time which are an inexhaustible mine for the historian. He is not an essayist like Montaigne, and holds no philosophical doctrine of any sort; he is a *conteur*, an *anecdotier;* but his *contes*, his *anecdotes*, are not of an ordinary kind, his actors are often the most celebrated men or women of his time, his *bons mots* are the essence of the witticism of the sixteenth century. He shows us the inside, so to speak, of history, brings us into familiarity with kings, queens, warriors, with the leaders of factions; he takes us from the Protestant camps to the Catholic, from France to Italy; he is universal and eclectic in a most uncommon degree, for he is essentially a sceptic, a fatalist, and an epicurean.

The family name of Brantôme was Bourdeille. His father, François de Bourdeille, second baron of that name, had six children. Brantôme was born between 1539 and 1542—we cannot fix the date exactly. He spent his youth at the Court of the Queen of Navarre, where he was taken by his grandmother, the Sénéchale of Poitou. He was sent to Paris and to Poitiers to pursue his studies, but he never knew Latin very well; he tells us boldly that there was nobody who, having read the letters of Margaret of Valois, "would not laugh at Cicero and his Familiar Letters." His education ended, he made a journey to Italy, the money for it being given to him by Henri II., who allowed him to cut wood in the royal forest of Saint-Yrieix. (The kings were very prodigal of this sort of gratification, though it ruined their domain, as it dispensed them from applying to the Treasury, which was always more or less in difficulties. The Venetian Ambassadors remarked that, in consequence of this, wood was nearly as dear in France as in Venice.) Italy was almost a second home at that time for all Frenchmen. The struggles between the emperors and the kings of France had familarized all Frenchmen with Northern Italy and with Rome. Brantôme crossed the Alps by the Grisons, the road ordinarily taken after the wars; he travelled in Northern Italy for a whole year, curious only of what related to war or to pleasure, entirely indifferent to works of art. He is a little astonished only at Rome, seeing "these proud antiquities, the ruins of these fine palaces, of these superb coliseums and baths which still show what they have been, and strike admiration and terror in all." He becomes much more fluent when he speaks of the courtesans of Rome, Venice, and Florence, famous for their wealth, their beauty, their culture; the Italian predecessors of the French Marion Delorme and Ninon de l'Enclos. Many of the stories, ancedotes, *bons mots*, which he collected in their company found their place in the second volume of the 'Diaries.' He notes also with care all the stories of duels, as he was himself a very good swordsman, and duelling was all the fashion in Italy as well as in France.

On his return, after a brief sojourn in Périgord, Brantôme went to Court, where he stayed some time. He attached himself more and more to the house of Guise, and particularly to the Duke François, whose increasing power was becoming every day more threatening to the royal authority. After the death of Francis II., the young Charles IX. found himself almost alone, and his Court was nearly abandoned. Brantôme was in the suite of François de Lorraine, the *grand prieur*, who accompanied the widow of Francis II., Marie Stuart, to Edinburgh; and he has given us a touching account of the journey of the unfortunate young Queen. He returned to France with the Grand Prior and stopped with him for a little time in London at the Court of Elizabeth. She gave in honor of the French gentlemen a ballet "of her ladies, representing the wise and foolish virgins, some having their lamps lighted, the others having neither oil nor fire and asking for it. These lamps were of silver, nicely made and adorned, and the ladies were handsome and well taught, and took us Frenchmen to dance with them. Even the Queen danced, with much grace and royal majesty, for she was then in great beauty and full grace." Soon after his return, began the first civil war. Brantôme was in the royal army, and took part in the battle of Dreux. His recollections of that famous battle are, as is usual with him, dispersed in his various "Discours," and many of them have much interest.

Brantôme soon lost his two chief patrons, the Duke de Guise, who was killed before Orléans, and his brother, the Grand Prior, who died from a cold which he had contracted on the evening of the battle of Dreux. He was of an adventurous disposition, and we see him preparing a naval expedition against Morocco, which ended merely in a journey to Portugal and to Spain; he prided himself on speaking the purest Castilian as well as French. He returned by way of Bayonne, where he found the Court, Queen Catherine, and the Duke d'Anjou, brother of the young King. Brantôme has a number of stories to tell of the meeting of the French and Spanish courts, which took place there on the occasion of the marriage of the King. Still pursued by his love of adventures, he goes, after the fêtes of Bayonne, to Malta with some French gentlemen who had offered their services to the Grand Prior of Malta. He was tempted a moment to enlist among the Knights of Malta, who were thinking at the time of making an expedition for the liberation of Greece; his friend Strozzi prevented him from taking this resolution, and he returned to France, always hoping to make a great fortune at Court. Strozzi, who, since his exile from Florence, had made himself very important in France, prevented him also from entering the Spanish service. Strozzi was himself thinking then of a great expedition towards "the isles of Peru"; Coligny was speaking to Strozzi of an expedition to Flanders. All these schemes were interrupted by another civil war

Brantôme was with the young King Charles IX. on the day of the retreat from Meaux to Paris, when the King was protected by the Swiss troops. He took part also in the battle of Saint-Denis. Strozzi had given him a company, but, after the peace, Brantôme, who did not like garrison life, resigned. He became very intimate with young Théligny, an ardent Huguenot, who married the daughter of Coligny. The chapter of M. Lalanne's work entitled "Brantôme Protestant" seems very conclusive. M. Lalanne gives us a sonnet, addressed by Brantôme to Théligny, which is a real profession of faith. How long did this fervor last? It is difficult to say. Brantôme had not the spirit of an apostle or a martyr, but he could have said what Crillon said once to Henri IV.: "I was a Huguenot only twenty-four hours, but I still always feel some little reminder of it." There is no trace of intolerance or fanaticism in Brantôme. It must be said also that he was a genuine admirer of rank and birth, and the Protestant leaders belonged to the highest nobility of France. Such men as Coligny and his brothers, as the Princes of Condé, as the King of Navarre, had a natural hold on his sympathies; he had, however, to take sides again when the third civil war began. Strozzi again gave him one of his companies, and he found himself on the royal side.

Brantôme witnessed the defeat of the Huguenots at Jarnac, and tells us how he saw the body of the Prince de Condé, who, when already wounded and lying on the ground, had been shot by the Baron de Montesquiou, lying in a room under that in which slept his mortal enemy the Duke d'Anjou. Two years before he had seen Condé made prisoner at the battle of Dreux. He does not conceal the fact that he was himself a great friend of the assassin of the Prince, the Baron de Montesquiou, who, he says, was "bon homme avec cela," and whom, eight months before, he had saved from drowning in the Seine. Civil wars make men more cruel than common wars. Brantôme speaks of another friend of his, who was killed a short time afterwards, at the siege of Mussidan, in Périgord, the Count de Brissac. "When he was young he was surnamed the Pigeon." "This worthy Brissac, so mild in appearance, with his soft, delicate, and feminine face, was too cruel in war, too prone to fight and to kill." After Jarnac, Brantôme became ill and had to return to Périgord. He was at Brouage with Strozzi when he heard of the horrors of Saint-Bartholomew. Notwithstanding his affection for Charles IX., he does not extenuate this "horrible massacre in which the King soiled his hands." We find him at the siege of La Rochelle with Strozzi and the Duke d'Anjou;

the siege was long, and Brantôme gives us all its details.

His military career ended in 1574. Kept near the King by his office of gentleman of the bedchamber, we see him following the Court in all its journeys, chiefly occupied with its love affairs, rivalries, and duels. He hoped to be named Seneschal of Périgord on the death of his eldest brother; the King had promised him this high office, but it was given to his nephew, in favor of whom the uncle had resigned it. Brantôme was very angry with the King, and threw in the river the gilt key of the King's chamber. "I enter his room no more; I abhor him, and swear that I will never enter it again; but I still frequent the Court, going to the Queen's room." One day, as he was trying a horse, he had a bad fall, and he had to remain for four years in bed. It was during this long and forced repose that he amused himself by writing his valuable souvenirs, which have made us almost familiar with the Court of the Valois and of Catherine de Médicis, with the manners of a time when courage and immorality went together, when the highest artistic culture, the greatest refinement of manners, were not incompatible with coarseness, brutality, and cruelty. Marguerite de Navarre dedicated to him her curious "Memoirs": "This work in a few days will go to you as a young bear, to be licked into shape. . . . It is a history worthy to be well written by a cavalier, a true Frenchman, born of an illustrious house, brought up by the kings my father and brother, friend of the most *galantes et honnestes* ladies of our time, among whom I have had the happiness to be numbered." Brantôme received this dedication in Périgord, where he spent his last years building a great castle, which he saw finished a short time before his death, on the 5th of July, 1614.

Correspondence.

THE NEW SOUTH.

To the Editor of The Nation:

Sir: As one of the many thousand Southern voters who at the recent election cast their first Republican ballot, I wish to express my grateful appreciation and hearty endorsement of the patriotic editorial that appeared in this week's *Nation* on the folly of any measure approaching a "force bill." Such an act would be in the nature of a public calamity. For while it is unfortunately true that there are glaring election frauds perpetrated each year in many Southern States, such crimes have never before been so fearlessly condemned as they are to-day by the enlightened representatives of public opinion in the South. The rascals, moreover, who resort to these practices, were never before called upon to count out the votes of a large number of intelligent men. What federal soldiers and federal marshals alike failed to accomplish, has been brought about through the operation of economic laws and a "let-alone" policy on the part of the national Government. The "Solid South" is at last dissolved, but no surer means could be employed to effect a crystallization of its fragments than even a threat to invoke the aid of national legislation to cure the evils growing out of a corrupt ballot.

In addition to the non-interference by the Government at Washington with the elections in the South, another great cause of the rapid disintegration of the old political order of things has been the economic revolution which has been going on in the old slaveholding States for a decade or more. The extension of railways, the opening of new mines, the construction of new factories and mills, and a thousand and one other agencies of modern civilization have hastened the growth of municipalities, and given a serious blow to the industrial and political ascendency of the agricultural classes. At the same time, a diversity of employments and interests has caused the growth of broader sympathies and widened the horizon of the Southern people considerably. Therefore all friends of the colored man, of the white man, of the South, and of the whole country must view with regret and alarm any indication on the part of the next Administration to return to that policy which once threatened to make of the Southern States a sort of Ireland. Especially would it be regretted at this particular time when the whole trend of events and circumstances is in the direction of a healthier division of both races in politics, and a growing sense of indignation regarding election frauds.

B. J. Ramage.

Sewanee, Tenn., December 5, 1896.

TRIMMING THE ELECTORAL COLLEGE.

To the Editor of The Nation:

Sir: In a letter to the Boston *Herald* of November 30, Mr. Charles R. Saunders points out a method by which the more populous States may be accorded their due weight in the electoral college, without attempting any constitutional changes, such as reducing the number of Senators from the sparsely populated Western States. Mr. Saunders's plan consists in simply increasing the membership of the House of Representatives by reducing to 150,000 the number of citizens necessary to constitute a Congressional district. This would give a House of 500 members, and an electoral college of 590 members, and would restore to the more populous States their proper weight in choosing a President. It is pointed out that Massachusetts, for example, would be entitled to nearly four times as many members as at present, estimated upon the basis of representation in Nevada, which has one Representative for 45 000 people, while Massachusetts has one for each 173,000, but the ratio of 1 to 150,000 would very appreciably mitigate the evil, and would still keep the membership of the House down to a manageable number. This may not be a new scheme, but it seems to be a comparatively simple method of overcoming what all must feel to be an unjust apportionment of power.

Yours very truly,
March G. Bennett.

Boston, December 7, 1896.

ENGLISH AND THE HIGH SCHOOL.

To the Editor of The Nation:

Sir: The defective preparation of college freshmen in elementary English is owing to the fact that most of the high schools have undertaken the work of "fitting boys for the active duties of life." (I quote these words from an advertisement of one of the leading schools in this State.) Every preparatory school has its fine curriculum and corps of professors. What we really need is a preparatory school to prepare students for the high school. The present system of preparatory schools has drifted upwards towards the college, and has got beyond its primitive idea. Like a good many other things in our social fabric, it needs to recur to first principles.

Francis D. Winston.

Windsor, N. C., December 7, 1896.

THE TEACHERS OF ENGLISH.

To the Editor of The Nation:

Sir: The instruction of children is a business, and the conditions and requirements for success vary in no respect from those which enter into any business. In a general way these requirements are sufficient capital, and a devoted attention to the business by persons of adequate experience and acquaintance therewith. So far as teaching is concerned, these conditions are very inadequately complied with at the present day. It is unreasonable to ask of children to display greater attainments than are possessed by their instructors. It is impossible, of course, to obtain competent instructors without paying the market price in the way of salaries. Has it occurred to your correspondents who have discussed this question so interestingly, that very few of the thousands of teachers would be able to make a respectable showing in those same examinations in English which are the reason of this severe criticism of their pupils? It seems useless to urge the need of better teaching in the primary or secondary schools under these circumstances. Until our teachers are able to know and use the English language properly, we can hardly expect such knowledge and use from their pupils. Whether it is possible to induce the employment of adequate capital to secure these results, is a question I am unable to answer. Yours very truly,

John J. Jennings.

Bristol, Conn., December 10, 1896.

"FLASKISABLE."

To the Editor of The Nation:

Sir: The Rev. Professor Skeat, in his 'Student's Pastime,' reproducing what he wrote in 1891, remarks that

"This curious word is given neither in Strattmann nor in Halliwell. It occurs at least twice in Lydgate's *Siege of Troye*. . . . It is clear that the sense is 'variable, changeable, or inconstant.'"

Would it not seem, from this, as if the learned Professor claimed to have first unearthed and defined the expression?

In my monograph entitled 'On English Adjectives in -able,' published in 1877, I give, on pp. 190, 191, two passages from Lydgate's *Tragedies*, generally cited as *Bochas*, wherein appears *flaskisable*, which I there explain by "variable, inconstant, fickle."

Adventuring into a province which I rarely visit, I also append to my quotations what follows, involving a mistaken etymology:

"The primary base of *flaskisable* I saw to be an archaic form of *flash; flasked* being found in *The Ancren Riwle*. But, that either the rhematic termination *-ize*, or the substantival termination *-ise*, . . . was added to *flask*, towards arriving at *flaskisable*, seemed to me a view quite untenable."

As regards *flasked*, literally *vlasketh*, in *The Ancren Riwle*, since the verb *flasken* is from the Old French *flasquer*, 'splash,' my citation of it was wholly beside the mark. This is parenthetic.

I then go on to say:

"Having submitted the word in question to a very eminent philologist, the Rev. Mr. Skeat, I am enabled to give its true analysis. Mr. Skeat regards *flaskise* as alternative with

flaskish,—as the spelling might have been,—a verb; and he connects *flask* with *flick* and *flicker*, and with the provincial *flasker*, *flacker*, and *flisk*. Going farther afield, he points to the Swedish *flaksa*, 'volitare,' and to the Icelandic *flaka*. *Flask*, 'flash,' is, then, a mere metathesis of *flaks-*, a stem of Scandinavian origin."

All this, so far as it bears on the source of *flaskisable*, is now tacitly unsaid; Prof. Skeat's present supposition, the probability of which is hardly likely to be questioned, being that the word is "a mere variant of O. F. *flechisable*, the O. F. equivalent of our *flexible*, from *flechir*, to bend."

Since the study of bygone English—of the works in which but comparatively few are accompanied with glossaries, while very many of them still await philological exploration and exploitation—is now industriously pursued in the United States, it would be of interest to know whether any of our scholars has come upon *flaskissen*, *flaskise*, or the like, as a variant of *flecchen*, anciently adapted from *flechir*. F. H.

MARLESFORD, ENGLAND, November 28, 1896.

Notes.

HENRY HOLT & Co. are soon to publish 'A Reader in Scientific German,' by Profs. Brandt of Hamilton and Day of Swarthmore; and 'The Outlines of Electricity and Magnetism,' by Prof. Chas. A. Perkins of the University of Tennessee.

Miss Isabel F. Hapgood has undertaken, at the request of the author, a translation of Coubertin's 'L'Évolution Française sous la Troisième République.' The work will be published shortly by T. Y. Crowell & Co., who have also in press a volume of lectures by Prof. William P. Trent, of the University of the South, on Washington, Jefferson, Randolph, Toombs, and Jefferson Davis, in their "Library of Economics and Politics."

The Universalist Publishing House, Boston, has nearly ready a 'Life of Alonzo Ames Miner, S.T.D., LL.D.,' by George H. Emerson, D.D., with a large number of pertinent illustrations.

We are in receipt of advance sheets of the second volume of Mr. George Haven Putnam's 'Books and their Makers During the Middle Ages,' completing the work, with an itemized index. We must return to it later, but its table of contents bespeaks matter of great interest, and especial value attaches to the subjects of the closing chapters, viz., on privileges, censorship, and legislation in Italy, Germany, France, and England, and the development of the conception of literary property.

Charles Scribner's Sons announce the first uniform edition of Rudyard Kipling's Works, to contain several stories not before collected, in twelve volumes. For collectors there will be a special American edition, consisting of 200 numbered copies, manufactured by the De Vinne Press on Japan hand-made paper with an R. K. water-mark; and Mr. Kipling will sign the photogravure frontispiece to volume one, while his father supplies some thirty or forty illustrations modelled in clay for copying.

From the same publishers we have received 'France under Louis XIV.: its Arts, its Ideas,' from the French of Émile Bourgeois, by Mrs. Cashel Hoey. This fine gift-book is a quarto, full of entertainment for those who are familiar with the age of which it treats, and full of instruction for those who are not. The entertainment and the instruction will come chiefly from the illustrations, of which there are more than five hundred, and of which the subjects, for the most part, are extremely well chosen. The text is written with intelligence and ability, but it is scarcely intended, of course, to be much more than a frame for the pictures. The twenty-two full-page portraits on copper are the most agreeable part of the work. The thirty-four other full page prints are half-tones. The countless illustrations in the text are of the kind we are used to nowadays, the kind that are more suggestive to the mind than pleasing to the eye; that take the place, and only that, of a written description. But one would be willing to exchange for a written description those of them reduced or repeated from prints containing "legends" (as important as anything else in the design), when from the quality of the reproduction the "legends" are illegible. The imperfections of the volume, however, belong to its class: its excellences are its own, and will not be overlooked by holiday givers or receivers.

Mrs. Clara Erskine Clement's 'The Eternal City: Rome—its Religions, Monuments, Literature, and Art' (Boston: Estes & Lauriat), makes a couple of pretty volumes, handsomely bound and printed, and illustrated with many cuts and with thirty photogravures. The compiler (for she is little more) contributes, in a pleasing, conversational style, the results of her reading in some of the standard works on the subject. In the first volume, for instance, we note little that is not to be found in Lanciani's two books on Rome, or in the latest edition of Middleton's well known work. From this last, indeed, three maps have been reproduced and printed without the slightest acknowledgment, while anybody who wants to know what Mrs. Clement owes to Lanciani has only to compare her accounts of the tombs of Minicia Marcella and Crepereia Tryphæna with his. In these two passages, which are practically paraphrases of Lanciani, she gives him not a word of credit, although his name frequently occurs in other parts of the book. But if Mrs. Clement had written a preface, she would probably have disclaimed much if any first-hand knowledge about ancient Rome; and one who can write of "the god Fascinum," or describe the *Taurobolium* in a context which might lead the uninformed reader to think that this Asiatic rite was practised in republican Rome, had perhaps better not meddle with such matters at all. It seems doubtful, too, whether Mrs. Clement knew just what pictures were to be used in the illustration of her book. The sources of the cuts are seldom given, the cuts themselves are sometimes of doubtful authenticity, and they are rarely, if ever, referred to in the text; occasionally they are not in accordance with the text. For instance, we are shown four so-called Vestals, but without the fillets which Mrs. Clement tells us were found on the head in the portrait of every Vestal virgin. On the whole, the book is of no interest to scholars, and even as a popular work it should be recommended only with caution.

Mr. William Winter reissues his pleasant 'Gray Days and Gold' (Macmillan) in a larger edition, slightly amplified and corrected, and copiously illustrated. The attempt to improve upon the beauty of the small pocket edition is, unfortunately, unsuccessful. The cover of the new book is weak, the paper indifferent, and the page but poorly proportioned. Some of the illustrations are well chosen—notably the full-page photogravures, and the drawings, after recent photographs, of architectural subjects; but all the numerous portraits, and many of the landscapes, are so poor, in both drawing and engraving, that the book were far better without them.

An edition of Irving's 'Alhambra' not bearing the imprint of the Putnams admonishes us of the lapse of time, to which copyrights must succumb. This ornately gilded volume of Macmillan's has for its distinction a large number of designs by Mr. Pennell, mostly pen-drawings, sometimes pretty unsubstantial, memoranda rather than studies. Mrs. Pennell speaks, in the introduction, of the work itself, recalling Irving's reëlaboration of it in 1857, and remarking its permanent success as a guide-book on Spanish soil.

Shall we discern a plot to undermine the traffic in "first editions" in the series of reprints called "The Temple Classics" just begun by J. M. Dent & Co. (New York: Macmillan)? The initial volumes are Wordsworth's 'Prelude,' following the first edition of 1850, and Southey's 'Nelson,' after the first edition of 1813. The general editor is Mr. Israel Gollancz, whose "Temple Shakspere" has won him a proper regard in this capacity. To each volume he supplies a bibliographical note; to the Nelson also a Table of Events, and to the Wordsworth a Table of Dates illustrative of the poem. To say that this series is handy and tasteful is superfluous.

The "Thistle Edition" of Mr. Barrie's novels (Scribners) proceeds with 'Sentimental Tommy,' vol. i., and 'The Little Minister,' vol. ii. It gives a fresh pleasure to the eye to rest on the noble typography of these volumes, whose beauty is otherwise also exceptional.

A plentiful show of daggers on the cover has been deemed appropriate to the translation of one of Alexandre Dumas's potboilers, 'Celebrated Crimes,' condensed by expurgation and otherwise into three volumes (Boston: Joseph Knight Co.). A few portrait and fancy illustrations have been introduced to heighten the festive appearance of these not unhandsome volumes.

Copeland & Day, Boston, continue their series of English Love Sonnets with a third volume, being Mrs. Browning's 'Sonnets from the Portuguese,' in the archaic style already adopted. We could praise this reversion without reserve but for the needless confusion of verse with prose involved in not indenting broken lines; and the early editions of Petrarch put to shame the here unalphabetized table of first lines. Mr. Bertram Grosvenor Goodhue's initials and borders in arabesque are well devised. In a special set of fifty impressions the initials have been rubricated.

Mr. Sydney Lear's 'Five Minutes: Daily Readings of Poetry' (Thomas Whittaker) well deserved a new edition. It is an exceptionally high and unhackneyed selection of verse, which one may take in small doses as suggested by the title, or browse in more freely. It has the calendar arrangement, and an index of first lines, and is altogether a book to be recommended.

The concluding volume (vi.) of the new edition of Johnson's "Lives of the Poets" (Scribners), edited by Arthur Waugh, gives the picture of Johnson in the possession of Mrs. Kay and Miss Drummond for frontispiece, and has besides heads of Thomson, Collins, Young, and Gray. In convenience and good workmanship the edition has just title to favor.

Mr. Charles Morris's 'Half-Hours of Travel

at Home and Abroad' (Lippincott) is contained in four volumes given to the four quarters of the globe. In these severally no particular order is observed, and there is no critical selection of authors quoted from, but the best will be found mixed with the newspaper and magazine tourist. Care has not been taken to fix the date of each excerpt, and all the writers do not appear in the index—*e. g.*, Sir Francis Head, p. 422 of volume i. Mr. Morris condenses at pleasure, and frequently summarizes the omitted parts. He also generally has a few words about the author. Half a dozen illustrations adorn each volume. One cannot deny a certain readability and interest in this compilation, but it could have been better done.

An unpretentious tribute to a writer of wide and deserved popularity is Elizabeth S. Tucker's 'Leaves from Juliana Horatia Ewing's "Canada Home"' (Roberts Bros.). Mrs. Ewing spent three years, 1867-69, at Fredericton, N. B., where her husband was stationed, and this volume is an account of her life there, as recorded partly from observation and tradition, and partly in Mrs. Ewing's bright and ingenuous home letters. Altogether the picture of this slight, girlish, golden-haired woman, her happy-go-lucky housekeeping, her love of dogs and of nature, her botanizing and her sketching, her snow-shoeing and canoeing, is delightful, and will win afresh the hearts of her numerous ad mirers. The volume is attractively illustrated with photographs and pen-and-ink drawings, and with several facsimiles of Mrs. Ewing's ineffectual attempts to copy the strange coloring of sky and woods in her temporary home.

By way of sub-title, Mr. Frank Samuel Child styles his 'Colonial Parson of New England' (Baker & Taylor Co.) "A Picture." For the broad sketch, however, which he has made, his method is too timid to give an interesting result. Mr. Brooks Adams once painted the same portrait with such vindictive attention to the sitter's ugly traits that, while he made the picture interesting enough, in all conscience, it was a libel almost indictable. Mr. Child, on the other hand, approaches the clergy in the spirit with which a Massachusetts housewife poured syrup in her pastor's coffee, despite his protest, saying, "Clear molasses is none too good for Mr. Russell."

Mrs. Baxter tells in her 'In Bamboo Lands' (Merriam Co.) a plain, undecorated tale of her tourist experiences in Japan, with accuracy in her geographical and historical names that is highly commendable. While her story is that of a traveller in beaten tracks, her abundant and judiciously selected illustrations show cultivated taste and fine judgment. The book is handsomely bound and printed, and there are many things which only a woman would be likely to notice and describe as they deserve to be set forth. She affords us a good glimpse into contemporaneous social life at the ports and capital of Japan.

Nothing but praise is due to the editor of 'Shakspere's Holinshed,' Mr. Boswell-Stone, and to his publishers (Longmans). The book is intelligent in plan and uncommonly painstaking and skilful in the execution. Those portions of Holinshed's 'Chronicle' which Shakspere used in his historical plays (including "Lear," "Macbeth," and "Cymbeline") are brought together in a handsome, well-printed volume, and every device of references, side-notes, headings, etc., is utilized to facilitate comparison with the dramas. The foot-notes contain a number of interesting suggestions on matters of detail, and furnish a host of references to contemporary chroniclers and records by way of correcting or supplementing Holinshed's statements. To students of Shakspere the work may fairly be described as indispensable; historical students will find it convenient, and the reader for pleasure will find much to entertain him. It is a genuine pleasure to register the appearance of so sensible and useful a book.

'The Eye and its Care,' by Frank Allport, M.D. (Lippincott), is a popular—that is, not a professional—book, true in fact, but diffuse in statement. Its most useful feature is a scheme (pp. 163 4) for the innocent preliminary examination of school-children's sight, to be followed in suspected cases by skilled inquiry. A large proportion of school-children are handicapped in their earlier years by unrecognized infirmities of sight and hearing which should cause them to be put into special classes.

The bound fifth volume of the *Land of Sunshine* is before us, and it is cheering to read in the last number the editorial assurance of the established prosperity of this illustrated magazine, with its widespread constituency, its lively independence, and its genuine learning. The editor, Mr. C. F. Lummis, is his own best contributor, and his series of articles on the Southwestern Wonderland is a distinct challenge to the tourist to match in Europe the New Mexican inscribed castellated cliff, El Morro, "the most imposing autograph album in existence"; the greatest natural bridge; Acoma, etc. Mr. Lummis has well prepared his readers for a project of publishing next year, in short instalments, critical translations of some of the original sources on the Southwest, not before accessible to the student commanding no other than his English tongue, with facsimiles. These, we dare say, will be so composed as to furnish ultimately a book without the cost of resetting.

No one can complain of the quantity of illus trations in the 'American Annual of Photography' for 1897 (Scovill & Adams Co.). The letterpress shows the customary want of training in the art of grammatical expression on the part of many of the contributors, and conveys no very novel or striking information. Two or three process color prints indicate little progress in this once promising art.

'Minerva: Jahrbuch der Gelehrten Welt' (Strassburg: Karl J. Trübner; New York: Lemcke & Buechner) presents in its seventh volume the constitution and personnel of the learned institutions of the world for the academic year 1896-'97. The editor, Karl Trübner, has to deplore the loss of the projector and hitherto chief editor of this indispensable work, the late Dr. R. Kukula, but pursues his course with a notable extension of the scheme to museums of natural science and archæology and learned societies. Another year will be needed to put this department fairly on its feet, though already a hundred pages have been added to the total bulk of *Minerva*, while the index, or *Personal-register*, is enlarged by but three. The frontispiece is an etched portrait of Prof. Goeje of Leyden.

—A paragraph which has begun the rounds of the daily newspapers indicates that a question is to be raised with Canada regarding the boundary line between Minnesota and Manitoba, in the chain of lakes between Lake Superior and the Lake of the Woods. The proposed contention is to the effect that the international boundary should follow the line of water communication to the *north* of Hunter Island instead of to the *south*. The area of land which would thus be placed in dispute may be estimated at approximately 500 square miles. Before entering into any such contention it would be well for those proposing it to examine into the merits of the case, since it is obviously inadvisable to raise the question unless there is ground for a difference of opinion. This portion of the boundary line was agreed upon and located by the Webster-Ashburton treaty in 1842. Regarding it the treaty reads: ". . . to the mouth of Pigeon River, and up the said river to and through the North and South Fowl Lakes to the lakes of the height of land between Lake Superior and the Lake of the Woods; thence along the water communication to Lake Saisaginaga and through that lake; thence to and through Cypress Lake, Lac du Bois Blanc, Lac la Croix, Little Vermilion Lake, and Lake Namecan, and through the several smaller lakes, straits, or streams connecting the lakes here mentioned to that point in Lac la Pluie, or Rainy Lake, at the Chaudière Falls." This portion of the boundary was surveyed and mapped by commissioners under the treaty, but the corresponding part of their map was never published. The manuscript sheets are understood to be in the custody of the State Department at Washington. Of the lakes mentioned in the above quotation from the treaty, however, two, viz., Cypress Lake and Lac du Bois Blanc, lie *south* of Hunter Island, and are located and named upon many maps. They will be found upon the map accompanying Nicollet's expedition of 1841, and that of Hind, the Canadian explorer, in 1857, as well as many of modern date. This fact in itself settles beyond peradventure the location of the boundary under the Webster-Ashburton treaty.

—Among the marked events at the Odéon in Paris during the month of November just passed have been performances in French of the "Persæ" of Æschylus and of the "Philoctetes" of Sophocles. Neither play would suggest itself as notably interesting from the point of view of modern stage representation, nor can it be said that the Parisians found a vast deal of interest in either. Of the two, the "Philoctetes" proved far less attractive, however. The performances of the "Persæ" drew crowded houses, and, surprising as it may seem to those familiar with the play, its dramatization of the woes of the house of Xerxes was greatly appreciated by large and somewhat miscellaneous audiences. This result was achieved in spite of an extremely unfortunate stage setting, in which the tomb of Darius, that should occupy the centre of the stage, showed many of the outward signs of a small tool house near the palace of Xerxes. As for the ghost of Darius, it "materialized" vaguely in front of the palace. The choral parts, forming the bulk of the play, were boldly but on the whole effectively dealt with, and in them the interest of the performance centred. Such music as there was came entirely from the orchestra, and cannot be said to have been invariably congruous in its effect. The surprising fact remains that the "Persæ" was made tolerably interesting to a modern audience of theatre-goers.

—To this result there is no doubt that the introductory discourse by the distinguished lady explorer, Mme. Jane Dieulafoy, substantially contributed. Just a shade of dis-

appointment was felt by her hearers when they found her entering into a somewhat elaborate discussion of the literary merits of the play. When Mme. Dieulafoy criticised Æschylus for making Queen *Atossa* disappear before *Xerxes* arrived despairing, defeated, and in rags, and accounted for it by the fact that the same actor had to take the two parts, she was certainly out of the range of Æschylean thought. A scene where *Atossa* should have comforted her son *Xerxes* could hardly have entered into Æschylus's plan, although Mme. Dieulafoy, borrowing Sarcey's well-known phrase, declared "c'était la scène à faire." A malicious on-looker might have insinuated that such a criticism of Æschylus's "Vision of the Judgment of Xerxes" was far too ladylike to be sound. However that may be, Mme. Dieulafoy justified the enthusiasm felt for her intrepid and romantic career in Persia by a few eloquent and striking sentences, in which she described the landscape of her predilection, the long blue line of far-off mountains visible from those royal habitations which her labors have unearthed, and gave a graphic picture of the gorgeous state which Xerxes resumed after his ill-starred invasion of Greece. Perhaps it was the manly garb which Mme. Dieulafoy, authorized by legal warrant, has chosen to adopt, and was wearing as she spoke, that led here in closing to pray that some Æschylus of France might at some future day have for his theme in song "the disaster and the confusion of our enemies." At all events, this was her peroration, which, needless to say, was greeted with rounds of applause, and lent to the play which followed an interest that some may incline to think unduly modern.

—The self-devotion, the intrigues, and the martyrdom of the Catholic missionary priests in England under Elizabeth and James I. have attracted much attention of recent years, and numerous documents have been published throwing light on the dark places of their history. Not the least important contribution to the elucidation of the subject is contained in the latest volume of the Camden Society's publications, entitled 'The Archpriest Controversy,' consisting of papers from the Petyt MSS, edited by Mr. Thomas Graves Law, with an introduction in which his well-known familiarity with the subject enables the reader to grasp the full purport of the documents. The missionaries, who risked liberty and sometimes life in their effort to win back their native land to the Roman obedience, were by no means harmonious. The secular priests among them were mostly loyal subjects, caring only for the souls of their fellow-creatures. The Jesuits were firebrands, deep in the political plots which culminated in the execution of Mary Queen of Scots and the Armada, and led to the Gunpowder Plot. After the death of Cardinal Allen, the two factions became openly hostile; the Jesuits had the ascendancy in Rome, and in 1598 procured the appointment of Blackwell, a secular priest well affected to them, as "Archpriest," with supreme power over the English priests, which he was to exercise in accordance with the advice of the Jesuit superior in England. The seculars were outraged at this, and a violent controversy arose, in which Blackwell used his authority oppressively to silence his adversaries, whose only resource was repeated and, for the most part, fruitless appeals to Rome.

—To the modern reader the most interesting feature of the contention is the fact that Elizabeth's Government, which at first classed all the missionary priests as enemies, came at last to recognize the distinction between the factions, and, while employing without scruple the sternest measures of repression against the plotters of treason, entered secretly into communication with the anti-Blackwell party and was disposed to aid it. In 1601, Bluet, one of the leading seculars, had audience with the Queen and Privy Council, and, at his suggestion, four of the imprisoned priests were banished in order to enable them to go to Rome with an appeal to the Pope, and in 1602 these envoys were encouraged on learning that the French ambassador had a message from Elizabeth, thanking him for his efforts in their behalf. Perhaps the most interesting paper in this volume is one ascribed by the editor to Bancroft, Bishop of London, showing his thorough acquaintance with all the details of the controversy, probably furnished to him by Bluet and Bagshaw, another leader of the seculars. The whole affair would seem to justify the assertion, so vigorously made by Lord Burghley, that the persecution of the missionary priests was wholly political and not religious. Mr. Law promises us another volume of these papers, which will be looked for with interest by all students of the tangled politics of the time.

—The general plan and character of M. Salomon Reinach's 'Chroniques d'Orient' (Paris: Ernest Leroux) is quite familiar to most students of archæology. Like its predecessor, the volume, which forms the second series (1891-'95), is a monument of enormous labor, which might have been simply the collection of a syndicate of industrious chiffoniers, armed with scissors. In reality, it is a work alive and penetrated in every paragraph with the wit, the trained taste, the wide experience, and the sound judgment of a single man. Many a paragraph, moreover, sums up or characterizes in a few lines a treatise or a book. Chronicles, as a rule, have a special dispensation from literary quality, yet M. Reinach declines to avail himself of this privilege. While speaking what he thinks with the most fascinating candor, and calling "un chat un chat" with complete independence, his précis are sprinkled everywhere with grains of good sense and of Gallic salt, which are as wholesome as they are sparkling and piquant. His work is far from being that of a mere compiler. He has thrown out original ideas and made discoveries of decided merit. We are glad to see republished as appendices the essays entitled "Les Déesses nues dans l'art oriental et dans l'art grec" and "Le Mirage oriental," the former of which has since received confirmation by the addition of links at each end of the chain of evidence; while the searching and masterly argument of the latter has been reinforced most unexpectedly by the discoveries of Mr. Arthur Evans.

—M. Reinach complains wittily of the long-windedness of archæologists ("Est ce que le *Rheinisches Museum* refuse les articles courts?") and of their tendency to commit "literary infanticide" by burying their productions in obscure periodicals. There is another vice which he denounces—and most scholars will agree with him from the bottom of their heart and of their purses—the practice of publishing their researches in luxurious folios at extravagant prices. M. Reinach does more than preach against this sin; he proposes to set a good example. He will issue very shortly a collection of statues and another of vases, profusely illustrated, at one dollar per volume. The title of the former work is 'Un Répertoire de la statuaire grecque et romaine.' It will appear very soon in three volumes, small octavo, the first reproducing the Clarac collection of engravings; the second, 4,000 antique statues not figured in that collection; and the third containing a text and copious index.

ANDREWS'S QUARTER-CENTURY.

The History of the Last Quarter-Century in the United States, 1870-1895. By E. Benjamin Andrews, President of Brown University. Charles Scribner's Sons. 2 vols. 8vo, pp. 390, 409, illustrated. 1896.

THIS history, although, as President Andrews tells us in his preface, it has been revised and enlarged, is still in substance the series of magazine articles which, with their rich abundance of pictorial illustrations, lately appeared in *Scribner's Magazine*. The author has sought to seize upon the more striking events which lend themselves most readily to description, by both pen and pencil, and to give us a telling series of tableaux. The quieter current of causes and effects which connect these pictures is purposely omitted or merely hinted at The gradual development of political leaders and of lines of public policy is no part of the plan. The rapidly shifting scenes introduce new men, new inventions, new situations, new conflicts and popular movements. It is something like teaching by the stereopticon, with the slightest thread of lecture to connect the views.

When we know the class of entertainment to which we are invited we shall have no cause for complaint that it is not something else, and can readily adjust ourselves for the full enjoyment of the pleasure offered us. The author tells us explicitly that we are "going upon a rapid excursion through vast tracts, with frequent use of the camera, and not upon a topographical survey." Such a plan affects the literary form of the work as well as its substance. The style is more familiar, more colloquial, becoming at times almost or quite careless. The effort to report a stirring scene sometimes betrays the writer into the rhetoric of the newspaper reporter, with his habit of pointing his descriptions of men and affairs with the sharp emphasis of current slang. We have, therefore, a somewhat free and rapid outline of events, in which the astonishing progress of the country furnishes such a succession of interesting and even startling pictures as to stir in us a new appreciation of the headlong speed with which our world is moving.

Among the earliest of the topics coming within the scope of the book is the return of the rebellious States to participation in the national Government. This is neatly characterized as a contest between the theory of "restoration" as upheld by Lincoln and Johnson, and "reconstruction" as advocated by the Congressional party of which Thaddeus Stevens was the leader. But no outward description of the plan of "reconstruction" is adequate, or even intelligible, which does not state Stevens's object and aim to preserve the ascendancy of the party in power by ruling the Southern States through the votes of the enfranchised freedmen. He was ready to go all lengths with his modern system of "thorough," and in his cynical way had little mercy for his followers who stuck at the extremest measures of disfranchisement necessary to make and keep a party majority. The second stage in the process was that in which, the education and property of the South being

excluded from public employment and natural leadership, a saturnalia of misgovernment and plunder shocked the civilized world. President Andrews's tableau of this condition of things is strong and, in the main, just. He does not bring out the fact, however, that, in the earlier steps of the carpet-bag rule, many men of personal purity of character were working at the impossible problem of "doing evil that good may come." The very instance of the Louisiana Returning Board of 1872 which he uses to "adorn the tale," points also "the moral" that the downward road is easy.

John Lynch, chairman of the Board, and Gen. Longstreet, who commanded the militia and ejected the McEnery Legislature, were both men of pure personal character. Longstreet, a foremost soldier of the Confederacy, had become sincerely convinced that it was a patriotic duty to accept in fullest measure the results of the war, including the enfranchisement as well as the emancipation of the slave. He accepted without flinching the loss of property, of friends, of position which followed. When self-respect and his standard of right demanded it, he retired into absolute privacy; his poverty and his proud isolation being the best proof that no corrupt motive had influenced him. Lynch was a graduate of Oberlin College, preëminently the abolitionist school of the West. When the war broke out, he was the superintendent of public schools at Circleville, Ohio, and master of the High School. Entering the army, he saw honorable service in different grades and became Major of the One Hundred and Fourteenth Ohio, a regiment which served in the Lower Mississippi campaigns. At the close of the war he bought a plantation in Louisiana, was elected to the State Senate, and, besides other public offices, was United States Surveyor-General for that region. In all these positions his honesty and integrity were marked and never questioned. Like Longstreet, he soon sought private life and left the State.

These two men sincerely believed, in 1872, that the freedman's vote was withheld by intimidation; and that, if cast, it would have carried for Kellogg as Governor all the precincts in which the census showed them to be in a decisive majority. They listened to the suggestion that, if the formal certificate were given to Kellogg, and the committees of Congress were plainly told that there was no free and fair election, a new election would be ordered under Gen. Sheridan's protection, and the opportunity for an honest polling of the legal vote be given. In pursuance of this plan, Lynch went to Washington and laid the facts before the Republican leaders with perfect candor. Speaking for himself and Longstreet and those who agreed with them in asking for the guarantee of a fair election, he declared that neither Kellogg nor McEnery ought to be installed as Governor upon such an election, and that the return of Kellogg was only a device to keep the power of correcting a wrong in the hands of a Republican Congress. Many members of Congress agreed that a new election ought to be ordered; but, after manifold delays and consultations of leaders, Lynch was referred to Senator O. P. Morton, as the mouthpiece of those in authority, and Morton informed him that it was not thought expedient to disturb the *de facto* governorship of Kellogg, based on the certificate which they of the Returning Board had issued. These significant and important facts must be added to the account given in the 'History.'

President Andrews gives the sequel in the recognition of Pinchback and Kellogg by the Administration, and their support by the troops of the United States.

"The House of Representatives," he says, "instructed its Committee on Privileges and Elections to inquire into the dispute. A report was made, February 20, 1873, which condemned federal influence. The committee found that McEnery was *de jure* entitled to the governorship, but that Kellogg, supported by the army, was *de facto* Governor. The committee recommended the passage of an act 'to secure an honest reëlection' in Louisiana. The recommendation was not adopted, and anarchy in effect followed (p. 85)."

Lynch and Longstreet and their friends found themselves pilloried in current history as the effective authors of the Kellogg Government when they had meant only to secure a new and really fair election. Their fault was in consenting, even for a good purpose, to use a device that was not in accord with the facts, and in giving the power to profit by it to those who were less scrupulous than themselves. When, however, the story of that Returning Board is told, the part of it which brings responsibility home to men in Washington ought not to be forgotten.

The next inevitable stage in the development was the full substitution of Madison Wells and his tools in the Returning Board, with Kellogg in the Governor's chair, for men of the pattern of Lynch and Longstreet. The end now aimed at was power, by whatever means and at whatever cost. Counting out the precincts necessary for this purpose was not thought to need any apology or pretext: the end to be reached was a sufficient reason. This was the scarcely disguised revolutionary method to which the "visiting statesmen" of 1876 gave the support of their presence and their acquiescence. The natural sequel came a year or two later, when, both from Louisiana and from Florida, the active perpetrators of the frauds offered themselves as witnesses before a Congressional committee to confess their perjuries and forgeries by way of vengeance upon the Hayes Administration because they had not been "provided for" as the price of their villanies. They, in fact, did that Administration a service by the evidence that such claims had not been recognized. This development of carpet-baggery into a condition of things which made decent men at the North wash their hands of the business, is adequately described only when its progressive steps are thus distinctly marked. For the sake of present readers as well as in aid of the future investigator, it is to be wished that the author had been more explicit in this part of his task.

In the treatment of the Anarchist murders of the police at Chicago, there is a pretty full quotation of Gov. Altgeld's criticism of the fairness of the trial, without any satisfactory statement of the principle upon which the prosecution is based. The omission is unfortunate. Attacks upon law and order, whether in the form of mobs or of treasonable insurrections, are all variations of conspiracies to commit a crime. The overt act being committed, the fact of the conspiracy creates a solidarity of guilt and of responsibility among all the conspirators. They all become responsible for what each may do, and the common sense of the people as well as the decision of wise judges has found it necessary and right to treat every conspirator as guilty of all that is done in pursuance of the common purpose. It is mere pettifogging to argue that they did not purpose to kill the individual policemen who fell, if there were a murderous intent which naturally resulted in the killing. The conspiracy is a fact to be shown to the satisfaction of the jury by evidence direct or circumstantial, and, being so proved, the responsibility of each conspirator follows. It has always been the effort of the teachers of sedition and the leaders in mobs and insurrections to slip their own necks out of the halter, leaving their poor dupes to bear the punishment of the acts openly committed. The subject should never be treated without emphasizing the wholesome lesson that the vigorous and righteous spirit of our immemorial law has always brushed aside such cobwebs, and held that the overt act committed gave true interpretation to the criminality of all the preceding steps, holding the leaders, as the popular common sense holds them, guilty of all that is done.

In telling the story of current events it came necessarily in President Andrews's way to touch upon matters which involve charges of fraud against political parties or their agents, or maladministration of office by high officials. In these cases the moral standard which he upholds, and his judgments of men and their conduct, are usually all that could be desired. This only makes more noticeable his apologetic treatment of those who were connected with the Crédit-Mobilier frauds. The gist of every such apology consists in arguing that the representative of a great corporation may give, and that members of Congress may receive, "advantageous opportunities for investments" in it (in short, gifts of money), without any plain violation of official duty and public and private morality, if only no measure is at the moment pending for which their votes are wanted! The statement of the proposition should be enough. When the author has occasion afterward to refer to Salmon P. Chase's good rule for a public officer, to "*be* right as well as to *seem* right, and to *seem* right as well as to *be* right," his applause of it makes one wonder how he could have failed to bring the Crédit-Mobilier affair to the same touchstone. Stupid, indeed, would be the lobby that would find itself trammelled in any degree within the lines laid down by President Andrews.

The book, as a whole, will aid the young to understand the wonderful growth of the country since the great civil war. It will help the middle-aged to recall with profit the connection and meaning of all that has passed under their own eye. It may even serve the systematic historian in fixing his own scale of treatment. In the beautiful form in which the publishers have presented it, it will amuse a leisure hour as well as adapt itself to more serious work.

AN ACRID AUTOBIOGRAPHY.

The Story of My Life. By Augustus J. C. Hare, author of 'Memorials of a Quiet Life,' 'The Story of Two Noble Lives,' etc., etc. 2 vols. New York: Dodd, Mead & Co. 1896.

To those who heretofore have had no acquaintance with Mr. Hare, except through the many volumes he has published, this last fruit of his mind will have a taste unconscionably strange. They have thought of him as the maker of some excellent literary guide-books (with others not so good) and as the pious annalist of 'Two Noble Lives' and 'Memorials of a Quiet Life.' Moreover, he has enjoyed the honors of relationship and association with the Hares of spotless reputation heretofore, Augustus and Julius; the Maurices, one of whom, Frederick's sister, married Julius Hare; and

Dean Stanley, a near relative. What will be his readers' astonishment to find him in these volumes doing such an amount of domestic laundrying in public as has hardly been paralleled in autobiographic literature, bringing a railing accusation against many relatives and other people, and indulging in a line of anecdote and reminiscence which should commend his book particularly to the Society for Psychical Research. Voluminously as Mr. Hare has written, he has brought down his narrative only to 1870, when he had hardly crossed the threshold of his literary career. Are we to expect soon an equally voluminous treatment of the subsequent period? Or will he wait until his surviving relatives and acquaintances are dead in order that he may treat them with the same remorseless candor he has shown in dealing with those who are dead already?

Happy the man who knows the art of skipping wisely before he adventures here. With much that is very entertaining, however indiscreet or scandalous, there is much that is extremely dull—letters and journals whose publication suggests an egotism to which nothing concerning the subject is unimportant; the whinings of his infancy or the petulance of his maturer years. It would be interesting to know if we are entering on a series of biographies and autobiographies of which the terrible frankness of this and Purcell's 'Manning' and Hamerton's autobiography are notable examples. It is difficult to conceive of the motive which has prompted such an exposure of family secrets to the public eye. Can it have been to insure the sale of large editions? Such a motive would not be entirely foreign to the moral temper of the book.

There have been autobiographers, Benvenuto Cellini, Rousseau, and others, who have shown themselves up with merciless sincerity, but Mr. Hare is not a fellow of their guild. The objects of his malediction and derision are his brothers and his uncles and his aunts; but not these exclusively. Occasionally he hints a fault in his own character, but infrequently. The book is depressing and humiliating regarded as a picture of the best society which England has to show. Here are jealousies and bickerings innumerable, also conspiracies and litigations, at least every other person characterized in such a way as to make them appear morally repulsive and deformed. One seems to read between the lines that Mr. Hare's own disposition is not the happiest imaginable. Whatever it was originally, his early training was so well calculated to make it worse that he deserves the fullest credit for such work as he has done and such good qualities as he has shown. The wonder is that he was not spoiled irretrievably for any use or joy.

Mr. Hare was born March 13, 1834, to the great annoyance of his parents, and soon after he was adopted by the widow of Augustus Hare, his mother thus answering her request: "My dear Maria, how very kind of you! Yes, certainly, the baby shall be sent you as soon as he is weaned; and if any one else would like one, would you kindly recollect that we have others?" Two of ten others, brothers, Augustus hardly knew. The father was an erratic spendthrift, the companion of Count d'Orsay, much in his style, but not without strong intellectual traits which made him the friend of Landor and attracted him to serious studies. If the boy was fortunate in escaping from his charge, he was not entirely so in his new surroundings. His new mother was completely under the influence of Julius Hare and the Maurice sisters, one of whom Julius married. These sisters were "a fearful scourge" of his childhood, and "completely poisoned his life" at Hurstmonceaux. "They persuaded my mother to join in their tireless search after the motes in other people's eyes." Frederick Maurice, who came to visit them and to court a lady who was a companion of Mrs. John Sterling, he did not like much better. "He maundered over his own humility in a way which even to a child did not seem humble." The sight of his uncle Julius was terrifying from the start, and grew more so when his special function was to punish the poor sickly child. A riding-whip was used, and it was well laid on and frequently. These things and others similar do much to dim the aureole of Julius Hare, for which Carlyle showed some contempt in his Life of Sterling. His wonderful reading is remembered here as elsewhere with the greatest admiration. When the boy's father came to the rectory he did not notice his existence, thus even bettering the instruction which he received when parting with his child. "He was in the habit of calling his children by the names of beasts." Augustus was "the Wolf," his brother William "the Beast," and his sister "the Tigress." Various members of the family get a fearful setting out. Mrs. Hare Naylor "would make the most fearful tirades against people, . . . and the instant they attempted to defend themselves she took down her trumpet." Our author remembers her daughter only as "a sickly, discontented, petulant woman," who "*preferred* ill health" because of the sympathy it excited, and got up a death-bed scene once or twice every year for the delicious excitement. There were alleviations when his mother's people were visited (his mother by adoption is always meant by "my mother" after his going to her). Sundays were "far less horrid" there than at home. Loving his mother passionately, he lived in constant fear of her. She was always on the watch for undue indulgence of him on her part, and with great success. Rhubarb was regularly administered morning and evening "to strengthen the stomach," and did much to weaken it. In his sixth year, under the reign of the Maurices, he was subjected to a penitential code: The most delicious puddings were talked of, dilated on, and then, at "le grand moment," when they were set before him and his mouth was watering, he was told to get up and carry them to some poor person in the village.

Mr. Hare's school-days were not much happier than the previous dispensation. There was open war between him and Mrs. Julius Hare, whose favorite discipline was to revile his immediate family. "She was the Inquisition incarnate." There was a Mrs. Alexander, "une personne glacée autant que glaciale," who came to the rectory for three days and stayed three weeks, and next came for three weeks and stayed five years. Her rule was absolute but advantageous on the whole. Nothing here or elsewhere is omitted that is likely to make Mr. Hare's narration disagreeable for the connections of the people whom he impales in his cabinet of moral curiosities. At Harrow he was sickly and wore iron "armor" for the straightening of his spine, but, though learning nothing valuable, and always homesick for his mother, he seems to have been happier than at home. Tutors were next resorted to, the last, a Rev. Charles Bradley, recommended by Arthur Stanley. He was the only person who ever taught young Hare anything, but his system of punishment was peculiar and ended in a fearful row. Young Hare was to be kissed before the school by another boy for carelessness in his Latin prose. He fled across the tables, upsetting the inkstands in his path, and finally took Mr. Bradley in the rear with a big lexicon, banging his bald head until his strength gave out; then he made off for Harrow as if he were the hunted thing whose name he bore. He was taken back on condition that there should be no personal relations between them, and there were none till he went to Oxford in 1853, consigned to the protection of Prof. Jowett, who showed him much, and yet peculiar, kindness. While they were walking together, after a mile of silence, Jowett would say, "Your last observation was singularly commonplace." Summoned before the Council and asked, "Now, Mr. Jowett, *can* you sign the Thirty-nine Articles?" he dumfounded them with, "If you've a little ink." In general there are only kind words for Dean Stanley, but, when writing that Jowett "utterly ignored the Incarnation, Resurrection, etc., out of the pulpit as in it," Mr. Hare insinuates that Stanley would have done the same if he had had more courage. Mr. Hare's opinion of Oxford is contemptuous: "The college lectures were the merest rubbish." He reckons that fourteen years and £4,000 were wasted on his education.

His first work, after a book of epitaphs, was upon certain hand-books of Oxfordshire and Durham, and he complains that the Murrays, who urged him to undertake the second book, "never repaid him" for his work. The present Mr. Murray has proved from his books that the house paid £142 for the first book, £180 for the second, and lost on them £158 and £300 respectively; also, that the second commission was given at Mr. Hare's request. One cannot help wondering how much of such perversion, which a retort on Mr. Murray does not help, we have elsewhere under the stress of Mr. Hare's excellent opinion of himself and all his works and ways. His recollections of Landor are amusing if not wholly fresh. We have heard before of his throwing his dinner out of the window in a fit of impatience. That story of Browning's is now capped with one of Landor's seizing a pheasant by the legs and throwing it into the back of the fire. Lord Brougham, whom Mr. Hare saw frequently, is characterized as "the most disagreeable, selfish, cantankerous, violent old man who ever lived," and there is a bill of particulars. Mrs. Grote, the wife of the historian, surpasses the eccentricities and enormities of her reputation heretofore. "When George Grote and I were young," she said, "we were equally distinguished by the beauty of our persons and the vivacity of our conversation"; and in not being an opera dancer she felt that she had lost her one great opportunity. Some of the best stories repeated are Dean Alford's—one, of Archbishop Harcourt's permission by his bishops to hunt, "provided he did not shout." Of course, he said, he would not join the meet, but he "might fall in with the hounds by accident."

The Land of the Castanet: Spanish Sketches. By H. C. Chatfield-Taylor. Chicago: Herbert S. Stone & Co.

On the Trail of Don Quixote. By August F. Jaccaci. Illustrated by Daniel Vierge. Scribners.

THE author of 'The Land of the Castanet' explains the lack of continuity between the chapters of his book by stating that several of

them were written separately as magazine articles. He covers chiefly the most familiar ground—Madrid, Cordoba, Sevilla, Granada, Gibraltar—and has the courage not only to describe once more the old scenes, but to add a great deal of simplified history and broad generalization, thus making his book one for readers to whom Spain is virgin soil. While there is nothing remarkably graphic or novel in his volume, it is entertaining enough, and that it is quite up to date may be inferred from the fact that reference is repeatedly made to the vigorous expressions of Spanish opinion as to America's supposed attitude toward Cuba. The writer came across a young Spanish officer, too, who had recently witnessed a Yale-Princeton football match, and who pronounced this sport "barbarous and cruel, and totally unfit for gentlemen." This same officer was an ardent admirer of bull-fights. Socially, the difference in the points of view is thus summed up :

"The first necessities of an Anglo-Saxon are a comfortable house and a good cook ; in Spain only the very rich have either, but the display of equipages in the Retiro excels the similar show in Central Park ; the opera in Madrid is as fine a sight as the opera in New York. An Anglo-Saxon invites a stranger to dine ; a Spaniard takes him to drive or to the opera."

Mr. Chatfield Taylor appears to have a morbid dread of the personal pronoun. In narrating a personal experience he always uses "one "—"one has never seen more happy and contented faces" ; "every person present greeted one with a friendly smile" ; "the best dancing one saw in Spain" ; and so *passim*. Nothing could be more awkward and self-conscious. The author, by this oddity, obtrudes the very thing he wants to hide, like an awkward person who does not know what to do in society with his hands.

In following the trail of Don Quixote, Messrs. Jaccaci and Vierge travelled on a path unbeaten by other tourists, avoiding towns and railways as carefully as the Vagabond in Spain. And they were rewarded for their discomforts by finding a country in which the habits and customs, the speech and dress, have remained practically unchanged since the day when Cervantes wrote his vivid sketches. They found the same old windmills, looking like toys placed there by a lunatic, the same primitive methods of travel, the same huge jars of wine, the same old way of threshing that was in use in the day of the Moors and the Romans, and nearly the same inns, in which the best room cost ten cents. They found the prison in which Cervantes is believed to have written his romance ; but, with the original door closed, it is so dark that he could not have done more in it than sketch it in his mind. As in the case of Homer, half-a-dozen places still contend for the honor of having given birth to this author, who lived in neglect and misery, and whose genius was first discovered by the English.

Mr. Jaccaci found that the Spaniards of the region immortalized by 'Don Quixote' are living so far back in the past that they have to day the same popular literature that England borrowed from the peninsula during the Elizabethan period. They still read 'Don Quixote' for its drollery, and insist that, apart from that, it contains the science of the world, too deep for them. Their fiction is still that which relates the adventures of Christian chevaliers, castle dames, and Moors, while the modern novelists, Galdós and Valdés, have not made the slightest impression on the popular imagination, and are read in the cities only. Moreover, not only do the villagers of La Mancha dress like Sancho Panza, but "all Manchegans are mines of those old sayings in which the wisdom of generations is crystallized into proverbs, which, like him, they constantly use to sum up tersely a situation."

A model traveller is Mr. Jaccaci—one of the kind that views even the discomforts of a primitive region through the rosy spectacles of a searcher for local tints. What if, in July, the thermometer often creeps up above a hundred at noon, while in the morning and evening heavy jackets and mantles are needed and a brushwood fire is a friend? He finds compensation in the fact that "the furnace air is dry, full of ozone, and rich with the pungent aroma of wild mountain plants. In a delicious monotony of surroundings the hours pass, enlivened only by the songs of the whirring, bustling, leaping locusts. How true is the Spanish equivalent for our 'dog-days' —*canta la chicharra*—the song of the locusts and cicadas rejoicing in the heat, which serves but to make the silence of the solitude heard." There was diversion, too, in the sport afforded by the wild pigeons and rabbits. Nor did he find man less interesting than nature, and there are some admirable character sketches in these pages, supplementing Mr. Vierge's delightfully suggestive pictures, which are scattered in great profusion through the volume, and go far toward showing that the author was right in feeling that "the illustrations of Cervantes's immortal romance should be the crowning achievement of Vierge's career." There is something in these sketches that gives one the atmosphere of a scene as instantaneously as a Japanese picture or poem.

In the author's opinion, our notions regarding Spanish indolence are true only as regards the "classes," "but the peasants are as hard-working a peop'e as can be found anywhere." To their frugal diet he attributes the fact that they are such healthy creatures, solid and limber, the whole body ready to spring. Among the women he still found some of the pure Arab type. They have a hard time of it, their only diversion being religion, which the men affect to scorn, at least in so far as it is embodied in priests. In their ignorance of the world the sexes are alike. They know not the difference between North and South America, and all Americans are supposed to be half-breed descendants of the great Conquistadores and the Indians. Only in one respect has this region been modernized. The author agrees with the Vagabond in Spain that travelling in Spain is now as safe as in any country, thanks to the 28,000 guardias civiles. He did, indeed, secure an order from the governor entitling him at any time to the services of some of these officials, should he wish them. But he made use of it only once or twice—not that there was any danger of brigands, in the old style, but because there are tramps in all countries, and one of these might have taken it into his head to murder the traveller for the sake of a few pesetas.

The Beginners of a Nation. By Edward Eggleston. D. Appleton & Co. 1896. Pp. xi, 377.

MR. EGGLESTON has here given us the first instalment of an extended work on the preparation of which he has long been engaged, and whose general title is "A History of Life in the United States."

"I have sought," he says in his preface, "to trace from their source the various and often complex movements that resulted in the early English settlements in America, and in the evolution of a great nation with English speech and traditions. It has been my aim to make these pages reflect the character of the age in which the English colonies were begun, and the traits of the colonists, and to bring into relief the social, political, intellectual, and religious forces that promoted emigration. This does not pretend to be the usual account of all the events attending early colonization ; it is rather a history in which the succession of cause and effect is the main topic —a history of the dynamics of colony-planting in the first half of the seventeenth century."

Mr. Eggleston has based his work upon a first-hand study of the primary sources, detailed accounts of which are given in the form of "elucidations," or notes, at the end of each chapter.

In its fundamental conception, as well as in its handling, 'The Beginners of a Nation' is a significant illustration of the change which has taken place in the treatment of American colonial history. This change, hardly generally recognized as yet, is not so much in method as in point of view. Earlier historians, with some of recent times, have been prone to regard the events connected with the founding and development of the colonies almost exclusively from the standpoint of the colonies themselves. The historian of the present day, however, trained under those modern historical methods whose watchwords are original research and comparative study, finds his proper point of view, not in America, but in England. To him the history of the English colonies in America is for many years the history of the operation of forces whose source was in the mother country, and whose every pulsation was registered on the face of colonial life. The earlier method gave us facts in abundance, but too often with faulty proportions and incorrect emphasis ; the later method, viewing the early struggles of the American colonies as a phase of the larger life of England itself, has already put some things in a clearer light and shown significance in much which hitherto has passed as mere chronicle. Mr. Eggleston has taken his stand at this modern point of view, and it is in his exposition of the social forces which prompted and directed English colonization in this country that his work, judging from this first volume, promises to be notable. The most obvious comparison, perhaps, is with Doyle's 'English in America'; but Mr. Eggleston is less insular and less hostile than Doyle, while at the same time he passes over many details which the plan of Doyle's work necessarily includes.

The present volume deals with the settlement and early history of Virginia, Maryland, and Massachusetts. The mistaken and vicious policy which for years prevented the development of Virginia, and subjected the colonists to untold privation and suffering, is set forth with great clearness. Mr. Eggleston takes issue squarely with the older writers who praise the administration of Sir Thomas Dale.

"Careful weighing of the original authorities," he says (p. 67), "shows that Dale was utterly pitiless in the cruelty of his discipline and unjust in his detention of the old planters, and that when he left the colony he was more generally execrated than any other man that ruled in these early days, not even excepting his successor, Argall. Dale's severity was serviceable in carrying the enterprise through straits, but the reports of his harshness brought the colony into disrepute and checked immigration."

This judgment, of course, will hardly be accepted by such synoptists as Lodge, who speaks of Dale's administration as "strong and wise," and of Dale himself as one "to

whom Virginia is more indebted than to any of her early governors"; or Thwaites, who finds that Dale "induced fresh immigration of a somewhat better class," and "broadened the foundations of a prosperous state"; but these writers must at least take account of the authorities whom Mr. Eggleston adduces.

Of greater interest, however, and best illustrative of Mr. Eggleston's methods, are the portions of the volume devoted to the rise of Puritanism and Separatism, and the early years of the Massachusetts and Plymouth colonies. Mr. Eggleston has thought it worth while to devote an entire chapter to the rise and development of Puritanism in England, and another to Separatism and the Scrooby Church, before treating of the migrations at all; and few persons will read these pages without feeling that the author has given them a new outlook, and that the often told story of the beginnings of New England has, in his hands, taken on new interest and a wider significance. Here, as elsewhere, it is the broad movement of events, and not details, that receives attention. To be sure, Mr. Eggleston has found himself unable "to treat otherwise than unreverently" "the founders of the little settlements that had the unexpected fortune to expand into an empire"; and, certainly, any one who has pictured the "fathers" as paragons of virtue, is likely to have his reverence pretty rudely shocked if he reads Mr. Eggleston's book. It is not, however, the careless irreverence of the mere iconoclast, but rather the frankness of a student to whom motives and actions are more than professions and words. While we cannot help wishing at times that the writer were less sarcastic, we find it hard to think that his judgments are, in the main, unjust. Even his severe treatment of Endicott is not without its illuminating element. For the efforts of some recent writers to extenuate the intolerance of the Puritans in Massachusetts Mr. Eggleston has no sympathy.

"I have disregarded," he says, "that convention which makes it obligatory for a writer of American history to explain that intolerance in the first settlers was not just like other intolerance, and that their cruelty and injustice were justifiable under the circumstances. This walking backward to throw a mantle over the nakedness of ancestors may be admirable as an example of diluvian piety, but it is none the less reprehensible in the writing of history."

Mr. Eggleston has certainly not allowed many instances of ancestral nakedness to escape him; on the other hand, his treatment of Roger Williams leaves a general impression of favorable bias.

Mr. Eggleston has the gift of style. Crisp, clear, forcible, epigrammatic, abounding in happy characterizations and skilfully turned phrases, it attains at times, as in the general estimate of the character of Roger Williams, to something very like brilliancy. Few works on the period which it covers can compare with this in point of mere literary attractiveness, and we fancy that many to whom its scholarly value will not appeal will read the volume with interest and delight. We must not fail to commend the serviceable index, prepared, apparently, by Mr. Charles A. Nelson.

The Natives of Sarawak and British North Borneo. By Henry Ling Roth. 2 vols. London: Truslove & Comba. 1896. L. 8vo.

In this work an excellent service has been done for the student of primitive native life. It is a collection in a compact form, and so arranged and indexed as to be almost as easy of reference as an encyclopædia, of the accounts given by travellers, officials, and missionaries of the habits, modes of life, religious beliefs, history, etc., of the ten or more distinct tribes inhabiting British Borneo. A considerable part is derived from the manuscript notes of the late Hugh Brooke Low, the results mainly of his own observations during eighteen years' service under the Sarawak Government. To these Mr. Ling Roth has added such information as Mr. Low had overlooked or has been available since his death in 1887. In every case the words of the authors cited are given, with a reference to the work, report, or periodical from which they have been taken. A great profusion of illustrations of the people, their habitations, dress, ornaments, weapons, household utensils, etc., add very much to the value and interest of the compilation. It contains also a considerable amount of the history of the different tribes, together with translations of religious hymns, love songs, and legends which have been handed down orally from generation to generation.

Though the work is intended principally for the anthropologist, yet it is full of interest for the general reader. This is especially the case in the chapters on marriage, head-hunting, and religious and legendary beliefs. The accounts of the apparently ineradicable passion for heads, to which a friend will be sacrificed if a foe cannot be found, and the manner in which they are cherished, are almost incredible. And yet these same head-hunting Dyaks have religious hymns which Mr. Lang says, in his characteristic preface, "appear very beautiful to me." They inculcate a high morality, also, as is shown by the precepts: "Corrupt speech do not utter," "Do not be envious of one another," "All alike be clean of heart." Among the legends is a curious one of the deluge in which "all mankind perished, except one woman who fled to a very high mountain. There she found a dog lying at the foot of a jungle creeper, and, feeling the root of the creeper to be warm, she thought, Perhaps fire may be got out of it; so she took two pieces of its wood and rubbed them together and obtained fire; and thus arose the fire-drill, and the first production of fire after the great flood." This woman and the fire-drill gave birth to a child, who, with the aid of certain beasts, birds, and fishes, learned from the Wind Spirit what it was necessary to do in order that the world should "go on as before." Some of the legends show true humor, and are very similar to those told by the West Coast African and the Southern negro. The place of Brer Rabbit, however, is taken by Plandok, the dwarf deer, a foot high only, who, by his superior cunning, outwits the other animals, including Bruang the bear and a giant man. The appendix contains some extensive vocabularies of the different languages and dialects spoken, and ethnographical notes taken from a Dutch writer. There is, finally, a map of the island showing the habitat of the tribes of British Borneo, and an excellent subject index and bibliography.

Old Houses of the Antient Town of Norwich, 1660-1800. With maps, illustrations, portraits, and genealogies. By Mary E. Perkins. New London, Conn.: The Author, 148 Pequot Avenue.

All who have ever visited Norwich need not be told by us that it is one of the most attractive and picturesque places in this country. Prior to its first settlement by the whites (1660) the region of which the present city is the centre was the favorite place of residence and resort of some of the most powerful and numerous tribes of the aborigines of Connecticut. Of course, its present name was taken from "the fine old city" of Norwich, England; but one may regret that the old Indian name of "Mohegan," as it was called by the General Court of Connecticut at the time the latter granted to certain residents of Saybrook permission to remove and settle there, was not retained.

The present work, which may be called an illuminated domestic history, brings vividly before us, in a sort of house to-house census, the state of society and the figures of many individuals in the period covered. Miss Perkins's painstaking citations from documents, and especially from private correspondence, and numerous and singularly attractive pictorial illustrations (exceeding 130 in number), convey a pretty clear view of the mode of life in a New England town before the rush and noise of the present century commenced.

Of course, nearly all those who lived in Norwich between 1660 and 1800 have passed away; but their descendants who still reside at their paternal home, and the host who have migrated to other parts of the country, can hardly fail to welcome this record of their ancestors, which includes not only many distinguished and well known personages, but many others, who, though less conspicuous in public, are not less interesting, especially to their posterity. Miss Perkins has endeavored to present the subjects of her narrative as they were in real life, without obliterating or concealing their quaintness under the folds of modern drapery. Their orthography was not quite that which prevails to-day, but it was much more correct than that of Major-General Israel Putnam, or even that of Queen Mary, the wife of William III.

Such a veracious contribution to the real history of the beautiful region to which it relates ought not to go unnoticed or unrewarded. The book is well printed, on good paper and with large and handsome type. A better or more tasteful series of process plates than those of the houses embodied in the text we have seldom seen, but there are also numerous precious portraits in photogravure. The genealogies fill a large space, and are not the least meritorious portion of this laborious work.

Reminiscences of an Octogenarian of the City of New York, 1816 to 1860. By Charles H. Haswell. Harper & Bros. 1896.

Mr. Haswell tells us in his preface, and again in his first chapter, that he compiled these reminiscences some twelve years ago, partly from his personal recollections and partly from a perusal of contemporary records. Unfortunately, the text nowhere indicates where recollection ends and gossip or the newspaper takes up the tale. This uncertainty compels the serious reader to so much research for corroboration or disproof that it leaves the book with but little real historical value. One can follow Mr. Haswell about the city in his hunting trips from Fourteenth Street to the Jumel estate on Washington Heights, with a sense of the miracles that a few years have wrought among those quiet wooded places; but his copious narration of incidents he could not possibly have seen, and that have no part whatever in a volume of "reminiscences," together with his disorderly mingling of mobs, the theatre, society, and

street openings, makes his bulky volume merely an historical curiosity shop.

Where Mr. Haswell sticks to his personal recollections he has many lively and amusing things to tell—for instance, of the cry of "Trollope, Trollope!" which, during the thirties, was visited on offenders against decency in theatres and other public places by those whom Mrs. Trollope's "malicious," "but essentially true," strictures on American manners had stung to a mortifying realization of them. His sketches of the country simplicity of social life in New York at that period bring with them a sense of loss that our more splendid but less sincere society does not altogether compensate for; nor does the "tough" of to-day, our "Chimmie Fadden," fill the place of the lost "Moze," the famous "Bowery Boy," with his quaint costume of beaver hat, soaped locks, gaudy necktie, frock coat, and full pantaloons turned up over firemen's boots; his Homeric gallantry and brawling patriotism. On the other hand, Mr. Haswell's endeavor to make a sort of history of the city from all sorts of contemporary sources breaks down badly. His book not only lacks selection and arrangement, but is full of statements based on mere hearsay which might easily become mischievous if accepted by a careless or ill-informed reader. Take, for instance, his attributing to Arthur Tappan a preposterous code of rules for his clerks, which purports to be a literal copy, but betrays itself as being second-hand misrepresentation (p. 189).

The illustrations of the book are numerous, interesting, and well selected. The break in our civic continuity as manifested in our architecture is perhaps their most striking lesson for this period of swift transition.

Some High-Class Books

SUITABLE FOR YOUR LIBRARY OR FOR HOLIDAY GIFTS.

Old Paris.
The Old Regime.
The Court of France.
} By Lady Jackson.

With 16 photogravure portraits on Japan paper. Each 2 vols., crown 8vo, cloth, gilt, gilt tops, with folding cloth jacket and cloth box, $5.00. Half levant morocco, gilt tops, $9.00.

Celebrated Crimes. By Alexandre Dumas, 3 vols., illustrated, 12mo, cloth, gilt tops, full gold stamp on the side, per set $4.50. Half calf or half morocco, gilt tops, per set, $9.00.

These marvelously fascinating historical tragedies are explained and embellished by eighteen full-page illustrations in photogravure, one-half from original drawings by E. H Garrett, and one-half reproduced from famous paintings of historical characters, the secrets of whose lives are discovered in the pages of the work.

The Rubáiyát of Omar Khayyám. Variorum edition. Edited by Nathan Haskell Dole. 2 vols, crown 8vo, cloth, gilt top. $3.50. Half levant morocco, gilt top, $7.00. With decorative title pages and frontispieces of portraits in photogravure of Edward FitzGerald and Friedrich Von Bodenstedt.

These volumes are practically an encyclopaedia of Omar Khayyám literature.

The Innocents Abroad; or the New Pilgrim's Progress. By Mark Twain. New Edition. Fully illustrated with thirty photogravure illustrations of scenery, cities, and architecture, visited by the author and his fellow pilgrims on their famous excursion to Europe and the Holy Land in 1867. 2 vols., crown 8vo, cloth, gilt tops, in cloth box, $5.00. Half levant morocco, gilt, gilt tops, $9.00.

Feudal and Modern Japan. By Arthur May Knapp. 2 vols., 32mo, cloth, gilt tops, per set, $1.50.

THE SAME.—Illustrated edition. With twelve photogravure illustrations of Japanese life, landscape, and architecture in each volume. 2 vols., 32mo, cloth, gilt tops, per set, $3.00. 2 vols., 32mo, half levant, gilt tops, per set, $6.00.

Mr. Knapp's special errand to Japan and his long residence there have given him peculiar advantages for observation. The scope of the book includes a study of the history, religions, language, art life, and habits of the people,

Les Miserables. By Victor Hugo. Five vols. Cloth, gilt tops, plain back and side, $6.25. Cloth gilt tops, full gilt sides and back, $7.50. Half cal or half morocco, $15 00. Illustrated with twenty photogravures and half-tones.

Some of the Best Books

FOR YOUNG PEOPLE PUBLISHED THIS SEASON ARE THE FOLLOWING:

Three Children of Galilee. A Life of Christ for the Young. By John Gordon. 1 vol., 12mo, cloth, illustrated, $1.50.

Beautifully illustrated with more than two hundred text and full-page illustrations of Holy Land scenery.

Songs and Rhymes for the Little Ones. Compiled by Mary Whitney Morrison (Jenny Wallis). New edition, with an introduction by Mrs. A. D. T. Whitney, and eight illustrations. 1 vol., 12mo, with ornamental cloth binding, $1.50.

Miss Gray's Girls; or, Summer Days in the Scottish Highlands. By Jeannette A. Grant. With sixty illustrations in half-tone and pen-and-ink sketches of Scottish scenery. 1 vol., small quarto, cloth and ornamental side, $1.50.

A delightful story of a trip through Scotland, missing nothing of the matchless scenery, and no place of historic interest. A book which will appeal to girl readers.

The Young Pearl Divers. A Story of Australian Adventure by Land and Sea By Lieut. H. Phelps Whitmarsh, author of "The Mysterious Voyage of the Daphne," etc. 1 vol., cloth, 12mo, illustrated $1.25

This is a splendid story for boys, by an author who writes in vigorous and interesting language of scenes and adventures with which he is personally acquainted.

A Loyal Little Maid. By Edith Robinson. A delightful and interesting story of Revolutionary days, in which the child heroine, Betsy Schuyler, renders important services to George Washington and Alexander Hamilton, and in the end becomes the wife of the latter. 1 vol., cloth, illustrated, 50 cents.

Big Brother. By Annie Fellows Johnston.

"Just a half-hour on a stormy winter night, but the emotions aroused and the tender chords set in vibration will require long years to quiet. Such a book, sweet, tender, pathetic, full of richest thought, is adapted for reading aloud in the family circle, or alone under the shaded lamplight, on the cars, or anywhere when a short, good story well told is in demand."—*Epworth Herald.*

1 vol., cloth, illustrated, 50 cents.

The Little Colonel. By Annie Fellows-Johnston. A new story, by the author of "Big Brother." The scene is laid in Kentucky, and the heroine is a very sweet little bluegrass girl whose winning personality will endear her to all readers. 1 vol., cloth, illustrated, 50c.

Wee Dorothy. By Laura Updegraff. With ten illustrations by Alfred C. Eastman. A story of two orphan children, the tender devotion of the eldest, a boy, for his sister, being its theme and setting. 1 vol., cloth, illustrated, 50c.

For sale by all bookstores, or sent, prepaid, on receipt of price.

HENRY T. COATES & COMPANY, Philadelphia.

JOHN LANE'S BOOKS

IN

BELLES LETTRES.

SECOND EDITION.

The Quest of the Golden Girl.

A Romance. By RICHARD LE GALLIENNE. With cover design by Will H. Bradley. Crown 8vo, $1.50.

"This book is the most entertaining and best thing that Mr. Le Gallienne has done."—*New York Evening Sun.*

"Only the reading of the charming work itself can do justice to its fascination. How delicately, wittily, daringly, exquisitely beautiful it is!"—*New York Sunday Journal.*

Bodley Booklets.

With Cover Design by WILL H. BRADLEY.

I. THE HAPPY HYPOCRITE: A Fairy Tale for Tired Men. By Max Beerbohm. 32mo wrappers, 35 cents.

Printed by Will H. Bradley at the Wayside Press.

The Child World.

Poems. By Gabriel Setoun. With over 100 Illustrations by Charles Robinson. Crown 8vo, $1.50.

"One of the most attractive books in the Christmas market. The verses are fitted to little eager minds, while the illustrations are such as the most fastidious must approve."—*Boston Transcript.*

Wymps.

Fairy Tales. By Evelyn Sharp. With 8 colored illustrations and decorated cover by Mabel Dearmer. Small 4to, $1.50.

"For 'Wymps and Other Fairy Tales,' by Evelyn Sharp, we have only the highest praise. The fantastic full page illustrations by Mrs. Percy Dearmer and her striking cover design are attractive for old as well as for young. The stories are original and excellent, that of 'The Boy who Looked Like a Girl' being one of the daintiest bits of children's fiction which we have read for months."—*Boston Journal.*

A Mountain Town in France.

By Robert Louis Stevenson. A Fragment. With 5 Illustrations by the Author. Demy 8vo, wrappers. Only 350 copies printed. $1.50.

An account of the author's stay at Le Monastier in the autumn of 1878. It was intended to serve as the opening chapter of his well-known volume, 'Travels with a Donkey in the Cevennes'; but the intention was abandoned in favor of a more abrupt beginning, and the fragment is now printed for the first time.

The Children.

By Alice Meynell. Cover design, end papers, title-page, and initial letters by Will H. Bradley. Fcap 8vo, $1.25. This is the first book printed by Will H. Bradley at the Wayside Press.

New Ballads.

By John Davidson. Fcap 8vo, $1.50.

"The touch is exquisite, the inspiration of a true artist."—*Chicago Record.*

"A prevailing moral earnestness gives his poetry individuality and power."—*Hartford Courant.*

"No one but a true poet is able to express so much in a few lines as does Mr. Davidson."—*Rochester Post-Express,*

Make Believe.

By H. D. Lowry. Illustrated by Charles Robinson. Crown 8vo, $1.50.

Poems.

By Alice Meynell. *Fourth edition.* Fcap 8vo, $1.25.

The Wise and the Wayward.

A Novel by G. S. Street, author of "The Autobiography of a Boy." Crown 8vo, $1.50.

Some Whims of Fate.

By Menie Muriel Dowie. Design cover. Fcap, 8vo, $1.00.

Walter Crane's Toy Books.

A reissue, each with new cover designs, and end papers, 25 cents each. The three bound in one volume, $1.25.

The Yellow Book.

Volume XI. With 12 illustrations. Small 4to, $1.50. Previous volumes, except volume I., to be had at $1.50 each.

THE BODLEY HEAD,

140 Fifth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, DECEMBER 24, 1896.

The Week.

THE Dingley bill has been abandoned in the Senate, to the evident satisfaction of its friends as well as of its enemies. The sole contest between the two was as to how the credit or the blame of its taking off should be apportioned. The only persons in the United States who have given any sign of mourning for it are they of the Boston Home Market Club. They take it hard, because they say they cannot possibly wait till next spring. So the public will have a chance to see what happens to people who cannot possibly wait for a certain thing, and yet are obliged to do so. The touching obsequies in the Senate were marred somewhat by a speech from Mr. Sherman, who said that the bill was designed simply to supply the necessary revenue to the Government. This is very far from the truth. It was designed to put money into the pockets of certain protected classes and interests, and incidentally to give the Government more revenue, *perhaps*. Now that we are all working together to keep the Goths and the Huns from overrunning civilized government, why not speak the truth? Why not acknowledge that if we want revenue merely, we can get it by a bill, of not more than one page of foolscap, that will be entirely unobjectionable—a bill putting a stamp tax on instruments used mainly by the rich, or by increasing the tax on beer, or by putting duties on tea and coffee, or, better still, by cutting down the public expenses to the dimensions of the revenue? A little candor would be very beneficial just now, and might help to pass the other tariff bill that is in preparation for next spring.

That was not the only disingenuous statement imposed on the Senate by Mr. Sherman. He said that if the revenues of the Government had been sufficient to meet its expenditures, there would have been no need of the sale of bonds to replenish the gold reserve—meaning, of course, the expenditures other than the redemption of legal-tender notes. How far this is from the truth the following figures will show:

PROCEEDS OF BOND SALES.		REVENUE DEFICIT.	
Feb. '94.....	$58,660,917	Fiscal year.	
Dec. '94.....	58,444,900	'94	$69,803,260
Feb. '95.....	65,116,275	'95	42,805,223
Feb. '96.....	111,166,246	'96	26,042,244
	$293,388,338		$138,650,727
		Excess of proceeds of bond sales..	154,737,611

If there had been no drain on the Treasury for gold (due to the Sherman act), the amount of money required to be raised by bond sales would have been only $138,650,727, or less than one-half of the amount actually so raised. Even the deficit that has existed Mr. Sherman ascribes to the Wilson tariff, whereas that tariff did not go into operation till August, 1894, after two bond sales had been necessitated and one of them effected. The truth is, that the deficit was caused by the McKinley tariff and the new pension legislation coming together. The former was avowedly passed "to reduce the revenue," and this it accomplished by repealing the sugar duties and giving a bounty to domestic producers of sugar. The latter added $50,000,000 to the public expenditures. The two things made a difference of $120,000,000 in the Government's balance sheet, and now Mr. Sherman puts all the blame on the "Wilson-Gorman tariff." Is not that prevarication about played out?

One part of Secretary Carlisle's report should make some impression even upon a torpid Congress. It is the part in which he urges retrenchment. On the basis of the present estimates, he notifies Congress that it will be deliberately voting a deficit of $45,000,000. Congress avows its own imbecile helplessness in the matter of increasing the revenue. Not an added tax can be levied, not an added dollar brought into the Treasury. Then why not cut down the appropriations? asks the Secretary. This seems an obvious suggestion, but Mr. Carlisle is the first man in authority at Washington to make it. Senator Sherman declared passionately the other day that it was a shame and a disgrace to Congress not to pass a bill to increase the revenue. The shame and disgrace of waste, of wanton and reckless extravagance, never occurred to him or anybody else in Congress. Nor does the Secretary of the Treasury leave all in the vague. He shows in detail where the extravagance has crept in, and intimates clearly the ways in which it may be pushed out. He justly asserts that "the great increase in the ordinary expenditures of the Government during the last seven years has been without precedent in our history."

The Secretary's conclusion is that of every other man who has looked into the affair, namely, that there has been no such "necessary extension or substantial improvement of our public service as to justify these enormous increases in expenditures." Wherever a probe has been thrust in, as by the Dockery committee of the last Congress, wastefulness and sinecures have been found. It is safe to say that any well-managed business, finding itself in embarrassment like the Government's at present, could extricate itself handsomely by the most obvious kinds of economy and cutting off of useless or scandalous expenses. But, of course, it is the last thing Congress will think of doing. Economy is the most unpopular policy that any man can advocate in any popular assembly—that is to say, if he advocates it sincerely, with a bill up his sleeve to enforce economy. An old English financier said, "If you want to rouse a certain cheer in the Commons, rise and deliver a panegyric on economy; if you want to invite a certain defeat, propose a bill to effect any particular economy." So it will doubtless be in this Congress. Mr. Carlisle's recommendation of retrenchment will be no more regarded than the whistling of the winter wind over the capitol. Nevertheless, he may have the satisfaction of knowing that he is entirely right. If there were any umpire between him and Congress, he would be given the victory without hesitation. As it is, he will have to put up with the somewhat meagre contentment of the Roman who proudly said that though the conquering side was pleasing to the gods, the defeated side was pleasing to Cato.

Four commercial bodies took action on Monday against the Cameron resolution for recognizing the independence of Cuba. The Baltimore Board of Trade passed resolutions declaring that the action taken by the Senate committee was ill-timed, hasty, and calculated to greatly embarrass, if not actually sever, the peaceful relations now existing between Spain and our country, and, as a natural consequence, to seriously damage our commercial and financial interests, already suffering from grave depression. The St. Louis Cotton Exchange adopted resolutions of similar tenor. They considered that such a step as that proposed by the Cameron report would be instrumental in lowering the values of all farm products, and especially that of cotton, to the great detriment of American producers of that staple. The Vicksburg Cotton Exchange and Board of Trade united in protesting against the Cameron resolution and in asking the Senators of Mississippi to vote against it. The Boston Merchants' Association took similar action. As all these protests were passed the same day and without any concerted action, they betoken a spirit of strong opposition among the commercial classes of the country to the reckless behavior of the Senators who compose that committee, to wit (of those present), Senators Sherman, Frye, Davis, Cameron, Cullom, Lodge, Morgan, Daniel, and Mills.

The *Tribune's* "Steady, Now!" on its Sunday editorial page was a proper, though tardy, appeal to reason in this Cuban business, but the men whom that paper should have made heroic efforts to "steady" were its own Washington cor-

respondent and its local "head-line editor." On the first page we were informed of the terrible danger that "Congress May be Defied," and the Old Pensioner was let loose for a column in denunciation of Secretary Olney's "counter-challenge of contempt and defiance." The patient explorer of the detailed dispatches given farther on would find that the House was in agreement with Mr. Olney, and that therefore all that was defied was a reckless committee of a reckless *Senate*. But the inflammatory headlines would have done their work with nine readers out of ten, who would have carried off the impression that the President was bent on wicked usurpation of the power of Congress. The instance is a good one of the incoherency and futility of much of our newspaper "editing." The devil's work is done on the first page, and the editor's appeal for deliberation and decency can have little weight with readers who perceive that it has none with himself. As for the head-line artists, they doubtless chuckle to themselves and say, "Let who will write the editorials of a country provided we may manufacture its news and put lying 'heads' on it."

Some of the Southern newspapers see trouble ahead in case Cuba should come into the Union and be "one of the United States." The first result would probably be one if not two mulatto Senators sitting beside Morgan and Call, and whom those high-born Caucasians would not associate with outside of the chamber. Maceo himself, whom they are so fond of praising, and who no doubt deserved all the praise he receives, was a mulatto. If he were alive and in Washington today, and were to hold a reception or give a dinner party, no Southern Democratic member of either house would go to it, or would be reëlected if he did. The condition of affairs in "Cuba Libre" would be such that a considerable part of the white population would leave the island, and the political power of the blacks would be correspondingly increased. All of them, both whites and blacks, are Roman Catholics of the bigoted Spanish type, in whose minds religion and the State are inseparably joined. Their presence as a part of our law-making power would be one more element of heterogeneousness, and an element especially obnoxious to the South. We do not wonder that Southern newspapers want to draw the line between Cuba Libre and annexation. Let Cuba be free, but not come any nearer to the United States.

The extraordinary performances of various Senators regarding our foreign relations provoke national curiosity as to their motives, and lend interest to any attempt on the part of their constituents to solve the mystery. The course of Roger Q. Mills of Texas has, perhaps, caused more surprise throughout the country than that of any other member of the body. He served for many years in the House, and established a good reputation in that branch, but his course in the Senate since the first year or two after his entrance has been almost worthy of a crazy man. The people of Texas do not know what to make of him. The Galveston *News* discusses at length his "diversities of character," characterizing him as "a statesman, if he may latterly be called such, of phenomenally fitful and irregular tendencies," and pronouncing his public career "a strange mixture of energy, industry, prudence, rashness, boldness, timidity, tenacity, and frenzy." As illustrations it cites his proposition in the Senate to prohibit the sale of bonds to save the Treasury and credit of the country from imminent peril; his announcement on the stump that he would vote for the free and unlimited coinage of pewter money before he would assent to the disruption of the Democratic party; and his recent scheme to have the President take military possession of Cuba.

There were several public men who were so active in the free-coinage secret service which "fixed" the Democratic State conventions of last spring, and so idle in the hot Presidential canvass which ensued, that comment of no very favorable nature was attracted, even from the silver organs; witness the sarcastic criticism of the Mobile *Register* and other Democratic organs on the conduct of these carpet knights. Some people reasoned that the free-coinage magnates were annoyed because, when they had led their followers to Chicago with their own Presidential candidate clearly pointed out, the mob stampeded after an unknown young adventurer. Others argued, with some show of plausibility, that the lack of anticipated funds for palace-cars and for carte-blanche at the best hotels had caused these leaders to prefer the comforts of their own homes between July and November. Others, again, believed that the fiat-money principles blatantly professed by Bryan had disgusted those who would go no further than free silver. Whatever the cause, it will be easily recalled that the unfortunate Teller was the only member of the senatorial silver clique to make a serious effort in the boy candidate's behalf. How bad a mess he made of it, when his forged quotations, designed for the consumption of Illinois farmers only, were exposed, is a matter of history.

Senator Vest of Missouri was one of the malingerers. It was said of him, as of the others, that Bryan's greenback notions were too much for him. We have always doubted such a motive, chiefly because it has been our invariable experience that a free-coinage agitator, pushed to the wall in argument, will show the colors of a thorough paper-money inflationist. The speech of Mr. Vest in the Senate, on Wednesday week, shows that our judgment was correct. Mr. Vest belongs by mental capacity, and probably by choice, to the ultra-inflation school of agitators. Here is his statement:

> "We are told that there is $22.85 per capita circulation in this country. A more atrocious falsehood was never put in print or uttered by mortal man. . . . There is no such money in circulation. They take no account of bank reserves, State or national. They amount to over $600,000,000 at the least, locked up by law, that cannot be used by the people nor paid out by the officers of those institutions. And yet they are counted from year to year. . . . What we want and must have in this country is more circulating medium."

This is the regulation fiat-money argument. What do we care for bank deposits? Who bothers his head about bank checks? How can you expect to impose on us by the story that the man with $100 in bank and nothing in his pocket is $90 richer than the man with $10 in his pocket and nothing in bank? What we want is people with pockets full of silver dollars, or (of course), in the case of objection to the weight, with purses full of new legal-tenders. Then everybody will be employed, everybody will be rich, everybody will have whatever he wishes. Mr. Vest, in short, proclaims off-hand the stupid and exploded fallacy that the only money in circulation is the money of private hoards, that its only use in commerce is to fill up the pockets of the people. Banks are a nuisance and obstruction to prosperity; bank deposits an idle fund, contrived to swindle a hard-working population; the Italian immigrant with his money-belt is your true type of capitalist. We commend Senator Vest for his frankness. Every new bit of evidence to show that the free-coinage agitators are only a set of fiat-money lunatics masquerading under free silver instead of unlimited paper, will add to the public awakening on the question.

The short session of a Congress is not apt to be fruitful of important legislation, the appropriation bills and other routine measures demanding all the time; but occasionally a non-partisan measure of great value is passed, like the civil-service law, which was carried through during the winter of 1882-'83. The present session seems now certain to be distinguished by the enactment of a law for the restriction of immigration more far-reaching than any ever passed. It applies an educational test to all persons over sixteen years of age who come from foreign countries, and denies admittance to those who "cannot read and write the language of their native country or some other language," except that an admissible immigrant over the age of sixteen may bring in with him, or send for, his wife, parent, grandparent, minor child, or

grandchild, notwithstanding the latter's inability to read and write. The House passed the bill in substantially the same form at the last session, the only changes made by the Senate being the substitution of sixteen for fourteen as the age limit, and the addition of an *ad captandum* provision allowing Cuban refugees to enter the United States, even if they are illiterate. The lower branch will doubtless accept these changes, and the President's approval of the bill may be expected. The enforcement of the new law will put an immediate and effective check upon the immigration of undesirable immigrants from the countries of southern Europe in particular. At the same time the annexation of illiterate Cubans on the one hand, and Hawaiians on the other, is the preoccupation of not a few supporters of the measure.

The Union League Club has chosen an excellent committee of fifty to go to Albany to urge Mr. Choate's election. There could hardly be better names found in the City Directory. These gentlemen are not necessarily going with the hope of succeeding. If success were easy, if the Legislature represented the people of the State, they would not have to go at all. A representative Legislature could not hesitate if it had to choose between Joseph H. Choate and Tom Platt for the United States Senate. It is because it is not representative, because it is "owned" and the press has been "called off," that this committee has been brought into existence. It goes to Albany mainly in order that the great scandal and disgrace of Platt's election may not pass without protest; that it may not be set down in history that when the State of New York could get one of its leading citizens, an able, learned, eloquent man of high character, to serve it in the Senate, it chose in his stead one of its meanest citizens, feeble, ignorant, mischievous, characterless—and no one cried shame. It goes to show that there are still Americans among us who recall the great days of the republic and the high standards of its founders, and would fain keep for their country its legitimate place in the march of civilization.

But one cannot read over the list of names on the committee without asking himself: Is it possible that fifty such men, influential as they are in finance, law, commerce, and manufactures, can do nothing to stop the payment of money to Platt by the corporations? But for this money he would have his legitimate place among us, that of an exposed blackmailer, and the State would be delivered from the scandal of his political influence. If this money were refused to him, his foul domination would cease instantly. Can these gentlemen do nothing to bring home to the officers of the companies on which Platt levies, the mischief they are doing to their country and their children? The man's power is utterly factitious. It rests on their money. Were they to withdraw the money, he would not have the slightest capacity to do them harm, and they must know that Platt's system cannot go on for ever. It must bring ruin in the long run on all the ideas, customs, and habits on which the safety of corporate and other property lasts. It is no more legitimate business or legitimate politics than "holding up" trains or passing forged checks. But it can run long enough to demoralize the whole community and hasten the day when, as one of the Bryanites said, "Bankers may be hung like horse-thieves."

Platt has very evidently prepared some circular letters for his dummies in the Legislature to send to Senator Pavey, in response to the latter's inquiry as to their attitude on the senatorship. Two replies of this kind have been published, and the similarity of language and ideas is so striking that there can be no doubt that both originated in the same quarter. Both are extremely eulogistic of Platt and his wonderful services, and are pervaded by the same tone of personal admiration for him which distinguished his circular letter to the Platt editors of the State two years ago. It is characteristic of him that he should be so careless of the reputations of his "men" as to make them publish their subserviency with so little disguise. Their letters are put into print in this city almost before it is possible for them to reach Senator Pavey by mail, the boss's anxiety to read his own praises of himself being too great for him to be able to await the slow process of the postal service. Ordinary consideration for the reputations of his dummies would lead him to employ several different hands in the composition of his replies, but he has never shown anything of that kind for his "men." We observe that Assemblyman Austin of this city makes the unnecessary announcement that he prefers Platt to Choate for Senater. How else could he hope to be Speaker of the new Assembly?

The argument that is oftenest used, and oftenest proves most irresistible, in discouraging opposition to Platt, is, What is the use of fighting him when he is certain to be elected? This has been employed in the interest of various politicians of doubtful character for many years in this State. It used to be said of Hill that "the Mugwumps have been pounding him for seven or eight years, and he is stronger now than he was when they began." He was apparently stronger, but not really so. He was able in 1892 to control both branches of the Legislature and the Governor, and had the machinery of his party so firmly in his grasp that he held a State convention in midwinter and had a solid Hill delegation sent to the Democratic national convention. But beyond that point he could not advance. The long "pounding" of the Mugwumps had made his character so well understood by the country that he had no strength whatever as a Presidential candidate. The same "pounding" so completely revealed him and his methods to the people of New York that in three successive elections they defeated him and his party by majorities ranging from 90,000 to 150,000, with the result finally of retiring him to private life. It is now necessary to do like work with Platt. He must be shown up so thoroughly that the people of the State will see him as he is and send him after Hill. No matter how successful he may be now, his fate is certain, provided honest men and honest newspapers do their duty.

Mr. Olcott, the new District Attorney, by Gov. Morton's appointment, makes the surprising announcement that, in selecting men for the minor positions of the office, he shall defer to the Assembly district Republican associations, asking them to submit names for his consideration. In consequence of his saying this he is already overrun with applications, all backed by the Republican machine workers. We beg to suggest to him that he may not be able to make his own selections for these minor places from such lists as he mentioned. It is possible that those places are all under the State civil-service regulations, and that he can make his selections only from the eligible lists which result from competitive examinations. The noble array of names which the "Progressive Civil-Service Reform Association," led by Gruber and Van Allen, is making out for him may not need to be considered by him. He can remove all the present incumbents, but can he fill their places otherwise than from the eligible lists? If it be found that he cannot, the discovery will intensify the loathing of the "Progressives" for the civil-service law. Possibly had he and the Progressives suspected it, the machine recommendation of his candidacy would not have been so hearty as it was. The question to be decided is whether or not these minor places come within the constitutional requirement that "all appointments and promotions shall be made according to merit and fitness, to be ascertained by examinations which, so far as practicable, shall be competitive." Mr. Olcott must show that competitive examinations would not be "practicable" in this instance, for under the following ruling of the Court of Appeals the matter is not decided by the regulations and statutes:

> "If the Legislature should repeal all the statutes and regulations on the subject of appointments in the civil service, the mandate of the Constitution would still remain, and would so far execute itself as to require the courts, in a proper case, to pronounce appointments made without compliance with its requirements illegal."

CUBA IN THE SENATE.

It is rather surprising that the task of embroiling this country in a war for "Cuba Libre" should have fallen to the lot of Don Cameron. This sluggish knight has had a seat in the Senate nearly a quarter of a century, and never took any interest in any public question until a couple of years ago, when he came out as a 16-to-1 silverite of the Bland and Bryan variety. His political activity has now assumed a new form. He proposes to recognize Cuban independence as an accomplished fact by resolution of Congress, and has secured a majority of the committee on foreign relations, including Senator Sherman, to report it favorably. The statement given out by Secretary Olney on Saturday to the effect that Congress was not vested with the diplomatic function of recognizing the independence of Cuba was not only right *per se*, but timely and necessary. It is imperative that a check be given to the attempt now making to conduct the foreign relations of the Government through town meetings. No other country has ever embarked on such a perilous career except France under the Revolution. The result of the experiment then was to involve the country in a war with the whole of Europe, which ended in her own subjugation by a despot and the eventual subjugation of the country and the despot after a deluge of blood lasting twenty years. They manage these things better in France to-day. They have profited by their experience. Although they have a republican form of government, the diplomatic function is reserved to the executive branch exclusively, and the question of recognizing a new government would never be submitted to the legislative department, still less to mass-meetings in the provinces. Government could not be carried on that way. Nor can it be carried on that way here. To submit such delicate questions to a referendum would be like giving dynamite bombs as playthings to a kindergarten. Constitutional questions of this kind must be judged by their consequences. Ex-Senator Edmunds is probably justified in saying, as he is quoted in the *Herald*:

"The right of Congress in its legislative character to declare war is expressly given by the Constitution, but the power to make peace and preserve it is given by the Constitution to the President, acting, in most cases, by and with the advice and consent of the Senate. To say the least, therefore, the right of Congress to recognize the establishment of a new state in the family of nations against the judgment of the executive branch is extremely doubtful, and to do so would, under existing circumstances, necessarily produce evils the extent of which can hardly be estimated."

Secretary Olney's statement, however, must be looked at in the concrete rather than in the abstract. He says that the power to recognize Cuba as an independent State resides with the President exclusively, and that the Cameron resolution, if passed, even by a two-thirds majority, will be inoperative. "It may," he continues, "raise expectations in some quarters which can never be realized. It may inflame popular passions, both in this country and elsewhere, may thus put in peril the lives and property of American citizens who are resident and travelling abroad, and will certainly obstruct and perhaps defeat the best efforts of the Government to afford such citizens protection. But except in these ways, and unless the advice embodied in the resolution shall lead the Executive to revise conclusions already reached and officially declared, the resolution will be without effect, and will leave unaltered the attitude of this Government towards the two contending parties in Cuba." This is equivalent to saying that the country shall have peace as long as Mr. Cleveland remains President. Nothing could be more judicious or more satisfactory to sober-minded citizens. Nothing done by Mr. Cleveland's Administration has been received with more manifest pleasure by the business interests of the nation. The news comes now by way of Europe that Mr. McKinley is of the same way of thinking as Mr. Cleveland; that he, too, is opposed to the break-neck policy of conducting our foreign relations by town meeting, and to a premature recognition of Cuban independence.

It is not probable that the Senators who voted for the Cameron resolution in committee on Friday really desire that it should pass. Long experience has taught us to look upon such outbreaks as gymnastic exercises merely. They are playing to the pit. They are afraid that somebody at home will "cut under" them. They want to do something that they think will command the votes of the multitude, and win the applause of the thoughtless and reckless portion of the community, hoping that the House or the President or the chapter of accidents will prevent their action from causing any great harm. This is what they mean when they say that "there will be no war." They mean that although they are taking the steps to bring on a war, somebody or something else will intervene to save us from that calamity. None of them thus far has expressed any desire for war. In fact, that would not be popular, for there is no feeling of hostility among our people towards Spain. Aside from a belief that Spain is an oppressor of a people struggling to be free, there is no disposition here to wish her harm. There is, therefore, no substratum of hostility for the veriest demagogue in the Senate to work upon. Hence we cannot imagine that the Senators who voted for the Cameron resolution had any other design than to put themselves on record as being as thoughtless and reckless as the other town meetings that are passing judgment on Cuban affairs in Texas, California, and elsewhere.

Reference has been made in this discussion to President Jackson's message of December 21, 1836, on the subject of the independence of Texas, as though it were a document decisively against Mr. Olney's position and in favor of Don Cameron. On the contrary, a more calm, temperate, and conservative communication was never penned by an American President. In its moral and practical aspects it sustains Mr. Cleveland admirably. Although the revolutionary government of Texas had a local habitation as well as a name, and was capable of entering into diplomatic relations with other governments, although it was conterminous with our territory, and although the revolutionists were Americans by birth and in one sense a part of ourselves, and although they had actually expelled the Mexican army, President Jackson counselled delay, and suggested that the republic of Texas be not recognized by us until it was recognized either by Mexico, its own mother country, or by some leading nation of the Old World. On the mere abstract question, whether the power to recognize resided with Congress or with the Executive, he rather leaned to the opinion that it belonged to Congress; but his opinion was not very decisive, and was evidently expressed as a matter of deference rather than of mature deliberation.

THE RISE IN OUR FOREIGN TRADE.

In the present somewhat unusual situation of our market for international exchange, the report of last month's foreign trade of the United States, just issued by the Bureau of Statistics, is particularly interesting. The belief was rather general, after the sound-money victory of November 3, that the merchandise export balance, which had been so exceptionally heavy during the summer and autumn months, would be reduced. The ending of the money-market disorder would make possible a renewal of plans for importing and marketing foreign goods; the same factor would encourage home producers and manufacturers to hold back their products in anticipation of better prices. As a matter of fact, the first advices received after the November vote announced that farmers at interior points had ceased to forward wheat for export in such quantity as characterized the movement of October, and that large orders for merchandise importations, placed conditionally in the foreign markets, were being executed.

The November statement, however, by no means shows any such change in the character of the month's foreign trade as had been anticipated. Our exports for the month were barely $4,000,000 short of the October record, and exceeded the exports of November, 1895, by $26,294,525. Imports, meantime, did not increase at all over either October or September; as a result, last month's excess of merchandise exports over imports was $59,053,885, against only $23,967,764 in November, 1895. For the eleven completed

months of 1896, the merchandise export balance reaches the extraordinary figure of $266,086,709, whereas last year, up to the close of November, we had actually imported more than we had exported.

This unexpected continuance of a diminished import trade is sufficiently explained by the dull commercial season which has prevailed. The maintenance of our heavy export trade, however, is of more material significance. While our breadstuffs exports for November were slightly less than those of the month preceding, the cotton shipments were decidedly increased, and in these two branches of our trade combined we sold last month to foreign consumers $16,500,000 more than in November, 1895, and $18,000,000 more than in 1894. By all accounts, moreover, our shipments of manufactured products to the foreign markets, not yet reported on in detail by the Bureau, have held during the last six weeks to their recent unprecedented average. The detailed summary of the country's commerce for October and for the first ten months of 1896 reaches us at the same time with the general statement for November, and in its export trade returns furnishes some interesting particulars.

Export of copper, for example, increased during the ten recorded months no less than $12,055,513 over the same period in 1895; Europe taking all the increased shipments. Exports of bicycles and bicycle appliances increased $2,921,603; shipments to England, the Continent, Canada, and Australasia having grown from almost nothing a year ago to a very active and flourishing trade to-day. Export of cotton cloths was larger by $5,661,859 in the ten months of 1896 than in 1895, nearly all of the heavy increase coming in our trade with China and Canada, two fields of commerce once surrendered almost wholly to the English manufacturers. Of machinery our total exports increased $4,593,076 over 1895, and here we have invaded the personal domain of the European manufacturer, for Great Britain and the European states took from us upwards of five millions more than they took in the preceding year. In practically every other branch of American manufacture, including leather, lead, zinc, wood, and paper goods, manufactured tobacco, and canned provisions, there has been an increase over 1895 running from 5 to 200 per cent.

These comparisons prove, quite unmistakably, that the accident of a season through which Europe was forced to buy our grain this year in larger quantity and at higher prices, is only one cause, and not the most important, of our present unusual command over the world's consuming markets. Our export of grain alone this year, up to the opening of the present month, showed an increase over 1895 of $45,801,725, but the total merchandise export from this country, during the same eleven months, increases over last year by the extraordinary sum of $156,349,350. In other words, the wheat shortage abroad accounts for barely 30 per cent. of the total increase in our export trade. It is, to be sure, an easy possibility for the tariff-tinkers to demoralize and overturn, as they have done before, this sound and wholesome movement. It is conceivable that persistence in an utterly indefensible currency system will once more throw us out of joint with the markets of the world. But if mischief of this sort can be obviated, our restricted import trade and our enterprising search for outside customers will lay a solid foundation for the future.

Nothing could better illustrate the new position into which this country has been brought, by the trade developments of the year, than the fact that foreign money centres are at this moment borrowing heavily in this market. We are aware that some of the present operations in exchange are described as simple speculation, whereby money is raised in New York city to hold back sterling bills for sale at next month's anticipated higher rates. But it must be obvious to every one familiar with the sterling market that this operation simply reduces itself to borrowing capital in New York for the purpose of deferring a present claim on the London money market. The discount rate to-day in the German cities is 5 per cent., at London it is 3½, while at New York it is 3 per cent. or less; the unusually high European rates being distinctly a result of the capital drawn to the United States in settlement of our large trade balance against the foreign markets. That this is the actual situation, and that the recent advance in foreign exchange represents loans by this country to Europe, not repayment of our own European debt, is plain enough from the remarkable increase in loans of the New York banks. This account has expanded $38,000,000 since the middle of last month, in the face of an absolutely lifeless local demand for loans. As a matter of public knowledge, most of the new loans of the last five weeks have been made on sterling-exchange bills as collateral.

This leaves the immediate future of our international relations in finance a problem of peculiar interest. Apparently the situation is reversed completely from that of the last few years, when a rise in sterling in December meant the recall of capital owed by us to Europe, not the borrowing of our capital by Europe. The quite invariable outcome of this country's situation, in the four years prior to 1893, was a movement of international exchange against us pretty much throughout the year, and a continuous gold shipment. Such an event seems hardly probable in the coming season; New York has now heavy maturing credits to draw upon in London, and they would certainly be drawn upon were foreign exchange to rise to the specie-shipping point. The usual heavy demand for remittances against our January interest payments might conceivably send some gold abroad this month; but, under all the circumstances, it would virtually go as a loan from us, and would hardly reach large dimensions. It is, therefore, altogether possible that the new year will begin with the Treasury reserve no longer in danger of depletion. The conditions under which this altered situation has developed accompanied, and in large measure originated with, the Wilson tariff act and the Government loan of February, 1896. It would be asking much, however, to expect the new Administration and its friends to concede any such connection. We shall watch with interest for their explanation of the matter.

PLATT AND THE CORPORATIONS.

THE Hartford *Courant*, a good Republican paper, states with remarkable clearness and force what an increasing number of people are to-day thinking and saying. It recognizes the fact that at the last election we merely escaped a great danger. We are somewhat in the position of people who, having been shipwrecked, have got ashore on a desert island and are asking themselves how they are to live until relief comes. "There was plainly something wrong," says the *Courant*, "with the way things were going, else there could not have been such a formidable demonstration against the very structure of society. Many are asking what the wrong things were. There is one wrong upon which there is very general and hopeless agreement—that is, the legislatures and the influence of corporations on them."

We shall not quote more from this article, which touches the core of the great evil with which we are contending in this State to-day. That the attacks of Bryan on the corporations did not make more impression was due to the fact that he attacked so many other things, and principally because he coupled with the corporations public and private credit. This ruined his case. But suppose he had confined himself to saying that the State legislatures were passing, and in many cases had passed, out of the hands of the people, and were now regularly bought up by money furnished by the corporations to a "boss," who undertook to procure such legislation and prevent such legislation as they desired, and who rendered no account; suppose he had alleged that the boss did his work by laying each member under pecuniary obligations, so that each member had a tacit understanding with him to follow his directions in the discharge of his legislative duties: what defence should we have made? Is it possible to deny one of the allegations made by the *Courant*? Could we have made any defence? We could not.

Moreover, we must not flatter ourselves that the Bryanite feeling is likely to die out. Bryan's follies about currency will

probably fade from the popular recollection. But what he says, and hundreds of others say, about the corrupt influence of corporations and rich men on our government will not fade from the popular recollection. It is the burning question of the day. The rapid decline in character and responsibility of the legislatures in the large States, such as New York and Pennsylvania, is feeding the flame of popular discontent. The agitation on this matter will last. We shall have to meet it in 1900. How shall we meet it? If we go on as we are now going, we shall have nothing to say. There is as yet no sign that our political men have taken the solemn lesson of last summer to heart. Some of them are preparing at Washington to increase the profits of a large body of rich men in their goods by a higher tariff. This State is preparing to set aside one of the foremost Americans of the day as a candidate for the senatorship, in favor of the very boss who carries on the corrupt and corrupting business of which we speak; and this when the antics of the Senate are filling the country with anxiety and alarm.

The boss in this State is treating the triumph of last summer as his triumph, and that of his nefarious trade. He has, as usual, returned a body of venal legislators subservient to his will. He has secured a Governor of his own stripe who gives every sign of readiness to do what he directs. He has apparently obtained the appointment, as Superintendent of Insurance, of a man whom a leading Republican denounced last year as a "stench in the nostrils" of honest men. We are credibly informed that the corporations would welcome his appointment, and do now support it, not because he is upright and skilful and experienced and honest, but because they know him to be pliable and easy to buy. In other words, his appointment would be, in a certain sense, in part a return for their money. The boss has also secured the control of the Railroad Commission of the State by getting his creatures put on it, so that his power over the moneyed companies of the State is really to-day more complete than it has ever been before. His arrangements are more perfect. He even exacts for himself the highest honor his venal Legislature has to bestow. Not in any direction is there the slightest sign that he or his followers have profited by the lesson of the election.

All men who love their country will do well to ask themselves now whether this can last without having in the end a serious reckoning. We have been astonished and alarmed by the financial theories of the Bryanites. Take care that we shall not be more alarmed in 1900 by their theories about government. It will be extremely difficult for us who allow the boss's relations with the corporations to continue, to meet them. Shall we be able to show that the people of Pennsylvania are truly represented at Harrisburg or the people of New York at Albany? Shall we be able to show that the sending of Quay and Cameron, Hill and Murphy to the Senate was for the popular good? Shall we be able to explain the Platt and Quay system to the multitude as the best thing we could do for the people?

The truth is, as every one is now seeing more and more, we cannot begin too soon to make ready for the next Presidential election. We shall have to encounter arguments far more difficult to deal with than Populist attacks on the currency. These are refuted by the nature of things and the course of events. But what kind of "catechism" or pamphlet shall we have to compose which will show Platt to be a good institution? Does any one suppose the discontented masses will say that the purchase of legislatures is a good use to make of corporate money? The campaign of 1900 will, too, be "a campaign of education," but it remains to be seen who will get the education. The thing which this year's campaign made clear was that the American people are not yet ready for bogus money, but it also made clear that they are not ready for the permanent establishment of boss government. What will they have in its stead?

STORE MANNERS.

THE Consumers' League, an organization of ladies who are interested in the condition of working-women and girls, and have published a "white list" of retail houses who treat them well, offers the following advice to shoppers:

> "If at any time you may feel irritated or annoyed by apparent indifference or carelessness of saleswomen, stop and consider what it means to be on one's feet from ten to fourteen hours a day, in a crowded space, shoved and pushed about, lifting heavy boxes at times, waiting on impatient customers and customers who wish to be helped to know their own minds, keeping accounts of sales and stock, taking addresses often given hurriedly and carelessly, and fined in many instances if written down incorrectly; and all this for salaries ranging from $3 to $8 a week, and obliged to dress neatly and fairly well, and to pay out of it for one's meals, lodging, washing, clothing, and carfare."

And this to saleswomen;

> "We must also appeal to saleswomen themselves to do their duty to the public and to their employers. Our efforts to secure for all the women and girls who work in retail shops in this city the same conditions which exist in the shops on the White List of the Consumers' League, are hampered by the fact that the service is often better in the shops which are not on the White List. The saleswomen in the shop which, of all others in New York, gives its employees the greatest number of privileges, have been so notoriously rude in their treatment of the public that ladies have given that reason for not patronizing it, and thus a very strong moral as well as business argument can be made in favor of fines and severity of discipline."

The observation on all this which most readily suggests itself is, that the great mass of shoppers are themselves poor, or of very moderate means; that they, too, have their worries and vexations, and that when they go shopping they do not do it for recreation, or for the consideration of anything except the best mode of making a dollar go far. Besides this, they are not obliged to go to any store in particular. When rudely treated in one, they can and do go to another; and they are not likely to submit to bad treatment because the shop-girls are too hard-worked or too poorly paid. They will not, under such circumstances, bestow any fruitful attention on the condition of the girls, particularly when, as the League acknowledges, the saleswomen in the shop which, of all in New York, "gives its employees the greatest number of privileges, have been so notoriously rude in their treatment of the public that ladies have given that reason for not patronizing it." We thus see that reflection on the troubles of the saleswomen would not always do good. Nor does even an improvement in their treatment by their employers always lead them to adopt better ways.

We are thus driven to the conclusion that the question of manners and consideration is of far more importance to the saleswomen than to the customers. The customers are not obliged to submit to bad manners; they can go elsewhere. Good manners mean business success to the girls. They mean the prosperity of the store, and, as a possible result, better wages and shorter hours. To the customers they mean simply a few minutes of pleasurable sensation, and a determination to make another purchase in the same place at another time. In fact, the bad manners of the salesmen, and particularly of the saleswomen, in New York, are one of the misfortunes of the city. One of the mysteries of New York business is the singular failure of both employers and employed to consider manners as part of the investment. It is safe to say that a pleasing address, an appearance of welcome and of a desire to satisfy the shopper, to meet her wishes and make her feel that her custom is valued, are worth a large amount of capital, in proportion to the size of the store. We should not exaggerate greatly if we said good manners would enable a dealer to dispense with one-third of his investment in money in all retail business.

This criticism is not so true of the men as of the women. The fault of the men when they try to be polite, especially with ladies, is coarse familiarity. The fault of the women is rudeness and indifference, especially towards other women. They affect not to see them when they enter the store, not to hear them when they ask to see goods; fling the article asked for before them in an unmannerly way, and resume a conversation of their own with their mates, making it difficult for the customer to attract their attention again. This is of constant occurrence in a large number of the stores, even in two in this city which are carried on, not for purposes of private gain, but to help women who have seen better days. Complaints of these have reached us on several occasions of late. Little is

done in either to help the customer, or make her welcome, or to make her feel that her purchase is of any importance. An English lady complained to us of what she considered the singular custom in the stores among the women, of not looking her in the face—one of the most elementary marks of human respect. The saleswomen look away in order to give greater emphasis to their general indifference.

Part of this is undoubtedly due to want of early training. Manners are now rarely taught to children either at school or at home. They grow up "kind o' natural"—that is, behaving as they feel. But a good deal is due to a desire to assert some sort of social equality. "I am as good as you and I want you to know it, though I am a saleswoman," expresses the feeling at the bottom of much rudeness and indifference. The thing to say to people to whose comfort this assertion is necessary, is that they should not seek or hold any employment which brings them into contact with the general public. There are thousands of occupations which can be carried on without intercourse with the world outside, and these are the proper occupations for persons who feel it necessary to maintain their independence by rudeness. For every woman who means to enter the retail trade, manners should be considered by her and her employer as necessary as neat dress, or stools to sit on, or ability to add and subtract, or English speech. They should be learned and cultivated, like typewriting and stenography, as among the qualifications for a particular kind of business. We are always surprised that employers do not pay more attention to this in selecting their salesmen and saleswomen. We believe bad manners to be as injurious to business as inaccuracy in accounts or ignorance about the goods. Of course they are difficult to discover, owing to the customers' unwillingness to complain of maltreatment, but there is all the more reason why employers should themselves keep a sharp watch, and not only make inattention or indifference to customers a reason for dismissal or fine, but make failure to please, invite, and make welcome, a disqualification for the business.

IN OLD GUJARÁT.

AHMEDABAD, October 23, 1896.

THAT there is no hotel in this interesting old town is probably the reason why it is so neglected by European and American tourists. But it is not unpleasant to pass a few days in a *dâk bungalow;* and behind the station, where there is an excellent restaurant, one finds good beds and service in the Government Rest Rooms, which occupy the site of an old mosque, though nothing remains of the latter save the two graceful minarets that rise among the palms of the Rest Room garden. A week's stay at Ahmedabad will, I think, give more insight into Hindu life than can be obtained by a month's residence at Bombay, Agra, or Delhi. Moreover, the architectural remains surpass in beauty those of the last-named cities. The great Jain temple here, that of Hathi Sing, is unique in the history of pure Hindu architecture, and the delicate carving in the windows of Sidi Said's mosque is not equalled by anything in India or even in Cairo.

There are other temples and mosques well worth visiting, but these, despite their attractiveness, are not the main charm of the town. For Ahmedabad is the chief city of old Gujarát (this is now the official spelling), and here are preserved better than anywhere else certain sects and institutions which have remained almost untouched since the Middle Ages. Here, for example, is the stronghold of the Jain faith, that sect which, more fortunate than Buddhism, has succeeded in maintaining religious preëminence and political power in its ancient habitat. The Jains here are no miserable ascetics. Most of them belong to the merchant class, and the saffron brow-mark is seldom seen save on the forehead of very comfortable-looking burghers; for the wealth of the city is chiefly in their hands. Here, too, flourishes the worship of dark Kâlî, Çiva's female counterpart, to which awful goddess (I have been permitted to enter her shrine and look upon her, and she certainly is an awful being) a goat is still often offered.

Through the courtesy of a Brahmin friend who has some influence at the temple, I received permission to witness the sacrifice. It was at midnight. The goat, emblem of that human sacrifice which till within a few years was offered at the same shrine, was slaughtered by the gaudy but dignified priest with no great suffering, though perhaps its cry was somewhat stifled by the shouts of the worshippers. Through the Three Gates at the moment happened to pass a belated Jain, who could not avoid seeing the horrid spectacle, since the altar of sacrifice is immediately in front of the door of the temple, and the latter stands beside the inner Gate. With what horror he shrank back! I love these gentle Jains. Their main tenet is to hurt no living thing, and they observe it scrupulously. Lately I was invited to see a private temple in the house of a wealthy Jain merchant. He asked me first to remove my shoes, for none may walk shod in a Jain temple. Over every lamp, and there were many in the room, a shield was placed, lest any insect should be hurt. There were a few ants on the floor. "Please do not hurt them," he said, and added, smiling, "They are kind little Gujarát ants, and bite so softly that it would be a shame to punish them." But I did not test their kindness.

"Would you like to see our hospital?" asked my new friend. I knew what he meant—the Pinjra Pol. How often I had heard of it, and wondered at such inhuman charity! Till the year 1859 there was no other hospital in Ahmedabad, but the Pinjra Pol has existed for centuries. It is the same in every Jain community, and even some of the Vaishnava sects have their own Pinjras, asylums for sick beasts and houses of refuge for decayed animals (I suppose there can be decayed animals as well as decayed gentlewomen), with a little private apartment for bugs and vermin. A boy goes out every day and collects all the vermin he can find in precarious situations, housing them for good when he returns with them to the Pinjra (cage). All cattle that can be saved from the butcher are brought hither to end their days in peace. Here all dogs may come and pass a green old age; and sick monkeys are taken from the romping *bander-log*, which sport about the ruins near Kankariya lake, and are tended in the Pinjra till they become convalescent.

All this has its absurd side of course; but the instinct is kindly that prompts it, and the effect of the teaching influences all classes. In this town of 148,000 inhabitants, where, through the narrow and crowded streets of the Bazar, thousands jostle each other and ox-carts are entangled every minute, I have only once seen an animal beaten. Indeed, an extra touch of the guiding-whip usually elicits a disapproving *bas* (Enough!) from the throng. Nor have I seen any man drunk or any woman struck in all my wanderings, though I have gone freely through the lowest quarters. Jains and non-Jains, all are well-disposed toward man and animals. It is the living faith of one powerful sect working on all the environment. Recently I stood by the Three Gates, and saw a group of water-carrier women pass through the court that connects the three massive gateways. There is a tree here, the home of squirrels. Not one of these common working-women, and they did not even belong to the Jain sect, failed to pause for a moment and fling a handful of grain to the expectant little beasts. It may have been all their religion, but it was good to see. The Jains themselves do not believe in God, but they have a very practical religion. It is a pity that it cannot be introduced among the nations of the West as a sort of subsidiary cult.

Speaking of the women reminds me that they have learned the art of walking like queens. I use this conventional expression, but in my limited experience with queens I have never seen one walk so well as does the stately working-woman of Ahmedabad. This is partly due to the fact that the latter wears only a short skirt and a sash, with sometimes a loose half-bodice, which is intended to cover the upper part of the breast, though it often fails to do so. Ease in attire is not, however, the main reason for the free gait and lofty carriage so conspicuous here; yet the secret is so simple that it is strange no fashionable boarding-school has caught it and advertised to turn out American girls that can walk. Let any young woman anxious to please try this receipt: Put a wad of cloth or straw on the head and balance on this a small jug or pail, walking around in the position enforced by the balance. I think an hour's daily exercise of this sort might improve health as well as carriage; but at any rate it would produce something better than the dragon stride of the English girl or the usual amble of her Yankee cousin.

There has just been opened, by the way, a "Hindu woman's club-house" in Ahmedabad, the first of its kind. It is a sort of native *gymkhana*, or exercise hall, exclusively for Hindu ladies. These ladies this week kindly put their hall at the disposal of the Gujarát "Educational Conference," which I was invited to attend. Appropriately enough, the principal topic discussed was female education. The building itself is of marble, of two stories, well ventilated, with a general appearance of being all windows, so light and airy are the rooms. It is situated directly opposite the "Female College." Of this latter institution, as of the Jain trade-guilds of Ahmedabad, I should like to give you an account, but I fear I have taken too much space already.

Through the aid of a native friend and the great kindness of the chief merchants, I was accorded the honor of a special session of the "grand masters" (of the guilds), who furnished me with information that is all the more valuable as these corporations are rapidly losing their antique privileges. Ahme-

dabad is the most important guild-city in India, and I am glad to express thus publicly my indebtedness to these good-natured gentlemen, who gave up two hours of a business day, submitting to be quizzed in regard to the rules and jurisdiction of their private associations, merely that the stranger within their gates might not go back disappointed.

E. Washburn Hopkins.

Correspondence.

DECREASING ILLITERACY OF THE COLORED VOTE.

To the Editor of The Nation:

Sir: The new election law of Maryland requires all voters who can write to sign their names upon the registry of voters at the time they register. In the Eleventh Ward of Baltimore city there were registered 2,885 colored voters. Of these, 910 could not write their names and 1,975 did write them. In other words, something more than two-thirds of them were able to write. Voters who in 1896 were forty-five years of age or over must necessarily have been at least fourteen years of age at the close of the war. There were registered 772 colored men of the age of forty five years or upwards. Of these, only 341 could write their names, and 431 could not. Voters who were between thirty-five and forty-five years of age were from four to fourteen years old at the close of the war. Of these, there were 705 registered, of whom 440 could write their names and 265 could not. The remaining class of colored voters were those between twenty-one and thirty-five years of age, none of whom were more than four years of age when the war closed. There were registered in the ward 1,408 of this class. Of these only 214 were unable to write their names. Reduced to percentages, it appears that fifty-six per cent. of the colored men over forty-five years of age cannot write; thirty-seven and a half per cent. of those between thirty-five and forty-five are in the same degree of illiteracy; while of those under thirty-five, only a trifle over fifteen per cent. are unable to sign their own names.—Respectfully, John C. Rose.

Baltimore, Md., December 17, 1896.

CHRISTIAN SOCIALISM.

To the Editor of The Nation:

Sir: A reader in this library has asked me to define Christian Socialism. I am unable to find a clear definition in any of the books. The latest definition I find is in a recent book by Lyman Abbott, entitled 'Christianity and Social Problems,' in which he says:

"It [Socialism] includes the Christian Socialist, who believes that Christianity is a social religion, and that the principles and precepts of Jesus Christ, carried out in social organizations, will revolutionize the present social order, as it has revolutionized social order in the past" (p. 123).

I should like to ask the editor of the *Nation* whether this definition is correct, and, if there be such a thing as Christian Socialism, why we may not logically have also Christian Anarchism, Christian Nihilism, and a number of other Christian isms.

The book referred to contains some statements worthy of notice, coming as they do from such a source, and which will be received with rejoicing by the enemies of the "money power." For instance, on page 61 the author says:

"At the present time one small body of men control the anthracite coal output, a second small body the oil, a third small body the meat, a fourth small body the transportation, and there are not wanting indications that a fifth small body will soon exercise a practical control over our currency or medium of exchange. This is a condition of things perilously near a control over a people's subsistence, against which Alexander Hamilton warned his countrymen."

Again, in the chapter on Christianity and Communism, referring to the single-tax idea, the author says:

"If land is made a subject of private ownership, it is only because the sovereign power deems such an arrangement better for the common welfare than is common ownership" (p. 86).

The advances made in Christian Socialism are pointed out on page 120:

"We have definitely abandoned *laissez-faire* and the Manchester school." . . . "Government has definitely, distinctly, and finally declared that the relations between men in industry cannot be left to the conflict of self-interest. There must be, in some measure, Government control exercised over them. From that declaration we shall never, in any Anglo-Saxon community, go back to the old pagan individualism."

Readers of this book, I think, would be glad to know how it is estimated by the *Nation*.

Very truly,

Wm. M. Stevenson, Librarian.

Carnegie Free Library,
Allegheny, Pa., December 18, 1896.

MR. KIPLING JUSTIFIED.

To the Editor of The Nation:

Sir: In your notice of Mr. Kipling's volume, 'The Seven Seas' (*Nation*, December 10, 1896), the reviewer quotes "that exceedingly keen and cool Oriental, the Swami Vivekananda," as authority for the statement that the very title of Mr. Kipling's ballad, "Gunga Din," is impossible. Happily for Mr. Kipling's reputation for accuracy, one authentic bearer of the name is on record to testify to the possibility of the combination. From an official document quoted in Trevelyan's 'Cawnpore,' page 93, edition of 1886, it appears that at the outbreak of the Indian Mutiny a Naick, or corporal, in one of the native regiments stationed at Cawnpore was named Gunga Din.

Ithaca, N. Y., December 17, 1896.

NAPIER'S LOGARITHMS.

To the Editor of The Nation:

Sir: The statements of the *Nation* have so much weight with cultivated readers everywhere that errors, when they creep in, must be harmful if uncorrected. In the review of my 'History of Elementary Mathematics,' in the *Nation* of November 26, the reviewer endeavors to supply what he considers a gap in my work by telling how Napier constructed his table of logarithms. The process actually followed by Napier was entirely different, and was described by him in his 'Mirifici Logarithmorum Canonis Constructio' (an English translation by W. R. Macdonald, 1889, is now an easily accessible work).

The reviewer commits another error when he attempts to correct a misprint in my 'History.' Evidently he did not have in mind the following passages taken from the 'Arithmetica Logarithmica' (1625) in which Briggs points out the advantage, "si Logarithmus sinus totius servaretur 0 (ut in Canone mirifico) Logarithmus autem partis decimae ejusdem sinus totius, nempe sinus 5 graduum, 44, m. 21, s., esset 10000000000"; and then says of Napier, "istam autem mutationem ita faciendam censebat, ut 0 esset Logarithmus unitatis, et 10000000000 sinus totius."

"UNCONSTITUTIONAL."

To the Editor of The Nation:

Sir: In a paper called "Words Coined in Boston," printed in the *New England Magazine* for November, Mr. C. W. Ernst wrote:

"An interesting document in the Boston Town Records of December 27, 1782, has the words *unconstitutional* and *unconstitutionality*. They may be coinages of Colonel William Tudor. At any rate, they have a new meaning. An English writer might call anything unconstitutional which seemed to him out of harmony with the constitution of his country; yet it might be legal. The Boston words denote something supposed to be illegal and of no force or effect because contrary to the constitution of the Commonwealth" (Vol. xv., p. 344).

While it is very likely that these are the earliest examples of both terms in the particular sense indicated by Mr. Ernst, yet it is highly improbable that *unconstitutional* originated in Boston, and certainly the word was not coined by Col. Tudor. Johnson's Dictionary (1755) recognized *constitutional* but not *unconstitutional*, while the earliest quotation given in the Oxford Dictionary for the former word in its political sense is under date of 1765. It would be strange if, among a people so stirred as were the American colonists by the events preceding and following the passage of the Stamp Act, such words as *constitutional* and *unconstitutional* should not have been employed. And in fact we find that, alike in colonial assemblies and in town meetings, from one end of the country to the other, the Stamp Act was denounced as "unconstitutional." It was at this period that, so far as the writer is aware, the word came into general use on this side of the Atlantic. Later, when State constitutions and finally the federal Constitution were drawn up, the word acquired the special signification pointed out by Mr. Ernst.

"It seems to them, that the trustees, thus empowered and enjoined to confer all the king's rights, expressed in the charter, could convey no other rights, nor no less; and that every grant or tenure of theirs, short of such, was contrary to the charter, and an illegal and unconstitutional reserve." 1743, *Brief Account of the Causes that have retarded the Progress of Georgia*, in *Collections Georgia Historical Society* (1842), ii., 92.

"Less did I think it kind to insist with the vehemence Mr. Grenville used, on positive declarations from Mr. Conway. Such commands appear to me highly unconstitutional, and therefore I do not see how they can be made with friendship to the party." 1764, June 5, H. Walpole, *Letters* (1891), iv., 242.

"*Resolved* [by the Virginia Assembly], therefore, That the General Assembly of this Colony, together with his Majesty or his Substitutes, have, in their Representative Capacity, the only exclusive Right and Power to lay Taxes and Imposts upon the Inhabitants of this Colony. And that every Attempt to vest such Power in any other Person or Persons whatever, than the General Assembly aforesaid, is illegal, unconstitutional and unjust, and have a manifest Tendency to destroy British as well as American Liberty." 1765, *Boston Gazette*, July 1.

"At a Time when the British American Subjects are everywhere loudly complaining of arbitrary unconstitutional Innovations, the Town of Boston cannot any longer remain silent without Just imputation and Inexcusable Neglect." 1765, Sept. 13, *Boston Records* (1886), xvi., 155.

"We do most expressly declare . . . That it is the opinion of this House, that the said act for granting and applying certain stamp duties, &c., as aforesaid, is unprecedented and unconstitutional." 1765, Oct. 2. *Connecticut Colonial Records* (1881), xii., 424.

"They discountenanced, and, it is hoped, for ever abolished, the dangerous and unconstitutional practice of removing military officers for their votes in parliament." 1766, E. Burke, *Short Account of the late Short Administration*, *Works* (1815), ii., 5.

"I heartily thank you for your honest remarks and candid sentiments on our American disputes. They have been always mine, and I trust we shall never differ in opinion thereon. The unconstitutional steps pursued to obtain a constitutional redress, can hardly be paralleled, and I fear they have kindled a fire which all their engines may not extinguish, notwithstanding all the paper puffs, and the distresses which they threaten Great Britain." 1766, Sir W. Johnson, in R. Rogers's *Journals* (1883), 219.

"The Utopian schemes of levelling, and a community of goods, are as visionary and impracticable, as those which vest all property in the Crown, are arbitrary, despotick, and in our government unconstitutional." 1768, Jan. 12, *Journal Mass. House of Representatives* (1767), *Appendix*, 26.

"I shall only say that his reasoning is much like that of a late letter-writer from London, whose wonderful performance, if I mistake not, was inserted in all our newspapers, who says, 'when an act of Parliament is once passed, it becomes a part of the Constitution.' This at once, I confess, shuts the mouth of all Americans from complaining of revenue acts, or any other acts of Parliament as unconstitutional; for what is an essential part of the Constitution, I think, cannot be unconstitutional." 1769, S. Adams, in W. V. Wells's *Life* (1865), i., 59.

"Resolved, that the late act for the shutting up of the port of Boston, and the two bills relative to Boston, which, by the last accounts from Great Britain, had been brought into parliament, . . . are calculated to deprive many thousand Americans of their rights, properties and privileges, in a most cruel, oppressive and unconstitutioual manner." 1774, in D. Ramsay's *History of the Revolution of South Carolina* (1785), *i.*, 20.

"He [Waller] was probably the more ardent, as his uncle Hampden had been particularly engaged in the dispute, and by a sentence which seems generally to be thought unconstitutional particularly injured thereby." 1779, S. Johnson, *Lives of the English Poets*, 87.

"Nevertheless, this unconstitutional Assembly, whose authority under an assumed charter has been tacitly acknowledged by the British Parliament, have not at all times been unchecked by the Corporation of Yale College." 1781, S. Peters, *History of Connecticut*, 90.

"I hope you will not think me too local or statically envious when I mention that a similar instance has occurred in Massachusetts, where, when the Legislature unintentionally trespassed upon a barrier of the Constitution, the judges of the Supreme Court solemnly determined that the particular statute was unconstitutional." 1788, J. B. Cutting, in G. Bancroft's *History of the Formation of the Constitution of the U. S.* (1882), ii., 473.

"I have just received a copy of an act of assembly of North Carolina for ceding to congress all the territory on the Western waters, or nearly all, together with the people. . . . But if congress accept the cession will they not sanction the most manifest violation of rights that can be committed? For expatriation of a part of the community is not a power included among those exercised by assemblys in America convened for ordinary legislation. If, then, the act of cession is unconstitutional, can congress derive any right under it?" 1790, P. Henry, in *Life, Corr. & Speeches* (1891), iii., 415.

"The address to the President contains a very full digest of all the arguments urged against the bill on the point of unconstitutionality on the floor of Congress." 1790, T. Jefferson, *Writings* (1895), v., 205.

"There appears, therefore, no room to say that the bill is unconstitutional, though there may be another construction of which the Constitution is capable." 1792, A. Hamilton, *Works* (1886), vii., 60.

ALBERT MATTHEWS.

BOSTON, December 13, 1896.

Notes.

EDWARD ARNOLD announces the speedy publication of Dr. Donaldson Smith's narrative of his pioneer exploration of the territory between Somaliland and Lake Rudolph; Col. Thornton's 'Sporting Tour through the Northern Parts of England and Great Part of the Highlands of Scotland' (1804), as volume ii. of "The Sportsman's Library"; and Louis Paulian's 'Paris qui mendie,' translated, under the title 'The Beggars of Paris,' by Lady Herschell.

D. Appleton & Co. publish at once 'The Struggle of the Nations: Egypt, Syria, and Assyria,' by G. Maspero, a companion volume to 'The Dawn of Civilization.'

'Dr. Jameson's Raiders,' by Richard Harding Davis, is in the press of R. H. Russell & Son.

'Dante in America: An Historical and Bibliographical Study,' by Theodore W. Koch, is to be issued by Ginn & Co.

Henry T. Coates & Co., Philadelphia, have nearly ready 'American Genealogies,' an alphabetical list of those printed in book form, by Thomas Allen Glenn. It will, we judge, dispense with the critical appreciations which Mr. Whitmore gave in his 'American Genealogist.'

'Le Satanisme et la Magie,' M. Jules Bois's more or less well-known book, has had such measure of success in its earlier and somewhat costly form that his publisher (Léon Chailley) has decided to bring out a cheaper edition of it. There is a certain false air of science about the book, which is really much less scientific than its author perhaps desired it to be and perhaps thinks it is. It is also much less interesting; for a book full of sorcerers and witches, of mages, of devils and ghosts, of spells and enchantments, and horrible Black Masses ought to be very interesting indeed. But there is nothing in the volume nearly so thrilling as J. K. Huysmans's account of the Black Mass in 'Là-Bas.' It is, indeed, to M. Huysmans that the most interesting pages of M. Jules Bois's book are due: a study by way of preface on the Satanists and the Luciferians. The volume also contains a translation of Book iv. of Cornelius Agrippa's 'Occult Philosophy.'

We have already reviewed, in the English translation, Victor Hugo's Letters from 1815 to 1835. Calmann Lévy's handsome original edition of the 'Correspondance' comes to us from Brentano's—a massive octavo of nearly 400 pages of large type.

The second volume of the 'Dictionary of Political Economy,' edited by R. H. Inglis Palgrave (Macmillan Co.), covers in about 850 pages the letters F to M. The editor calls especial attention to the articles on the "Historical School of Economists" and on the French, German, and Italian Schools of Economics, and these articles are evidently the result of much pains. We are disposed to prize this Dictionary principally on account of its biographical and historical matter. There is here comparatively little room for difference of opinion; when it comes to a statement of theories and doctrines, it is perhaps impossible to exclude the personal bias of the writer, and some of the minor articles amount to little more than expressions of the preferences, or prejudices, of those who have prepared them. We venture the further criticism that a considerable number of titles might have been omitted: the differential calculus, for instance, hardly seems to call for any treatment in a Dictionary of Political Economy.

The second volume has appeared of Prof. Bury's valuable edition of Gibbon's 'Decline and Fall of the Roman Empire,' now publishing in seven volumes by Methuen & Co., London (New York: Macmillan). The editor has already, in an introduction, surveyed the merits and the necessary defects of so old a classic, and he accompanies the progress of the text with local rectifications and with references to our larger (because later) knowledge. The footnotes additional to Gibbon's are again supplemented by an appendix of authorities, with learned discussions of the origin of agnosticism, world-eras, early church institutions, the number of Christians under Diocletian and Constantine, the genuineness of Antoninus's rescript concerning the Christians, the persecutions of the Christians in the first and second centuries, the attitude of Constantine to the Christian religion, etc., etc.

In Harper's uniform edition of Mark Twain's works, the contents of the latest and seemingly last volume range over nearly twenty years, and embrace 'Tom Sawyer Abroad,' 'Tom Sawyer, Detective,' and a number of minor stories, fragments, and *jeux d'esprit*. The illustrations are humorous and occasionally something more.

Messrs. Putnam give two new forms to Irving—one as an addition to the "Heroes of the Nations" series, namely, his condensed Life of Columbus; another, a collection of stories and legends, with an eye to classes in literature. Both these volumes are illustrated, with pictures new and old; Darley's Rip Van Winkle outlines being reduced for the collection, and many plates from De Bry and Herrera and other old books of voyages appearing with the Columbus, which has besides a priceless frontispiece in "the authentic portrait" of the explorer; but we fear this claim will give rise to much contention.

'The Illustrated Bible Treasury,' which Thomas Nelson & Sons send us, should be a welcome aid to Sunday-school teachers and in general to Bible students with meagre libraries. It combines the advantages of a condensed concordance to both authorized and revised versions, a subject-index, a pronouncing dictionary of proper names, together with a good deal of matter relating to Biblical archæology and Orientalisms supplied by accredited writers. We need but add that an indexed Bible Atlas is included, and that the whole is clearly printed and beautifully bound in flexible covers.

A summary of Nansen's experience on the *Fram*, the results of our Presidential election, the progress of the Venezuela settlement, the Transvaal's course since Jameson's conviction—these are some of the signs of fresh, up-to-date editing of Hazell's Annual for 1897 (London: Hazell, Watson & Viney). "A cyclopædic record of men and topics of the day," it truly calls itself, and in its twelfth year it finds the demands on its space and the necessity of enlargement greater than ever. It is a mine

of compact information as to current matters, personal, political, parliamentary, legal, financial, and commercial. The maps are of the Sudan, Guiana, Armenia, and the Transvaal.

Extreme clearness of expression and accuracy of scientific statement characterize the late Dr. H. Newell Martin's 'Human Body' (Henry Holt & Co.), in the advanced course of the American Science series. This excellent seventh revised edition, dated only last May, accentuates the public loss in the author's very recent and much-lamented death. As he has expressed it, he tries to show the outposts and outlooks of physiology as they now are, and one wonders who will conduct, for the classes of the future, in this advanced work that for the past sixteen years he has carried on *pari passu* with the progress of science. His work is not ostensibly for students of medicine, but they may profitably study it; and the student of general science who intelligently accompanies the leader to this point, is well beyond the physician who may have stopped where his professor of physiology halted a dozen years ago. The arrangement of the book is excellent, and there are frequent summaries that make practical application of the principles as previously explained. The final chapter, on reproduction, is omitted from such copies as may be specially ordered, but the delicacy and purity with which this function is explained warrant its going before any minds, not in mixed classes, sufficiently mature to appreciate the rest of the volume. Ignorance and innocence are not twins, and knowledge as here conveyed leads only to physical rectitude.

Those who regard popular domestic medicine and the allied sciences and arts as either entertaining or serviceable will be gratified with 'In Sickness and in Health,' by the late J. West Roosevelt, M. D., and a group of collaborers (D. Appleton & Co.). This colloquial discussion, which runs over nearly a thousand large octavo pages, sets forth in everyday speech almost all the physical ills of man, and most of the measures suitable to combat them, and ranges from psychology to the preparation for the grave. Its matter is sound, and, for heads of families and mature persons who have the time and the inclination to prepare in this way for the evil days, it is as safe as any such treatise can be in untrained hands.

'Practical Points in Nursing,' by Emily A. M. Stoney (Philadelphia: W. B. Saunders), has been specially prepared for those in charge of private as distinguished from hospital patients. It is neither redundant nor meagre in its injunctions, and not only admirably fulfils its proclaimed purpose, but would be a particularly valuable reference-book for families geographically or financially beyond the range of trained nurses.

Two small volumes, arranged for a didactic course covering two years, make 'A Text-Book for Training Schools for Nurses,' by P. M. Wise, M.D. (G. P. Putnam's Sons), whose peculiarity is the attention paid in it to the care of insane patients. It devotes a much larger space to what is commonly known as First Aid than seems necessary for pure and simple nursing.

A book of pleasing little poems reminiscent of childhood, by Louise Chandler Moulton, is called 'In Childhood's Country' (Boston: Copeland & Day). Unfortunately it is defaced rather than illustrated by its pictures of odd-looking children, some of them absolute caricatures. Better luck has befallen another collection of verses for and about children, 'The Child World,' by Gabriel Setoun (The Bodley Head), which gains distinctly in interest by the illustrations scattered profusely through its pages. The illustrator is Charles Robinson, who did the same kindly office for Stevenson's 'Child's Garden of Verses.' Mr. Setoun's verses are too much like Stevenson's in subject and manner to escape the comparison which the accompanying illustrations immediately prompt; but on the whole they endure it better than one would expect, though lacking something of the buoyant imagination which saved Stevenson's simplicity from the least touch of dulness.

'Les Trois Dumas,' by André Maurel (Paris: Librairie Illustrée) is mostly very thin stuff, especially in the portions which treat of Gen. Dumas and the elder Alexandre. The third and larger part, devoted to Dumas *fils*, contains some information concerning his dramas which is neither very new nor very full.

Halpérine-Kaminsky's translation of Tolstoi's articles on Zola, Dumas *fils*, and Maupassant, which appeared in the *revues*, is issued in book form by Chailley, Paris. The speech of Zola and the letter of Dumas, which were the proximate cause of Tolstoi's expression of opinion, are prefixed, and a reperusal of them greatly enhances the pleasure felt on reading the Russian author's views. The Maupassant study is a remarkably sound one, though it is far from saying the last word on this gifted writer, who, with so much that is absolutely debasing in its immorality, has left so much more that is as absolutely moral, powerful, and superb.

The second volume of Charles Livet's admirable 'Lexique de la langue de Molière' (Paris: H. Welter) includes the words from "dadais" to "luxuriant." A general review of the work must necessarily be postponed until the remaining volumes are published.

Bibliographica, Part xi. (London: Kegan Paul; New York: Scribners) has among its leading articles one on "Calligraphy in the Middle Ages," by Sir E. Maunde Thompson, who introduces a goodly number of facsimile specimens of choice hands, and concludes with pictures and some account of the furniture of a mediæval library, with pivoted desks and book-rests, shelving, presses, and other apparatus. In a larger plate, Petrarch and Boccacio are shown in debate near a revolving desk. Mr. F. Madan has some interesting notes on George Thomason's great collection of Civil War tracts, now in the British Museum, and concludes that Thomason's dates affixed to them are usually of the day he procured them, but sometimes (as is clear) of publication. Examination also reveals that the popular works generally used in their imprint the historical year (Jan. 1) rather than the calendar year (March 25) in issues between those dates; the class of official, theological, and learned stood by the calendar. Readable at once and substantial are papers on "English Armorial Book-stamps and their Owners" (including Pepys), by W. Y. Fletcher, and "Private Printing in France during the 15th Century," mostly ecclesiastical, by A. Claudin. The former is fully illustrated.

D. B. Updike (The Merrymount Press), Boston, gives notice of the discontinuance of the English periodical the *Quest*, of which he was the American publisher. He hopes to retain the services of some of the *Quest's* "Birmingham School" designers.

The account of German Philhellenism, by R. F. Arnold, which fills considerably more than one-half of the latest number of *Euphorion* (*Ergänzungsheft* ii.), may be of interest to others besides students of German literature, whose notice it would hardly escape. Philhellenism is perhaps the most striking manifestation in all history of what may be called international sympathy; and in Germany the movement extended over so long a period—more than three-quarters of a century—and so many of the most brilliant names were connected with it, that its rôle in the intellectual history of the people is by no means unimportant.

At the forty-fourth annual meeting of the Wisconsin State Historical Society on December 10 the new accessions to the library during the year were reported at 9,002, of which 5,247 were books and 3,755 pamphlets. There were, besides, gifts of some 3,000 duplicates. The entire collection contains about 94,000 bound volumes, with nearly as many pamphlets. A library building for which the last Legislature had appropriated $180,000 has been begun on an ideal site presented by the State University. The work has been retarded in order to ascertain the best architectural model, as well as that every detail may be made incombustible. It is hoped that the forty-sixth anniversary, in 1899, will be celebrated in the completed edifice. The whole estate of Lyman C. Draper was bequeathed to the society, of which he had been the chief promoter for a generation. This bequest has been formed into a fund the income of which will be devoted to paying for an exact and voluminous index to the Draper manuscripts. These consist of 400 folios relating to the history of our Northwest and Southwest from 1750 to 1815, already much resorted to by historical students. The peculiar feature of the meeting was a series of speeches commemorative of Lucius Fairchild, who was a principal benefactor of the society, and widely known as head of the Grand Army, a Government official in England, France, and Spain, and the first man who served six years as a Governor of Wisconsin.

The Atlas to accompany the official records of the Union and Confederate Armies concludes with three supplementary sheets (135 A, B, C) and the fore-matter of the complete work, namely, table of contents, plate by plate; references from the several volumes of the records to the Atlas plates illustrating them; an alphabetical list of authorities (*i. e.*, of the officers responsible for the sketches and their assistants); and finally a geographical index to the plates, filling more than a dozen folio pages in five columns.

The ninth annual meeting of the American Economic Association will be held at Levering Hall, Johns Hopkins University, on December 28-31.

Nothing with a more distinctive stamp, or better conceived and executed, in the way of a Christmas gift, especially for descendants of the Pilgrims, has come to us than the portfolio of six etchings, by Harold B. Warren, entitled 'Scrooby and Austerfield: The English Homes of Brewster and Bradford' (Boston: Damrell & Upham). The subjects of these excellent plates are a charming distant view of Scrooby from the Great North Road, proceeding south from Bawtry; the old mill of Scrooby; a farmhouse near the site of Scrooby Manor, the home of William Brewster; a still living tree contemporary with him, with Scrooby Church in the background; the church in Austerfield where William (afterwards Governor) Bradford was baptized; and Bradford's cottage birthplace. The letterpress is as praiseworthy as the etchings, supplying a topographical description so lucid in connection with them as

to make one feel that he had been upon the very spot.

Dean Bradley of course gave permission to erect in Westminster Abbey a memorial to Sir Walter Scott; and the committee, headed by the Marquis of Lothian, has chosen a copy of Sir Francis Chantrey's bust. The sum required for this purchase and for Abbey fees is estimated at £600 to £700, of which more than half has been subscribed in Great Britain. An opportunity for Americans to share in this pious work is offered, and subscriptions not exceeding $25 individually may be sent to the Boston Public Library, the Boston Athenæum; to Charles W. Sever, Harvard Square, Cambridge; to Mr. Fiske Warren, 220 Devonshire Street; or to Mr. James Murray Kay, 4 Park Street, Boston.

—Dr. William R. Shepherd has published, in the "Columbia University Studies in History, Economics, and Public Law," a six-hundred page 'History of Proprietary Government in Pennsylvania,' which he modestly characterizes as "merely an outline of its territorial and governmental institutions." He has used almost exclusively original and contemporary material, the chief of which is the great collection of Penn manuscripts in the possession of the Pennsylvania Historical Society. We can do little more than indicate the principal matters treated by Dr. Shepherd and commend his book to students. The work is divided into two parts. Part one comprises an account of the land system and land administration of Pennsylvania, including early stipulations concerning land grants, Indian affairs, and the boundary disputes with Maryland, Connecticut, Virginia, and New York. The account of the dispute with Maryland is much the best narrative we have of that complicated struggle. Part two deals with the government of the province, with separate chapters on the various frames of government, the Council, the "lower counties," the question of oath or affirmation, bills of credit, taxation of the proprietary estates, proprietary instructions, and the powers of the deputy governors, and the relations with the home Government. All of these topics are treated, notwithstanding the author's disclaimer, with great detail. We note that Dr. Shepherd finds "unsatisfactory" the commonly received opinion that Penn "intended to establish a commonwealth of which the governing body should be Quakers." As Proprietor, Penn represented the Crown, and could not at pleasure divest himself of the responsibility involved in that relationship; moreover, his writings show him to have been "distinctly paternalistic in his attitude and tendencies." Penn's later financial difficulties seem to have been attributable principally to his steward, Philip Ford, whose success in "bleeding" his employer emphasizes Macaulay's judgment that Penn "was not a man of strong sense"; but although he left to his sons a contested estate and a heavy burden of debt, making their relations with the province difficult and exposing them to misrepresentation and abuse, their correspondence with their officers in the province contains "few harsh and unkindly expressions," while on several occasions "they displayed a commendable public spirit." It is to be observed that much of the opposition to the younger proprietors came from the Quakers, who resented the desertion of Penn's sons from that sect.

—Franklin's reputation for accuracy and impartiality suffers somewhat at Dr. Shepherd's hands. As the latter shows, "from an early date the wildest ideas prevailed in Pennsylvania concerning the wealth of the Proprietors." In the appendix to the 'Historical Review of the Constitution and Government of Pennsylvania' (1759), published with Franklin's approval, if not actually written by him, is given "an authentic paper" purporting to be "a copy of an original paper drawn by Mr. Thomas Penn himself," in which the value of the Proprietary interest in the province was estimated at about £250,000, but to which the writer of the 'Review' adds other estimates sufficient to bring the whole amount up to £10,000,000 sterling. According to Dr. Shepherd (p. 84), "no authentic document of this origin or nature is known to exist." Into the account of events in 1683, in the same work, are introduced disconnected passages from an alleged "remonstrance" of the Assembly in 1704. Dr. Shepherd shows (pp. 303, 304) that this document was in reality "a series of studied insults and exaggerations," and that not only was it never read in the Assembly or formally approved by them, but the minutes of the alleged proceedings were actually interpolated by the Speaker, David Lloyd. There is no proof, also, to sustain the statement that at a conference between the Council and the Assembly, in May, 1689, "several members of the Assembly were induced by the Governor to refuse to give their attendance." In short, the 'Historical Review' not only is a partisan production, but, in Dr. Shepherd's opinion, has little value as authentic history. On the other hand, the Proprietors themselves had no love for Franklin. In 1748 Thomas Penn wrote: "He is a dangerous man, and I should be glad if he inhabited any other country, as I believe him of a very uneasy spirit. However, as he is a sort of tribune of the people, he must be treated with regard." Gov. John Penn wrote in 1764: "There will never be any prospect of ease and happiness while that villain [Franklin] has the liberty of spreading about the poison of that inveterate malice and ill nature which is deeply implanted in his own black heart." It was in the election campaign of that year that the Proprietary party, straining every nerve to defeat Franklin and Galloway and divide the Quaker vote, told the Germans how Franklin had said that "the great number of German boors herding together had a tendency to exclude the English language." Without denying that Franklin might have made such a statement, his friends explained it by saying: "'Tis well known that boor means no more than a country farmer, and herding signifies flocking or gathering together, and is applied by the best English writers to harmless doves and to ladies in distress."

—The second volume of the 'Histoire de la Langue et de la Littérature Française' (Paris: Armand Colin) surpasses the first in two points—general uniformity of treatment and style, and interest of subject-matter. Of its nine chapters, eight are devoted to literary topics (Roman du Renard, Fabliaux, Roman de la Rose, Drama, etc.), while the last traces the development and variations of the language during the corresponding period, namely, the end of the middle ages. Neglect of proportions appears, however, in the space allowed to one or two of the contributors. Unless bulk, rather than quality, is taken as the measure of literary importance, it is not easy to understand why the literature of edification (didactic works, sermons, translations, etc.) should occupy 109 pages, while the whole of later mediæval French poetry, from Guillaume de Machault to Villon, covering two centuries and including many distinguished names, is compressed into a single chapter of sixty pages, with very scanty quotations; and to Villon himself is allotted the rather niggardly share of five pages. Indeed, so far as this last-mentioned chapter is concerned, the reader will find that a good anthology (such as Crépet's 'Les Poètes Français,' for example) is an indispensable auxiliary if the originals are not available. No doubt the endeavor to treat the literature objectively, to suppress the personal note, has been conscientiously kept up; but the fact that the names of the contributors are, thus far at least, conspicuous in the learned rather than in the strictly literary world has certainly facilitated the task in this respect.

—The scholars have had their innings; we trust that the *littérateurs* will be given theirs with the Renaissance. For, after all, it seems chimerical to try to exclude personal feelings and taste from discussions full of human significance, and there is interest in observing how already the writers tend to break out of bounds so soon as enthusiasm gets the better of erudition. Thus the learning and critical accuracy shown in M. Bédier's admirable chapter on the Fabliaux are, in our opinion, enhanced by the not wholly objective import of the social and ethical conclusions of the writer. Further, no reader will regret that the editor (Prof. Petit de Juleville) has granted himself the luxury of the following original epigram for the purpose of pointing his explanation of the tendency of early comedies towards satire on feminine frailty, in what seems to us the most compact treatment possible of the mediæval drama: "Si toutes les femmes étaient infidèles, la comédie jouerait les femmes vertueuses" (p. 435). Elsewhere in the volume appear touches of amiable chauvinism which would do credit to a member of "L'Alliance Française." The work therefore bids fair to be much more than a record of facts, a compendium of scholarly hypotheses, and a summary of conventional or traditional judgments. As a mark of the scrupulous care given to details, it may be noted that the two volumes contain but one misprint of any consequence, the spelling of Gower's name as "Glower" (vol. ii., p. 526). Special attention must be called to M. Brunot's continuation of the philological part of the work, which is quite equal in thoroughness and accuracy to the introductory essay. The sight of such excellent results as collective scholarship has produced in these two volumes suggests that a union of American and English collaborators for a similar purpose might bear equally good fruit.

—The Royal Historical Commission of Belgium is following the example of the English Master of the Rolls, and is beginning to print the mediæval rentals and account-books of the great monasteries of the Low Countries. 'Le Livre de l'Abbé Guillaume de Ryckel (1249-1272)' has just been printed from a MS. in the Library of the University of Liège and issued as an "annexe" to the Bulletin of the Commission; and it is also published separately by Engelcke of Ghent. It contains what the editor, Prof. Henri Pirenne of Ghent, going back to the terminology of an earlier period, designates a "Polyptyque" of the great abbey of Saint-Trond; and that for an interesting period. M. Pirenne points out that the first half of the thirteenth century was an epoch of decadence for the Benedictine monas-

teries, owing to a diversity of causes, chiefly economic. This volume records the efforts, to a large extent successful, of the energetic Abbot, William of Ryckel, to recover the revenues that had been escaping from the grasp of his predecessors, and to establish a system of management more in accord with the changed conditions of the time. Incidentally it gives a good deal of information about mediæval finance and mediæval agrarian conditions. M. Pirenne, who is already favorably known to historical students for his brilliant papers on the origin of municipal constitutions in the *Revue Historique*, has carefully brought together in his introduction all that is known of the personal history of the abbot, and has given a lucid summary of the results of his administration. To those who knew what the like materials are for English history, the value of this Polyptyque can be best expressed by saying that it is worthy to be placed by the side of the 'Domesday of St. Paul's.'

—The latest items of information from the bulletins reporting advances in the higher education of women abroad should serve as a reminder to the more inflammable advocates of the cause that there are two opposite methods of arriving at the common end. While from Zurich, where the number of *Studentinnen* has already reached the respectable figure of 150, news comes of an agitation for the acquisition of the same rights as belong to the vested holders of the field, the *Studenten*, advices from Oxford show a strengthening of the foothold of women students upon university life without agitation or public discussion of any sort. Three years ago the liberal-minded Principal of the Cheltenham Ladies' College responded to a practical demand of the time by opening a house in Oxford for the use, primarily though not exclusively, of students from her own school. This house, which enjoys the honorable and significant distinction of being the first collegiate institution founded at either Oxford or Cambridge in close connection with a girls' school, has now twelve students in residence, has been formally recognized by the Association for the Education of Women in Oxford, and admitted to representation upon its Council for a period of five years, under the corporate title of St. Hilda's Hall. St. Hilda, it will be remembered, was that famous prioress of Whitby whose rule included both monks and nuns, at the time when the priory was celebrated as a school of learning, sending forth bishops and saints from its walls. There is something both conciliatory and stimulating in this association, by a name, of the work of the modern young woman at Oxford with one of the honored traditions of the past. It has doubtless been necessary in many instances to take the kingdom of heaven by violence; but the women students to whom it is freely offered are to be accounted fortunate in being spared the marks and scars of the assault.

—Educated Jews in Europe are determined that the history of their race shall be written by Jews and from a Jewish standpoint. Many books upon branches of the subject have lately appeared, as, for instance, Reinach's 'Fontes Rerum Judaicarum,' to which we gave an extended notice about a year ago. It is evident that the ground must be cleared by numerous monographs before a general history of the Jews in Europe, or even in any one country, can be properly written. To this preliminary task Hebrew scholars and societies are devoting themselves, and one of the latest results is comprised in Drs. Vogelstein and Rieger's 'Geschichte der Juden in Rom' (Berlin: Mayer & Müller), of which the first volume has reached us. The intention of the authors is to give in the briefest possible space (this volume consists of more than 500 pages) accounts of all the material available for the history of the Jews in Rome, and in particular to present a careful study of the inner life of the oldest Jewish community in Europe. This volume covers four periods, the first being that of the Jews under heathendom, 139 B. C. to 312 A. D., and the other three ending respectively with the years 1000, 1304, and 1420. Following the accounts of the sources for each period are chapters on the private life, manners and morals, finance and literary productiveness of the community. There are several appendices, one of which contains inscriptions from the Jewish cemeteries in Rome. The book is written in a simple, straightforward style, and is a thoroughly scholarly production. Its dispassionate treatment, for example, of the evidences about the individuals who are said to have suffered martyrdom or persecution in Rome under the early emperors may be recommended to certain archæologists of a different creed, whose enthusiasm has sometimes carried them out of the bounds of scientific argument.

THE PAINTINGS OF MEISSONIER.

Meissonier: His Life and his Art. By Vallery C. O. Gréard de l'Académie-Française, Vice-Recteur de l'Académie de Paris. With Extracts from his Note-books, and his Opinions and Impressions of Art and Artists, collected by his Wife. Translated from the French by Lady Mary Loyd and Miss Florence Simmonds. With 34 plates and 236 text illustrations. A. C. Armstrong & Son. 1896.

THIS is a splendid and, in many ways, an interesting volume, but it is almost the worst and most confused piece of book-making that we have ever seen. First in its table of contents is the memoir by M. Gréard, which, in the words of the author, is neither a continuous biography nor a detailed appreciation of the master's work. It is avowedly founded on the notes and conversations collected by the artist's second wife, and is largely made up of direct quotations from them. It occupies 119 of the 395 pages of the book. Then come 220 pages of the notes themselves, under the general title of "Meissonier's Wisdom," arranged with no discoverable system. They are, indeed, supposed to be arranged topically, under such headings as "Man," "Art," etc., but there seems no reason why almost any of these notes might not as well appear in any other section as in that in which it is to be found. Not only are all the sayings which have been quoted in the memoir to be found again here, but many of them are given several times over in slightly different forms. If Meissonier happened to tell the same story or repeat the same criticism half a-dozen times, as might well happen, down it went into the note-book and out it comes again in these pages. There is no indication when the sayings were uttered, and the few letters are undated. After the "Conversations" comes an appendix of 17 pages of smaller type, consisting of a "Notice" by the Perpetual Secretary of the Academy, and this again is founded on the "Conversations," and quotes from them freely. Finally come some thirty pages devoted to a "Catalogue of Meissonier's Works," which is the only workmanlike thing in the volume. There is no index, and only a rudimentary table of contents. The result is confusion worse confounded. In the labyrinth of repetitions, with its total lack of arrangement and almost total lack of dates, it is impossible to find anything that is wanted. Even in the catalogue of works we have spent a half hour looking in vain for the "1807." A vague general impression of a not very eventful life and some sense of an individuality are all that remain with one.

Neither is the material thus "edited with a pitchfork" very valuable in itself. Meissonier was not a profound critic of art or of life, and his "wisdom" is not of an astonishing sort. He was a man of sound common sense, and of immense strength of purpose and capacity for labor; very vigorous, very determined and tenacious, and very vain; but his mind was neither a deep nor a subtle one. His bulldog pluck and energy carried him to the highest point of material success in his profession, but what he had to say to the world is said in his pictures, and he had nothing to add through the medium of language that is of importance.

It is in the 270 illustrations of this volume, then, that its real importance lies. These illustrations are, on the whole, admirable. Meissonier's works are easy to reproduce, and lose little in the process, nearly all his best qualities being as visible in these cuts as in the originals. Many of the "text illustrations" are as large and almost as good as the photogravure "plates," and Meissonier's detailed and clear-cut style is specially suited to half-tone reproduction. As a collection of reproductions of Meissonier's pictures, therefore, this volume is most interesting, and affords an admirable opportunity for a review of his career.

By the average person who possesses some small knowledge of modern paintings, extreme minuteness of detail is probably considered as the most pronounced characteristic and the greatest merit of Meissonier's art. "Finished like a Meissonier" is a proverbial phrase with such persons, and they are apt to imagine that the qualities of eye and hand which rendered such minuteness possible, and the vast industry which achieved it, are the principal elements in Meissonier's fame and the cause of the phenomenal prices his works have attained. That minuteness and laborious finish are a part of the commercial value of these works it would be absurd to deny, but it may be affirmed that they have practically nothing to do with the painter's artistic reputation. Mere minuteness and the evidence of labor will always have their effect on prices, but they will never make a man Member of the Institute, Grand Officer of the Legion of Honor, or President of the Société Nationale des Beaux-Arts. The extreme "finish" of Meissonier's work is in reality merely the outcome of a physical peculiarity or defect—extreme shortness of sight. In his essay on Bonnat in Vandyke's 'Modern French Masters,' Mr. Blashfield relates how that master, sitting next to M. Maspero at a great dinner one night, said to him:

"'Maspero, you who are so near-sighted, tell me how does M——, away down there at the foot of the table, appear to you?'

"'Well,' replied M. Maspero, 'I see a white spot, which I know is his shirtfront, and a flesh-colored spot, which I know is his face.'

"'Ah,' cried Bonnat, 'how I wish my pupils could see things in that way!'"

Now it is noticeable that the near-sighted men who really "see things in that way"

never paint them so, and the reason is not far to seek. Their manner of painting is conditioned less on what they see in nature than on what they see upon their canvas. All "broad" work in painting—all free and large handling—is intended only for distant effect, and becomes unintelligible when seen near by. The near-sighted painter cannot see his picture at all at the distance for which such painting is intended, and all his work is therefore calculated for close inspection, and is consequently clean, smooth, and detailed in the extreme. If the painter is exceptionally near-sighted, it may even happen that he paints pictures calculated for a nearer vision than is possible to the average human eye, and which can be seen properly only by the aid of a glass. So we have the paradox that those who see least detail in nature, with unaided vision, are precisely those who paint most, and it is the short-sighted and purblind painters who astonish us with their amazing sharpness of delineation. The lengthening of the visual focus in age, as well as growth of mastery and impatience of little things, may well be one of the reasons for the greater breadth of style in the late work of all great painters. Certain it is that even Meissonier's miracles of minuteness are works of his early time, and that while he never became a broad painter (in the purely technical sense), yet his later works seem more capable of imitation by a normal human being than do his earlier. Boldini, though always much freer in touch, was once as fond of a small scale and almost as minute as Meissonier himself. He now paints the size of life and with a large brush.

While the small scale and microscopic workmanship of Meissonier's pictures may therefore be treated as, in a sense, accidental, and while his real merits would have been the same if he had habitually worked in the size of life, yet it is also true that the scale reacted on the manner, and in a way peculiarly suited to the genius of the artist. Meissonier has himself stated with great clearness a truth familiar to all painters, but perhaps not so well known to the public. He says:

"The smaller the scale of one's picture, the more boldly the *relief* must be brought out. The larger the scale, the more it must be softened and diminished. This is an absolutely indispensable rule. A life-size figure treated like one of my small ones would be unendurable."

He does not attempt to give any reason for this rule, nor have we time and space to attempt to find one now. The reader must be content, for the present, to accept the fact that this rule exists. Its acceptance will help in the understanding of Meissonier's work, and of the way in which the accident of scale coöperated with the temperament of the painter to produce the style we know so well.

This style was formed in all its essentials singularly early. From the very first the great little pictures seem as masterly as anything their author afterwards produced. His life was a long one, and was filled with untiring study and industry, yet he never did things better than he did at first; he only did other things as well. How this quite prodigious mastery was attained so early is a mystery. It would almost seem as if this artist had never had to learn, had had no period of uncertainty and struggle—had almost been born a master. In the present volume the dates of his work are hardly ever given, and the quality of his production is so even that internal evidence is of little avail. The subjects change, but not the manner. From the beginning of his career to the end the conception of art is identical, the methods are the same, the achievement is almost uniform.

It may even be doubted if some of Meissonier's earlier work is not the best that he has left, merely because the subjects and the scale of that work are admirably fitted for the display of his qualities and the minimizing of his limitations. It is the admirable series of "Smokers" and "Readers," "Painters" and "Connoisseurs," which give the fullest measure of his powers and the least hint of his shortcomings; which made his reputation and perhaps are likeliest to maintain it. These pictures are in the purest vein of genre painting, and immediately suggest comparison with the wonderful little masters of Holland. At first Meissonier was considered as a reviver of Dutch art, and that he was a great admirer of that art there can be no doubt. Upon examination, however, it soon becomes visible that the differences between him and his models are as great as the resemblances. First of these differences is a fundamental one of point of view. The Dutch masters were pure painters, and their subjects were strictly contemporary. They contented themselves with looking about them and painting what interested them in what they saw. Meissonier only two or three times treated contemporary subjects, and then when something intensely dramatic or historically important attracted him. You would look in vain in his work for any such record of the ordinary life of the nineteenth century as the Dutchmen have given us of that of the seventeenth. Meissonier was such a master of the antiquarianism he practised—he managed to enter so thoroughly within the skin of his two or three favorite epochs—that he almost deceives us at times; but he was nevertheless essentially an antiquarian, and, therefore, his work never has the spontaneity of the old work.

Another difference is in the quality of drawing. Meissonier was a wonderfully accurate draughtsman. His drawing is composed of equal parts of astonishingly clear and accurate vision and of deep scientific acquirement. It is not the drawing of the great stylists, the masters of beautiful and significant line, but it is marvellously forceful and just. The drawing of Terburg is equally accurate, but seems to have no formula, no method, no ascertainable knowledge behind it. It seems unconscious and naïve in a way which that of Meissonier never approaches. Finally, in color and in the management of light, Meissonier cannot be compared to any one of half-a-dozen Dutch painters. His tone is almost always a little foxy, his handling a little dry. Sometimes in interiors with only one or two figures his realistic force of imitation of that which was before him almost carried him to a fine rendering even of light and color. He had built his picture before he painted it, and had only to copy what was directly under his eye, and he did this so well as almost to become a colorist and a luminist. It is only when he tries to paint open-air subjects and larger compositions that his defects become very apparent.

His merits are all to be included in the two great ones of thoroughness and accuracy. He never shirked any difficulty or avoided any study, was never sloppy or formless or vague. His knowledge of costume and furniture was only less wonderful than his grasp of character and his perfect rendering of form. He was a thorough realist, with little imagination and less sense of beauty, but with an insatiable appetite for and a marvellous digestion of concrete fact. His work is amazing in its industry, but his industry never becomes mere routine. His detail is never mere finikin particularity of touch, but is patient investigation of truth. At his best he is hardly sufficiently to be admired; but he awakens only admiration, never emotion. His drawing is absolute, his relief startling, he almost gives the illusion of nature; but he never evokes a vision of beauty or charms one into a dream.

Meissonier's qualities are fully sufficient to account for the admiration of the public and the universal respect of his brother artists; and as long as he was content to be a genre painter they were sufficient to make him easily the first genre painter of his time, if not quite (as an artist has recently called him) the "greatest genre painter of any age." In his later work they are less sufficient. He became ambitious, he wanted to be a great historical painter, to paint a "Napoleonic Cycle," to decorate the walls of the Pantheon. He transferred his personages to the open air, he enlarged his canvases and multiplied his figures, he attempted violent movement. His methods, which had been admirably suited to the production of almost perfect little pictures of tranquil indoor life, were not so adequate to the rendering of his new themes. His prodigious industry, his exhaustive accuracy, his vigor and his conscientiousness were as great as ever, but the most exact study of nature in detail would not give the effect of open air, the most rigorous scientific analysis of the movements of the horse would not make him move, the accumulation of small figures would not look like an army. It was in vain that he built a railway to follow the action of a galloping horse, or bought a grain field that he might see just what it would be like when a squadron had charged through it. What he produced may possibly be demonstrably true, but it does not look true.

The best of these more ambitious works is perhaps the "1814." The worst is certainly the "1807," which has found a home in the Metropolitan Museum. This picture is almost an entire failure, and yet it possesses every one of the qualities which made Meissonier's greatness in as high a degree as any earlier work. The industry, the strenuous exactness, the thoroughness, the impeccable draughtsmanship, the sharpness of relief, are all here at their greatest. The amount of labor that the picture represents is simply appalling, and it is almost all wasted because it is not the kind of labor that was wanted. On all these figures not a gaiter-button is wanting, and the total result of all this addition of detail is simple chaos. The idea of the composition is fine, but the effect is missed. Looked at close at hand, each head, each hand, each strap and buckle is masterly, but, at a distance sufficiently great to permit the whole canvas to be taken in at one glance, nothing is seen but a meaningless glitter. It is not only true that a life-size figure treated like one of Meissonier's small ones "would be unendurable," but it is equally true that a great number of such small figures will not make a large picture. The sharp and hard detail which was in place in his early canvases, is fatal to the unity and breadth necessary to a large composition. It is equally fatal to the sense of movement. The "Smokers" and "Readers" were doing as little as possible, and one felt that one had plenty of time to notice their coat-buttons and the smallest details of their costume; the cuirassiers of "1807" are dashing by at a furious gallop, and the eye resents the realization of detail that it could not possibly perceive. Even

if the action of the horses in the picture were correct (and, for once, it is not), nothing could make them move when the eye is thus arrested by infinitesimal minutiæ.

Such was Meissonier: within his limits an almost perfect painter, and, even when he overstepped them, one whose terrible conscientiousness in the exercise of amazing ability will always merit deep respect. He thoroughly earned the honors he received, the fortune he acquired and squandered, and the immortality of which he is reasonably certain.

THE BRONTË CIRCLE.

Charlotte Brontë and her Circle. By Clement K. Shorter. Dodd, Mead & Co. 1896. Pages xi, 512. Portraits and other illustrations.

"This is not a biography, but a bundle of correspondence," writes Mr. Shorter in bringing his work to a conclusion. It is, however, a bundle of correspondence exceeding in interest most such collections brought to light forty years after the death of the central figure to which they relate. The book owes its inception to the "kindly pressure" of a friend, and its value mainly to the material put at the editor's disposal by the Rev. Arthur Bell Nicholls, husband of Charlotte Brontë (now incumbent of a parish in Ireland), by Miss Ellen Nussey, and by the family of the late Mr. W. S. Williams.

"It has been with extreme unwillingness that Mr. Nicholls has broken the silence of forty years, and he would not even now have consented to the publication of certain letters concerning his marriage, had he not been aware that these letters were already privately printed and in the hands of not less than eight or ten people."

We have here altogether about 380 letters, separated and classified under seventeen different heads, with entertaining biographical introductions, such as "Patrick Brontë and Maria his Wife"; "Childhood," "Brussels," "Patrick Bramwell Brontë," "Emily Jane Brontë," "Anne Brontë," "Ellen Nussey," "Curates at Haworth," "Charlotte Brontë's Lovers," "Literary Ambitions." Over 300 of the letters are from Charlotte herself—160 of them to her bosom friend Ellen Nussey, 100 to one of her publishers, Mr. Williams. In these pages Charlotte, and Emily, and Anne appear to live again—more ordinary mortals, perhaps, than those limned by Mrs. Gaskell; not less interesting, perhaps more lovable. A certain weight is lifted off our minds concerning them. Their lives, if short, were full of occupation and intensity to themselves; less sad, apart from the tragedy of Bramwell's intemperance, than we had hitherto been led to suppose. Their father was not at all the bear we had pictured; if he did not invite much confidence, he inspired love and respect. It is no small tribute to his true character and disposition that Mr. Nicholls, whose suit for Charlotte he had repulsed for more than a year, and whose resignation of a curacy under him he practically compelled, after Charlotte's death, lived on alone with him until his death in 1861. Mr. Shorter pays ample tribute to Mrs. Gaskell:

"In the whole of English biographical literature there is no book that can compare in widespread interest with the Life of Charlotte Brontë by Mrs. Gaskell. . . . She brought to bear upon the biography . . . all those literary gifts which had made the charm of her seven volumes of romance. . . . Apart from these letters, a journey in the footsteps, as it were, of Mrs. Gaskell, reveals to us the remarkable conscientiousness with which she set about her task. . . . She spared no pains to find out facts. . . . She visited every spot associated with the name. . . . She wrote countless letters to her friends."

He then goes on to give the other side of the picture. Her work was undertaken largely at Mr. Brontë's desire, yet

"although we, who read Mrs. Gaskell's memoir, have every reason to be thankful for Mr. Brontë's decision, peace of mind would undoubtedly have been more assured to Charlotte Brontë's surviving relatives had the most rigid silence been maintained. The book, when it appeared in 1857, gave infinite pain to a number of people, including Mr. Brontë and Mr. Nicholls; and Mrs. Gaskell's subsequent experiences had the effect of persuading her that all biographical literature was intolerable and undesirable."

The humiliations to which Mrs. Gaskell was subjected, having, through her solicitors, publicly to apologize for certain statements, and to excise in subsequent editions portions of the first, arose from her having implicitly, without inquiry, taken as truth statements made to her by Charlotte Brontë. (It reminds us of the case of Mrs. Stowe and Lady Byron.) This is all now matter of literary history. No trained writer like Mrs. Gaskell would act so now. This is only one of the respects in which a careful perusal of Mr. Shorter's book has reminded us of the manner in which the world has sobered and been made more cautious than in 1857. Mrs. Gaskell paid heavily for her mistake. We confess we believe Mr. Shorter would have shown better taste in not again raking up and going over the story. He appears to us too much inclined to seek occasion for blaming her. The insertion on page 130 of the *Athenæum's* repudiation of her is quite unnecessary. At page 49 we read concerning portions of a letter: "The passage in brackets is quoted, not quite accurately, by Mrs. Gaskell." On comparison, the only difference we can find is the presence of an extra word, "being," which was wanting in the original and in no degree alters the sense. At page 294 we are given a letter which we are told was "partly printed in a mangled form in Mrs. Gaskell's memoir," and at page 432 "is a portion of a letter upon which Mrs. Gaskell practised considerable excisions." Again, on comparison, we find that in both these instances it would have been impossible, with the persons then living, for Mrs. Gaskell to quote more than she did.

The correspondence of which the book is composed might well have been broken into chapters according with different phases in the lives of Charlotte Brontë and her family, and introducing sketches of the different personalities as they came into her life. As it is, the letters are arranged, not in order of date, but of subject, often but of one subject of the many of which they treat. The narrative is thus broken up and confused. Again and again, at long intervals, the same incidents and interests come up. In one chapter the illness and death of persons are referred to, and in subsequent chapters they are alive and well. Taking the century of letters from Charlotte to Mr. Williams, we find them upon or between the following dates in chapters in the following order: 1849-1850, 1848, 1847-1849, 1850, 1849 1852, 1847-1851, 1848-1853, 1847-1849, 1847-1850. Those to Ellen Nussey are in tolerable order: 1832 to 1849 up to chapter vii.; then we have 1831-1852, 1833-1849, 1851, 1840-1844, 1844-1852, 1851, 1849, 1850-1851, 1844-1855.

Enough of criticism. In the rich treat Mr. Shorter has laid before us the only difficulty is to select the best portions. The book cannot but lead to renewed interest in the Brontës, their works, and everything that has been written about them. Charlotte Brontë's friendship with Ellen Nussey was perhaps the most enduring element in the web of her life.

"Of all her friends, Ellen Nussey must always have the foremost place in our esteem. Like Mary Taylor, she made Charlotte's acquaintance when, at fifteen years of age, she first went to Roe Head School. . . . Ellen Nussey and Charlotte Brontë corresponded with a regularity which one imagines would be impossible had they both been born half a century later. The two girls loved one another profoundly." "Ellen Nussey, as we have seen, accompanied Anne Brontë to Scarborough, and was at her death-bed. She attended Charlotte's wedding, and lived to mourn over her tomb. For forty years she has been the untiring advocate and staunch champion, hating to hear a word in her great friend's dispraise, loving to note the glorious recognition, of which there has been so rich and full a harvest. That she still lives to receive our reverent gratitude for preserving so many interesting traits of the Brontës, is matter for full and cordial congratulation."

In a letter to Mr. Williams, under date of January 3, 1850, Charlotte writes:

"Friendship, however, is a plant which cannot be forced. True friendship is no gourd, springing in a night and withering in a day. When first I saw Ellen I did not care for her; we were school-fellows. In course of time we learned each other's faults and good points. We were contrasts—still we suited. Affection was first a germ, then a sapling, then a strong tree. Now, no new friend, however lofty or profound in intellect—not even Miss Martineau herself—could be to me what Ellen is; yet she is no more than a conscientious, observant, calm, well-bred Yorkshire girl. She is without romance."

Charlotte Brontë had no illusions regarding herself. Declining an offer of marriage in 1839, she writes: "As for me, you do not know me; I am not the serious, grave, cool-headed individual you suppose; you would think me romantic and eccentric; you would say I was satirical and severe." She took no interest in and understood nothing of her father's country. "With the French and Irish I have no sympathy." Her letters from Brussels, apart from 'Villette,' show she was incapable of seeing the good in a Catholic people. She exhibits practical good sense in business matters. Writing to Miss Woolner in 1846: "The York and Midland is, as you say, a very good line, yet I confess to you I should wish for my part to be wise in time. I cannot think that even the very best lines will continue for many years at their present premiums, and I have been most anxious for us to sell our shares ere it be too late, and to secure the proceeds in some safer, if, for the present, less profitable investment." Yet she does not appear to have succeeded in making particularly remunerative bargains with her publishers. A footnote tells us: "Miss Brontë was paid £1,500 in all for her three novels, and Mr. Nicholls received an additional £250 for the copyright of 'The Professor.'"

In connection with an incident that appeared in a subsequent novel, we are tempted to quote the following somewhat long extract from a letter to Emily from Brussels in 1843. Charlotte spends a holiday afternoon wandering about the suburbs, and proceeds:

"When I came back it was evening; but I had such a repugnance to return to the house which contained nothing that I cared for, I still kept threading the streets. I found myself opposite to Ste. Gudule, and the bell, whose voice you know, began to toll for the evening salut. I went in quite alone, . . . wandered about the aisles till vespers began,

. . . I stayed until they were over; still I could not leave the church. . . . An odd whim came into my head. . . . I felt I did not care what I did, provided it was not absolutely wrong, and that it served to vary my life and yield a moment's interest I took a fancy to change myself into a Catholic and go and make a real confession, to see what it was like. . . . I had to kneel there some ten minutes waiting. . . . At last that [penitent] went away, and a little wooden door inside the grating opened. . . . I was obliged to begin. . . . I commenced by saying I was a foreigner, and had been brought up a Protestant. The priest asked if I was a Protestant then. I somehow could not tell a lie, and said 'Yes,' He replied that in that case I could not 'jouir du bonheur de la confesse'; but I was determined to confess, and at last he said he would allow me, because it might be the first step towards returning to the true church. I actually did confess—a real confession."

The letters to Mr. Williams are from a literary point of view the most interesting. They abound in good sense.

"Do not wish to keep them [his daughters] at home. Believe me, teachers may be hard worked, ill paid, and despised; but the girl who stays at home doing nothing is worse off than the hardest wrought and worse paid drudge of a school. . . . Give their existence some object, their time some occupation, or the peevishness of disappointment and the listlessness of idleness will infallibly degrade their nature."

"I smile at you again for supposing that I could be annoyed by what you say regarding your religious and philosophical views; that I could blame you for not being able, when you look amongst sects and creeds, to discover any one which you can exclusively and implicitly adopt as yours. I perceive myself that some light falls on earth from heaven—that some rays from the shrine of truth pierce the darkness of this life and world, but they are few, faint, and scattered, and who, without presumption, can assert that he has found the *only* true path upwards?"

In closing this book, as in closing Mrs. Gaskell's memoir, the reader will perhaps exclaim, "Oh! had she lived!" We are inclined to agree with Mr. Shorter: "It is not easy to believe that the future had any great things in store." "More she could not have done with equal effect had she lived to be eighty."

The Ship's Company, and Other Sea People. By Lieut.-Com. J. D. Jerrold Kelley, U. S. Navy. Harper & Bros. 1896.

"Sir," said Dr. Johnson, "no man will be a sailor who has contrivance enough to get himself in jail." Dr. Johnson uttered this aphorism from a knowledge of the nature of a sailor's life of the period in which he lived. Then the career of a mariner was the very sum of hardships and privations. In England the press-gang was in vigorous operation to procure recruits for ships of war. Not only were the highways and byways raked to secure men, but ships homeward bound, in sight of port, after a voyage of two or three years, were boarded and their crews seized and consigned to naval vessels, to serve for years without once putting their feet on shore. Moreover, merchant ships were small, ill equipped, and inadequately provisioned; and scurvy, against which no safeguard was instituted, decimated the crews of vessels engaged in long voyages. Nor on ships of war were any precautions taken to avert the attacks of this terrible disease. In the Seven Years' War, in which only 1,512 English seamen and marines were killed or wounded, 133,000 died of disease or were missing. Moreover, flogging was the recognized mode of punishment for sailors in the naval and merchant service. In both, hardly a day elapsed that men were not tried up to the gratings and their backs furrowed with the cat-o'-nine-tails.

In our time all this is changed. Seamen are now protected by adequate laws from cruel treatment, ships are large, well equipped, and amply provisioned. Moreover, steam has so largely superseded sails as a means of propulsion that voyages are short and stops in port much prolonged. The use of steam has also greatly changed the character of both officers and crews. While seamanship so long as men float upon the ocean will be a necessary qualification, a wider and more scientific knowledge is requisite. Quick decision, iron will, and unfaltering courage are, under the new dispensation, no less obligatory. Indeed, the strain entailed upon the faculties of officers in charge of our swift ocean liners, moving at a speed of twenty knots an hour or more, with the responsibility for the safety of from 500 to 1,000 human beings, demands in the highest degree the qualities above mentioned.

Lieut.-Com. Kelley, in his 'Ship's Company,' graphically describes the nature of the duties of the officers, above and below, on our swift ocean liners. He reveals the dangers that encompass the vessel, and the ceaseless vigilance and intelligence required to bring to a successful conclusion a voyage of only from five to seven days' duration. In the chapter entitled "The Squadron Cruise" he employs a different note. This relates to the pleasures of yachting, its even, uneventful, and joyous life. In "Midshipmen, Old and New," he records the difference in training of naval youngsters in the past and to-day. He emphasizes the multitudinous accomplishments necessary to those who man the modern ship of war. The naval officer of to-day not only must be a seaman, but must be equipped with a thorough knowledge of mechanics.

The remaining chapters of Mr. Kelley's book are replete with interest. Altogether he reveals how far present conditions of the sea are dissevered from those of the past, from those of Marryat, Cupples, and other writers. Even with the handicap of the loss of picturesqueness that formerly attached to the sailor man (though more in the imagination than in reality), Mr. Kelley is by no means inferior to his distinguished predecessors in delineating with vigor and force all that relates to the modern ship's company. He finds in them ample material to compose a volume which, from the point of view of contrast and literary merit, elevates him to a high level as a writer on sea topics.

The illustrations are very numerous, interesting, well drawn, and reproduced. They add largely to the attractiveness of the book.

Grasses of North America. By W. J. Beal, Ph.D., Professor of Botany and Forestry in Michigan Agricultural College. Two volumes. Henry Holt & Co. 1896.

The first volume of this useful work was published ten years ago. It deals with the general physiology of grasses and with the application of physiological laws to profitable cultivation. The management of grass-lands is discussed in a practical way, and a good deal of attention is given to the foes of the grass-family, such as insects and fungi. To make the volume of even greater use to farmers, the matter of clovers is brought within the scope of the work.

In the volume just issued Professor Beal has considered the grasses from a descriptive and systematic point of view, and he closes his work by a short account of their geographical distribution. There is also a bibliography. The whole treatise represents an immense amount of labor carried on under exceptional difficulties. The author says in his preface that he found it "necessary to limit the time for study to a few weeks each year. Little opportunity could be found for this work while college classes were to be instructed; besides, a considerable portion of the long vacation was claimed for participating in farmers' institutes." The treatise, therefore, embodies disjointed studies which have been coördinated and united as best they may. In such a work we must not look for the qualities which characterize systematic descriptive botany prosecuted without a break.

When the construction of a volume extends over so long a period as ten years, we expect naturally to find some lack of proportion and perspective, and we may not hope with confidence that all of the latter portions will be wholly consistent with the earlier parts. Professor Beal has, however, reduced these faults to a minimum, and, considering his absorbing duties in another field which is emphatically his own, he has made a substantial contribution to agrostology. This contribution consists chiefly in the enormous number of measurements of different parts of grasses which he has most patiently and conscientiously conducted. The treatise will be valued as a useful record of accurate work in this direction, and will long serve as a treasury from which compilers will be likely to draw.

From a hint in the preface we infer that the author was disappointed in the matter of illustrations. Those which are given are only 126, to illustrate 151 genera; a scant supply at best. They are mostly accurate and telling, but in mechanical execution are not worthy of the text. A few of them look as if they had already done yeoman service in agricultural bulletins, and the lettering of the figures seems to secure distinctness at the hazard of destroying all artistic effect.

The two volumes must be taken together in order to show the true character of the task accomplished by Professor Beal in this department of botany. The author is an intensely practical man, who has devoted his energies untiringly to the improvement of agriculture in Michigan, and he has had the satisfaction of knowing that his work has told wholly for good. It must be a great relief to him to realize that this treatise is now happily off his hands, and that he can apply himself to forestry, a crying need in his State, while his two volumes can do their own work in a wider field than a single commonwealth. He can feel assured that the completed work will be acceptable especially to those whose interest in grasses is largely industrial.

In Buncombe County. By Maria Louise Pool. Chicago: Herbert S. Stone & Co. 1896.

This book is Miss Pool's gage flung down before Miss Murfree. She challenges her boldly by name. "Does Miss Murfree know? Are those people on the Tennessee side different from the men and women here? She has a glamour, a mist from her much-described hills and valleys that obscures clear sight." The unclouded vision of Miss Pool then reports to us such characterizations as these: "a vile, low, licentious, sly people, . . . singularly devoid of any capability to understand anything different from themselves." This cool filching of the only possession of the North Carolina mountaineers—their good name—tempts a reviewer who has lived among

them to question whether the snap-shot photographs of a scamperer like Miss Pool are really more accurate than the idealizations of a lifelong devotee. Certainly the friendly mountain folk, who show by so many traits the Scotch-Irish stock from which they are sprung, and who exhibit in no small degree the virtues traditionally ascribed to those who breathe mountain air, would be puzzled to recognize themselves in the product of Miss Pool's kodak. It is comforting to reflect that they will never be called upon to make the identification—though one cannot be too sure of this in these days when they have their college settlements, and hold weekly debates on free silver and the Armenian question.

For the hardened realist that Miss Pool professes herself to be, a singular gleam of romance illumines her page. She does not venture to discover a living mountain beauty among the "thin-lipped, lascivious-mouthed, bony-faced women," but to the dead mother of 'Ristus is granted a posthumous praise. From her the boy had his "warm-tinted, lovely eyes," and the artist who had loved her for a summer and then ridden away, is brought back by a scrupulous Providence to die under the haunting eyes of his unacknowledged son. It is to be feared that a bit of Miss Murfree's mist got over to the North Carolina side and into Miss Pool's eyes.

For the rest, her book is pleasantly written, with slight descriptive touches that are admirable in their restraint. It betrays its date by being of that time long since past when there was an Asheville Junction. A millionaire's touch has now transformed that into something rich and strange, and, as nearly as we can make out, on the spot where Amabel's redbird made its dash for freedom, now rises a millionaire's church with its New York tenor and choir-master.

Constitutional History of the United States. By George Ticknor Curtis. Vol. II. Edited by Joseph Culbertson Clayton. Harper & Bros. 1896.

THE first volume of Curtis's 'History of the Constitution of the United States' was published in 1854, and the second in 1858. In 1889 a revised edition in one volume appeared, with the promise of a second volume covering the period from the adoption of the Constitution to the close of the civil war. The task was left unfinished at the author's death in 1894, but the more or less complete manuscript of thirteen of the proposed seventeen chapters was found among his papers, and has been edited by Mr. Clayton at the request of Mr. Curtis's family. The editor has confined himself, so far as the body of the work is concerned, to "putting the posthumous material in condition for publication," although he has taken the trouble to verify dates and citations, and has corrected some manifest clerical errors. A few of the latter have escaped his attention, and one or two of the later chapters show lack of the revision to which the author would doubtless have subjected them. In the main, however, the completed portions of the volume, though but a fragment, probably stand substantially as they were intended to appear.

From the first, Curtis's History of the Constitution was held in deservedly high repute. Without parade of details, its judicial air, its dialectic skill, its broad generalizations, and its earnest and rather formal style made especial appeal to lawyers and judges, and secured for it the honor of frequent citation by the courts as a "standard authority." To a considerable extent these qualities characterize the posthumous volume before us; nevertheless, we can but think that most readers will lay down the book with a distinct feeling of disappointment. The reason is not far to seek. With the exception of the first two chapters, which are a luminous setting forth of the contrast between the development of political opinion concerning the nature of the Constitution and the judicial views of it, there is little that has not been said more than once before, and, it must be confessed, said rather more interestingly. One realizes afresh how much the Constitution has been studied, and how clearly it has been expounded, when a historian of Curtis's ability can improve so slightly upon the old and tell us so little that is new.

The chapters treating of the acuter phases of the slavery struggle, of secession, and of the Reconstruction legislation are hardly of a piece with the earlier parts of the book. They are able and vigorous, but they befit the advocate rather than the impartial and philosophic historian. The severe criticism of the abolitionists for their attitude towards the Constitution recalls the denunciation which Curtis himself had to endure from the abolitionists in 1851, when, as United States Commissioner in Boston, he caused the fugitive slave Thomas Sims to be returned to his master. Curtis is convinced that the civil war might have been averted if the North had but made the concessions that it ought to have made, while the conduct of the Republican party during the Reconstruction period, and the creation of the Electoral Commission in 1876, are unsparingly condemned. Truly, some ghosts die hard. No doubt there was quite enough in the political events of that troublous time for which it would be hard to find either constitutional or moral justification, but only a narrow and technical view of constitutional principles can approve wholesale disparagement of the acts of a government suddenly compelled to fight for its life, and afterwards feeling its way, with no sufficient precedents to guide it, to a readjustment of the relations of the rebellious States to the Union. Lawyers have never had much difficulty in proving that Secession was illegal and Reconstruction unconstitutional, nor political philosophers in showing how both might have been avoided. The problem of the United States, however, was to prevent Secession from becoming effectual, and, after that had been accomplished, to restore normal conditions; and if, in the struggle, much was done which is now difficult of defence, it was demonstrated that, in times of great national exigency, the lawyer's view of constitutional powers and limitations must often yield somewhat to the force of sheer necessity.

Somewhat less than half of the 780 pages of the volume are devoted to an appendix, consisting chiefly of documents designed, as Mr. Clayton says, "as an apparatus for students." Most of these are so readily accessible that the propriety of reprinting them here is not obvious. Special interest, however, attaches to Curtis's argument for the plaintiff in the Dred Scott case, a note in reply to criticisms of his views of the Constitution by John G. Tyler, and his much-censured oration of July 4, 1862, before the municipal authorities of Boston. The analytical index to the Constitution appears to be taken from the Revised Statutes of 1878, although no source is indicated, and the same work seems to have been drawn upon for the text of the Constitution with references to judicial decisions, although Mr. Clayton has cited many additional cases. The volume has a full index.

Shakespeare's Heroes on the Stage. By Charles E. L. Wingate. Thomas Y. Crowell & Co.

MR. WINGATE'S 'Shakespeare's Heroes on the Stage' is a companion volume to his 'Shakespeare's Heroines on the Stage,' and is constructed upon a similar plan, which consists in putting the name of a celebrated character at the head of a chapter, and grouping under it biographical sketches, anecdotes, and criticisms of the most famous actors who have appeared in it. The manifest disadvantage of this system is that it is necessarily fragmentary and disconnected. The players of different eras are all mixed up together—the same names appearing over and over again in different parts of the book—and the mind of the reader is confused by a vast amount of repetition and a chronological tangle which is not resolved by the faithful insertion of dates. These faults are all the more serious because the book, presumably, is intended only for persons possessing little or no general knowledge of dramatic history, the material which it contains being, for the most part, a digest from such familiar authorities as the *Tatler*, Pepys, Dr. Doran, Hazlitt, Macready, Barry Cornwall, George Henry Lewes, Leigh Hunt, Dunlap, and others. These excerpts and paraphrases are good enough in their way, but are not particularly valuable except as an inducement to the reader to go to the original source. The interpolated anecdotes, when they are not apocryphal, are exceedingly venerable and well worn. What original matter there is consists mainly of reflections by the compiler which can be regarded only in the light of padding.

If Mr. Wingate was in want of matter to fill up his allotted number of pages, he might have extended his researches with profit to his readers, if not to himself. His "heroes" are *Othello*, *Iago*, *Lear*, *Shylock*, *Coriolanus*, *Macbeth*, *Hamlet*, and *Richard III.* He has nothing to say about famous impersonations, old or modern, of *Falstaff*, *Benedick*, *Romeo*, *Mercutio*, *King John*, *Wolsey*, *Brutus*, *Antony*, or other less prominent Shaksperian parts. The mention of these omissions is, perhaps, a sufficient comment upon the incompleteness of his work and the misleading comprehensiveness of his title.

It is only fair to add that his record, as far as it goes, appears to be fairly accurate and full. Indeed, the trouble which he has been at to preserve the names of a host of forgotten or insignificant players is wholly superfluous. Among the most interesting features of his book are the old portraits, some of which are uncommon, while all are well reproduced. All that remains to be said is that his literary style is agreeably fluent, if rather reckless—easy writing without being hard reading—and that he has taken the pains to prepare a good index.

Intermezzi: Kunstgeschichtliche Studien von A. Furtwängler. Leipzig and Berlin: Giesecke & Devrient; New York: Lemcke & Buechner. 1896. 4to, pp. 92.

THE present volume, the latest from Professor Furtwängler's tireless pen, consists of four short essays and an excursus. The first essay presents, with the help of four fine photo-engravings and several half-tones, a hitherto un-

known bronze head, the property of the Duke of Devonshire. This head is regarded by the author as an unquestionable Greek original of about 460 B. C., and as in all probability the work of Pythagoras of Rhegium, an artist of first-rate importance, the mint marks of whose genius Prof. Furtwängler believes himself to have discovered. The second essay is devoted to the Minerva Medici of the École des Beaux-Arts. This statue was discussed by the author in his recent 'Masterpieces of Greek Sculpture.' It was then for him a Roman copy of a bronze original, the Athena Promachos of the Athenian Acropolis, which, as he then argued, was the work of the elder Praxiteles. Now, after a renewed examination under more favorable conditions, it has become for him a Greek original, the long-lost central figure of the eastern pediment of the Parthenon. The third essay brings to light an all but unnoticed frieze in the Louvre, shows convincingly, so far as one can judge without independent examination, that it is a pendant to the well-known frieze in Munich with the nuptial procession of Poseidon and Amphitrite, and assigns the two to an altar before the temple of Neptune, built by Cn. Domitius Ahenobarbus, between 35 and 32 B. C. The fourth essay vindicates an Augustan date for the Roman monument at Adamklissi in the Dobrudja, first made known to the world in 1895, and treats of types of Germanic and other barbarian tribes represented thereon. The excursus brings a powerful battery of arguments into the field against the genuineness of the "Tiara of Saïtapharnes" and the associated gold objects purchased by the Louvre last spring, of which M. Salomon Reinach has well informed our readers.

These papers exhibit Professor Furtwängler's characteristic and extraordinary qualities —his unparalleled familiarity with Greek and Roman monuments of every class, his ingenuity, audacity, and self-confidence in hypothesis, his admirable faculty of lucid and telling exposition. Like everything that he writes, they are full of invaluable instruction for students sufficiently advanced to know how to judge them. To mere amateurs, unable to distinguish between break-neck conjecture and demonstrated certainty, they are likely to do as much harm as good.

Mere Literature, and Other Essays. By Woodrow Wilson. Boston: Houghton, Mifflin & Co. 1896.

THIS volume contains eight essays, all but one of which, that on Burke, had already been printed in magazines and reviews. This new essay, with the one which precedes it on Bagehot, are the only really substantial contributions to criticism in the volume. Mr. Wilson is primarily a political writer, and in his study of Burke he writes about what he understands. Most of the other essays belong to a species of writing of which there is still a good deal published every year, chiefly in this country, and which is on this account worth a brief analysis.

The first essay is on "Mere Literature," and is a protest against scientific contempt for literature as such. What Mr. Wilson wants to show is that there is something in literature above and beyond science. The idea is an old and, we should have supposed, an outworn one. But, waiving this, the method of treatment is also antique and imitative. It is a specimen of the half-rhapsodical, half-metaphysical essay transmitted to us from an elder day — let us say, the day of De Quincey or of Coleridge. It deals much in abstractions; it consists, in fact, in great measure, of statements, preferably antithetical, about abstractions such as Wit, Humor, Invention, Fancy, Imagination, Literature, Poetry, Scholarship, etc. "Seers" are often referred to as a superior order of men into whose intimacy the author has been admitted, and he himself writes a little as if seated upon a tripod. This method of writing has never had any tendency to convert the scientific man from thinking meanly of "mere literature"; it inclines him rather to laugh at the whole thing as a *reductio ad absurdum* of literature. Such literature, he would say, consists mainly of a collection of logical fallacies. What the author actually does is to take an abstract noun, define it in such a way as to suit a preconceived theory, and then, from the definition, demonstrate the truth of the theory. If, after the theory is demonstrated, facts suggest themselves which are at war with it, then there must be something doubtful or wrong about the facts, because the theory is already established.

For instance, Mr. Wilson, wishing to contrast literature and scholarship, declares that the groundwork of the former is "not erudition, but reflection and fancy." Scholars "*do not reflect;* they label, group kind with kind, set forth in schemes, expound with dispassionate method." It would necessarily follow that scholars are incapable of producing true literature. But, having established this, Mr. Wilson suddenly remembers that Gibbon, who was a scholar, was the author of a book commonly regarded as having the marks of literature, and who certainly was capable of reflection. He gets over the difficulty very neatly by declaring that "if we continue Gibbon in his fame, it will be for love of his art, not for worship of his scholarship"; *i. e.*, it may be that it is all a mistake to think Gibbon a great writer; but, if a great writer, we must remember that it was not through scholarship, but through literary gifts, that he was a great writer. This is very complete, but we greatly fear that, among the maliciously scientific, it will be derided as an excellent specimen of what might strictly be called mere literature.

But we have a more serious fault to find with Mr. Wilson than this. It is that he systematically teaches principles which we believe to be radically erroneous. In his second essay, "The Author Himself," he undertakes to encourage individualism in literature, and recommends a "certain helpful ignorance" as tending to foster it. "It is best for the author to be born away from literary centres, or to be excluded from their ruling set if he be born in them. It is best that he start out with his thinking, not knowing how much has been thought and said about everything." Now this is written under the idea that in literary centres there is a set which is hostile to novelty and individuality, and is doing its utmost to stifle both. Such may have been the fact once, but it long since ceased to be true. There is a high premium on individuality in the literary market, and any one who can open a new vein need not despair of attracting attention. To tell him, however, that ignorance will help him is to give him the very worst advice in the world. He cannot know too much of what others have done. His knowledge will no more take away the edge of his individuality than it will take away his appetite for dinner.

But Mr. Wilson is one of those who think that all "centres" are bad. His philosophy is eminently rural. He thinks that all the best lawyers are to be found "in the country." We hardly know of a single lawyer of distinction in the Northern United States who is a product of country life, and the tendency to the cities is so strong that we could mention country districts where the places made vacant by the death of country lawyers of the old school are filled by the scum of the profession. It is an inevitable corollary of views like these that, for the critic and reviewer, Mr. Wilson has nothing but contempt. The critic is the enemy of freshness and originality, and, "set on" by the fashionable coterie which rules the town, he harries the poor young author, and disables him from earning a livelihood. And so it goes on. These essays are an echo of the past. No such world exists as that which Mr. Wilson describes. Individuality is not what needs stimulation, but excellence. Of ignorance there is enough, Heaven knows, already.

Impressions and Experiences. By W. D. Howells. Harper & Bros. 1896.

THE distinction is not very well defined, but we prefer Mr. Howells's experiences to his impressions. His earliest memories concern a country printing office wherein and whereof he had practical experience, and his narrative of the manner of creating and distributing a "local" newspaper fifty years ago is sufficiently entertaining. The "country printer" whom he describes was his father, and perhaps he is restrained by modesty from saying too much in his praise, but he might have gone much further in this direction without offending against good taste. The early Free-Soilers were interesting and often noble men, and the glimpses that we get of the elder Mr. Howells make us wish that we knew more of him. If it is true, as Mr. Howells says, that "the old-fashioned country newspaper formed almost the sole intellectual experience of the remote and quiet folks who dwelt in their lonely farmsteads on the borders of the woods," why should he doubt if his father's paper influenced its readers at all?—since it was a sincere attempt at conscientious and self-respecting journalism, addressing itself seriously to the minds of its readers, and seeking to form their tastes and opinions. Carlyle's readers are not repelled by his hearty laudation of his father's stone-masonry, and we are willing to believe that the honest and earnest Free-Soil editor out in the Western Reserve built himself a monument more lasting if less visible than a stone bridge.

It may be that the somewhat atrabilarious temperament which Mr. Howells displays of recent years has made him doubtful whether any earnest work is worth while. If everything is for the worst in the worst possible world, what is the use of struggling? Why not fold our hands and let the crash come—the sooner the better? To be sure, Mr. Howells's pessimism has not practically carried him so far as this. He still encourages mendicancy by promiscuous almsgiving; but he frankly confesses that he does not believe that his action has any tendency to reduce the aggregate of human misery. He apparently justifies himself by subjective considerations: he is afraid that if he does not give to street beggars his heart will become hard, and he thinks it of more importance that it should be kept soft than that the efforts of the Charity Organization Society to suppress mendicancy should be successful. We do not know by what process of reasoning this conclusion is justified; but we cannot assent to it. We do not believe that Mr. Howells's heart would become ossified if

he never gave another penny to a street beggar, and we are quite sure that any slight cardiac induration that resulted from this course of action would be more than made up for by the arrest of cerebral tendencies in the opposite direction.

For it appears to us to admit of no question that Mr. Howells has suffered from the bad company that he has been keeping. We do not impugn his literary judgment—an artist can find material anywhere: George Eliot's early sketches of plain people rank with the best work that other writers have done in describing aristocratic life. But the exclusive contemplation of morbid specimens of humanity, without any defined purpose or expectation of improving their condition, is necessarily demoralizing. Physicians are not demoralized by dealing with disease, because they deal with it only to cure or relieve; but Mr. Howells has no hope for his patients. He describes a poor woman in Central Park (whom he conjectures to be out of work), listening to a shabbily dressed man (whom we conjecture to be professionally out of work), who shows her that it would make no difference if she had work, because, "in the nature of things as we have them, it could only be a question of time when she must be thrown out of any place she found." Such wisdom Mr. Howells says he cannot gainsay, and then goes on to tell us that if the poor became rich they would only be unkinder for it. One feels like asking, in the name of common sense, what will Mr. Howells have. He does not want things as they are now, he thinks things would be worse if the poor became rich; and we cannot imagine any arrangement that would content him except to leave the poor as they are, and to reduce the rich to the same condition. This has often been proved to be the logical outcome of Socialism; but few socialists come so near to admitting it as Mr. Howells.

As was explained in the 'Bab Ballads' in the case of Baines Carew, Esq, excessive sympathy and sentimentality are disqualifications for serious work. But they have had even more serious effects in Mr. Howells's case. We may treat as a venial offence his thrusting upon us the hideous and sordid aspects of humanity. He has become so accustomed, perhaps, to the company of vagabonds and outcasts who display their amputations and imposthumes for professional purposes, that he feels no impropriety in showing the world by ocular and nasal demonstration that its righteousness is literally nothing but wounds and bruises and putrefying sores. This is not in accordance with Horace's theories of good taste; but Horace was of the Romantic school. Yet when it comes to the bold assertion that the rich do not wish to see conditions bettered, even for their own sakes, and merely to escape being confronted by the loathliness of poverty, we must protest. The imputation is so outrageously unjust as to require no comment. That Mr. Howells should make it, shows, we fear, that the poison of Socialism has reached his moral sense. Does he really suppose that he is the only person that is distressed by the existence of poverty and misery? Does he not know that thousands of rich people are agonizing over these evils and sacrificing themselves in a hundred ways to alleviate them? Because these people decline to rob the deserving poor by encouraging fraudulent mendicancy, are they to be condemned as heartless? And because they are not willing to surrender themselves to sentimental imbecility and helpless pessimism, are they to be assured that in justice they should be reduced to the level of the offscourings of mankind?

It may be thought that we take Mr. Howells's "impressions" too seriously; that it does not make much difference what he says. But it does at least make a difference to him what he says, especially if it is not true; and it makes a difference to him what he does if it is not wise. He has carried his pathological studies far enough; let him come back to wholesome conditions, and once more show us some sound specimens of humanity, even if he has to idealize a little in doing it.

The Adventures of My Life. By Henri Rochefort. Edward Arnold. 1896. 2 vols., 8vo.

M. ROCHEFORT has abridged his Life for English readers, and if the portions which he has excided are more offensive to good taste than those retained, they must be curiosities. He begins the narration of his "adventures" by filling several pages with odious and utterly unvouched for scandals about Marie Antoinette and Napoleon I. which have nothing whatever to do with his life. His unrivalled gift for coarse vituperation is displayed on every possible occasion, and the whole book appears to be principally a medium for paying off old scores by pouring unmeasured abuse upon nearly every public man with whom Rochefort's virulent journalistic methods brought him into conflict. While there are many interesting passages in these volumes, their principal interest is in furnishing a "human document"; in the unconscious exhibition which the author makes of his childish vanity, his reckless untruthfulness, the petty meanness of his character, combined with a ferocity that is almost ludicrous. Although he deserves credit for the courage with which he assailed the corrupt and demoralizing government of Napoleon III., his subsequent career in connection with the atrocious Commune and with that ridiculous impostor Boulanger awakens a suspicion that he opposed the Empire not so much because he hated despotism as because he needed a target for abuse. He has not been able to make his peace with any of the numerous governments that France has had in his time, and, if we take his word for it, there is hardly a respectable man in France except Henri Rochefort, Victor Hugo, and the Communards, who displayed their patriotism by murdering priests and destroying works of art.

BOOKS OF THE WEEK.

A Book of Offices and Prayers. Compiled by two Presbyters of the Church. James Pott & Co. $1.
Almanach de Gotha. 1897. Gotha: Justus Perthes; New York: Lemcke & Buechner.

PERKINS'S OUTLINES OF ELECTRICITY AND MAGNETISM.

By Prof. CHARLES A. PERKINS of the University of Tennessee. *Illustrated.* 277 pp. 12mo, $1.10 *net.*

A complete but compact elementary text-book in which the essentials of the science are carefully presented and explained. The requirements of the ordinary college course have been kept in view While facts are treated as more fundamental than theories, and receive corresponding emphasis, the ripest results of modern thought are utilized in the explanations of the facts. The original papers of investigators, or, where they are in a foreign language, English authorities who describe and discuss them, are constantly referred to. An appendix contains brief directions for laboratory experiments illustrating the main principles of the science.

GOETHE'S GOTZ v. BERLICHINGEN.

Edited by Prof. FRANK GOODRICH of Williams. With map XIII + 170 pp. 70c. net.

The only edition for American students. Goethe's youth and a study of the German knight in the 16th century are the main topics of the introduction, but there and in the notes all historical allusions are carefully explained.

New Editions with Vocabularies.

ERCKMANN–CHATRIAN: Le Conscrit (Bôcher) 304 pp., 55c.

HAKLUYT SOCIETY.

President—Sir CLEMENTS MARKHAM, K.C.B.

The following Work, forming one of the Society's volumes for 1896, is NOW READY for ISSUE TO MEMBERS:

The Discovery and Conquest of Guinea.

Written by GOMES EANNES DE AZURARA. Translated and Edited by C. RAYMOND BEAZLEY, Esq., M.A., F.R.G.S., and EDGAR PRESTAGE, Esq., B.A. Volume I.

The Annual Subscription is One Guinea. Lists of Works already issued, or in preparation, may be obtained upon application.

WILLIAM FOSTER, Honorary Secretary.
4, Lincoln's Inn Fields, W. C.

A GREAT ARCHITECT.

John Wellborn Root.

A Study of his Life and Work, by HARRIET MONROE. With Etchings and Drawings by CHARLES F. W. MIELATZ and Facsimiles of Designs by Mr. ROOT. 1 vol., 8vo, $6.00 *net.*

In some important respects the same kind of interest attaches to Mr. Root as to H. H. Richardson. Both were highly successful architects, who stamped their genius on American architecture, and both were cut short in the midst of great careers. Mr. Root's field of labor centred in Chicago, and his genius reached its fullest expression in the general plans for the marvellous structures of the stupendous Exposition of 1893. His relative, Miss Harriet Monroe, the poet-laureate of the Exposition, here tells the interesting story of his life, having made free use of his essays, after-dinner speeches, letters, and other papers. The book is fully illustrated with facsimile reproductions of Mr. Root's drawings and with etchings and pen-and-ink drawings by Mr. Charles F. W. Mielatz of New York. It is a handsome volume, printed with great care and bound in fitting style.

Sold by Booksellers. Sent, postpaid, by

THE BIBLE AS LITERATURE.

A Course of 14 Lectures on this subject is now being delivered at Plymouth Church, Brooklyn, on Sunday evenings, by

Rev. Dr. LYMAN ABBOTT.

These lectures are exciting great interest, and will command the attention of all readers and Bible students. We will furnish in pamphlet form complete reports of the course, together with suggested Bible readings, for one dollar. On receipt of price, copies of the lectures already delivered will be mailed at once, post paid, and the rest weekly as they appear. Address MISS L. R. WHITLOCK, 145 Willow St., Brooklyn, N.Y.

WANTED.

FOR WORK IN PHILADELPHIA,

a college-bred man and student of English literature who can write well and correct proof, and is competent to conduct a class of cultivated adults in literary studies. The position to be filled is an agreeable one, and the salary about that of a college teacher. Address P. O. Box No. 2123, Station A, Philadelphia, Pa. stating qualifications, experience, and age.

"YOU may not be worthy to smoke the 'ARCADIA' MIXTURE'"

"By all odds the most thorough and impressive study of the question which has yet been presented."

AN ESSAY ON THE PRESENT DISTRIBUTION OF WEALTH IN THE UNITED STATES.

By CHARLES B. SPAHR, Ph.D., Associate Editor of *The Outlook*. 12mo, 184 pp. Appendices, Index. (Vol. XII. in Crowell's Library of Economics and Politics.) $1.50.

"There is here presented a problem which the people of wealth and influence must face whether they will or no. It cannot be laughed down or beaten down. We have only just seen the first lifting of the standard of revolt against the present social order call to its support over 6,000,000 of the 13,000,000 voters of the nation. That vast power was not concentrated by any whim of the moment, but by a deep-seated sense of wrong and injustice in the control and direction of industry. And as surely as there exists good ground for complaint, so surely will this movement grow up to a day of change—and whether change shall come gradually or radically or violently will depend, as all history shows, upon whether the problem is earnestly and conscientiously faced by the influential classes early or late or not at all."—*Springfield Republican.*

The Nation.

NEW YORK, THURSDAY, DECEMBER 31, 1896.

The Week.

It is not easy to make out what the political or financial prospect is. Senator Wolcott has just come back from Canton in high feather. In fact, everybody who comes back from Canton is in high feather. Mr. Wolcott's feather is due to Mr. McKinley's cordial approval of his bill providing for the sending of delegates to another international conference about currency. Says Mr. Wolcott:

"Major McKinley is cordially in favor of making good the promise of the party, and he seemed profoundly interested in the bill and in what was said about it. He is in thorough harmony with the party, and his main purpose is the good of the country. He is taking a very broad view of his duties and responsibilities. I think that the bill is likely to be passed in a short time after the holiday recess, and, of course, Major McKinley can arrange for a conference soon after his inauguration, if he so desires."

In fact, Major McKinley appears to approve of everything proposed to him for "the harmony of the party" and "the good of the country." His profound interest in the idea of an international conference, and in everything that is said about it, shows what a fresh mind he has, for a good deal of what is said about it is afflicting to a real lover of his race.

In the last *Review of Reviews* there is an account by Mr. Walter Wellman of a visit to Major McKinley by Mr. Kohlsaat, the editor of the Chicago *Times-Herald*, before the convention, to urge on him the necessity of calling for the gold standard in the St. Louis platform. Mr. McKinley, Mr. Kohlsaat says, was opposed to the 16 to-1 ratio, but decidedly objected to the use of the word gold in the platform. And why? Because

"He depended less upon his own opinion in this matter than upon the testimony offered by his numerous correspondents in the party. The Governor exhibited hundreds of letters received from prominent Republicans in all parts of the country bearing upon this very point. The great majority of these writers said the word gold should not be in the platform."

So, you see, he could not be expected to have an opinion about the national standard of value till his mail came in, or any opinion about it after the mail came in except the one supplied by his correspondents. The convenience of having a President of this description in troublous times must be plain to the meanest understanding.

Chairman Dingley's paper, the Lewiston *Journal*, argued some days ago that it was undesirable for Congress to reduce appropriations, and now Mr. Dingley himself takes the same view in Washington. He is "astonished" at Secretary Carlisle's contention, in his report, that Congress has been extravagant and should retrench. To be sure, as the Secretary pointed out, there has been an annual average increase, during the past seven years over the preceding four, of $58,000,000 in the pension bill; but Chairman Dingley says that few grumblers over this increase can be found. So of the increased expenditures on the navy and on fortifications. If the people do not rise up to denounce them, the proof is clear that there is no extravagance. Mr. Dingley discreetly leaves out of the account one of the heaviest items—the increase of $18,518,845 in "civil and miscellaneous" expenditures. Here are the public buildings, so dear to the heart of the log-roller, and the useless offices, so precious to the spoilsmen. In a single department of the Treasury a committee of Congress found it possible to effect a saving of $200,000 a year simply by introducing business methods and dispensing with superfluous employees. Did Mr. Dingley never hear of this retrenchment? Does he imagine that fifty others like it are not possible and urgent? It is discouraging to find a Congressman of his character and standing indifferent to public waste. As either chairman of the ways and means committee or Secretary of the Treasury—one of which he is thought certain to be after March 4—he would be in a position to do much for economy in public expenditures. That is a crying need of the times in both nation, State, and city. But Mr. Dingley argues that because we have been lavish and wasteful, we must for ever keep on being so.

The annual attack upon civil-service reform in the lower branch of Congress was made on the day before its adjournment for the holiday recess. The defenders of the spoils system brought forward their familiar arguments—that, in the words of Mr. Gibson, a Tennessee Republican, "life tenure of office is not democratic, it is not republican, it is not American, it is not right, it is aristocratic and monarchical"; but there was plainly evident a lack of confidence, and a perception that their cause is a losing one. Mr. Baker, a New Hampshire Republican, went so far as to declare that "under the spoils system the public business had been better handled than now, when clerks are kept under secret espionage, and are not better off than factory hands"; but Mr. Brosius, a Pennsylvania Republican, who, as chairman of the civil-service committee, has made a thorough study of the subject, easily disposed of this charge, and defended the President's recent order extending the scope of the civil service as "a thoroughgoing merit-system order." Mr. Settle, a North Carolina Republican, moved to strike out the whole appropriation for the Civil-Service Commission, explaining that "this would cripple the law a great deal, and I wish I could cripple it a great deal more." This statement, we are told, "was heartily applauded by many Republicans on the floor and was vociferously hailed by the galleries"; but when it came to a vote, the spoilsmen of both parties could not rally a third of the House to their support. Worse still, an amendment was adopted further extending the reform, by providing that "all persons employed in the Library of Congress shall be appointed solely with reference to their fitness for the particular duty, and without reference to their political or party affiliations, and shall be removed for cause only."

An interesting feature of the discussion was the straightforward statement made by Chairman Brosius as to the proper attitude of the Republican party and its incoming President towards this matter. He characterized it as most remarkable that a proposition to starve out the Commission should be made by a Republican member, when the party's national platform, adopted last June, contained a resolution stating that "we renew our repeated declaration that the civil-service law shall be thoroughly and honestly enforced and extended wherever practicable." He quoted Mr. McKinley's commendation of this resolution in his letter of acceptance, and his statement that "the Republican party will take no backward step upon the question." He recalled Mr. McKinley's treatment of an attempt to cripple the reform by cutting down the appropriation for carrying it into effect in 1890, and endorsed the position then taken by the man who will become President next March:

"It is a Republican measure, and is in accord with the highest and best sentiments of the country, and no party will have the courage to wipe it from the statute-book or to amend it save in the direction of its improvement. The Republican party must take no step backward. The merit system is here, and is is here to stay, and we may just as well understand and accept it now, and give our attention to correcting the abuses, if any exist, and improving the law wherever it can be done to the advantage of the public service."

The net result of the spoilsmen's assault was thus an extension of the reform and the committal of the next Administration to still further extensions.

The decision of Justice Keogh, in the civil-service case which was raised in Brooklyn, should impel the Civil-Service Reform Association of this city to begin proceedings at once to bring the office of District Attorney within the regulations of the law. Justice Keogh's opinion follows exactly the lines of the Court of Ap-

peals decision quoted by us the other day, to the effect that the Constitution of the State, requiring competitive examinations wherever practicable, is self-operating and must be carried out, no matter whether there be express laws directing it to be or not. The only question at issue is, Are competitive examinations practicable? The Mayor of Brooklyn held, in regard to certain places in the municipal service, that they were not. The court decides that the Mayor has no authority in the matter, since the question of practicability is not subject to the opinion of any mayor, or governor, or other executive officer, or of the Legislature. This covers the District Attorney's office here completely. That office has not been brought within the regulations by the Governor's act, but it is within them under the Constitution, and exception by the Governor is of no validity. Mr. Olcott ought to be compelled to select all his minor subordinates from the eligible lists, after competitive examination. His choice of Van Allen and young Lauterbach for two of his chief assistants gives alarming evidence that he cannot be trusted to fill the minor places without some restraining power which will protect him against the demands of the machine.

The Choate meeting last week was thinned by the inclemency of the weather and the condition of the streets, but it had the very great value of drawing from Mr. Guthrie the first positive description we have had from Platt's Republican associates of the system by which he has debauched and degraded his party, and now proposes to make himself Senator. Mr. Guthrie asserts positively that this system is founded on contributions received from corporations; that these contributions are concealed from the stockholders by false entries in the books; that there ought to be legislation making it a penal, as it is a moral, offence to use the funds of the companies in any such way, and that there ought now to be a legal investigation of the whole matter. The thing has now gone so far that such an investigation can hardly be avoided sooner or later. Before these investigators every corporation officer in New York ought to be summoned, and so ought Platt himself. Platt would undoubtedly deny everything, but there must be among the officers of the corporations a large number, at least, who will not under any circumstances lie or prevaricate. We are also indebted to Mr. Guthrie for an exposure of the fraud which Platt has so successfully practised on a portion of the public, in giving out that he "had waged a splendid and most statesmanlike fight against timorous and quibbling Republicans who sought to keep out of the St. Louis platform the word gold." This is pure fiction. Mr. Guthrie showed clearly by indisputable evidence that the gold plank was settled on, just as it was adopted, by McKinley's Western friends days before Platt reached St. Louis. Platt was occupied at this time in getting money from corporations to lead his fraudulent delegation to the convention.

We call the attention of all persons who have doubts as to the real sources of Platt's power and the secret of his ownership of the Legislature to an interview with Mr. E. C. Benedict published last week in the *Evening Post*. There are few men in the city who are familiar with the "inside workings" of more large corporations than Mr. Benedict is. It is expert opinion of the first rank, therefore, which he gives when he says that the "government of this State is in the hands of three houses"; that "the third house does business on the principle of 'Stand and deliver'"; that "that is the way the Legislature treats corporations"; and that "the present ruler is as much more expensive than the former one of a different political stripe as an educated, skilful, high-priced man is than an ignorant and low-priced one." Does anybody have any doubt as to what two men Mr. Benedict refers to in these utterances? Does anybody have any doubt as to whom he refers when he speaks of a man who at present "acts as a clearing-house for boodle"? Yet when the man thus characterized is about to elect himself, because of his boodle power, to the Senate of the United States, it is with great difficulty that the press and people can be persuaded that they ought to protest against it and prevent it.

The train is now laid. It must before long be fired by some one. The Republican party in New York cannot longer with safety carry Platt and his system, which would have damned it beyond redemption in its most victorious days. It can still less carry them in these days of doubt and anxiety. It cannot meet the issue in 1900 with a Legislature elected and controlled by a boss, and with the boss himself in the United States Senate, and modelled on Tweed. Tweed, too, had planned the transfer of his ring to Washington when he was cut off untimely. The party has allowed his system to be set up in Pennsylvania also, and the foundations are being laid in other States. If this republic is to last, this mode of government must be abandoned. It contains every defect and abuse in the monarchies of the old world against which the United States was intended as a protest.

The principal argument against the retirement of the greenbacks is that they save to the Government the interest on $346,000,000 of bonds. The Comptroller of the Currency in his recent report controverts this assertion, and shows that as an economical proposition it would have been cheaper for the Government if it had issued bonds for the full amount of the outstanding greenbacks in 1879, called these in and cancelled them. If that had been done, the cost to the present time would have been, in round figures, counting principal and interest, $742,000,000, whereas the cost and liability of maintaining the redemption of the notes has been, in principal and interest, $1,100,000,000, showing a difference of over $300,000,000 in favor of paying off and cancelling the greenbacks in 1879, when specie payments were resumed. This does not make any account of the cost of maintaining the Bureau of Engraving and Printing and of keeping the notes in good condition. It may be said that a part of the money obtained from the later issues of bonds has been used to pay current expenses of the Government, and is therefore not chargeable to the cost of greenback redemption. On the other hand, it is reasonably certain that but for the greenbacks no new issues of bonds would have been made. They could not have been made without new legislation. The Government would have worked along somehow without borrowing. Bond issues for current expenses would not have been tolerated. Congress would have been compelled to cut down current expenses or to increase current income. It might have made some small temporary loan when the deficit first showed itself, but it would not have issued bonds running a long term of years to meet a temporary deficit. Public opinion would not have tolerated such waste.

It may be asked why it was necessary to issue long-time bonds for greenback redemption. The reason is that there was no law authorizing temporary loans, and that Congress refused to pass one, although frequently asked to do so by the President and the Secretary of the Treasury. The only way open for the Executive to meet the Government's liabilities was to issue bonds which had been authorized long ago under other circumstances and when the rate of interest was higher than it is now. Congress was willing to avail itself of the money borrowed in this costly way. It could appropriate money recklessly when the Treasury was full of borrowed money, and at the same time shed crocodile tears over the sinfulness of the Executive in borrowing it. So shameless a spectacle has rarely been witnessed in the annals of representative government as that offered by the Fifty-third Congress, and repeated by the Fifty-fourth, in dealing with this question—refusing the power asked for by the President to borrow on the best terms, denying practically his power to borrow at all, yet plunging both hands up to the elbows into the money so obtained. Add to this the refusal to increase the revenue by other means than borrowing, and we have the result to which reference was made

above, namely, that the existence of the Government's legal-tender notes, and the necessity of redeeming them on demand, have been the cause, not only of the recent bond issues, but of the extravagance in public appropriations. Is there any reason to expect better things hereafter?

The failure of the National Bank of Illinois came as a great surprise to the public last week because it had been considered for a quarter of a century one of the most conservative financial institutions in the country. Anybody familiar with the business affairs of Chicago would have included it in any list of the panic-proof banks of that city. It was this reputation, slowly built up, that gave it the very large deposit account of $13,000,000. Under these circumstances the failure becomes absolutely inexcusable. It is the old story of speculations inside the bank; that is, excessive and apparently unlawful loans to speculative undertakings, such as the Calumet Electric Street Railway. The national banking law forbids the lending of more than one-tenth of a bank's capital to one person, corporation, or firm, directly or indirectly. If the published reports are correct, it would seem that this law must have been violated in a glaring manner, and even after the Comptroller of the Currency had given the officers and directors warning. It may be asked why the bank examiners did not find out this condition of things in time to put a stop to it. The answer probably is that the books of the bank were kept in such a way as to conceal the facts. No system of public examination of books can be depended upon if the examiner must go behind the books, for then he becomes a detective officer, and detection requires time. If it were necessary to put detectives on the 5,051 national banks of the United States, an army would be required instead of the handful now employed, and their work would in most cases be obstructive instead of helpful to legitimate business. After the Comptroller was made acquainted with the internal condition of this bank, his action appears to have been both prompt and prudent. It is very hard to decide whether a bank shall be put in the hands of a receiver as soon as information reaches the Comptroller that it is shaky, or whether opportunity shall be given to rehabilitate it, even at the risk of its becoming worse. Generally the latter course would be approved by nine business men out of ten, regard being had to the circumstances of each case.

The official canvass in two States shows overwhelming majorities for amendments to the Constitution making more difficult the exercise of the suffrage by immigrants. Hitherto Texas has allowed a man of foreign birth who had resided in the State for one year to vote upon declaring his intention to become a citizen at any time before an election. The last Legislature submitted a proposition that such a declaration must be made not less than six months before the election, and it was ratified by a vote of about five to one. Minnesota has permitted a foreigner to vote upon a declaration of intention to become a citizen, provided he has resided in this country one year and in the State four months before an election. The last Legislature submitted an amendment requiring that an alien shall become naturalized before he can exercise the suffrage, which means that he must have resided in the United States at least five years, and the proposition was carried at the polls by a large majority. A noteworthy feature of this vote in Minnesota is the fact that six men out of ten in the State are of foreign birth, and that only about two-thirds of these are naturalized, so that a measure restricting the foreign vote was submitted to an electorate of which a majority at present are of foreign birth. Nevertheless, no issue of nationality was raised, and the result shows that the amendment must have been supported by many foreign-born voters.

The Galveston (Texas) *News* notes the facts that a mob of white men attacked negro laborers employed in a saw-mill at Canfield, Ark., a few nights ago, shot twenty of them, and left the wounded men without attention all night; that a similar assault was made on negroes in Frostville, Ark., on another night—nine of them were shot, and none of the murderers was arrested; and that the editor of a weekly newspaper published at Ashland, Ala., while sitting in his home one evening recently, was shot dead by an assassin who fired through the window, because he had made war in his paper on certain lawless gangs that have been operating in the country. The *News* says that the American people sympathize very deeply with the Armenians and with the Cubans, which it considers all right; that they are moved by an ardent desire to suppress the cruelty of the Kurd and of the Spaniard, which it also considers all right. But it holds that their first duty is to prevent the brutalities that are perpetrated in their own land, and it thus forcibly applies the obligation of which it speaks:

> "There are evidently some scaly Kurds in Arkansas. Why not demand of the Governor some much needed reforms? Alabama has some assassins quite as black in the heart and as dangerous as those who are said to have slain Maceo. Why not begin the great work of humanity and justice at home? After we have put down our armed clans of midnight murderers, our Kurds and Macheteros, if you please, it will then be time enough to test our powers on the outlaws of foreign lands."

Kentucky is one of the oldest of the States, the first to come into the Union after the original thirteen, and yet, by the confession of Kentuckians themselves, the end of more than a century as a commonwealth is a condition scarcely better than general anarchy. Not only life but also property is unsafe. For weeks mobs have been destroying toll-gates and overthrowing vested rights without hindrance from the authorities, while other mobs have been taking men accused of crime from sheriffs and jailers who made little effort to thwart the schemes, and putting them to death. Such outrages as these, the *Courier-Journal* well says, "reflect not only upon the cowards who constitute the mobs, but upon the entire communities in which they take place; for they would soon be checked, if they had not been wholly prevented, were local public sentiment wholly out of sympathy with them." Senator Blackburn is an excellent type of the demagogue who is overflowing with indignation against Spanish outrages upon the Cubans; but what sort of a defence could Blackburn's State make if Spain should address to our Government a protest against the anarchy that prevails in Kentucky and endangers the lives and property of any Spaniards who may settle there?

Mr. John Morley made an address on education, a couple of weeks ago, before a London technical school, in which the casual overflow of his full mind contained many wise and witty things. He began by admitting that speeches on education were among the most tiresome in the world to listen to—as he could testify from having both made and listened to many—and the reason was that there were not two sides to the question. When everybody was agreed about the advantages of education, it was hard work arguing without any opponent. However, a fresh practical turn had been given the subject lately in the alarm over German trade competition, whose formidableness (if real) proceeded from the superior technical education of Germans. But there were signs that the great English manufacturers and captains of industry were awaking to their remissness in this particular, and would speedily remedy it. Still, he thought the difference between the young German business man and the young English business man was not wholly one of advantages to be had in schools. In Germany the young men who were to succeed to the family business were in the habit of travelling and acquiring languages and getting a broad knowledge of the conditions of international commerce. In England it was too often true that the sons of the house passed their waiting and preparatory years in devotion to pleasure—especially to sport. In Germany the father said, "Thank God, I have a son!" In England the son said, "Thank God, I have a father!" There is a great truth in this, though it never dawned on the mind of the author of that alarmist book, 'Made in Germany,' which so frightened Lord Rosebery,

THE TARIFF REOPENING.

Nobody can envy the committee of ways and means the task they have set themselves of "giving hearings" on the tariff. They have (or had) a theory that half-a-dozen well-meaning men in Washington city could put their heads together and construct a tariff affecting some two thousand articles directly, and as many more indirectly, on reasonable principles. Nothing is more beautiful in theory than a judicious tariff such as *we* would make if we were not bothered by other people. But other people will not let us alone. Not only do they come rushing in and taking up our time when we ought to be at work putting our benevolent and disinterested views into shape, but they bring in all sorts of outlandish views. For example, quinine has been free of duty for more than twenty years, and the production of it in this country is greater now than it was before the duty was removed; yet here come the quinine-manufacturers and want to have the "blood tax" renewed. They can give you more reasons for it in one hour than you can answer in six months, because they know all about the business and you know nothing about it except the naked fact that they are making more quinine now than they ever did before; and you end by yielding to them.

Next comes somebody who wants to make chlorate of potash. This has always been on the free list. It is one of the raw materials of several branches of manufacturing industry, such as calico dyeing, blasting-powder, friction matches, etc. This individual thought he could make it without any tariff. He invested $150,000 in the business, hired fifty men, and went to work. The price of chlorate went down and he was obliged to close his works. Now he wants a duty on chlorate of potash to enable him to make a profit. Some folks must pay this, of course, and we happen to know just who they are because he has told us. They are not the millions of consumers, who are not worth considering, because the amount that each one has to pay is so very small, but the calico printers, the blasting-powder men, and the friction-match men. They have protection. Why should they not divide with the chlorate-of-potash man; or, better still, why should not the duties on calico, blasting-powder, and friction matches be raised so as to cover the tax on chlorate of potash? Look at chromate of potash, a first cousin to chlorate of ditto. There is a duty of 25 per cent. on chromate, which so stiff a protectionist as the late William D. Kelley declared to be an outrage. If we have a duty on chromate, we ought to equalize matters by having one on chlorate. Few would think of equalizing the other way—that is, by repealing the duty on chromate. The house that has the monopoly of that article in the United States would find plenty of reasons to the contrary.

Next in the procession comes the cattle-grower, or the butcher, or both, who want a duty on hides. Hides have been on the free list twenty-five years, and not even McKinley dared to offend the boot-and-shoe interest of Massachusetts to the extent of putting a duty of 10 per cent. on them. It was the opinion of shrewd politicians that if hides had been made dutiable at that time, Mr. Henry Cabot Lodge would have been retired to private life. It is not improbable that a similar result would follow a similar measure now, or as soon as Mr. Lodge's present term expires. If anything could prevent it, it would be the direful consequences of having George Fred Williams in his place. A correspondence is published between J. R. Leeson, President of the Boston Merchants' Association, and Congressman Joseph H. Walker on the subject of the proposed duty on hides, which shows that such a duty is seriously contemplated, and that it would, as Mr. Leeson says, "do more to alienate confidence in the management of the Republican party than possibly any other single fact throughout this entire section." Mr. Walker seems to admit this, but he thinks, nevertheless, that there is much to be said on the other side. In order to make protection consistent with itself, the hide-producer must have his share. If he has not had his innings for twenty-five years, perhaps that is an added reason why he should have them now. Evidently Mr. Walker would like to have this cup pass from him, but if he must drink it, he will—for the sake of principle. We note this proposed duty on hides as perhaps the most ominous thing in the whole list, not excepting wool. There are not many people in Massachusetts, or in the leather-producing interest of the country, who take the same view of the principle that Mr. Walker takes. They will say that the principle of tariff and trade in general is to get one's bread and butter; and that whatever takes bread and butter away from them is a false principle.

There are many others in the procession who will call for comment as the hearings proceed. The only additional one that we have room for now is anthracite coal. Anthracite has been on the free list for twenty-six years. It was put there because we were the only producers of the article on a commercial scale in the world. But latterly anthracite has been found in the Rocky Mountains on the line of the Canadian Pacific Railway, in Peru, and in some other places of convenient access to the San Francisco market, to which it is introduced free of duty. In fact, it is carried thither from Swansea, Wales, as return cargo of grain-carrying ships. The necessity of putting up the price of coal in San Francisco for the principle of the thing is obvious. So we are to have a serious and sober argument (as serious and sober as Mr. Walker's on the subject of hides) in favor of a duty on anthracite coal. Time must not be counted against this any more than against the other.

In good earnest, these hearings are probably the greatest scandal connected with the whole tariff system. There is hardly a rule of evidence or of good morals which they do not violate. In the first place, the witnesses are not examined on oath, so that they can make any statement, however false or reckless, without fear of penal consequences, and nevertheless the object of these hearings is to furnish a basis for legislation. In the next place, they are interested witnesses; that is, they have a strong pecuniary interest in the effect they produce on the mind of the committee. In other words, a well-told lie or exaggeration may bring them great wealth. In the third place, they are examined in the absence of the opposing party. The consumers, whose interest it is that the protectionists should not get what they want, are not represented at all. It may be said they might be represented if they chose, but few consumers have a direct interest in the tariff. The possible effect on prices is in each individual case too small to warrant the expense of going to Washington and staying there, and the vexation of appearing before a hostile committee to be worried and browbeaten by the high-tariff men. This fact alone ought to make the committee an investigating committee acting solely in behalf of the country at large. This the committee never is. It sits, not to ascertain whether a manufacturer ought to have any protection at all, or to inquire into his reasons by the methods of a hostile or suspicious cross-examiner, but as friendly patrons to take his own account of the amount of protection he needs. It must be remembered that the presumption is against any protection at all. The right to buy and sell where he pleases is the *prima-facie* civic right of every human being. If this right should be for any reason curtailed or taken away, the burden of showing that this curtailment or abolition is just or necessary is on the person proposing it; and when he proposes it for his own private profit, no cross-examination can be too severe for him. We did hope that after the scare of last summer this scandal would not reappear.

THE INDIANAPOLIS CONVENTION.

It is understood that twenty delegates will go from New York and an equal number from Brooklyn to the coming Indianapolis convention, all of them being appointed by organized commercial bodies. Philadelphia and Boston will be represented in like manner. The movement, although exclusively Western in origin, has attracted the attention of the East in such a way as to insure all the participation and coöperation here that could be desired. The dominant feeling among the originators of the movement, and among all who are now taking an in-

terest in it, is that unless those who won the victory in the recent campaign improve the opportunity by putting our monetary system on a firm foundation, so that it will "go alone," the other side will take that work out of our hands and put it on a very different foundation. What it will be, nobody can now tell, but it will probably be something even worse than silver at 16 to 1. At all events it will not stop after touching that goal. If the friends of sound money do not find out what they want and make the effort to reach it, they will be left behind in the election of 1898, and still more so in that of 1900.

The fact that prosperity has not come to the extent expected must be faced. The reason why it has not—one of the reasons at all events—is that the situation has not changed except in the one particular that the Bryanites were defeated for the time being. Everything else stands exactly as before. The party that supported Bryan is in full panoply ready for another bout. The game of 16 to 1 is only adjourned four years, perhaps not so long. The business community on both sides of the water know this, and they will use the intervening time to fortify themselves for it. They will govern themselves by the prospect, as they see it, of the security and certainty of investments. If public opinion and legislation move in the direction of sound money, the spirit of enterprise will revive. If not, the torpor of the past will supervene, and the Republican party will be answerable, as it ought to be, for the consequences. So far as the politicians are concerned, they have thus far shown themselves absolutely helpless. It is not to be supposed that they are unwilling to do something to get the country and themselves out of the present rut: they simply don't know what to do. They have been "doing something for silver" so long that they cannot think of anything else now but another international conference, which is very much like taking a hair of the dog to cure the bite. They need an impulse from behind to prompt them to an imperative duty.

The present financial needs of the country could not be formulated more clearly and concisely than they have been in Mr. Carlisle's recent report. One paragraph especially ought to be burned into the thoughts of all men who are in any way responsible for the business prosperity of the land. A part of this we reprint, viz.:

"So long as the United States notes remain in circulation, questions as to the mode and manner of their redemption, and as to the means of procuring and maintaining a coin reserve for that purpose, will be made political issues; and so long as these questions remain in politics, public confidence in the stability of our currency must be more or less disturbed. Even if the agitation of these questions affected only the value of United States notes, the consequences would be sufficiently serious to justify a demand for their permanent retirement; but the character of our currency is such that whatever creates a doubt or suspicion concerning their prompt redemption in gold, on presentation, necessarily impairs confidence in the whole volume of our circulation, and inflicts much greater injury upon the public than could possibly result from the failure of ordinary banking institutions to redeem their paper. Every menace to the gold reserve, and every manifestation of a formidable public sentiment in favor of the redemption of our notes otherwise than in gold coin, at once alarms the whole business community, depresses trade and industry, and impairs the value of our public and private securities in all the markets of the world."

From this undeniable premise he argues the absolute necessity of retiring these disturbing notes and getting rid of them, not by hoarding them in the Treasury, where they constitute an ever-present temptation to extravagance in public expenditures, to currency inflation, and to renewed gold exports, but by blotting them out of existence.

Under present arrangements the Government is responsible for the gold reserve of the nation. In other words, it has assumed a banking function of the highest importance without having the means which banks possess of providing themselves with gold when the demand for it arises. A gold reserve belongs to the mercantile machinery of a nation, of which banks constitute a part. By means of their discounts and deposits the banks are enabled to procure gold when they need it, and to let it go when they do not need it. Such a method of regulating the reserve is in use in all countries except ours, and was in use here until we fell into our present Slough of Despond, in consequence of a war that ended more than thirty years ago. With us the gold reserve can be replenished only by selling bonds; and whether bonds shall be sold or not at any time depends on politics—that is, it depends on politics whether public and private bankruptcy shall supervene at any time or not. Just now the state of politics is such that bankruptcy may be forced at any time by an excess of expenditures over receipts, since there is no power to pass a bill for increasing the revenue, although everybody says that more is needed. This is over and above the ordinary difficulty of maintaining the reserve—the difficulty due to greater or less demand for gold to meet the requirements of international trade.

The aim of the Indianapolis convention is to give direction and strength to public opinion in favor of taking the Government out of the banking business, to formulate a plan for that purpose, and to form an organization to fight for it. It deserves the support of all intelligent, public-spirited, patriotic citizens.

A MACHINE CHARTER.

It is intimated by the committee which has prepared the proposed charter for the greater city of New York that they have designed a system of administration which will "render the city self-governing," that they have endowed it, "in general and in detail, with every right, power, and privilege essential to municipal independence, subject to the sovereignty of the State." When their work is examined, nothing of this kind can be discovered. They have created a new municipal assembly, of 141 members, and say they have proposed for it a "multiplicity of powers," but when those powers are examined they are found to be so restricted as to be deprived almost entirely of the self-governing or home-rule idea. Thus, the first principle of self-government is control of expenditures, of appropriations. The new Assembly has no power over these whatever beyond the power to cut down an appropriation fixed by the Board of Estimate and Apportionment. It cannot increase or enlarge any item, nor insert a new one. It can put in operation no new plan of public work, involving the expenditure of over a million dollars, without first submitting it to a vote of the people.

Moreover, for this Assembly two houses are proposed, a lower one of 104 members elected from senatorial districts, and an upper one of 36 members to be elected from council districts, with a President to be chosen on a general ticket. These council districts are to be ten in number, of which five are within the present city of New York, and these five are to elect 20 of the members. Brooklyn is to have three districts, with 12 members, and the remaining sections are to have four members. The members of both houses are to be chosen for two years, all to go out at the expiration of their terms. They are given powers which we have been forced to take away from our present Board of Aldermen, but certain restrictions are added to the exercise of them. The assumption of the commission seems to be that, by increasing the size of this municipal body, its quality can be improved. All experience points to the contrary conclusion, for, in so large a body as this would be, responsibility would be more difficult to place than ever. What the quality of the lower house would be we can judge by the quality of our present boards. That the upper house would differ much from this is very doubtful, considering the way in which it is to be chosen. If all its members were to be elected on a general ticket, there might be hope of improvement, but, with the district division proposed, it is not easy to see how much improvement could be expected. Then, too, if the upper house is to act as a check on the lower, and is to attract a better type of legislator, the term ought to be longer than that of the lower house. No great city in the world with a successful system of administration has a municipal assembly constituted on such principles as this one is.

Under this Municipal Assembly, again, and more or less distinct from it and independent in action, are several great administrative departments, each with powers of its own. Then, too, there are five boroughs and twenty-two local boards,

all with powers of their own, as well as powers which they share with the Municipal Assembly. Was there ever such a complex system of divided responsibility as this? First we have the State Legislature at Albany, with sovereign powers over local or municipal matters. Then we have the Municipal Assembly, which in its composition will be simply another Legislature, with certain powers, more or less restricted, but all subordinate to the State body. Then we have thirty or more other smaller bodies, working under both the State and the municipal bodies, with some independent powers of their own. How would the people ever be able to fix responsibility for any particular act upon anybody? It would be passed from one to the other in a way that would delight the soul of every political trickster in the city. In fact, nothing more delightful in the shape of irresponsible or political machine rule could be devised. The Boys could carry on their operations amid constant roars of laughter, for no reformer would ever be able to pin one of them down to responsibility for a single act.

What the charter proposes to do is to magnify and aggravate incalculably the evils of legislative rule from which the city suffers now. Instead of one Legislature we should have two, nearly equal in size and undoubtedly similar in the quality of membership. What boundless possibilities of log-rolling these two would possess, with the local political bosses of the borough and district boards all working together to put through jobs for their own benefit! This city, with its great wealth, would be the object of all attacks, and we should find the boroughs of the Bronx, Brooklyn, Richmond, and Queens combining against that of Manhattan with a regularity that would make our taxpayers regret that a Greater New York was ever conceived.

It is impossible to find in this elaborate scheme for divided responsibility anything except a plan for purely partisan government. What is proposed is the creation of a state within a state, under such conditions as will give the politicians who now rule us from Albany greater powers and opportunities than they enjoy at present. If we could have a state of our own here, with real and full self-governing powers, we should all have reason to rejoice, but this is the last thing which the machine politicians of the State at large desire. They want to keep the wealth of the great cities at this end of the State in their power, in order to fleece them for the benefit of the other sections of it; but they should have a care lest, by making a subordinate state here now, they pave the way for separation hereafter when the evils of rule from Albany shall become too grievous to be tolerated longer.

The whole spirit of the new charter is revealed, in fact, in the bi-partisan police board provision. It is this spirit which appears in the elaborate system of divided responsibility, and we are sure also it will be found in nearly or quite all other provisions when these shall have been subjected to expert examination. Lauterbach has found it there, for he says it is a charter for which the people should be deeply grateful, and that he is sure it will be adopted by the Legislature virtually unchanged. Lexow has found it also, for he says it will be "hustled through" the Legislature without delay. This will be the result unless the people of the city who really care for good government, and think that the enlarged city should have the best measure of such government possible, decide to assert their right to be heard in the matter.

A PRINCE OF IMPOSTORS.

One of the most extraordinary cases of successful mendicancy on record was brought to light in a trial which came to an end in London on December 17. It was an action for damages for libel brought against Mr. Labouchere of *Truth*. The plaintiff was one Brooks, formerly a Nonconformist minister, but for the past eight years a swindler and impostor of amazing effrontery and still more amazing success. By means of begging-letters and other forms of fraudulent pretence, he had obtained in the course of seven or eight years no less a sum than $40,000. He lived in fine style, setting up a carriage and pair, with horses besides for his wife and daughter, and keeping several servants, gardeners, grooms, etc. Finally, his impudence growing by what it fed on, he made a dead set at Mr. Balfour, and succeeded in wheedling out of that astute First Lord of the Treasury a grant of $1,000 a year from the national fund for deserving authors. Thus brought before the public eye, he was also brought before the eye of *Truth*, in the columns of which journal he was mercilessly shown up. Hence his libel suit, and hence his complete snuffing out when the case was heard.

He had to undergo a cross-examination at the hands of Sir Frank Lockwood, and the career of imposture, fraud, and canting hypocrisy he was forced to confess to, so long continued and so astounding in its results, can scarcely have been rivalled since Cagliostro's day. He began as a fierce Radical in politics. One of his early letters averred that "trusting to the mercy of a landowner is like trusting to the honor of a brigand or the mercy of a tiger." Asked by Sir Frank if that was his style, he replied, "That's my Radical style." But his Radical style brought in little money, and he soon saw a great light and became the stiffest kind of a Tory. Pressed as to where he got the addresses of the thousand gentlemen to whom he sent out his letters, he finally admitted that they came out of Debrett. It was mainly with the quality he dealt, and it must be confessed the quality came down handsomely. Like our Tammany statesmen, Mr. Brooks kept several banking accounts, and their production in court showed balances of from $600 to $3,000 at the very moment he was assuring the dukes and first lords that he had not a penny to live on. Of course, he was always engaged in a "great work" of some sort. Now it was an elaborate refutation of Socialism—this appears to have been what caught Mr. Balfour. Then it was a work in defence of the Constitution—"Your own constitution, I presume you mean?" interjected Sir Frank Lockwood. Brooks was an author and very fond of authors. One of his benevolent schemes was to found a home for decayed authors. He certainly did it in the case of one author. A part of his defence was that he had earned a good deal of money by his pen. Thus, he read one item from his private accounts: "Magazine article, 'Why I Became a Liberal Unionist,' £18." "Is that question and answer?" interposed the nimble Sir Frank.

Brooks did, in fact, a good deal in the political line. His pious hatred of home rule seems to have been worth thousands of pounds to him. He got up some sort of a conference in Glasgow with "ministers and farmers" in the interest of Scottish agriculture. This netted Brooks £350, but what good it did Scottish agriculture does not appear. The fellow actually came to this country to "investigate social questions"—his expenses and salary paid, of course, by certain gentlemen "interested in social movements." But he compliments our shrewdness by saying in his testimony that he "soon found that he was too much of an Englishman to get on comfortably with the people of the United States." Nevertheless he wrote his article on the United States, and it naturally attracted a "great deal of attention," one earl even having "pointedly referred to it."

One cannot but be struck, in reading the names of Brooks's victims, with the extraordinary array of bimetallists that figure in it. There is Mr. Balfour to begin with. Brooks had a whole series of letters from him about his "work." These were not allowed in evidence, which is a pity. They would have been a good commentary on the foundations of Mr. Balfour's belief, both social and economic. A statesman taken in by so arrant a knave is hardly the man to deal successfully with what Bagehot called "the commerce of imperceptibles." Then there was that other tower of strength to the bimetallists, Mr. Lidderdale. Brooks had marked him out for an easy prey. So he had the other great authority, Hucks Gibbs. This is the sort of stuff he wrote to him:

"While meditating to-day, this Sunday morning, on the exceeding goodness of God, it was borne in upon me that I should apply to you for assistance for the execution of my literary work, which is done with the object of advancing the glory of God, to whom I have dedicated my pen. I am wholly without

money, and am entirely dependent on my pen."

Does not the fact that a man could be caught by such transparent humbug argue that there is something wrong with his head? The fine lot of bimetallists that Mr. Brooks bagged is a strong corroboration of our ancient thesis that bimetallism is, in many of its victims, a form of mental strabismus. Moreton Frewen escaped Brooks, but this was doubtless only because he was not in Debrett and was in this country.

Short work was made of the lying prince of begging-letter writers by the jury. They would not even hear him out, but found for Mr. Labouchere, with costs, without leaving their seats. So Brooks will probably give up his carriage and his work for the nobility and turn Radical again. His success for eight long years is an appalling thing, and his final exposure ought to serve a useful end. The moment one of his lying letters was turned over to the Charity Organization League, the man was investigated, and his whole scheme of hypocrisy and fraud laid bare; yet think of the easy way in which he laid his hands upon $40,000 of the money of the charitable. The only defence left them is the one that Mr. Howells urges for indiscriminate and unblinking charity—namely, that it makes the giver "feel good."

THE HOLY MOUNTAIN.

ALLAHABAD, November 12, 1896.

INDIA is a very uncomfortable country, but so interesting that one does not notice discomfort until there is leisure to think about it. This year is worse than common. Drought makes every road a river of dust; other rivers are dried up. Grain is poor as well as scarce, and garden products are sapless. As for food, the traveller is in a bad way. If he eats meat or fruit, he is threatened with cholera; if grain or vegetables, he is reminded that the bubonic pest (which is fatal, though the hotel-keepers discreetly allude to it as the *chota bimâlî*, "little sickness" of Bombay) chiefly affects vegetarians. Fish is forbidden by taste as well as by prudence. Milk must be rigorously eschewed, and butter is not less baneful. Bread and tea are both poor stuff in India, and water of course is always dangerous. The only good and sure thing is whiskey. The Anglo-Indians have, indeed, two curious theories in regard to *bilâti pânî*, "soda water"; first, that if whiskey (brandy is now tabued) be added to it, every deleterious effect of the water will be offset; and, second, that, if allowed to stand a few days, the soda water becomes harmless, no matter what its source: "The impurities settle to the bottom of the bottle." "Including the germs?" I asked. "Germs," said my informant, an English officer, "are a figment of the physicians." What with natives who will not be segregated when attacked by the plague, and Europeans who will drink soda water made out of the local stagnant pool, it is no wonder that the shrines of the disease gods are reaping the only harvest of the year, and that a few Europeans have lately died of cholera. The autumn's temperature has been abnormal, though for an American 95° to 100° in the shade is still quite endurable, but it is moderating and now seldom goes over 90° at noon. It is the sudden drop to 45° at night that affects the health.

Apropos of the famine (for when the price of grain is advanced from 100 to 200 per cent. the expected famine may fairly be said to have arrived), a curious instance of the relations between Government and the natives was unwittingly recorded this week by the Government organ, the *Pioneer*. On one page the reader was told that Lord Elgin, the Viceroy, in the course of a facetious after-dinner speech made at Ulwur, said that, although he had been advised to give up his annual tour of inspection and devote himself to the work of relieving starvation, yet he should not do so, for there was as yet, so far as he could see, "no famine at all"; in confirmation of which he read a telegram from "some one" which stated that there was no real distress. On the next page of the same paper it was reported that several wretched creatures in the central provinces had been found too weak to make use of anything save cooked food; that they were dying of starvation, and not a few had perished ere their friends (they themselves being too listless to make the effort) could convert into food the tardy coins destined for their relief. The Viceroy spoke largely of his "duty of inspection," but, though it is doubtless true that the tour is not wholly one of pleasure, the account of junkets, dinners, shows, and illuminations (at Ulwur the Viceroy spent the whole evening "enjoying the brilliant spectacle") is not calculated to make more loyal the impoverished natives, who are already restless and discontented with English "indifference."

That Government has refused to limit in any way the export of grain, and adheres strictly to the principle of non-interference with trade, is another popular grievance; but this is a question of polity, which may be defended. The result, however, as the natives point out in very strong language, is that nothing now can check the rapacity of the crafty *bunnias*, dealers, who hold their grain, sell it by handfuls, and daily force up the price, hoping that it may not rain, while every one else in India is praying that it may, speedily withal; for, given water within a fortnight, and famine may be averted; but otherwise—and as yet there are no indications of rain—there will be a sad tale to tell of the coming year.

Of these things, when I sat down, I did not intend to write, but out of the fulness of the heart the mouth naturally speaketh of the present rather than of the past; and the present condition of India, not only in respect of material needs but also as regards her changing attitude toward England, is one of absorbing interest. It were easy to be indiscreet, and for the nonce I shall say no more on this point, except this, that there is more thought than is spoken, and that the annual "Indian Congress" but faintly reflects the feelings of high-caste Hindus. As an American I have received confidences from lips that were sealed or gave only smiling answers as long as I was supposed to be English; and from these confidences it has become clear that the sentiments voiced by the "truculent Bengalese," as English papers style them, are not confined to any one district of India, but, if they have found no loud echo, are already reëchoing softly in the hearts of all the people.

I have endeavored to obtain some information in regard to the moribund trade-guilds of Gujarat, but my notes are not yet sufficiently systematized. I found, however, as I expected, that Rajputana showed a less developed organization of guilds. Strictly speaking, these corporations are not guilds but trade-unions, both in Rajputana and in Gujarat. Though I must reserve till another time a discussion of these antique unions, let me give of the powers assumed by them one amusing example, which I got the other day from Dhraugodar in Kathiawar. It appears that two or three years ago cholera broke out in this little state, starting among a colony of sweepers. The Mahâjans, or chief men of all the unions, thereupon assembled together and decided that the sweepers had been exercising bad magic, and that, to remove the evil spirit of disease, the culprits' homes must be burned. The Mahâjans then marched in a body to the sweepers' quarter and personally set fire to the latter's houses, which were destroyed. No one thought of making a stand against the Mahâjans, not even the sweepers, till some meddling European informed the sorcerers that they could get damages in court. Eventually the Mahâjans were amerced in the estimated value of the burned buildings, and the fine was paid out of the local funds of the union. It is evident that a few years ago this last act in the comedy would never have been played. The Mahâjans ruled the town. The sum paid out of the funds as a fine was entered in the account-book of the union as "moneys disbursed for the suppression of cholera"; and the joke after all was rather with the Mahâjans, for the drastic means employed actually stopped the cholera!

To visit the Holy Mountain of the Jains, which rises steeply above the plain of Palitana, was one of the secondary objects of my trip to Kathiawar. I was informed that few Englishmen and no American had ever before ascended the Holy Mountain, and though the latter statement is doubtless incorrect, yet the necessary preliminary—a long, tedious, and dusty drive in a *shigram*, or bullock-cart—has probably prevented most tourists from abandoning the railroad and taking the journey across the plain to Palitana; so I may perhaps venture to hope that to many of your readers a description of this wonderful town may prove of interest.

The river Shatrunjaya waters, or tries to water, a broad prairie. Over this rises a lofty double crested hill, from the summit of which one can see the Gulf of Cambay to the east, to the southwest the veiled form of the giant of the Gir; while west and northwest stretches a vast plain; but southwards lesser hills modify the abruptness with which, as one approaches from the north, the Holy Mountain seems to spring directly out of the low level beneath it. On this mountain is the silent city of the gods. From crest to crest, and filling all the cup between, are streets and squares of temples, while around them all circles the high wall which guards the whole. Save the few priests, who daily tend the gods, no man lives there. At sundown the only gate closes behind the last pilgrim, as he is hurried through the battlemented rampart, and the Holy Mountain is left to the divinities and their appointed servants. The city is one huge sanctuary, for within it no layman is permitted to eat or drink. At the very gate of the town itself, as elsewhere at the gate of a temple, the shoes must be put off. One enters quietly among the gods. The accompanying priest speaks in low tones; there is no bustle within or noise of any kind, save the tinkle of temple bells, the soft twit-

tering of birds about the door, and the fervent prayer of some passionate pilgrim kneeling before his chosen shrine and calling on his god, as he sways his body backwards, and again forwards till his forehead rests upon the marble floor. The long streets of individual temples are broken only by great courts, each having a separate wall and gate, and fashioned within after the type of Hindu houses. One grand temple rises in the middle of each court, while little jewelled shrines line all the sides.

The effect of the whole is impressive but peculiar. The place seems not so much like a city of living gods as like a cemetery of the dead. And some of these gods are indeed dead, for even the Five Pandavas, the heroes of the great Epic, have here a temple, and stand up in a row, very fierce and straight, with their mother and mutual wife on either side. But they get no flowers now. On the other hand, although most of the temples are devoted to the deceased Tîrthankars, or Saints of the Jains, yet there is a pleasing catholicity about this modern pantheon, and in fact one of the shrines most frequented is a Mohammedan tomb, while a Shivaite goddess has perhaps the most popular porch of all; so that the mountain is holy to Jain and Mussulman, Shivaite and Vishnuite alike, and the gods of the latter sects are as alive now as ever they were.

The finest temples here are naturally those built by the Jains, and these afford a good opportunity to study historically Jain architecture, which differs almost as much from the ordinary Hindu temple architecture as it does from that of the Mussulmans. The priest that accompanied me said that the earliest temples on the mountain were built about 8000 before the Christian era, and that is as near as one usually gets to an exact date when one asks a native. The oldest of these shrines dates in fact from the eleventh century A. D., and the place was evidently used at first as a refuge and defence, what time the Mussulmans swept Kathiawar and ravaged rich Somnath. All these marble and inlaid palaces are kept in good repair, and it is still fashionable for wealthy Jains to erect here and there new shrines; but the place is already so crowded that few more can be built, and I noticed that one of the latest temples is erecting on the road up the mountain. If devotion continues, there will doubtless be in course of time a row of stately temples from the bottom to the top of the Holy Mountain.

As the morning advanced and the sun began to pour directly down upon the glittering pavements and flash reflected from every marble wall, the temperature grew unbearable. Each narrow lane of shining stone became an open oven, wherein the passenger struggled against glare and heat, but felt that he was approaching dissolution. I gave at last the order to descend, and, after being decorated with a garland of flowers, graciously offered to me by the courteous attendant (terms cash), got into the *dooly*, a swinging seat borne on the shoulders of four coolies, and descended to the plain below, where even then, though it was still early, great heat waves seemed to undulate in misty whiteness across the arid waste: but it was only the glare and dust ascending.

This letter, I fear, is overgrown already, but may I add to its heterogeneous contents two rather interesting philological items? As is well known, the addition of *eka*, 'one,' to ten or hundred is often said to give a "depreciatory" sense to the Sanskrit numeral. Now I am not aware that this has been brought into connection with a fact in modern Hindustani, to wit, that *das-ek* does not mean 'eleven' (this is *igârah*), but 'about ten.' May not the older meaning also have been not "depreciatory" but simply indefinite? The second item is a fact I observed in the vicinity of Bhaunagar. In this State, pure Gujarati is spoken in the capital, but every village has its local dialect. In Bhaunagar city the Sanskrit initial *s* remains intact, as it does everywhere in pure Gujarati, but among the villages in the neighborhood it is the practice to substitute for this *s* the *spiritus asper*. Thus, for *samjânte*, 'Do you understand?' the villagers say *hamjânte*, making the same change as obtained regularly in Avestan and occurred on occasion in Greek.

E. Washburn Hopkins.

JEAN FOUQUET.

Paris, December 18, 1896.

M. Gruyer, a member of our Academy of Fine Arts, published last year, at this period, the first volume of his description of the picture galleries of Chantilly. This magnificent volume, illustrated with fine photogravures, was dedicated entirely to the foreign schools. M. Gruyer promised to give us another volume on the French School, which is so magnificently represented at Chantilly. He found out that one volume would not suffice; in all likelihood three volumes will be necessary.

This year a single painter has filled the volume which M. Gruyer now offers for our admiration. Jean Fouquet occupies the first place among our French *primitifs;* his work was considerable, but it has become very rare. The Duke d'Aumale has been so fortunate as to be able to add to his collection of French painters no less than forty authentic paintings of this old master. "Les Quarante Fouquet" are famous miniatures, which were detached two centuries ago from a book of Hours, made for Étienne Chevalier, Treasurer of France in the reign of Charles VII. Each of these large miniatures is a picture in itself, a composition with numerous figures and with a dramatic effect. The photogravures in M. Gruyer's book have, of course, not the ideal charm which is found in the miniatures themselves, so remarkable for their color; in them we can appreciate only the beauty of the composition, the variety of the attitudes, the expressions of the personages. We lose much, yet enough is left to give a true idea of the genius of the painter.

About Jean Fouquet himself we really know very little. He was born between 1410 and 1425 (it is impossible to give the date with exactitude) in Touraine. The city of Tours and the landscapes of Touraine, "the garden of France," as it was then called, are constantly found in his landscapes. It is evident that he learned his art from the Flemish painters, the masters of Bruges, who had acclimatized their naturalistic art in the Duchy of Burgundy; but it is also evident that he learned much from Italy. M. Henri Bouchot, in the *Gazette des Beaux Arts*, has recognized the hand of Jean Fouquet in some miniatures of the 'Bible Moralisée.' These miniatures seem to have drawn the King's attention to Fouquet, then a young man, and to have led to the making of the King's portrait now in the Louvre. It represents Charles VII., about the age of forty, in the year 1444; already worn and old-looking. The Pope sent for Fouquet in 1445, and also wished to have his portrait painted by the French artist. It was Eugene IV., who had just reëntered Rome after his expulsion in 1434 by the populace, at the instigation of the Colonnas. This portrait, which must have been very interesting, as Eugene IV. was represented in company with two dignitaries of the Papal Court, was placed in the sacristry of the church of Minerva; it remained there till the middle of the eighteenth century. Nobody knows what has become of it since that time. After he left Rome, Fouquet remained some time at Florence, where he became acquainted with Gentile da Fabriano, of whom Michael Angelo said that his style was as sweet as his name, and where he was able to study the pictures and the drawings of Vittore Pisano.

On his return to France, Fouquet found at once a most powerful patron in the person of Étienne Chevalier, who ordered him to paint a diptych for the Church of Notre Dame, at Melun, in memory of his wife, Catherine Budé, whom he had lost some time before, and who was buried in that church. Étienne Chevalier owed his fortune to Agnes Sorel, the famous mistress of the King; he had always remained a friend of hers, and was chosen by her as the executor of her will. He buried her, according to her will, at Loches, the place nearest to the village of Fromenteau, where the favorite was born. One of the sides of the diptych shows the Virgin Mary, with the features of Agnes Sorel; the other is the portrait of Étienne Chevalier, with his patron Saint Stephen at his side. At the same time Chevalier ordered Fouquet to illustrate for him a book of Hours, in which Jesus Christ, the Virgin, and the Saints were to be glorified. This work occupied the painter for nearly ten years, from 1452 to 1460. It marks the finest period of the life of the painter, and is a real monument of art. The influence of Italy is clearly felt in it. If its heavy furs, hats, and accoutrements remind one still of the Flemish school, Italy is easily recognized in its porticoes, pilasters, domes, in its groups of angels which take the mind back to the purest pre-Raphaelite schools. The anatomy of the bodies is still a little cold and dry, but there is a marked effort toward the exact reproduction of nature.

Charles VII. died on July 22, 1461, and his successor, Louis XI., cared very little for art, and was occupied only with ambitious schemes. Fortunately for Fouquet, Chevalier outlived Charles VII. seven years, and continued to protect the painter to the end. In 1469 Fouquet illustrated for him a Boccaccio which is one of the jewels of the Royal Library at Munich. M. Gruyer cites carefully the following works of Fouquet: the Hours made for Jean Moreau, a citizen of Tours, and those of Marie de Clèves, Duchess of Orleans. Both are lost for the present, but they may some day emerge from an unknown library.

Fouquet began in 1438, by order of Charles VII., an illustration of the 'Great Chronicles of France.' We possess in the National Library at Paris these Chronicles, in which Fouquet appears as a painter of battles, and shows us Paris during the struggle between the Bourguignons and the Armagnacs, with its gibbet of Monfaucon, its tower of the Templars, Tours surrounded by its walls. Unfortunately the 'Great Chronicles' extend no further than the beginning of the reign of Charles VII.; we can therefore not look in this work for Joan of Arc and her romantic exploits. In 1470, Louis XI. founded a new order of chivalry, the order of Saint-Michael;

and on this occasion he had his portrait painted by Fouquet, surrounded by the new knights. Shall we call it a portrait? "We know," says M. Gruyer, "that Louis XI. did what he pleased with his portrait painters. Once he charged Colin of Amiens with this task, ordering him to suppress wrinkles and whatever was ugly and old, to give him an aquiline nose, a round face, hair in abundance. He asked him to paint very minutely the insignia of the Order of Saint-Michael, to take particular pains with his coat, his hunting-boots, and his horn. And this is what we call 'historical evidence'!" The legendary face of Louis XI. is so different from the portrait by Fouquet that the latter was for a long time taken for the portrait of Louis XII.

Jacques d'Armagnac, Duke de Nemours, was also one of the great patrons of Fouquet. It was for him that he made the illustrations for the 'Antiquities' of Josephus. The Duke de Nemours was beheaded in 1477 at the age of forty years; his daughter, Catherine d'Armagnac, married the Duke de Bourbon, and the last admirable work of Fouquet thus came into the possession of the house of Bourbon. It is now in the National Library at Paris. After the tragic death of the Duke de Nemours, Fouquet lived three years longer at Tours, where he died in 1480.

The Hours painted by Fouquet for Étienne Chevalier show us in three miniatures the portrait of the Treasurer of France; and his initials, E. C., are spread everywhere in this incomparable work. Gaignières, the famous collector, had copies made of them and of the portrait of Charles VII. for a great collection which bears his name and is in the National Library. The manuscript was mutilated only towards 1700. Forty great miniatures were bought at Bâle by George Brentano La Roche of Frankfort, and are now framed and hung in the galleries of Chantilly. Besides these only four more are known; two are in the museum of the Louvre; the third was found in 1881 by M. George Duplessis, the keeper of our gallery of engravings at the National Library, and offered by the Duke de la Trémoille to this library; the fourth was in the collections of the poet Rogers, and was offered by him to the British Museum. It is not impossible that a few others may be found hereafter.

M. Gruyer describes with great minuteness the forty miniatures of Chantilly, and enters into many interesting details on their subjects. The first shows Étienne Chevalier and his patron saint attended by angels and doing homage to the Virgin and the infant Jesus. "Under the brush of Jean Fouquet, we see the art of the Middle Ages giving way to the art of the Italian Renaissance." If the dress, the attitudes, the instruments of music of the angels recall to us the statues of the cathedrals of the Middle Ages, the Italian Renaissance triumphs in a portico with gilt woodwork, in pilasters of the Corinthian order, in the various details of architectures, in the genii which smile over a cornice, holding in their hands garlands of foliage and fruit. We see at once that Fouquet found all the elements of his decoration in the churches of Florence; he remembers Brunelleschi and Michelozzo. We see in almost all these charming miniatures the happy marriage of the traditions of the Middle Ages and of the reviving admiration for the pure and magnificent works of antiquity. As M. Gruyer says: "Jean Fouquet, though he has his domicile on the banks of the Loire, always lives in thought on the banks of the Tiber and the Arno."

Those who, after having admired the exact reproductions obtained by the modern processes of the forty miniatures of Fouquet, read the pages which M. Gruyer writes on each of them, will have much to learn from one who has made it the object of his life to study the Italian and the French schools, and will admire also the historical knowledge which has enabled him to make many interesting remarks on the work of the painter of Charles VII. and Louis XI.

Correspondence.

A MEMORIAL TO THOMAS HUGHES.

To the Editor of The Nation:

Sir: It may interest some of your readers to know that a subscription has been started in England to erect a permanent memorial to the late Thomas Hughes, Q. C., author of 'School Days at Rugby.' A meeting of old Rugbeians was held in the Jerusalem Chamber at Westminster, on June 10, when the following resolutions were passed:

"That a personal and permanent memorial to Tom Hughes should be established at Rugby; that the subscription list should be opened to the friends and admirers of Tom Hughes all the world over; that the first object to which subscriptions should be applied should be a life-size statue of Tom Hughes by a first-rate sculptor, and that any surplus of subscriptions after the provision of the statue should be devoted to assisting the Home Mission work identified with Rugby."

A committee headed by the Rt. Hon. G. J. Goschen is in charge of the work. They have ascertained that such a statue as is desired may be procured for £1,300. Subscriptions may be sent to the "Tom Hughes Memorial Fund" at Messrs. Prescott, Dimsdale & Co., 50 Cornhill, E. C., London. The writings of Thomas Hughes have exercised so extensive and healthy an influence in the United States, that it hardly can be doubted that many Americans will feel like responding to this call. On the circular in my possession subscriptions are announced of all amounts from £100 to half-a-crown—that is, from $500 to sixty cents. It is not improbable that this appeal has already been brought to the notice of the American friends of Hughes; but the circular reached my hands only a short time ago.

I may add that the Rugby School Mission, in which Tom Hughes was greatly interested, is doing admirable work in London and Birmingham among the lowest class of boys.

William Everett.

Quincy, Mass., December 22, 1896.

A CASE OF PIRACY.

To the Editor of The Nation:

Sir: Will you permit me to call attention, through your columns, to a new development in the pirate's trade in the United States? In 1894 Messrs. Macmillan published in their "Cranford" series a version of 'Æsop's Fables,' retold by myself, with introduction and notes derived for the most part from my larger edition in the "Bibliothèque de Carabas." The book was intended for children (and their parents), and was illustrated by Mr. T. Heighway.

I have recently come across an entirely unauthorized reprint of this work, reproducing by some photographic process the whole work except the notes, and professing to be published by a Boston firm, which modestly veils its identity under the title of "The Rodgers Company" (significant name—why not the "Jolly Roger Company"?).

So far all is according to the professional etiquette of the pirate. But it is, I think, unusual with him to entirely remove all reference to the author's name, as has been done in the present instance. One cannot, perhaps, be surprised if some publishers fly the Jolly Roger, but they might not, at least, change the ship's name.—Yours faithfully,

Joseph Jacobs.

December 28, 1896.

THE BIOGRAPHIC TERROR.

To the Editor of The Nation:

Sir: In your review of Augustus J. C. Hare's 'Story of My Life' occurs the following sentence: "It would be interesting to know if we are entering on a series of biographies and autobiographies of which the terrible frankness of this and Purcell's 'Manning' and Hamerton's autobiography are notable examples." There is no question that, from the æsthetic standpoint, such books are to be condemned; but can the same be said from the ethical point of view? Many a man whose moral character is weak is kept reasonably close to the path of rectitude by the fear that a wide deviation therefrom may become publicly known. For the same reason most men refrain from public display of infirmities of temper. The restraining force of public opinion is all the stronger if it sits in judgment upon a man not only during his life, but after he has passed away. If a man knows the weak points of his own character, he will probably take the necessary precaution to prevent, not only contemporaries, but posterity, from criticising adversely any acts of questionable morality that he may be tempted to commit. He will take the advice of the prudent Scotchman—

> "If there's a hole in a' your coats,
> I rede ye tent it;
> A chiel's amang ye takin' notes,
> And, faith, he'll prent it."

It is the vice of most biographies, as of most funeral sermons, that they are too eulogistic; that they show us only the good side of their subject and pass in silence over the bad ones. There is often a wide difference between a man as his neighbors and friends knew him, and the mental picture of him intended for the larger public after his death. The prime requisite of a good biography, as of a good history, is that it shall be truthful. A man's life may be worth writing as an example for, or as a warning to, posterity, or as a mixture of both. In any event the truth should be told. For we may feel sure, with Sir James Mackintosh, that the whole of truth will never be detrimental to the whole of virtue. If a man's career has been such that it will not bear public scrutiny, it is better that it be buried in oblivion. If his position in life be so conspicuous that this is impossible, let him see to it during life that no stain be placed upon his memory by his own acts. It will do the world no good, and it may do much harm, to look upon the past through the distorting medium of personal feeling or of national pride.

The disagreeable frankness of some recent biographies is in accordance with the scientific spirit of the age, and we may expect more of them. This spirit is unmerciful in its search for facts. It is no longer content to explore the hidden recesses of the physical universe; it has invaded the mysterious depths

of the human mind. There is nothing hid that shall not be revealed, is a prediction that is in process of fulfilment, not as theologians understand it, but as the undaunted searchers for truth have willed it. CHAS. W. SUPER.

DECEMBER 24, 1896.

"ORGANIZED LABOR" AND THE MERIT SYSTEM.

TO THE EDITOR OF THE NATION:

SIR: Indiana should not be named as the only State in which the leaders of "organized labor" have advocated the adoption of the merit system. When the civil-service reform bill was pending before the last Ohio Legislature, its passage was urged by a resolution of the Cincinnati Trade and Labor Assembly, and the President and Secretary of that organization went before the Committee to which the bill was referred and spoke effectively in its favor. The Ohio trades-unionists are civil-service reformers so far as heard from.

C. B. WILBY.

CINCINNATI, December 21, 1896.

ECONOMICS IN EARLY AMERICAN COLLEGES.

TO THE EDITOR OF THE NATION:

SIR: The unanimity with which the graduates of our colleges rallied for the defence of the national integrity and honor during the recent Presidential struggle, has had wide recognition. This fact may lend general interest to a brief statement of the length of the campaign which these colleges have carried on for the economic education of the American people. The meagre records of our earliest colleges and their vague language would make it difficult to apportion the degree of honor which each deserves for its early and continuous offer of such education.

The University of Pennsylvania (College of Philadelphia), one of whose founders was Franklin, appears to have been the first to offer instruction not only in law and in civil government, but also in economics. In 1756 this college adopted a plan of liberal studies framed by its Provost, William Smith, in which, after prescribing a "preliminary training in logic and metaphysics to develop his powers of thought, the student was to be brought to a knowledge and practical sense of his position as a man and a citizen, and this by a course embracing ethics, natural and civil law, and an introduction to civil history, to laws and governments, to *trade* and *commerce*." William and Mary College in 1779 added to its curriculum the subjects of law and police and the law of nations, and sometimes it has been assumed that economics was taught from that date in connection with the last-named topic. An old copy of the college laws without date, but showing that it was printed in the early part of this century (about 1807, according to President Lyon G. Tyler), mentions Smith's 'Wealth of Nations' among the text-books then used. Considerable search and personal inquiry has failed to discover economics in the curriculum of any other college before 1820, when it was enumerated among the subjects to be taught at Harvard. Its addition to the curriculum of the rest of our older colleges soon followed—at Yale in 1824; at Columbia in 1827; at Dartmouth in 1828; at Princeton in 1830; at Williams in 1835. The accessible evidence tends to prove, and correction is asked if the keepers of original records find reason for it, that the professorship of Moral Philosophy and Political Economy established in Dartmouth College in 1828 was the first chair so named in the United States.

The almost simultaneous introduction of this study by Harvard, Yale, Columbia, Dartmouth, Princeton, and Williams probably was due to the industrial revolution which the inventions of Arkwright, Hargreaves, and Fulton had wrought, the expansion of commerce which followed the close of the Napoleonic wars, the growth of our population, and the increasing mobility of labor and capital, which before 1820 gave rise to new political issues in the United States—tariff, Bank, slavery, and internal improvements. The addition of economics to the curriculum of these colleges undoubtedly was facilitated by the appearance, as early as 1821, of an American edition of Say's 'Political Economy.' This was the first text-book upon this subject used in most of these colleges, and presented it in clear, orderly, and attractive form.

JAMES F. COLBY.

HANOVER, N. H., December 18, 1896.

HOW TO BUILD UP A UNIVERSITY.

TO THE EDITOR OF THE NATION:

SIR: The last official list of the accredited schools of the University of California enumerates sixty-seven secondary schools, the pupils of which are privileged to enter the University without undergoing the formality of an entrance examination.* Such an educational Utopia might indicate—to the initiated, at least—an almost miraculous development and progress in our public-school system within comparatively a few years. But those in a position to judge best are not a little alarmed at this diffusion of higher education at the expense of lowering the standard of attainment. No doubt the almost boundless extension of accredited schools has been partly resorted to as a compromise measure. For many years the University was languishing and the attendance defective. Only ten years ago there were hardly 300 students in the different departments of Berkeley, while there are at present nearly 1,500, with a freshman class of over 500 members.

The founding of the Leland Stanford, Jr., University at Palo Alto caused considerable stir among the supporters and those depending directly upon the success of the University of California. With the institution of the present system of accredited schools the flood-tide in favor of Berkeley has set in, as far, at least, as quantity is concerned. While the University gained by the new system a certain beneficent supervision over the secondary schools, not originally provided for by any organic law, the final result of the plan has so far proved detrimental to the cause of thorough higher education. Year after year the number of students in our State University has increased, as there is almost no barrier to keep them out. After a secondary school once has been accredited, the future university student need apply himself only moderately in order to insure his or her matriculation upon the recommendation of the high-school principal, considering that to such principals (who, with their assistants, are almost without exception elected annually) it is of vital importance to make a good showing by recommending and inducing their pupils to enter the University. In many cases the preparatory work is most superficially and wretchedly done, as the Berkeley professors are ever ready to admit. The writer knows of cases where the whole Latin course, covering nominally four years, was completely finished by boys of average ability within one year—of course somewhat in the fashion in which Arthur Pendennis galloped through the classics with his tutor, while preparing at his mother's home for Oxford.

Now, as we here in California are continually assured that the entrance conditions of our State University are essentially those of leading Eastern colleges, it would be interesting for the advocates of a higher educational standard to know what percentage of the pupils from our accredited schools intending to enter the State University in the fall of '97 could pass the prescribed entrance examinations of Brown, Amherst, Bowdoin, or Dartmouth, or even the examinations exacted from a certain class of applicants for Berkeley and Palo Alto. The leading universities and colleges of this country, foremost of all Johns Hopkins, Harvard, Yale, Columbia, Princeton, and a score of others, do not approve of the accrediting system, and, as a rule, adhere to a strict entrance examination. That, of course, implies hard and earnest work for any applicant, who can easily measure his eventual chances of success beforehand by a close study of the examination papers of previous years at his disposal.

After careful inquiries, I find that not a single country in Europe has ever dispensed with the university entrance examinations. The pupils of the great English grammar schools, such as Eton, Harrow, Rugby, and others, must pass the matriculation examination before entering the universities, no matter how elegant the Latin verses and the Greek composition of the applicants may previously have been. The French lycée admits no student to the university without a severe test before a board of Government examiners, and the same rule applies also to the German gymnasium. Here the examining board will only in exceptional cases excuse an applicant of high standing from the oral examination; from the written, *never*.

The university entrance examinations throughout Europe mark an important epoch in the career of those who wish to undergo this severe ordeal, and no examination that may follow afterwards is regarded as of equal importance and severity. It is essentially the separating of the wheat from the chaff. Were we here in California to apply these principles to our secondary schools, the University of California would not have to descend to the level of the high schools, and make up the deficiency in the proper preparation during the freshman and even sophomore years. It is not so much quantity as quality that should be expected of the State University, established by the people, for the people, in the interest of higher education. However, this aim is not reached—to use the homely truism of one of our California university presidents—"by placing every fifty-cent boy or girl within reach of a two-thousand-dollar college education"; and the inevitable result of such a policy must be to bring about a condition of affairs to which Bulwer-Lytton refers in one of his works with an almost prophetic pathos, when he

*For a number of years past the University of California has annually sent members of its faculty to the different high schools throughout the State to ascertain whether or not the work of these schools should be accepted by the University. So far, these examiners have added every year to the number of accredited schools, and at present only a few small secondary schools of the State have not yet been placed on the favored list. In a few cases only, privileges already granted have been partly withdrawn from some of these accredited schools.

writes: "It is not from ignorance henceforth that society will suffer—it is from over-educating the hungry thousands who, thus unfitted for manual toil, and with no career for mental, will puzzle wiser ministers than I am." A CALIFORNIAN TEACHER.

DECEMBER 17, 1896.

"A DUNGEON OF LEARNING."

TO THE EDITOR OF THE NATION:

SIR: In your issue of Nov. 26 occurs, in p. 409, col. 2:

"There is a vast difference between 'a mine of learning' and 'a dungeon of learning.' The lucidity implied by the former phrase," etc.

The fact is, however, that, as ordinarily used, the latter phrase is exactly an equivalent of "a mine of learning," and connotes no deficiency whatever of "lucidity." We have, in it, a provincialism, the currency of which is chiefly confined to Scotland and some parts of the north of England. And in no way or degree is it depreciatory. The lady who, according to Boswell, spoke of "a dungeon of wit," intended to be highly complimentary; and no Caledonian would think himself disparaged, but quite the contrary, by being called "a dungeon of wisdom."

"A dungeon of learning" is "a magazine, treasury, or storehouse of learning"; the metaphor being based, presumably, on an arbitrary retrenchment of the secondary import of *dungeon*, namely, 'a receptacle both deep and dark.' It may be noted, in this connection, that *dungeon*, to signify 'abode,' 'habitation,' high or low, as it sometimes did of old, is not known to have survived to recent days. F. H.

MARLESFORD, ENGLAND, Dec. 12, 1896.

Notes.

THE turn of the year brings us in sight of the beginning of the complete Byron—Prose and Poetry—to be edited by his grandson, the Earl of Lovelace, and published in conjunction by John Murray, London, and Charles Scribner's Sons, New York. All other texts, it is said, will be put to shame by this, which nearly all the original MSS. and proof-sheets are extant to verify. Moore's letters will be greatly filled out and extended.

If the number and beauty of illustrations, excellence of typography, and sumptuousness of general appearance are to be regarded as the prime requisites for a Christmas gift-book, the palm must be borne off this year by Prof. Sloane's 'Life of Napoleon Bonaparte' (The Century Co.), of which the first volume has just been published. This volume goes only to 1797, and is occupied mainly with a narrative of Bonaparte's early life, and of the political disturbances in Corsica in which he played a part before he became an actor on a larger stage. The author's style and method of treating his subject are already familiar to readers of the *Century Magazine*, and need no comment at this stage of the publication of his articles in book form. But a few words must be said about the illustrations. Several new ones, reproduced in color from famous pictures, have been added to those which originally appeared in the *Century Magazine*. In excellence of workmanship it would be difficult to surpass these reproductions, among which is the frontispiece, Meissonier's celebrated "1814." Still, we think a protest should be entered against the practice of adorning professedly historical work with fancy pictures. The ideal way of illustrating volumes of history or biography is to insert only contemporary portraits and pictures, facsimiles of documents, and illustrations affording the reader additional information from the standpoint of actual observation. It is in this fashion that most of the best modern histories published in Europe have been illustrated, notably Duruy's celebrated histories of the Greeks and Romans, and Erdmannsdorfer's admirable history of Prussia to the accession of Frederick the Great. The Century Co. and Prof. Sloane do, indeed, supply some contemporary portraits, but their most elaborate illustrations are reproductions of fancied scenes in the life of Napoleon and in the history of his time, which possess not the slightest historical value — such pictures, for example, as "Bonaparte Pawning his Watch" and "Bonaparte as a Frequenter of a Six-sous Restaurant in Paris."

Few, if any, more brilliant narratives describing life in Paris during the Reign of Terror have been written than M. Edmond Biré's 'Journal d'un bourgeois pendant la Terreur,' which has just been translated into English as 'The Diary of a Citizen of Paris during the Terror' (Dodd, Mead & Co.). The author is a distinguished historical scholar, whose reputation as a critic rests upon his excellent little work 'La Légende des Girondins,' which is so far the most valuable contribution towards a true knowledge of the aims, policy, and personalities of the group of brilliant young orators whose pathetic fate has obscured their shortcomings. Steeped as this work and his 'Paris en 1793' show him to be in Revolutionary lore, M. Biré resolved to depict the daily life of a middle-class inhabitant of the capital during the most dramatic epoch in French history. His minute knowledge enabled him to use a wealth of detail after the fashion of Defoe, and events live in his pages as vividly as in those of actual contemporaries. But he has an advantage over contemporaries in that he can insure the presence of his fictitious hero at all scenes of importance. The book is not to be confused with ordinary historical fiction of the Weyman type, for M. Biré backs up his statements with constant citations from primary authorities, and his learned notes make his volumes a first-rate guide to the bibliography of the French Revolution. To any one who desires a correct and vivid knowledge of the circumstances of the Reign of Terror, and who is disinclined to work through Schmidt's 'Tableau de la Révolution Française,' M. Biré's volumes may be commended as far superior to the abstruse and specious wordiness of Carlyle's 'History,' or the tawdry inaccuracy of Dickens's 'Tale of Two Cities.'

In the third and concluding folio volume of Cathedral Cities, etched by R. Farren, and published by Macmillan & Bowes of Cambridge, is terminated a publication dealing with the four eastern and the two northern cathedrals of England. The Minsters of the North, York and Beverly, together with Lincoln, a minster of the East, occupy this volume, to which is prefixed a most workmanlike and painstaking introduction by the late Prof. Edward A. Freeman. "I do trust it will come out some time," he wrote to the publishers in 1887. "I spent a good deal of good work upon it." The minute pains bestowed upon the subject, which may be said to have been for a long time the one nearest to Freeman's heart, lends an interest to his introduction only less than that which attaches to his similar introduction to the first volume of the series dealing with Ely and Norwich. Lincoln and Beverly are not intrinsically so interesting as York, as Ely, or as Norwich, and our writer has devoted especial pains to Beverly. As for Mr. Farren's etchings, they are up to the mark of those in the previous volumes. Long since, his view of Ely from the flooded fen, and of Peterborough from the river Nene, proved him to be a worthy representative of Old Crome, and in the present volume his view of Lincoln Minster from Holmes Common must be called his masterpiece, worthy to rank with those earlier visions of the fens and broads.

Under the title 'Fireside Stories Old and New,' Henry T. Coates & Co., Philadelphia, publish a collection of short stories of approved excellence, including such classics as "Father Tom and the Pope," Poe's "Purloined Letter," Balzac's "Chef-d'Oeuvre Inconnu," "A Dog of Flanders," O'Brien's "What Was It?" and others. To younger readers these volumes will be an acceptable holiday gift, while the older will not grudge them a place on the library shelf.

Under the title 'Papers Presented to the World's Congress of Ornithology,' the Charles H. Sergel Co., Chicago, have issued, in an attractively printed octavo volume of about 200 pages, the papers read before the congress held in Chicago Oct. 16-21, 1893, under the auspices of the World's Congress Auxiliary of the Columbian Exposition of 1893. These papers, twenty-seven in number, are all of a popular character, and from the Presidential address by Dr. Coues on to the end of the volume approach the subject very largely, almost wholly, in its æsthetic and humanitarian aspects. The papers are varied, mostly well written, and many of them exceedingly interesting, not only for the every-day reader, but for students of bird-lore. They can but serve a useful purpose in awakening a more general interest in the subject of bird protection, and deepen desire for the study of one of the most beautiful and attractive classes of animals—already a fascinating recreation to so many amateurs seeking a closer contact with nature.

The multiplication of editions of Horace shows the never-dying appreciation of this poet, who has something for every man, in spite of the paradoxes as to his lyric genius promulgated in our own day. The edition of Messrs. Page, Palmer, and Williams, abridged for the use of English schoolmasters (Macmillan), is greatly to be commended as presenting the result of the soundest researches in an elegant form and lively style. It is not, like some recent editions, given up to reviving Bentley's wildest vagaries in the text, and coupling them with Kiessling's no less wild vagaries in interpretation, but is everywhere sensible and sympathetic. The matter of quotations from both ancient and modern poets is, in accordance with the prevailing fashion, somewhat overdone; but the editors have deserved well of Horace and his readers to-day.

Lemcke & Buechner send us the *Almanach de Gotha* for 1897. The editor's preface, always readable and always read, is this year livelier than usual, displaying the extent of silent labor bestowed upon the present issue of the venerable annual, while giving a gentle pat to the critics who find "unexplainable omissions"; nearly all of them having reference to the Princess Alice of Great Britain, mother of the present Empress of Russia, who, however, is not omitted after all. The past

year, say the editors, has been a good one for reigning princes and potentates, among whom and even among ministries changes have been extremely few. The stability is reflected in the four regulation portraits, two being of the Duke and Duchess of Orleans, and two of petty German princes. Next year we may look to see the Italian-Montenegrin alliance thus commemorated. We cannot indicate all the overhaulings or new features of the *Almanach*. One, of great practical utility, is a list of national holidays (but Labor Day is inexactly put down as national with us); another is the chapter on English protectorates, and here we note the accented *e* in "Rhodé-sia," in place of Rhodes-ia.

The same firm sends us the long and eagerly awaited index volume to Le Soudier's 'Bibliographie Française,' or French Publishers' Trade-List Annual. More than 600 octavo pages are occupied by a single-line alphabetic subject-author index, with name of publisher; and sixteen pages by a "table systématique," or a classification *by publishers—i. e.*, if you are interested in works on Anarchy or Heraldry or Athletics or Dreams, you will find the names of publishers whose catalogues are classified for those subjects. This is reasonable, if it is not what the English 'Reference Catalogue' has given us. But the subject-author index is the main thing, and who can be too thankful to M. Le Soudier for such a comprehensive glimpse of the present literary productiveness of his country? We have here not only a key to the catalogues in the other five volumes, but even (to some extent) to those of publishers not embarked in this enterprise; and account is taken of catalogue omissions and of some publications subsequent to the printing of the catalogues. The beautifully clear typography invites much surface browsing; *e. g.*, Victor Hugo fills nearly a whole page (one six-hundredth) of the index, with seventeen publishers to his name. Racine, with more publishers, falls a good deal short of this; so do Voltaire, Rousseau, Chateaubriand, Lamartine, Sue, Zola, etc., etc. The elder Dumas slightly exceeds Hugo.

'L'Islam,' by the Comte Henry de Castries (Paris: Armand Colin & Cie.), is not intended by the author to be a history of the Mahometan religion. His aim is far more modest; he undertakes simply to discuss the problems which the French have to face in their administration of Algeria, for instance. This portion of his work may not appeal to American readers, but there is a great deal more in his very fascinating book. M. de Castries has endeavored, and not unsuccessfully, to clear away many misconceptions as to the facts of Islamism; he has traced the origin of many of these to their source in the opposition, at once political and religious, of the Christian Powers in the Middle Ages. He shows how modern views of Islamism are erroneous in many important respects, such as, for instance, the question of polygamy, the doctrine of fatality, and the usual conception of the Mahometan paradise. His view of the causes of the wide and rapid extension of the new creed preached by Mahomet is set forth in a soundly written chapter: the chief cause, he concludes, is neither the appeal to sensuality, the attractiveness of fatalism, nor mere blind fanaticism, but "unquestionably the extreme simplicity of its dogmas." The book has very full appendices and a complete index, so rare a feature of French works that it merits special mention.

M. Yves Guyot's book 'L'Économie et l'Effort' (Paris: Colin) is a very serious and well-studied presentation of important economic truths. In the ten chapters which are formed of the ten lectures from which the book has grown, the author treats successively economics, exchange, property, capital and labor, the currency, protectionism, and Socialists. His pages are well worth reading and pondering on both sides of the Atlantic.

M. Léon Bourgeois, in a small volume of one hundred and fifty pages, 'Solidarité' (Paris: Colin), maintains that this word expresses a new idea and is indicative of an evolution of human thought. The actual idea of solidarity, he affirms, is the resultant of two forces—the scientific method and the moral idea. He examines in detail the opposing theories of the economists and the Socialists, discusses the laws which govern solidarity, and defines the doctrine which goes by that name. This doctrine tends to increase the liberty and power of each individual in the common action, freely accepted by all. Though the book is not a long one, it is full of matter, and provides abundant food for thought and reflection.

We mention Prof. R. von Schubert Soldern's lecture 'Über den Begriff der allgemeinen Bildung' (delivered as an inaugural at the University of Leipzig, and published by H. Haacke of the same city) as a contribution to a problem of ever-growing interest in modern times; a step towards its solution the address can hardly be called. A condition most difficult of realization stares us in the face—the need of a common *Weltanschauung* (theory of the universe), which alone can furnish a uniform standard and connecting bond for the various elements of general culture and make it common. But, concludes the lecturer, this theory has gone to pieces, and therein lies the canker of our general culture.

An essay entitled 'Wie sollen wir Heinrich Heine verstehen?' by I. E. Poritzky (Berlin: Duncker), has for its object the psychological explanation of Heine's character and inner antagonism by the influences of his childhood and youth, with their extraordinary contrasts and peculiar anomalies. The local surroundings of the poet's birthplace, the Jewish orthodox family, the Bible, the period of Romanticism and the vicissitudes of the Napoleonic era—the parents, relatives, and friends, the school life and private reading—these and other influences, which often evoked the strangest conflicts of thought and feeling in the youthful mind, are separately considered in the essay. The author's tone is sympathetic but fair and dispassionate—qualities in which critics of Heine are so often lacking that, for this reason alone, though for others as well, the little work is to be commended.

The new illustrated monthly magazine of local biography, genealogy, history, and antiquities, the *Essex Antiquarian*, has already been issued with the January imprint at Salem, Mass. The editor, Mr. Sidney Perley, well known for his proficiency in all these branches, opens the number with an article on the commercial history of Salem. The most prominent feature is the beginning of a list of all soldiers and sailors of the Revolution accredited on the official lists to Essex County; but more important still is the first instalment (Abbe) of a Genealogical Dictionary of the county down to 1800, also the work of Mr. Perley. The magazine should have an assured support.

The strength of an institution of learning is measurable by its losses, and such a measure is afforded by the *Harvard Graduates' Magazine* for December, which chronicles the death of two eminent teachers, Profs. Josiah Dwight Whitney and Francis James Child, and one eminent statesman, the late William Eustis Russell. Of the ex-Governor an excellent photographic portrait is given, and for a full characterization of the man the memorial address of Prof. Norton leaves nothing to be desired. It deserves to be widely circulated as a tract for the times. The rest of the number presents the usual miscellany exhibiting the life of the University, and possessing an absorbing interest for the alumni, while well calculated to impress and instruct all college-bred men.

The *Geographical Journal* for December contains an interesting summary of the work of the Jackson-Harmsworth Polar expedition during the past year, which consisted mainly in the exploration of Franz Josef Land, with the result of revolutionizing "our ideas and maps" of this country. As the accompanying map shows, it is a region of islands, straits, and seas, and accordingly hardly suitable as a point of departure for higher latitudes. The dramatic incident of the meeting with Nansen, who "was as black as a stoker from head to foot," is described at length. This is followed by an account, by Prince Henry of Orleans, of his remarkable journey from Tonkin to Assam, in the course of which he opened up 1,500 miles of entirely new country, presenting extraordinary difficulties to travellers. "In three months we crossed seventeen chains of mountains. Roads, in the true sense of the word, there were none." One mountainous district passed through was partly cultivated as rice-fields. Capt. Purey-Cust, R.N., describes an eruption of Ambrym Island in the southwest Pacific, which he witnessed in October, 1894. Observing that a lava-stream was approaching the shore, he steamed to the place, and "presently the head of the stream appeared—a red-hot, rapidly moving mass of molten lava, some thirty yards wide, with lumps of clinker tossing about on the surface. In another moment it entered the sea, and then . . . a dense pillar of steam rapidly rose straight up to a height afterwards measured by sextant and found to be 4,600 feet. There was no explosion as the lava touched the water, but a few seconds later enormous bubbles of water commenced to rise some 100 feet or more, like the explosions of heavy submarine mines, and then burst violently outwards in radiating tongues of water and black masses of presumably lava." Classical geography is represented by Mr. Myres's "attempt to reconstruct the maps used by Herodotus," illustrated by several diagrams.

There is a noteworthy demonstration in progress at the English universities apropos of the changed management of the *Academy*. An Oxford committee, consisting of Prof. Robinson Ellis, Mr. F. C. Conybeare, and two ladies, has undertaken, on behalf of some friends of Mr. J. S. Cotton, and of various contributors to the *Academy* during his late editorship, to "attest their gratitude to Mr. Cotton for the unwearied devotion with which he has acted as editor, by raising a sum of money which may form a slight, though inadequate, memorial of their feeling towards him and the journal he has so ably conducted." They have so far raised the very respectable sum of £125, but the names of their contributors are specially interesting, since they include the Vice-Chancellor of Oxford, three other heads of leading Oxford colleges, six Oxford professors, various dignitaries of the church,

and a number of Cambridge scholars, as well as Dr. Garnett of the British Museum, and other people of weight. The task of the committee has been a rather delicate one, since they have naturally desired to express no opinion as to the present management of the *Academy*—only to express approval of Mr. Cotton. All this has been successfully achieved in an amended circular, and in due time Mr. J. S. Cotton, who is about to leave England for India, will receive a mark of friendly appreciation of which he may well be proud.

Mr. F. C. Conybeare of University College, Oxford, has discovered, in an old Armenian version which he is translating for the *Expositor*, a controversial dialogue, the Greek original of which he thinks exists in the Royal Library at Vienna. It contains a discussion of Christian doctrines between a Christian and a Jew, and the arguments as to the divinity and the Messianic character of Christ are remarkable for their bearing upon various utterances of Philo. These, and an allusion to the "grandsons of the apostles," make it necessary to assign a very early date to the original.

—Mr. Laurence Hutton's 'Literary Landmarks of Venice' (Harpers) is a small volume of sixty-three pages, based upon an article which appeared in *Harper's Magazine* last summer. It belongs to a series dealing with literary landmarks of historic cities, and contains a great deal of useful information such as cannot be found in ordinary guide-books, or indeed anywhere between the covers of a single book. When the traveller arrives in Venice for the first time, he is aware of a certain confusion and oppression which comes from the contrast between the extraordinary familiarity of the scene presented to the eyes and a sense of vacuous debility proceeding from a failure to recall distinctly and definitely the hosts of associations, with persons and events, which seem to rise before the memory only to mock and elude its grasp. This is owing in great measure to the fact that Venice has so long been a Mecca for literary tourists, each one of whom, if of any importance, has left some slight Venetian association clinging to his name. Mr. Hutton has done a benevolent and pious act in looking them all up, identifying their residences, and giving us a list of their names, with just enough of anecdote and information about their Venetian lives or visits to make a book. From Petrarch and Erasmus to Browning and A. J. C. Hare, the list is long, memorable, and heterogeneous. Mr. Hutton's list contains nearly a hundred names of persons and more than twice as many names of places.

—Two unpublished letters of Rouget de l'Isle appeared in the *Journal des Débats* of November 8, having been sent to that newspaper by M. Georges Michel. They date from the period when the author of the "Marseillaise," ruined and held in suspicion by the Government of the Restoration, was living at Choisy-le-Roi in the house of General the Baron Blein, another suspected person, whose charitable hospitality poverty had forced him to accept. Both these letters are addressed to Alexandre Duval, Academician and dramatic author, who had shown himself a friend in De l'Isle's need, and had taken some steps towards its relief. The most interesting thing that the letters bring to light is a brief glimpse that is given, in the second of them, of the Revolutionary poet in the midst of the first tumultuous outbreak of Romanticism. This letter is dated May 4, 1830, and it is a very vivid bit of letter-writing and full of movement. The Revolution of July brought Rouget de l'Isle relief and some years of comparative ease. Louis Philippe, "remembering that the author of the patriotic song had been one of his companions in arms," granted him a pension of fifteen hundred francs out of his privy purse, and Béranger was able to obtain for him two other pensions of a thousand francs each. These modest resources enabled Rouget de l'Isle to hire at Choisy-le-Roi the little house where he died on the 26th of February, 1836. But it was by his friend General Blein that his funeral expenses were paid. The General himself had come back into favor with the new Government, which restored to him his rank, and he was at the side of the King and was wounded when Fieschi made his attempt upon Louis Philippe's life.

—At the beginning of its session on the 27th of November, M. Gaston Boissier laid before the Academy of Inscriptions and Belles-Lettres a communication addressed to him by M. Gauckler, director of antiquities in Tunis, concerning a recent discovery which is of considerable importance, both from the point of view of art and also from that of literary history. Certain soldiers of the Fourth Tirailleurs had dug up near their camp at Susa a mosaic, very well preserved, which may date from the first century of our era. Of the three figures which this mosaic shows, M. Gauckler has no hesitation in identifying the one which occupies the centre; it is Virgil composing the 'Aeneid.' The poet is represented clad in an ample white toga with a blue border; he holds on his knees an open roll of papyrus, on which appears the eighth verse of the first book of the 'Aeneid': "Musa, mihi causas memora," etc. On his right the muse of history interprets a manuscript to him. On the left the muse of tragedy is listening. This last personage wears a fringed theatre dress girt high up with a cincture; her left arm holds up a tragic mask. There is no portrait of Virgil which is known to be authentic. The oldest ones are miniatures, notably that of the celebrated Vatican manuscript. All must derive from a common source, for all show certain features of resemblance. The present mosaic, like all the rest, shows Virgil with short hair and beardless. M. Boissier, whose erudition gives great weight to his opinion, looks upon the present *trouvaille* as probably the reproduction of some celebrated work, perhaps of one of the portraits of which Martial speaks. The Academy received M. Boissier's communication with the most lively interest, and gave its sanction to publication. The photographs which accompanied it will be reproduced in phototype.

—In his inaugural address as rector of the Berlin University (October 15, 1896), Prof. Heinrich Brunner, the first of living authorities on Teutonic legal history, throws much light upon the organization of the mediæval universities. The cosmopolitan character of these bodies, the fact that they sprang up first on Italian and French soil, and their intimate relation to the Church, have caused the majority of writers to assume that the determinant influences in their organization were Roman-ecclesiastical. Brunner shows that the influence exerted by Teutonic customs and forms of association was really decisive. The two leading types of the mediæval university were furnished by Bologna and Paris. At Bologna the student body, largely composed of mature men, was the university. The students elected the rector, to whom the professors must swear obedience. In the middle of the thirteenth century, however, there were two *universitates scolarium*, or student-bodies, that of the ultramontanes and that of the citramontanes; and at an earlier period there appear to have been four. The strongest of the four was that of the Teutons, which was afterwards the dominant "nation" in the university of the ultramontanes. Brunner holds that it was the association of the Germans which furnished the model for that of each of the other nations; and in their association he finds all the characteristics of the German protection-gild (*Schutzgilde*), which was simply the modified and Christianized form of the sworn brotherhood (*Bundbruderschaft*) of the heathen Teutons. He shows interesting resemblances between the student organizations at Bologna and the *universitates mercatorum*, or associations of German merchants (*Hansen*) in non-German countries. At Paris the original form of organization was quite different. There were no "nations" and there was no rector. The university was the body of teachers, and the student inscribed his name on the roll of a special *magister*. Here again Brunner finds a Teutonic form of association, that of the craft-gild, and is able to show numerous and striking points of resemblance between the artisan gilds of North France (where the law and custom were entirely Teutonic) and the faculties of the Paris University. Early in the thirteenth century, however, "nations" were formed after the fashion of Bologna, and the Parisian type of university organization was modified. This modified Parisian type furnished the model for the German universities.

—'The Cartulary of the Monastery of St. Frideswide'—the foundation whose chapel became Oxford Cathedral, and whose revenues Wolsey secured in the nick of time for the new College of Christ Church—has recently been edited by the Rev. S. R. Wigram for the Oxford Historical Society. The second volume is now before us, containing the Chantry and Country Parish Charters (Macmillan). It will be of interest chiefly to local antiquaries and genealogists. St. Frideswide was not among the more opulent or powerful of English religious houses; and, moreover, this present volume is made up almost entirely of grants, quit-claims, leases, final concords, and other formal documents. Still, there are some fair "pickings" for the general historian, which should not escape notice. There is the record, for example, of the gift of a mill (c. 1165) "with the miller, Hugh by name, and his wife and chattels and children" (p. 232); and another of a yardland (c. 1180) "which Aldred held, together with Aldred himself and his wife and children and all pertaining to him" (p. 263). We learn that at Binsey—which Oxford men remember as the first hamlet outside Oxford on the road to Cumnor—it was the custom for a villein to be succeeded in his holding by his *youngest* son (p. 18). The three or four undated lists of villein services (pp. 195, 234, 356) present nothing unusual; but in a certain agreement as to tithes belonging to the year 1191 we come across the distinction, possibly of some significance, between "assarts" "from the demesne" and "from the common pasture of the rustics" (p. 333). The pestilence of 1361-32 so diminished the revenues of an endowed chantry that episcopal permission had to be obtained to serve it with one instead of two priests; the outspoken canons add to their summary of the document,

"on account of the dearness of priests" (p. 14). But the tidbit is the account (p. 325) of a trial by battle about the year 1147. A certain knight, named Edward, had refused to perform what the Prior and Canons deemed his due service for a hide of land. They brought suit against him, and the trial by battle took place "in the court of the Earl of Leicester, on a green pasture near the house of Godwin." The record thus proceeds: "After a time, when there had been many an 'altercatio' (set to ?) between the champions ('pugiles')—although Edward's champion had lost his sight on the field" (we will trust only temporarily), "a fact which escaped the observation of the Prior and his men—when both the champions sat down and neither dared attack the other, peace was made" between the litigants. Oddly enough, it is from Leicester that Mr. J. R. Green gets the story of a trial by battle between two kinsmen which he tells with such effect in his 'Short History.' It may be noticed that we have charitably given page references. The Cartulary is accompanied by one of those exemplary indices, made to order, which omit not a single personal or place name, and give no help at all for anything else.

DU BOIS'S SLAVE-TRADE.

The Suppression of the African Slave-Trade to the United States of America. By W. E. Burghardt Du Bois. [Harvard Historical Studies, Vol. I] Longmans, Green & Co. 1896. Pp. xi, 335.

Mr. Du Bois has at last given us a critical and, we think, definitive account of the efforts put forth for more than two centuries to suppress the African slave-trade to the United States. His work is founded upon an exhaustive and discriminating examination of the primary sources, as found in colonial, State, and national statutes, Congressional documents, publications of foreign governments (particularly Great Britain) and of various societies, and personal narratives. The title of the volume accurately defines its scope: it is a history of the suppression of the slave-trade, not a history of slavery. Into the general subject of slavery, either at home or abroad, Mr. Du Bois does not go, save in so far as is necessary to make clear the movements in connection with the slave-trade itself. To the narrative portion of the volume, about two-thirds of the whole, have been added valuable appendices containing chronological lists of colonial and State laws, from 1641 to 1871, aiming to restrict the slave-trade, a list of more than a hundred typical cases of vessels engaged in the American trade, and an excellent bibliography. The wealth of material indicated is extraordinary, even in this day of learned monographs; but out of it Mr. Du Bois has produced a book by which every judgment on the subject of which it treats must be tested, at least for many years to come.

The slave-trade to America seems to have begun with the Dutch, who in 1619 landed twenty "Negars" in Virginia; but the English were not far behind, although it was not until 1672 that the first successful English company was chartered. By 1700 the colonists were declaring in favor of the trade, and the English policy had become one of encouragement. Between 1698 and 1707 probably 25,000 slaves were brought to America annually, an increasing proportion going to the continent. The rapid growth of the slave population, however, had early bred in the colonies a "condition of vague dread and unrest," never afterwards wholly absent; and by 1698 South Carolina had sought to lessen the danger by passing an act to encourage the immigration of white servants. The attempt of Virginia in 1710 to restrict the trade by imposing a duty was defeated by the veto of Gov. Spotswood; in 1772, however, the Burgesses petitioned the King in favor of checking the trade, and in 1778 it was finally prohibited by law. The trade in Maryland, never large, had nearly ceased of its own accord by 1769, although importation by sea was not prohibited until 1783. In Georgia the efforts of Oglethorpe and the London proprietors to prevent the slave-trade received little support from the colonists, and the trade probably continued without restriction until the Revolution.

In the middle colonies, also, it was reserved for the English to develop a trade which the Dutch had begun. In spite of revenue duties, the slave traffic in New York grew rapidly in importance, and was all the more profitable because the traders took care not to overstock the market. The first American protest against the slave-trade came from Pennsylvania in 1688, but it was not until 1780 that an act for the gradual abolition of slavery was passed, while "participation in the slave-trade outside the colony was not prohibited until 1788." Both importation and exportation were prohibited in Delaware by the Constitution of 1776 and by law in 1787. In 1786 New Jersey put importation under the ban. The fear of political insurrection, which furnished the chief motive for restrictive measures in the South, was little thought of in the middle colonies; instead, those colonies, as Mr. Du Bois shows very clearly, limited the slave-trade "mainly because it did not pay." Only in Pennsylvania did the opposition take on a moral aspect. In New England, on the other hand, moral repugnance to the trade grew less and less, overborne by the great profitableness of slave voyages. Rhode Island eventually became "the greatest slave-trader in America," and Massachusetts, by the act of 1705 allowing a rebate of the duty on negroes upon reëxportation, turned her ports into exchange markets for slaves. "Not until the years 1787-1788 was slave-trading in itself an indictable offence in any New England State."

At the time of the Revolution, therefore, the early efforts to restrict the slave-trade by the imposition of duties had given way to positive attempts to regulate it, or to prohibit it entirely. It was the general opinion that both slavery and the slave-trade would shortly disappear; "there were, in 1787, few things to indicate that a cargo of five hundred African slaves would openly be landed in Georgia in 1860." Prohibition of the trade by the "Association," under the Continental Congress, was undertaken as a war measure, as part of an attempt to enforce general commercial non-intercourse with Great Britain, but its permanent effect was slight, while the stoppage of importation, and the consequent rise in the price of slaves, swelled the trade after the Revolution to nearly the same proportions as before. Not only did economic prostration at the close of the war appear to demand a re-opening of the trade, but the divergence of opinion in different sections of the country as to the length of time within which slavery would probably disappear led to the adoption of a policy of non-interference. Under the Confederation, accordingly, action against the slave-trade was State, not national, while in the Convention of 1787 the subject was disposed of by one of the most famous of the constitutional compromises. Yet the discussion in the Convention had served to show ominous differences of moral attitude towards slavery. "The South," to quote Mr. Du Bois, "apologized for slavery, the Middle States denounced it, and the East could only tolerate it from afar; and yet all three sections united in considering it a temporary institution, the cornerstone of which was the slave-trade." When government under the Constitution began, the slave-trade was legal in Georgia and the Carolinas, and not actively antagonized in any other State.

The first twenty years of the constitutional period saw several attempts to suppress the slave-trade. The excesses of the Haytian revolution, begun in 1791, filled the South once more with the old dread of negro uprisings. In 1792 South Carolina prohibited the importation of slaves for two years, and renewed the act from time to time until 1803. Georgia passed a prohibitory law in 1798, which was never repealed. Similar measures followed in other States. The early debates in Congress at length bore fruit in the first national act against the slave-trade, that of 1794. This act was strengthened in 1800; and a third act, prompted, like the preceding, by continued apprehension of danger from Hayti, was passed in 1803. In the meantime the State laws had proved ineffectual in checking the growth of the trade. "It was notorious that New England traders carried on a large traffic." South Carolina, whose Representative in Congress had publicly declared that the State was unable to enforce its laws, gave proof of his accuracy, in 1803, by repealing its law against importation. In 1804 Congress partially opened the Louisiana Territory to the slave-trade, and removed all restrictions, except as to the foreign trade, in 1805; but in practice, as Mr. Du Bois shows, the whole trade was foreign, "for the slavers merely entered the negroes at Charleston, and immediately reshipped them to New Orleans." In 1806, after long debate, "the last attempt to tax imported slaves ended, like the others, in failure." The fear of the planter and the philanthropy of the Quaker had alike gone down before the mercenary demands of the trader.

The act of 1807, prohibiting the African slave-trade under heavy penalties, and restricting the coastwise trade, could not be regarded as a great victory by the anti-slavery men, nor, on the other hand, did it satisfy the South. Mr. Du Bois has collected indisputable evidence that the act speedily became, in practice, a dead letter. In the face of unanswerable proof that its provisions were systematically violated, the federal Government remained apathetic, neglected to issue necessary instructions to collectors and prosecuting attorneys, and failed to prosecute offenders actually captured. Certain obvious weaknesses in the act itself were sought to be remedied by supplementary acts in 1818, 1819, and 1820. The first, by encouraging informers, sought "to remedy defects by pitting cupidity against cupidity." The last made direct participation in the trade piracy, punishable by death, but not until Lincoln's Administration was the penalty inflicted. Smuggling declined, but the slave-trade thrived. Spasmodic attempts to enforce the law resulted, between 1818 and 1821, in the capture of eleven American slavers; in consequence, slavers took clearance papers from foreign ports, hoisted foreign flags, and carried on their operations securely in defiance of the

American cruisers. At home, attempted enforcement of the law grew less and less, and "red-handed slavers, caught in the act and convicted," did not need to despair of Presidential pardon. Mr. Du Bois shows that such pardons were granted by every President from Jefferson to Jackson, inclusive. In short, the efforts of the United States to suppress the slave-trade had failed, and failed primarily because of the criminal negligence of Government officials. There remained the final resource of "energetic and sincere international coöperation."

The story of the conduct of the United States in the long negotiations over the international treatment of the slave-trade forms one of the most discreditable chapters in the history of American diplomacy. That England's contention for an international right of search should have been resisted by other European Powers was but natural, considering the naval supremacy of Great Britain; nor had Americans forgotten their own recent grievances. The inability of the United States to cope with the evil single-handed had, however, been abundantly demonstrated, and in 1822 a committee of the House of Representatives reported "that the only method of suppressing the trade was by granting a right of search." But the United States, while urging the nations of Europe to declare the slave-trade piracy, refused to allow the right of search to be extended to American waters or to have any application "to citizens chartering the vessels of a third nation." England refused assent to such an emasculated treaty, and negotiations were broken off. As one European nation after another granted the right of search, the share of the United States in the slave-trade increased, while the importation of slaves into North and South America reached, by 1837, the enormous figure of 200,000 annually. Yet, in spite of this, to quote Mr. Du Bois, "the only answer which this country for years returned to the long-continued exposures of American slave-traders and of the fraudulent use of the American flag, was a recital of cases where Great Britain had gone beyond her legal powers in her attempt to suppress the slave-trade. In the face of overwhelming evidence to the contrary, Secretary of State Forsyth declared, in 1840, that the duty of the United States in the matter of the slave-trade 'has been faithfully performed.'" In 1841 Lewis Cass, United States Minister to France, entered a "theatrical protest" against the proposed establishment of an international right of search. Even the provision of the Treaty of Washington, in 1842, for joint cruising by English and American squadrons, was "never properly carried out by the United States for any length of time." By 1860 the American slave-trade had come to be carried on "principally by United States capital, in United States ships, officered by United States citizens, and under the United States flag"; yet Cass, now Secretary of State, refused even to allow this country to be represented at the London conference proposed by Lord John Russell, and later declined a proposal for joint cruising off the coast of Cuba. Not until 1862 was a treaty finally made with Great Britain granting the long-resisted right of search. The coastwise trade was prohibited in 1864, and by the end of the war the slave trade was at last suppressed.

The economic conditions which tended to strengthen the hold of both slavery and the slave-trade in the South are set forth by Mr. Du Bois with great clearness in the chapter entitled "The Rise of the Cotton Kingdom." The increase of the cotton crop from half a million bales in 1822 to five million in 1860, together with enlarged consumption of cotton goods, established firmly the "large-plantation slave system," and increased the demand for slaves; and when this demand could no longer be met by the border States, the foreign slave-trade was looked to for further supplies. Census returns showed a rise in the average price of slaves from $325 in 1840 to $500 in 1860. Very interesting; and, historically, of especial importance, is Mr. Du Bois's discussion of the forces underlying the Government policy of inaction, and of the lengths to which violation and evasion actually went. The presence of a strong Southern element in every Cabinet from 1820 to 1850 strengthened the hold of the South upon the Administration, and, in so doing, effectually prevented active efforts to put a stop to the slave-trade. Where the national Government was not actually negligent, official judgment was prone to construe the law in favor of the slave-traders, and the courts could not be depended upon to punish clear cases of violation. The attempts to check the traffic by stationing cruisers on the African coast were ridiculously impotent.

"When it is considered," writes the United States consul at Rio Janeiro, in 1847, "that the Brazil station extends from north of the equator to Cape Horn on this continent, and includes a great part of Africa south of the equator, on both sides of the Cape of Good Hope, it must be admitted that one frigate and one brig is a very insufficient force to protect American commerce, and repress the participation in the slave-trade by our own vessels."

As the struggle for the extension of slavery grew more bitter, and the growing demand of the South for the removal of all restrictions on the trade in slaves began to be formulated with more and more definiteness, there came about, as Mr. Du Bois's researches show, "such a remarkable increase of illicit traffic and actual importations in the decade 1850-1860 that the movement may almost be termed a reopening of the slave-trade." The evidence which he has collected on this point is startling. New York was the centre for the equipment of slavers, eighty-five being fitted out in that port during eighteen months of 1859-'60. In 1856 it was estimated that "forty slavers cleared annually from Eastern harbors, clearing yearly $17,000,000." Stephen A. Douglas declared "his confident belief that over 15,000 slaves had been brought into this country" during 1859. "Negroes, newly landed, were openly advertised for sale in the public press, and bids for additional importations made." The efforts of the national Government, in the meantime, grew constantly weaker, while those of the cruisers on the African coast went to the verge of ceasing altogether. "A letter from on board one of them shows that, out of a fifteen-months' alleged service, only twenty-two days were spent on the usual cruising-ground for slavers, and thirteen of these at anchor; eleven months were spent at Madeira and Cape Verde Islands, 300 miles from the coast and 3,000 miles from the slave market." Finally, the attitude of the Confederate Government towards the article in the Constitution of the Confederate States prohibiting the importation of African negroes is shown by its circular-letter of instructions to its foreign ministers, extracts from a copy of which, addressed to Hon. L. Q. C. Lamar, Commissioner at St. Petersburg, are given by Mr. Du Bois (pp. 189-190). The letter disclaims absolutely any power in the Confederacy to interfere with the slave-trade; such power being, it declares, reserved to the States.

One can but be impressed in reading this volume with the pervading weakness of the moral opposition to the slave-trade. Mr. Du Bois gives full credit to the influence of the various anti-slavery and abolition movements in arousing the public conscience, but he does not hesitate to point out that these efforts were weakest at the very times when it was most necessary that they should be strong. Even in colonial days "experience proved that an appeal to moral rectitude was unheard in Carolina when rice had become a great crop, and in Massachusetts when the rum-slave traffic was paying a profit of 100 per cent." Mr. Bois utters no reproaches, and he rarely moralizes.

"It may be doubted," he says in his final chapter, "if ever before such political mistakes as the slavery compromises of the Constitutional Convention had such serious results. . . . It was the plain duty of the Constitutional Convention, in founding a new nation, to compromise with a threatening social evil only in case its settlement would thereby be postponed to a more favorable time. This was not the case in the slavery and slave-trade compromises; there never was a time in the history of America when the system had a slighter economic, political, and moral justification than in 1787; and yet with this real, existent, growing evil before their eyes, a bargain largely of dollars and cents was allowed to open the highway that led straight to the Civil War. . . . No persons would have seen the Civil War with more surprise and horror than the Revolutionists of 1776; yet from the small and apparently dying institution of their day arose the walled and castled Slave-Power. From this we may conclude that it behooves nations as well as men to do things at the very moment when they ought to be done."

This, of course, is both admirable and true. The slavery and slave-trade compromises of the Constitution were, unhappily, part of the price paid in order to have a Constitution and a Union at all. The Providence which, from seeming evil, thence educes good, ordained that the Union itself should be the instrument of abolishing slavery in one-half of it. On the other hand, it may be allowed that the utmost straining of the mental vision could hardly have enabled the fathers to look very far into the future; while as to other qualities "one cannot," as Mr. Du Bois himself says, "demand of whole nations exceptional moral foresight and heroism."

Mr. Du Bois is a negro, a graduate of Harvard, and a professor in Wilberforce University. His story of the suppression of the slave-trade is told with simplicity, directness, and convincing force, and in an interesting style rarely found in monographs. We have failed to note in the book a single important statement of fact for which specific authority is not adduced; but there is an entire absence of anything like pedantry, and irrelevant matter has been rigidly excluded. That this study will long remain the authoritative work on the subject of which it treats may be confidently predicted. Amid all the discussion over the probable future of the negro in this country, it is matter of profound significance and great encouragement that a member of the race which, scarcely more than a generation ago, was openly bought and sold and hunted in our streets, should have traced, out of abundant knowledge and with unbiassed mind, the course of our national connection with that unholy traffic, from its beginning to its close, in a volume which is an honor alike to its author, to the university whose approval

it has received, and to American historical scholarship.

SOME TRANSLATED NOVELS.

A Tragic Idyl. By Paul Bourget. Charles Scribner's Sons.

Episcopo & Co. By Gabriele D'Annunzio. Translated by Myrta Leonora Jones. Chicago: Herbert S. Stone & Co.

The Triumph of Death. By Gabriele D'Annunzio. Translated by Arthur Hornblow. George H. Richmond & Co.

THE name of the English person who has taken the trouble to translate 'A Tragic Idyl,' by M. Paul Bourget, is discreetly withheld from the title-page. Such reticence may be indicative of a sort of death-bed repentance, a reluctance at the last moment to associate one's name with so dull a version of situations and sentiments almost inevitable in, but not confined to, French fiction. There is probably no case so bad that it cannot be made better worth consideration than a vulgar scandal, if treated subjectively with a certain degree of acuteness and subtlety. M. Bourget's possession of both these intellectual qualities and his liberal use of them have hitherto presented him to us in a more inspiring aspect than that of a glorifier of adultery. Apparently, however, his subjectivity is a measurable quantity, not always on tap, since he can write a long novel with little to distinguish it from the work of the mob whose profession it is to show that the only use for marriage is to provide a safe way for a woman to become licentious, and, consequently, an object of envying admiration to society.

In one of his essays on modern French writers, it is pointed out by Mr. Henry James (so alert to seize and able to appropriate the French point of view) that whether the imputation of coarseness be a serious reproach to an author or not, the epithet *coarse* may apply to feeling as well as to performance; when it comes to represent a state of perception, he sees a real danger much more appalling to some minds than a moral one, and that is the danger of literary deterioration. He questions whether this state may not be "a consequence of too prolonged a study, however disinterested, of the ugliness and uncleanness of life?" Both reflection and question are pertinent to the consideration of 'A Tragic Idyl.' There is no literary fineness or distinction, and no recognition from the author that the intrigue is base and the intriguers the commonest clay. M. Bourget exhibits himself on the verge of a literary catastrophe. We are disposed to make Mr. James's interrogative solution affirmative and to extend its application, in view of the decline of literary beauty since the naturalists began to proclaim that the indecent, the brutal, and the monstrous could be legitimately and honorably exploited in literature. The Romantic novelists insisted on the misunderstood or injured wife and her sacred right to one sympathetic lover, and they insisted with much attention to the flow of their sentences and the grace of their expression. The early Realists were indifferent as to the number of lovers, cared not so much for beauty as for accuracy, but sought the word with a patience generally rewarded by the effect. The Naturalists, the successors of a long line of manipulators of immoral situations, find themselves most at home in the study of the avowed prostitute, pay no attention to form, and show enthusiasm for the fitting expression only when it is a gross one.

If there is no essential unity or even natural relationship between good morals and good literature, the simultaneous debasement of the essence and the form is a curious coincidence. Increasing coarseness is not, however, accountable for the disappearance of wit, which is never particular about its company, yet appears to have vanished from French letters with Guy de Maupassant, the most rigid and brilliant of Realists, and not far from the grossest. A display of wit, of humor, any recognition of the comic, may be deemed indecorous by professional dissecters of disease and sin, or perhaps it is felt that the ghost of a smile would impair the perfection of their laborious pessimism. At all events the Naturalists, including the purposeful female English Naturalists, are distinguished from others not more by a negative contempt or positive antipathy for good morals than by an impenetrable solemnity.

Among the dismallest recently introduced into English is the Italian Gabriele D'Annunzio. This young gentleman is positively swathed in sables. For ten years he has been known in Italy and much talked about, though not always respectfully. When about twenty he published a volume of which his own modest description is that it was written in "plastic verse of faultless prosody," and that it showed "a shamelessness which I have never seen except in the freest poets of the sixteenth and seventeenth centuries." One effect of the notoriety secured by this volume was to bring upon him "a sort of aphrodisiacal madness," from which he says he emerged a new man, with new conceptions of life, which he proceeded to express in a series of novels called, collectively, "Romances of the Rose." With the translation of the first of the series he became known to France, where he found a select circle of worshippers, but not wide popularity. Through the years, whispers of his power and indecency have been wafted to England and across the Atlantic, but only recently have translators succumbed to these temptations. The first translation published in America, the work of Myrta Leonora Jones, who supplies a very good biographical introduction, is that of 'Episcopo & Co.,' a horrible tale, fortunately short. Though it was written about the time of D'Annunzio's new birth, under the influence of Tolstoi and Dostoievsky (he is very susceptible to influences), the traces of his unpleasant madness are conspicuous. It is the wild, incoherent confession of an unhappy, shabby, nerveless wretch, who, under the control of a man of strong will and quite inhuman, marries a harlot, and between the two is driven to murder and insanity. The feebleness of Episcopo is so pitilessly exposed that repugnance is modified by compassion, and both his pathetic love for his son and the child's fury in defence of his abominable mother purify slightly the foulness of the atmosphere. The completeness of conception and unrestrained brutality of presentation proclaim literary genius, but genius so perverted that it shares the detestation inspired by its expression.

"Has it ever happened to you," the miserable Episcopo asks, "after looking fixedly at a woman, suddenly to lose all sense of her humanity, and to see with a plainness which astounds you the beast, the female, the brutality of sex?" Nothing else happens to the reader looking fixedly at Ginevra, the wife of Episcopo; and, transferring his gaze to the pages of 'The Triumph of Death,' he feels that nothing else ever happens to the author even glancing casually at any woman. 'The Triumph of Death' is one of D'Annunzio's latest works, the third of the "Rose" series. This is presumably an expressisn of his "new conception of life," wherefore we hope that all expressions of the old (which he appears to think of with shame) have been burned. If 'The Triumph of Death' is the voice of a soul purified through suffering, a glimpse of that soul in its original blackness would be a ghastliness to avert which one might cheerfully endure any penance.

The book may be roughly divided into two parts—a study of the sensations, chiefly erotic and wholly diseased, of George Aurispa; a sequence of incidents picturing some hideous form of death, and accompanied by descriptions of many loathsome diseases, mental and physical. These incidents and descriptions are feeders for Aurispa's introspection and reflection. Admirers of D'Annunzio who wish to bring his work into some sort of relationship with morals and decency, discover that a wonderful moral lesson is deliberately taught in 'The Triumph of Death,' viz., that sensuality inevitably leads to crime. D'Annunzio might possibly be a more respectable person, he would certainly cut a much smaller figure in letters, were he capable of writing a novel to prove such a platitude. What we are most conscious of is that the thing is done for the sake of doing it with absolute singleness of purpose, and that D'Annunzio speaks from his mind, from his temperament, because he can't help it, though, if he had been constituted in the least bit otherwise, he would have followed his prescribed way out of all difficulties and died first. We should let him alone or take him as we find him, and not read into him intentions which make a plausible excuse to ourselves for taking him at all.

The nearest thing to good in George Aurispa is his consciousness of corruption, but the hopelessness of his corruption is the remoteness of his ideal state from any adequate standard of moral or sane living. He felt that his mind was corroded, but he took ingenious precautions to hasten disintegration. He had moments of ferocious antipathy for his besotted sensuality, but he always contrived to throw the burden on the woman who shared that. His egotistical assumption of potential superiority to his mistress is a monstrous misconception. He had vague, subtle sympathy with the pain of the world, but he was angry with his mother because she intruded on his sensitive organization domestic afflictions which obliged him "to occupy himself with anything but his love, to suffer for anything but his love." On the whole, though, Aurispa is touching in his relation to his mother, and the chapters which describe his home, synthesizing as they do with extraordinary power and dramatic vividness the influences most present in his susceptible youth, constitute his best apology. The fantastic boyish notion of spiritual identity with his uncle Demetrius impelled him constantly towards suicide, though the dreams for which the elder Aurispa died appear to have been rather more than those of the younger aspirations heavenward. Crudely speaking, when George Aurispa commits suicide, he is about as mad and bad as a man can be. His choice was between a lunatic asylum and death, and there is no lesson of any sort to be deduced from his preference.

D'Annunzio has no appearance of writing with a reasoned intention. Whether he is engaged in turning an abnormal nature inside out with astonishing intellectual lucidity, or

in describing the superstitious ecstasies and horrid physical blemishes of a band of pilgrims, he does his work with the spontaneity of the apostles and the deadly precision of an instrument of fate. There is no power for good, and there is enormous power for evil. Life as rendered by him is all ugly and unclean.

It is to be supposed that translators have a code of ethics and some sense of a duty of fairness to their author. It is not fair to D'Annunzio to put him into English. No translator can reproduce the sensuous flow, almost rhythm, of his prose; and the English tongue dissociates him from his race and his traditions, brings him sharply into comparison with English thought and English feeling, making him appear altogether monstrous and giving him no benefit of a doubt. We have fortunately no standards in our literature by which to measure him, and if we have them in our life, let us at least be thankful for the decency, or prudery, or hypocrisy which compels us never to mention them.

Fridtiof Nansen, 1861-1893. By W. C. Brögger and Nordahl Rolfsen. Translated by William Archer. Longmans, Green & Co. 1896. Pp. x, 402. 8vo. Illustrated.

Fridtiof Nansen, the son of Baldur Fridtiof and Adelaide Nansen, was born at Great Fröen, West Aker, Norway, October 10, 1861. He was educated in the local schools, where he maintained a good rank, and, from the first, was devoted to woodland outings and athletic exercises, for which the adjacent highlands and woods of Nordmarken offered abundant opportunity. His home training was of a Spartan sort which disregarded minor luxuries and even comforts, while giving ample scope to family affection. His father was a jurist, refined and courteous, enjoying the fullest confidence of those associated with him. His mother, as in the case of so many distinguished men, was an exceptional woman. To a masculine will and disregard of conventionality were added an even temper, great efficiency in domestic duties, and a practical and straightforward nature. At a time when it was thought an unseemly exercise for women, she was devoted to snow-shoeing, in which her son afterward became so proficient. As their income was modest, much of the work was done by members of the family; the boys took turns in waiting on the table, and, until they were eighteen, the mother was their only tailor.

After some uncertainty as to his choice of a career, during which he was entered as a cadet at the military academy, Fridtiof chose to continue his scientific studies in a zoölogical direction. On passing a praiseworthy second examination, he undertook, at the suggestion of Professor Collett, a voyage to the sealing-grounds of the North Atlantic on the Norwegian sealer *Viking*, in 1882. He made good use of his opportunities for study of the arctic fauna, and gained on this voyage the reputation of a mighty hunter of bears. On his return to Norway, the distinguished Dr. Danielssen, Director of the Bergen Museum, offered young Nansen the position of conservator, which was accepted at once; being, in fact, a remarkable piece of good fortune for a man so young and untried. The energy, activity, and unselfish devotion of his aged chief had no doubt a most beneficial influence on the younger man. Active in every worthy cause, though himself a partial cripple; distinguished in zoölogy, in medicine, and in social reforms; deprived by death of all those most dear by ties of blood and marriage, Danielssen stimulated every one about him to his best efforts in whatever work. Paternal alike in encouragement and reproof, his young subordinates gave him a truly filial respect and affection.

Nansen devoted himself to his duties and to research, without neglecting his athletics, for which the mountainous country about Bergen afforded every advantage. He pursued investigations into the finer structure of the central nervous system, at first in the myzostomoid worms, and, later, among other invertebrates and the lowest types of vertebrates. Afterward he took up the study of the embryology of the cetacea, and in both directions his researches hold an honorable place in the literature of these subjects. He was recognized as a promising student, and from Marsh and Jordan in America came suggestions that he should accept a post across the Atlantic. But Nansen was not cut out for continued laboratory work. Already his imagination had been stimulated by the attempt of Nordenskiöld to cross the Greenland ice-cap. An admirable snow-shoer, an exceptional athlete, blessed with a singular capacity for ignoring all sins of omission or commission in the matter of diet and dirt; with a perfect disregard of precedent and opinion when his own mind was made up; with an absolute self-confidence, which was reinforced by a very intelligent and practical command of details—surely no man was ever better fitted by nature for the task of exploration in the arctic regions. His friend Grieg writes:

"It never occured to him to take society and circumstances into account as factors to be considered and reckoned with; when once an idea took hold of him, he followed it up unshrinkingly to its ultimate consequences. Contradiction was wasted on him; with kindness you could get him to do anything. The reason why his intimates were so devoted to him was that, though he was sometimes inconsiderate and stiffnecked enough, at other times one could not but recognize in him an exceedingly delicate and affectionate disposition. . . . The child was always strong in him."

In 1887 Nansen broached his idea of an expedition to cross Greenland, in which, with much encouragement from a few men of mark like Nordenskiöld, he met much opposition, and failed in Norway to enlist the necessary capital. It was finally made possible by the generosity of Augustin Gamél of Copenhagen. In April, 1888, he finished his examinations for the degree of Ph.D., and on the 2d of May he set off for Copenhagen on his way to Greenland. The history of that expedition and its success has already been recorded in these columns. In May, 1889, he returned triumphant, and received on his arrival a popular ovation. Not long afterward he married Eva, daughter of the younger Prof. Sars, the celebrated zoölogist of Christiania.

The arctic fever was still in his blood; indeed, it may be doubted if any one who has contracted it ever completely recovers. In 1890 Nansen was setting forth his plans for a new Polar expedition, writing his account of the Greenland journey and a book on the Greenland Eskimo, so that one wonders what time he had for sleep after attending to his new duties as Curator of the University Museum at Christiania. Success attended his efforts. In 1892 the *Fram* started on that remarkable journey of which the past summer has seen the triumphant return, and the main details of which are familiar to the public.

These facts have been extracted, not without difficulty, from the volume before us, which is far from profuse in dates and precise details. One wonders—finding described the "Great Ice Age," the history of "arctic explorations from the earliest times," and even, we are assured, in the original (what has been mercifully omitted by the translator), an account of the geology of Norway. We are told with enthusiasm how the hero bumped his head at the age of five years, and the series of his portraits would do credit to the personal panoramas of some English periodicals. At first one queries, "Is it padding and puffery, or not?" but the verdict on closing the book will be in its favor. It is simply that our worthy Norsemen have become so intoxicated with admiration and the joy of possession that their book has bubbled over. Who shall have the cynicism to reprove them with anything more scathing than a smile?

Alone in China. By Julian Ralph. Harper & Bros.

Mr. Ralph touches very gently, almost reverently, "the decayed old gentleman" of the Far East. Arriving in the country during the war with Japan, he went at once a house-boating through the Garden Provinces, and saw uncontaminated China. He understood why the people born on the soil call their land "the Flowery Kingdom," and "Heaven Below," if not "Celestial." He discovered a continual succession of new beauties. Japan might be glorified by House, Arnold, Hearn, Finck, Knapp, and a host of journalist-authors bound to find in the Mikado's domains the one unsoiled Eden of earth; but who ever even dreamed of discovering in China the "land of pure delight," of "sweet fields arrayed in living green"? Surely, the New York journalist has made a "beat." He pictures China as lovely to the eyes, idyllic in its rural beauty and rustic mirth and joy. Here are youth, fun, refinement, culture, happiness, fertility, fairies, poetry, learning, art, luxury, and loveliness.

In a word, Mr. Julian Ralph has written a delightful book of travels in the form of stories and sketches. Having already made the acquaintance of his Chinese scenes and characters in Harper's periodicals, we are ready to welcome them as herein set in permanent form. The author may be assured that his book will "beget a kindly feeling for the people of the withering Flower Kingdom." Indeed, some pathetic pages which, though not "crowded with the reflections of gorgeous colors," suggest the dying dolphin in their iridian change and richness of rhetoric, will certainly bring tears to the eyes of susceptible readers. The two stories—both the one which furnishes the book's title and "Plumblossom's Adventures"—show what real life is to the feminine part of the Christian, when entering the Chinese, world through the gateway of marriage—whether with a yellow follower of Confucius or a white father of Eurasians. Other of the seven chapters admit us into the realms of travel, politics, social life, and the fairy world.

Despite the facile pen of the writer and his chameleon-like power of quickly catching and reflecting the colors of a region visited by him for but a few months, there is, to one long familiar with "chit-book," "tiffin,' "boy," and "cumshaw," a curious sense of limitation in both the text and its writer. Nevertheless, to those who wish enjoyment only, and are as modest in their expectation of solving the problem of Chinese human nature as is the author, there will be no

disappointment in this very attractive volume. Fully up to the text, if not surpassing it in artistic merit, are the soft and clear drawings of Mr. C. D. Weldon.

BOOKS OF THE WEEK.

A Great Scientist.

Life and Letters of William Barton Rogers

By EMMA ROGERS. With several portraits and other illustrations. 2 vols., crown 8vo, $4.00.

Professor Rogers was one of the great scientific scholars of America, and held equal rank with the European authorities in science of his time. His life covered a wide and unusually interesting range of experiences, from his boyhood in Philadelphia through his life as student and professor at William and Mary College, his labors as head of the Geological Survey of Virginia, his engagement as Professor and Chairman of the Faculty in the University of Virginia, and—as the culmination of his great career—his years of fruitful service as the first President of the Massachusetts Institute of Technology.

This biography, by Mrs. Rogers, is a judicious and noble tribute to Professor Rogers. It comprises a large number of letters by and to him, his correspondents including nearly all the eminent scientific men of his time, also many distinguished and interesting persons in literary and professional life.

Sold by Booksellers. Sent, postpaid, by

HOUGHTON, MIFFLIN & CO., Boston, 11 East 17th Street, New York.

A NEW CHAP-BOOK

ANNOUNCEMENT

WITH the issue of January 15th, the Chap-Book will take what is probably the most significant step in its career. The Publishers, Messrs. Herbert S. Stone & Company, have determined to enlarge the magazine to the size of the English weekly reviews, and to begin at once the publication of criticisms of important new books. The restriction of size has hitherto made the Chap-Book's mention of contemporary books necessarily occasional, cursory, and inadequate. In its new form it will have ample space for reviews which shall keep the reader informed of all the considerable publications in history, travel, and belles-lettres.

In addition to this, the Chap-Book will continue to print stories, poems, and essays as before. The department of "Notes" will be continued and enlarged, and will appear at the front of each issue. The illustrations are to be limited to portraits, pictures of literary interest, and purely decorative designs.

Mr. Max Beerbohm's series of caricatures will be continued throughout the spring, and, from time to time, there will be carefully chosen and printed colored supplements.

Mr. Henry James's latest story, a novelette, will appear in the Chap-Book as a serial, and Mr. Clarence Rook's interviews with literary men, of which the first was on Mr. Bernard Shaw, is to be continued.

It is believed that there is still a field in this country for a review which shall give carefully selected original matter and, in addition, to the best of its ability, subject contemporary writing to the highest literary standards. The Chap-Book's endeavor is to be at once sane and entertaining. It wishes to invite criticism as a literary and critical journal of the first rank. With its list of contributors, it has long since ceased to desire comparison with the numerous obvious imitations of it—the so-called miniature magazines. These papers had, indeed, before the majority of them died, succeeded in destroying any charm which the small size originally had.

With the prospective changes, the Chap-Book hopes to offer all it has formerly given the public, and much more. The price remains unchanged ($2.00), although the amount of material in its pages will be increased two-fold.

THE CHAP-BOOK, JANUARY 15th

Published by HERBERT S. STONE & CO., Chicago

A NEW WORK BY MR. ANDREW LANG.

Pickle the Spy;

Or, THE INCOGNITO OF PRINCE CHARLES.

With Portraits and Illustrations. 8vo, 342 Pages, $5.00.

**This book is not a novel, though it contains the materials of romance. The subject is the mysterious disappearance of Prince Charles from February 28, 1749, practically till his father's death in 1766. These years, especially 1749-1756, were occupied in European hide-and seek The Ambassadors and Courts of Europe, and the spies of England, were helpless, till in 1750 a Highland chief of the highest rank sold himself to the English Government. The book contains his unpublished letters and information, with those of another spy, James Mohr Macgregor, Rob Roy's son. These, combined with the Stuart Papers in Her Majesty's Library at Windsor, the Letters from English Ambassadors in the State Papers, the Political Correspondence of Frederick the Great, the French Archives, illuminate a chapter in Secret History. The singular story of Macallester the spy also yields some facts, and the whole exhibits the last romance of the Stuarts, and the extremes of loyalty and treason.

LORD LEIGHTON'S DISCOURSES ON ART.

ADDRESSES DELIVERED TO THE STUDENTS OF THE ROYAL ACADEMY.

By the late Lord LEIGHTON, Sometime President of the Royal Academy. With Portrait. 8vo, 310 pages, cloth, extra, gilt top, $2.50.

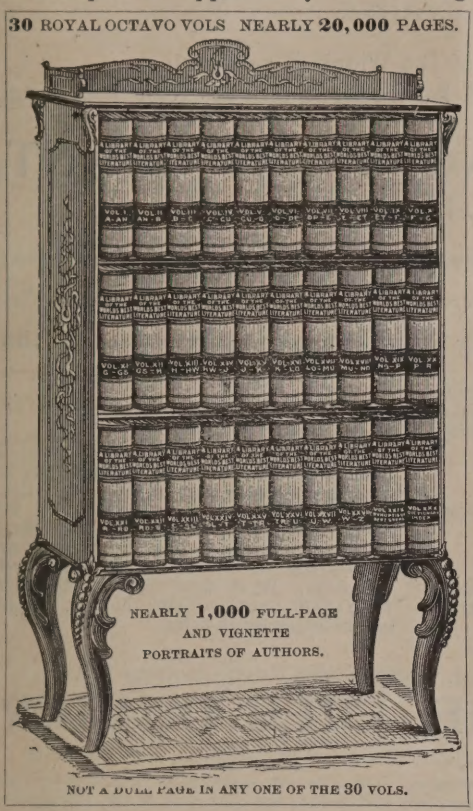
Club closes IN JANUARY

And Prices will Positively be Advanced

It is but a few weeks since **HARPER'S WEEKLY CLUB** announced an exceptional opportunity for securing at about half the regular price the greatest of all literary works yet attempted.



30 ROYAL OCTAVO VOLS NEARLY 20,000 PAGES.
NEARLY 1,000 FULL-PAGE AND VIGNETTE PORTRAITS OF AUTHORS.
NOT A DULL PAGE IN ANY ONE OF THE 30 VOLS.

CLUB ONE positively closes this month, and the price will be at once advanced. **NOW** is your very best opportunity to secure that important new work,

Library of the World's Best Literature.

Being a comprehensive survey of all writers, speakers, and thinkers, ancient and modern, with their masterproductions, and with hundreds of elaborate essays on great authors and great books by leading literary critics of this country and Europe

This great Library is to Literature what the Encyclopædia Britannica is to the Arts and Sciences.

A DELIGHT TO SCHOLARS

A LIBERAL EDUCATION

To each and every member of the family.

The Elaborate Essays alone are worth many times the cost of the entire thirty volumes. Every Home should possess this superb new work, which covers the whole world of Poetry, Romance, History, Biography, Oratory, etc., etc., from the dawn of time to the present day.

PRICES Greatly Reduced to Harper's Weekly Club Members.

	Reg. price per vol.	Price to Members of Club.	Total amt. saved.
Cloth Edition,	$3.00	$1.60	$42.00
Quarter Russia,	3.50	1.90	48 00
Half Morocco,	4.00	2.20	54.00
Full " (Extra),	5.50	3.20	69.00

NOTICE *This Club will close in January, and as memberships are being taken up rapidly, it is safest to order at once, as the right is reserved to close the Club immediately,* **WITHOUT NOTICE.**

Address all communications to

HOW TO JOIN THE CLUB.

On receipt of $3 ($2 to cover membership fee in HARPER'S WEEKLY CLUB and $1 as first payment on the Library), your name will be enrolled for whichever edition you select, and the volumes already issued will be sent you at once—the others to follow at brief intervals. Owing to the extremely low price at which the work is supplied to members, the cost of delivery must be paid by the purchaser. Since the initial payment is only $3 in any case, be sure to state which edition you desire. WE ESPECIALLY RECOMMEND THE HALF-MOROCCO STYLE, which is rich, handsome, and will last a lifetime—important considerations in a work for permanent possession and study. Balance on set arranged in monthly payments so small that subscribers will hardly feel the outlay. *If not entirely satisfactory the volumes may be returned within 10 days and money will be promptly refunded.*

HARPER'S WEEKLY CLUB. Headquarters, 91-93 5th Ave., New York
C. L. BOWMAN, Manager.

"Young people who grow up on ST. NICHOLAS are pretty sure to like the best literature."
—*Home Journal, Boston, Dec 5, 1896.*

THE JANUARY ST. NICHOLAS

New Year's Number.

Containing a delightful table of contents, including a complete long story—

"DANNY AND THE 'MAJOR.'"

A Story of the Plains.

Danny is a soldier's boy, and the "Major" is a horse. Mrs. Custer, who read the manuscript, said of it, "It is true to the very life: to read it is like being there."

THE SERIAL STORIES

of ST. NICHOLAS for the coming year are especially noteworthy. One, "Master Skylark," by John Bennett, illustrated by Reginald Birch, is a story of the days of Shakspere, the poet himself being one of the characters, although the hero and heroine are a boy and a girl.

Begin the New Year

by subscribing to ST. NICHOLAS for the young folks of your household. The volume began with the November number, and several of the serials commence in that issue. All new subscribers who begin with January may receive the November and December numbers free of charge (December is the beautiful Christmas issue) on request Subscribe through dealers everywhere, or remit $3.00 to the publishers,

THE CENTURY CO.
UNION SQUARE, NEW YORK.

HAND-BOOK TO THE LABOR LAW OF THE UNITED STATES

By F. J. STIMSON. 12mo, $1.50 *net*

A popular hand-book to the law of labor, employers' contracts, strikes, boycotts, and the relation of the wage earners, both to ordinary employers and to railway or other corporations and trusts, as it exists in the several states of the Union to-day.

THE NATION

"Mr. Stimson writes law in such a way that it can not only be studied, but read; a rare gift, and one which only sound lawyers, and very few of those, possess. Most of the trouble caused by the labor problem is produced by pure ignorance, and if an additional labor law would be passed, compelling every one, before he undertakes to discuss labor questions or agitate for any new labor reform, to read this hand-book, we are satisfied that there would be a saving of a very considerable percentage of the annual pecuniary loss to the country which comes from useless strikes and boycotts."

LABOR AND ITS RELATION TO LAW

By F. J. STIMSON. 16mo, 75 cents *net*

THE INDEPENDENT

"Unless we are greatly mistaken, this is the clearest, fairest, most level-headed, all around condensed statement of the labor problem in relations to law and right, individual, social, and corporate, that has yet been put into print."

Speech and Speech-Reading for the Deaf.

The latest methods of instructing deaf children with special reference to the experience of Helen Keller. Illustrated by Irving Wiles.

A Rose of Yesterday.
By F. Marion Crawford.

The third instalment of Mr. Crawford's new novel. A study of divorce.

The Absurdity of War.

"The last remnant of man's mode of deciding disputes in the animal or savage state." By E. L. Godkin.

Napoleon's Interest in the Battle of New Orleans.

With a Description of the Battle by General Andrew Jackson.

The battle of New Orleans, in which 2,117 British soldiers and 13 Americans were killed and wounded, excited the interest of Europe, especially of Napoleon Bonaparte, who was in Elba at the time. General Jackson wrote a personal letter to James Monroe which describes the battle and which was read by Napoleon. It is believed that this letter, which is of extraordinary interest, has never before appeared in print.

Dr. Weir Mitchell's Great Story of the Revolutionary War,

"HUGH WYNNE, FREE QUAKER."

With a Synopsis of the Chapters already Published in November and December.

This story is attracting universal attention. The present instalment contains two thrilling episodes in the life of its young Quaker hero just before the outbreak of the Revolution.

Lenbach, the Painter.

A beautifully illustrated article on a famous German painter, with his portrait of Bismarck, engraved by Henry Wolf, as the frontispiece.
